LONGMAN, ORME, BROWN, GREEN, & LONGMANS,
PATERNOSTER ROW.

M.DCCC.XLI.

JOHN LIGHTON PRINTER,
JONES'S COURT, FLEET STREET, LONDON

P R E F A C E.

THERE are few tasks of more difficult accomplishment, than the one which an Author feels bound to undertake, when a performance which has engrossed much of his time, and to which he has probably directed his best energies, is about to be submitted to the public. Literary usage appears, however, to have decided, that upon such an occasion, some prefatory observations are considered indispensable; but, while prompted by a natural desire to enter somewhat freely into the merits of that which has occupied his most earnest attention, the overwhelming apprehension of being thought egotistical, and the bare possibility of really becoming so, will often paralyze the Writer's best intentioned efforts. In the present instance, I can truly say, that my incessant occupation from the hour I commenced this volume to the very eve of its publication, coupled as it has been with an anxious desire to render it worthy of public favour, have left me no time to consider what arguments would be most likely to fix the reader's attention to the following pages: in what terms I should entreat his kind indulgence; or upon what grounds I could venture to deprecate the severity of criticism.

May I be allowed to say, that I have endeavoured to produce a work, which—while I am fully sensible of its numerous imperfections—I trust, may be generally acceptable, and, I hope, extensively useful? Its design, though briefly, is not obscurely, stated in the title-page: and its contents, multifarious as they are, are so perceptible at a cursory glance, owing to the alphabetical arrangement, that it would be almost impertinent to trouble the reader with more than a mere reference to the general plan.

A wonderful change has of late years taken place in the means adopted for diffusion of a taste for literature and science. The talents and attainments of eminent Professors, in every department of literature, in every branch of art, in every scientific pursuit, are now called into vigorous and united action; and it may indeed be truly said, that we live in an era when the youth of our country cannot fail to meet, in all directions, with advocates as sincere as they are disinterested, for their intellectual progress, their moral advancement, and for the grand result of these—their future happiness.

Some are labouring, with well-directed zeal, to establish literary and scientific institutions; others are cheerfully becoming the indefatigable instructors of imperfectly educated adults; and many, with an ardour and earnestness of purpose in the highest degree creditable to them as men of science and as citizens of the world, are unfolding the treasures of their well-stored minds to delighted audiences in the lecture-room.

It is evident that in a publication of this varied character, it would be absurd to lay claim to any great merit on the score of originality; for, although I have not unfrequently ventured to deviate from the beaten path, under an idea that certain subjects might be rendered more inviting to the desultory reader, without detracting aught from their real value, I believe that, in such instances, no unwarrantable liberties have been taken, no levity indulged in where the subject required a becoming gravity, and no attempt made to render an article merely amusing, which ought to be strictly didactic or logically exact. In short, it has been my constant aim, as far as the limits of this publication would permit, to collect into different foci the result of the observations I have made, and to reflect the scintillations of light from every quarter within the compass of my circumscribed vision.

It may, at first sight, appear that a great disparity exists between the length of the different articles. It must be remembered, however, that many are merely definitions of technical terms, which could be better and more clearly expressed in a brief sentence or two, than in half a column. The magnitude or intricacy of others demanded a comparatively long discussion; and there are not a few which, either from their novelty or their present popularity, would be considered as too slightly noticed, if the same process of condensation had been used in regard to them, as was applied to others, of equal importance perhaps, but more generally known, or better understood.

I am well aware how natural it is for a person who is engaged in any particular study, or who has a predilection for some given topic, to be desirous of making himself as fully acquainted with it as possible, and to feel, perhaps, a degree of disappointment, where another person, with different views and pursuits, would be abundantly satisfied; but the candid reader, I am persuaded, will grant, that a *complete system* of any science can hardly be expected in a work whose highest excellence must, after all, be a judicious brevity; and that if *principles* be clearly stated, they will often suffice till the details can be sought in works especially adapted for their elucidation. My great object has been to produce a book that should meet the wants and

wishes of a very large and most respectable class of readers, whose opportunities of studying the ponderous tomes of science are as unfrequent as their aspirations after knowledge are ardent. To the literati, I know it can present few attractions; to the man of science it presumes not to offer anything new. But there may be times, when even these may find it convenient to consult a hand-book of reference, so portable and yet so full, if it be merely to refresh the memory on some neglected or forgotten theme.

I consider it unnecessary to enumerate the various branches of literature which are comprised in the following pages, my object having been to concentrate therein, as far as was possible, the whole of the liberal arts—briefly, it is true, but with as much perspicuity, and in language as simple and familiar as I could command; neither do I deem it at all important to name the numerous works which I have found it necessary to consult. It will be seen, throughout the work, that wherever I have been indebted for any material information, I have not failed to acknowledge the source whence it was derived. But although it may be needless to dilate on the general nature of the contents, for the reasons before given, it is essential to notice that the *facts in science*, &c. which surround the pages, have, with few exceptions, a direct reference to some subject treated on in that particular page, or contains a further illustration of it. These marginal observations have occupied no inconsiderable time; and I hope they will not be less valuable than the moral precepts and proverbs have been found which encompass the pages of “The Treasury of Knowledge” and “The Biographical Treasury.”

And now, in bringing these remarks to a close, it may not be improper to observe, that, although I have studiously avoided the introduction of any matter foreign to the immediate subject under consideration, I have not been unmindful of the connection that exists between the natural and the moral world, nor have I neglected any suitable opportunity of enforcing sound principles in ethics, and that willing obedience to the laws, without which science is acquired in vain, and learning often proves a curse.

“The philosophic youth

To NATURE's voice attends, from month to month,
And day to day, through the revolving year;
Admiring, sees her in her every shape;
Feels all her sweet emotions at his heart;
While TRUTH, divinely breaking on his mind,
Elates his being, and unfolds his powers.”—THOMSON.

THE SCIENTIFIC AND LITERARY TREASURY.

A3

ABA

A IS the first letter, and the first vowel, of the alphabet in every known language, except the Ethiopic; and is used either as a word, an abbreviation, or a sign. If pronounced *open*, as in *FATHER*, it is the simplest and easiest of all sounds; the first, in fact, uttered by human beings in their most infantile state, serving to express many and even opposite emotions, according to the mode in which it is uttered. A has therefore, perhaps, had the first place in the alphabet assigned to it. In the English language it has four different sounds: the *broad* sound, as in *FALL*; the *open*, as in *FATHER*; the *slender*, or *close*, as in *PACK*; and the *short* sound, as in *FAT*. Most of the other modern languages, as French, Italian, German, &c. have only the *open*, or Italian *a*, pronounced short or long.—Among the Greeks and Romans, A was used as an arithmetical sign: by the former for 1; by the latter for 500; or with a stroke over it for 5,000. The Romans also very extensively used it as an abbreviation; which practice we still retain, as A.M., *artium magister*; A.D. *anno domini*, &c.—A, *a*, or *an*, in medical prescriptions, denote *ana*, or equal parts of each.—A, in music, is the nominal of the sixth note in the diatonic scale; in algebra it denotes a known quantity; in logic, an universal affirmative proposition; in heraldry, the *dexter chief*, or chief point in an escutcheon; and it is the first of the dominical letters in the calendar.

AA'M, or HAA'M, a Dutch liquid measure, containing about 36 English gallons.

AAN'CHE, a name sometimes given to wind instruments with reeds or tongues, as the clarinet, hautboy, &c.

AA'NEE, in music, the tones and modes of the modern Greeks.

AARDVARK, or EARTH PIG, an animal common in Southern Africa, which feeds entirely upon ants, and is remarkable for the faculty with which he burrows deep in the earth to avoid his pursuers, and for the instinct he displays in securing his insect prey.

AAVO'RA, a species of palm-tree.

AB, in the Hebrew calendar, the 11th month of the civil year, and the 6th of the

ecclesiastical. In the Syriac calendar, it is the last of the summer months. The eastern Christians called the first day of this month *Sabbat Miriam*, the fast of Mary, and the 15th, on which day the fast ended, *Faith-Miriam*.

A'BAB, a sort of militia among the Turks.

AB'ACA, a plant, of which there are two species, growing in the Philippine Islands; the *white* producing lint, of which fine linen is manufactured; and the *grey*, hemp, which is made into cordage.

ABACINA'RE, a punishment, described by writers of the middle ages, wherein the criminal was blinded, by holding red-hot irons before his eyes.

ABACIS'CUS, in ancient architecture, the square compartments of Mosaic pavements.

ABACOT, a cap of state worn in the form of a double crown, used by the ancient kings of England.

ABAC'TUS, a term used by ancient physicians for a miscarriage.

AB'ACUS, a sort of cupboard or buffet, used by the Romans, and which in times of great luxury was plated with gold.

ANACUS, in architecture, the superior member of the capital of a column, to which it serves as a kind of crown. It was originally intended to represent a square tile laid over a basket; and it still retains its original form in the Tuscan, Doric, and Ionic orders; but in the Corinthian and Composite, its four sides or faces are arched inwards, having a rose or some other ornament in the middle.—ANACUS, among ancient mathematicians, was a table strewn over with dust, or sand, on which they drew their figures.—ANACUS, in arithmetic, an ancient instrument for facilitating operations by means of counters. Its form is various; but that chiefly used in Europe is made by drawing parallel lines distant from each other at least twice the diameter of a counter; which placed on the lowest line, signifies 1; on the second, 10; on the third, 100; on the fourth, 1000; and so on. In the intermediate spaces, the same counters are estimated at one half of the value of the line immediately superior.—There

[ABA]

The Scientific and Literary Treasury ;

[ABB]

were also other inventions similarly denominated; viz. ABACUS PYTHAGORICUS, a multiplication table, invented by Pythagoras; and ABACUS LOGISTICUS, a rectangular triangle, whose sides, forming the right angle, contain all the numbers from 1 to 60, and its area the products of each two of the opposite numbers. This is also called a *canon of sexagesimals*.

In justice to the present advanced state of science, and at the same time, as a sincere though feeble tribute to the genius of one of the most scientific men of the age, we are bound to notice in this place a most extraordinary automatic invention by Mr. Babbage, (infinitely exceeding the powers of the abacus of ancient arithmeticians,) the object of which is to compute and print the most difficult astronomical or navigation tables, &c., such as could not otherwise be effected without immense intellectual and manual labour. We hear that the machine is not yet quite completed, but the inventor asserts, and his assertions are verified by Sir David Brewster and other eminent men, that not only can the highest operations of arithmetic be performed by this stupendous engine, but it is capable of correcting its own errors, and, when corrected, it can print off the results, independent of human aid! By this it appears that the machine consists of two parts, a calculating, and a printing part, both of which are absolutely necessary to its entire perfection. In explaining his mode of accomplishing such great objects, the inventor observes, "that nearly all tables of numbers which follow any law, however complicated, may be formed, to a greater or less extent, solely by the proper arrangement of the successive addition and subtraction of numbers breifing each table;" and he then proceeds to shew, by a series of tables and explanations, the theory of his art, as well as the mechanical execution required for its performance. The limits of our work, however, are inadequate to give a fair illustration of so skilful a contrivance, but it may be sufficient to lead the enquiring mind to farther investigation. [We may here remark, *en passant*, that it is to this end that a book of reference, so extensive in its aim as the present, must of necessity be constantly directed. Wherever, by reason of its brevity, or the magnitude of the subject on which it treats, it cannot enter into the necessary details, it may still excite a laudable curiosity for more elaborate information, and thereby lead to its acquirement.]

ABATEMENT, in law, signifies the rejecting a suit, on account of some fault either in the matter or proceeding.—ABATEMENT, in heraldry, something added to a coat of arms, in order to lessen its true dignity, and point out some imperfection or stain in the character of the person who bears it.—In commerce, ABATEMENT means a discount in the price of commodities for money advanced by the buyer, or some other cause.

AB'ATIS, trees cut down and laid with

their branches turned towards the enemy, so as to form a defence for troops stationed behind them.

ABATOR, in law, one who enters into a house or lands, void by the death of the last possessor, before the true heir.

AB'ATURES, a term, with hunters, to denote the sprigs or grass thrown down by the stag in passing by.

ABB, or ABB-WOOL, a term used by clothiers for the warp.

AB'B'E, a French word, literally meaning an *abbot*; but the character generally spoken of under the name of *abbé* has long ceased to be of any official nature. Before the Revolution, the term *abbé* designated a very numerous body of persons, who had little or no connexion with the church, except the apparent one which they derived from this title, but who followed a course of theological study, in hopes that the king would confer on them a real abbey, that is, a part of the revenues of a monastery. They were engaged in every kind of literary occupation, and exerted an important influence on the character of the country; nor was there scarcely a family of distinction in France wherein an *abbé* was not found in the capacity of a familiar friend and spiritual adviser.

AB'BESS, the superior of a nunnery, or other religious community of women. She has the same authority as an *abbot*, but cannot exercise any of the spiritual functions.

AB'B'EY, a religious house governed by a superior, under the title of an *abbot* or *abbess*. Abbeys differ in nothing from priories, except that the latter are governed by priors, instead of abbots. The abbeys of England, at their dissolution under Henry VIII., became lay-sees; when no less than 190 were dissolved, the yearly revenue of which has been estimated at 2,853,000*l.*; an almost incredible sum, considering the value of money in those days. At present, an abbey is, in general, the cathedral or episcopal church of the see or diocese in which it stands.

AB'BOT, was originally the name of every aged monk; but, since the 8th century, it denotes the head of a monastery. In most countries they held a rank next to that of bishop, and had votes in the ecclesiastical councils. At present they are chiefly distinguished into regular and commendatory; the former being real monks or religious, and the latter only seculars or lay-men. These last, notwithstanding that the term *commendam* seems to signify the contrary, have the perpetual enjoyment of the fruits of their abbeys. Anciently the ceremony of creating an *abbot* consisted in clothing him with the habit called *caecula*, or cowl: putting the pastoral staff into his hand, and the shoes called *pedales*, on his feet; but at present, it is only a simple benediction.—It was because certain abbots and priors in England, in right of their monasteries, held lands of the crown, for which they owed military service, that they obtained the title of lords, and were summoned, as barons, to parliament; and

THE KING OF FRANCE HAD FORMERLY THE RIGHT OF APPOINTING ABBOTS OVER TWO HUNDRED AND TWENTY-FIVE MONASTERIES.

SOME PROTESTANT CIRCUMEN, IN GERMANY, STILL BEAR THE TITLE OF ABBOT, WITH THE RIGHT OF SITTING IN THE DIET OF THE STATES.

[ABE]

A New Dictionary of the Belles Lettres.

[ABO]

THE ABDUCTOR OCULI IS ONE OF THE MUSCLES ARISING FROM THE ORBIT OF THE EYE, AND IS SOMETIMES CALLED THE SCORFUL MUSCLE.

from this custom the bishops, in modern times, have the same honour.

ABBREVIATION, a contracted manner of writing words so as to retain only the initial letters. Such abbreviations were in common use with the Romans, as they are with us, to save time and space. [For a complete list of those most necessary to be known at present, we refer to "*The Treasury of Knowledge*."]—**ABBREVIATION**, a mathematical term, given to the process by which a fraction is reduced to lower terms.—**ABBREVIATION**, (in music.) One dash, through the stem of a minim or crotchet, or under a semibreve, converts it into as many quavers as it is equal to in time: two dashes into semiquavers; three into demisemiquavers; and so on. When minims are connected together like quavers, semiquavers, &c., they are to be repeated as many times as if they were really such notes. An oblique dash through the 2nd, 3rd, and 4th lines after an arpeggio, signifies that it is to be repeated; for quavers, a single dash being used; for semiquavers, a double one; and so on.

ABBREVIATORS, officers who assist the vice-chancellor in drawing up the Pope's briefs, and reducing petitions into proper form, to be converted into bulls.

ABDICAT'ION, properly speaking, is a voluntary resignation of a dignity, particularly a regal one; and if he in whose favour the abdication was made, dies, or declines the offered dignity, the right of the abdicated prince is reverted. Involuntary resignations are, however, also termed *abdicationes*, as in the case of Napoleon's abdication at Fontainebleau.

ABDITA'R'UM, or **ABDITO'R'UM**, in archaeology, a secret place for hiding or preserving valuables.

ABDOMEN, that part of the body usually called the belly. It contains the viscera more or less immediately connected with digestion, and the kidneys which secrete the urine. By anatomists, the abdomen is divided into three anterior regions, viz. the epigastric, or upper one; the umbilical, or middle one; and the hypogastric, or lower one: there is also one posterior region, called *regio lumbaris*.

ABDOMINALES, a numerous order of fishes, which have the ventral fins placed behind the pectoral, in the abdomen; as salmon, trout, herrings, carp, sprats, &c. It includes the greatest number of the fresh-water species.

ABDUCTION, the crime of unlawfully taking away, either by force or fraud and persuasion, the person of another, whether of child, wife, ward, heiress, or woman generally.—The word *abduction* is also used in surgery, to express a peculiar fracture of the bones.

ABDUCTOR, in anatomy, a name given to several muscles on account of their serving to open or draw backwards the parts into which they are inserted.

ABELIANS, or **ABELITES**, a Christian sect which sprang from the Gnostics. They abstained from matrimony, but

adopted the children of others, and brought them up in their own principles.

ABELMOS'CHUS, the seed of an Egyptian plant, which resembles musk in its perfume, and is used by the Arabians in their coffee.

ABERRA'TION, in astronomy, an apparent motion of the fixed stars, occasioned by the progressive motion of light.—

ABERRATION, in optics, the deviation of the rays of light, when reflected by a lens or speculum, whereby they are prevented from meeting in the same point. Aberrations are of two kinds, one arising from the figure of the reflecting body, the other from the unequal refrangibility of the rays themselves.

ABEY'ANCE, in law, the expectancy of an estate or possession: thus, if lands be leased from one person for life, with reversion to another for years, the latter estate is in abeyance till the death of the lessee. It is a fixed principle of law, that the fee-simple of all lands is in somebody, or else in abeyance.

ABJURATION, a forswearing, or renouncing by oath: in the old law it signified a sworn banishment, or an oath taken to forsake the realm for ever. In its modern, and now more usual signification, it extends to persons, and doctrines, as well as places.

ABLACTATION, a sort of ingrafting trees, by leaving the graft on its proper stock, until it be fully incorporated with the new stock. Also, the weaning a child from the breast.

ABLECTI, in ancient Rome, a chosen band of foreign troops, selected from the *extraordinarius sociorum*.

ABLEG'MINA, in Roman antiquity, choice parts of the entrails of victims, called also *profeicie, porricia, prosecta*, and *prosemina*. The ablegmina were sprinkled with flour, and burnt on the altar; the priests pouring some wine on them.

ABLUENTS, diluting medicines, or such as dissolve and carry off impurities from any part of the body.

ABLUTION, a religious ceremony of washing the body, still used by the Turks and Mahomedans. It originated in the obvious necessity of practising cleanliness, for the prevention of diseases in hot countries; for which purpose it was made a religious rite; and by an easy transition of idea, the purity of the body was made to typify the purity of the soul: an idea the more rational, as it is perhaps physically certain that outward wretchedness debases the inward mind.—**ABLUTION**, among physicians, is used either for washing the external parts of the body by baths; or detaching the bowels by thin diluting fluids.

ABOL'IA, a kind of military garment worn by the Greek and Roman soldiers.

ABOMA'SUS, the paunch, or fourth stomach of ruminating animals, in which the process of digestion is completed. Ruminating animals, or such as chew the cud, have four stomachs; the first, is called

FORMERLY, BEFORE TAKING REFUGE IN A CHURCH MIGHT ESCAPE PUNISHMENT, BY CONFESSING THEIR GUILT AND ASKING THE READM.

[ABR]

The Scientific and Literary Treasury;

[ABS]

center; the second, *reticulum*; the third, *omasa*; and the fourth, *abomasus*. It is in the abomasus of calves and lambs that the runnet is found, used for curdling milk.

ABORI'GENES, a name given to the original or first inhabitants of any country; but more particularly used for the ancient inhabitants of Latium, when *Aeneas* with his Trojans came into Italy.

ABORT'ION, in a *figurative* sense, any production that does not come to maturity, or any design or project which fails before it is properly matured.—In medicine, it means a miscarriage, or the fetus brought forth before it is perfectly formed.

ABOUT, the situation of a ship immediately after she has tacked.—About ship, an order to the crew to prepare for tacking.

AB'RHACADAB'RA, a term of incantation, formerly used as a spell or charm, and worn about the neck as an amulet against several diseases. In order to give it the more virtue, it was to be written as many times as the word contains letters, omitting always the last letter of the former, and so forming a triangle. But charms and incantations have had their day; and *abracadabra*, if used at all, now serves as a word of jest, like *hocus pocus*, and other unmeaning gibberish.

ABRA'SION, in medicine, the corroding or wearing of the intestines, by sharp and acrimonious humours, or medicines.

ABRA'XAS, or ABRA'XAS, in church-history, a mystical term expressing the supreme God, under whom the Basilidians supposed 365 dependent deities. It was the principle of the Gnostic hierarchy.—ABRA'XAS, or ABRA'XAS STONES, are very numerous, and represent the human body, with the head of a cock, and the feet of a reptile. The name of *Abraaxas stone* is, in modern times, applied to a variety of gems that exhibit enigmatical compositions, but have not the true characteristics of the Basilidians.

AB'RAUM, a kind of red clay used by cabinet-makers to deepen the colour of new mahogany.

ABREAST, side by side, or opposite to; a sea term, applied to two or more ships ranged together.—ABREAST of a place, means directly opposite to it.

ABREUVOIR, a French word for a watering-place, or any place dug for retaining water, as in camps. In architecture, the interstices between two stones to be filled up with mortar or cement are called abreuvoirs.

ABRIDG'MENT, the bringing the contents of a book within a short compass. The perfection of an abridgment consists in taking only what is material and substantial, and rejecting all superfluities, whether of sentiment or style: in which light, abridgments must be allowed to be eminently servicable to all whose occupations prevent them from devoting much time to literary pursuits.—ABRIDGMENT, in law, the shortening a count, or declaration; thus, in *assize*, a man is said to abridge his plaintiff, and a woman her de-

mand in an action of dower, if any land is put therein, which is not in the tenure of the defendant; for on a plea of non-tenure, in abatement of the writ, the plaintiff may leave out those lands, and pray that the tenant may answer to the remainder.

ABROTANUM, in botany, a species of plant arranged under the genus *Artemisia*; called also Southernwood.

AB'SCESS, an inflammatory tumour containing purulent matter.

ABSCIS'SA, the part of any diameter or axis of a curve line, cut off by a perpendicular line, called the ordinate.

ABSCIS'SION, in rhetoric, a figure of speech, whereby the speaker stops short in the middle of his discourse, and leaves his hearers to draw their own inferences from the facts he has stated.—In astronomy, the term *abscission* denotes the cutting off the light of the first of three planets when the third comes in conjunction with the middle one.

ABSENTEE, a word of modern times, applied to land-owners and capitalists, who expend their incomes in another country.

ABSOLUTION, a religious ceremony of the church of Rome, by which the priests assume the power to forgive sins. In the ancient Christian church, *absolution* was a judicial act, by which the priest, in the name of the community, invoking the favour of God, announced to the penitent his remission from ecclesiastical punishment, and readmission into the bosom of the church. The fathers of the Protestant church maintain, that God alone can forgive and deliver from sin; that a judicial power over the souls of Christians is conferred neither on priests nor teachers.

AB'SOLUTISM, in matters of theology, a doctrine charged on the Calvinists; whereby God is supposed to act from mere pleasure, in regard to the salvation of mankind. Absolutism is the grand obstacle to an union between the Lutherans and Calvinists.

ABSORPTION, the process in animated nature, by which the digested aliments or substances that support the body are carried into the blood. In chemistry, *absorption* means the conversion of a gaseous fluid into a liquid or solid, on being united with some other solid.

ABSORB'ENTS, calcareous earths, or other medicines which soak up the redundant humours of the body.

ABSORBENT VESSELS, are those which absorb the digested aliment, and carry the new matter, called *chyle*, into the system. They are either *lacteal*, or *lymphatic*. The *chyle* being white like milk, gives the name *lacteal* or milky to the vessels through which it is conveyed. The substance contained in the lymphatic vessels is the old and worn-out particles of the system, and such others as may have been received in it from the surfaces of the body: it is perfectly transparent, on which account it is called *lymph*, giving the name *lymphatic* to its vessels.—The term *ABSORBENT VESSELS* is also used by some

PERSONS WHO DERIVED THEIR INCOMES FROM IRELAND, AND DID NOT RESIDE THERE SIX MONTHS, WERE FORMERLY TAXED TWENTY PER CENT.

THE TAX ON IRISH ABSENTEES WAS LAID ON AT THE BEGINNING, AND TAKEN OFF ABOUT THE MIDDLE OF THE EIGHTEENTH CENTURY.

[ABS]

A New Dictionary of the Belles Lettres.

[ACA]

naturalists for the fibres of the roots of plants, which draw nourishment from the surrounding earth.

ABSTEMIL, a name given to persons who could not partake of the sacrament from their natural aversion to wine.

ABSTERGENTS, medicines proper for cleansing the body from concretions and other impurities, not to be effected by simple ablutions. Abstergents are of a saponaceous nature, and therefore very different from mere ablutions.

ABSTINENCE, the abstaining or refraining from what is either useful, agreeable, or pernicious; but more especially, from eating and drinking. In the Romish church there are "days of abstinence," as well as "fast days;" the former importing a partial, and the latter, almost a total abstinence from food.

ABSTINENTS, a sect of Christians who appeared in France about the end of the third century, professing celibacy, and abstinence from particular kinds of food, &c.

—The most rigid **ABSTINENTS** of the present day, are those who, under the whimsical denomination of *tee-totalers*, (*TEA-TOTALERS*?) profess to abstain wholly from the use of all liquors stronger than tea or coffee. In the United States, according to a calculation which has appeared, nearly half-a-million belong to the different "temperance societies;" and even their disciples in England, on a general muster-day, are able to make a display of forces sufficiently numerous, we should think, to alarm the proprietors and keepers of those temples of sin called gin-palaces, which rear their unblushing heads in every street in the metropolis, presenting to the mind, when viewed in contrast with the squalid and filthy wretches who support them, a truly appalling picture of moral, mental, and physical degradation. Whatever means may be found most effectual for banishing the detestable vice of drunkenness from civilized life, should most assuredly be promoted, whether it be *tee-totalism*, the stocks, or the whipping-post; yet we cannot help feeling that there is something bordering upon the ludicrous in these promiscuous assemblages, where "reformed" drunkards, i. e. emaciated old sots, either affecting abstemiousness or having spent all their substance in bacchanalian orgies, set up for apostles of temperance, and decant on their former bibulous propensities, in order that blushing maidens and innocent youths may have an adequate idea of the enormity of drinking a glass of home-made wine. It should, however be observed that, as among professing Christians some are less strict than others, so among the advocates of the "temperance system," some give much greater latitude than others to the meaning of the term; nay, there are those, we understand, who, so far from insisting on the necessity of *tee-totalism*, regard it as a wishy-washy doctrine, and are willing to allow their converts a generous glass whenever the wants of the body require one. There appears to be a

wise liberality in this, which induces us to hope their efforts may eventually succeed.

ABSTRACT, a concise but general view, or analysis, of some large work; in which sense it differs from an *abridgment* only as being shorter, and its entering less minutely into particulars; and from an *extract*, as this last is only a particular view of some part or passage of it.

ABSTRACTIVE, in logic, that operation of the mind whereby it forms abstract ideas. The faculty of abstraction stands directly opposite to that of compounding. By composition we consider those things together, which, in reality, are not joined together in any one existence. And by abstraction, we consider those things separately and apart, which, in reality do not exist apart. In its passive sense it implies occupation with one's-self to the exclusion of other objects.—**ABSTRACTION**, in chemistry, the process of drawing off by distillation any part of a compound, and returning it again to the residue to be redistilled.

ABSTRACTIOUS, an epithet for the native spirits of aromatic vegetables, in distinction from those produced by fermentation.

ABUTMENTS, the extremities of any body adjoining another, as the extremities of a bridge resting on the banks or sides of a river. Also the junctions or meetings of two pieces of timber.

ABYSS, any deep place that is supposed to be bottomless, as the deepest or unfathomable parts of the sea.

ACA'CIA, a beautiful shrub, one of the species of which bears rose-coloured flowers.—In the materia medica, acacia is the inspissated juice of the pods of the *mimosa Nilotica* of Linnaeus.

ACAE'NA, a genus of curious evergreen herbaceous exotics, chiefly from South America and New Holland.

ACADEMICS, a sect of philosophers, who followed the doctrine of Socrates and Plato, as to the uncertainty of knowledge and the incomprehensibility of truth. Academic, in this sense amounts to much the same with Platonist; the difference between them being only in point of time. They who embraced the system of Plato, among the ancients, were called *Academici*; whereas those who did the same since the restoration of learning, have assumed the denomination of *Platonists*.

ACADEMY, in Grecian antiquity, a large villa in one of the suburbs of Athens, where the sect of philosophers called *Academics* held their assemblies. It took its name from *Academos*, a celebrated Athenian, who resided there, and became celebrated from its being the place in which Plato taught philosophy.—**ACADEMY**, in the modern acceptation, is a society of persons united for the pursuit of some objects of study and application, as the Royal Academy of Arts of London, and the Royal Academy of Sciences of Berlin. The first academy of science, in modern times, was established at Naples, by Baptista Porta, in 1660.

TO ENCOURAGE THE FERRIES, AND THEREBY INCREASE THE NUMBER OF MARINERS, QUEEN ELIZABETH PASSED LAWS IN FAVOUR OF ABSTINENCE.

ABSTRACTION IS THE GROUND-WORK OF CLASSIFICATION, BY WHICH THINGS ARE ARRANGED IN ORDERS, GENERA, AND SPECIES.

[ACA]

The Scientific and Literary Treasury;

[ACC]

ACALYPHA a genus of exotic shrubs, natives of North and South America the calyx of the male flowers consists of four small, roundish concave and equal petals, but no corolla in the female flower the calyx is composed of three leaves and no corolla

ACALIPPA (see Nettles) third class of *Cuvier's Loophites* The first species (*acalepta libera*) float on the sea The hydrostatic (*acalepta hydrostatica*) are so named from the air bladders or vesicles by which means they suspend themselves in the water

ACANACEA a class of plants which are prickly and bear their flowers and seeds on a kind of herb

ACANTHA a name given to the prickles of thorny plants—**ACANTHA** is also used by zoologists for the spines of certain fishes as those of the *echinus marinus* &c

ACANTHA CELOS an epithet given to all the plants of the thistle kind

ACANTHINE among the ancients, something belonging to or resembling the herb acanthus hence we read of acanthine garments acanthine woods &c

ACANTHOPIBIS, a genus of venomous serpents classed by Cuvier with the vipers, but differing from them in many essential characters They are native of New Holland, where they live in holes at the roots of trees Their name is derived from the tail which is terminated by a little spur

ACANTHOPTERY GIL one of the divisions in the natural order of fishes which Cuvier has established Its name is suggested by its spinous fins

ACANTHOS CLII a genus of insects Order *coleoptera* family *scarabæidæ*

ACANTHOCLINUS a genus of insects Order *coleoptera* family *cecidividae*

ACANTHURUS (thorn tailed or Langet fish) a genus of fishes ninth family of Cuvier's order with spinous fins found in the West Indian Seas and much relished as food

ACANTHUS in architecture an ornament representing the leaves of the acanthus or herb bear's brier, principally employed in the Corinthian and Composite capitals

ACANTHUS, Turkish light horse the avant guard of the Grand Seignior's army

ACASIA a genus of shells found in sponge and never affixed to hard bodies

ACERUS in zoology a numerous genus of insects comprehending the vermin which infest several animals and insects in general

ACALIPPA (*acalepta*) a negatent philosophers the impossibility of comprehending something uncertainly in science

ACATIRY an officer of the king's household designed to be a check between the cooks of the kitchen and the purveyors

ACATHOLICI, the name by which Protestants are distinguished in some Catholic countries, as a term less objectionable than heretics

ACATIUM, in antiquity, a kind of boat

or pinnace used in military affairs The acatium was a species of the *nates acatuaræ*

ACAU LOSE or **ACAU LOUS** among botanists, a term used for such plants as have no stem

ACALILA, in Roman antiquity solemn festivals held in honour of Acca Larentia the nurse of Romulus they were also called *Larentalia*

ACCAPITA RT in our old law books the act of becoming a vassal or paying homage to some lord Hence **ACCAPITUM** signified the money paid by a vassal upon such an occasion

ACCELERATION, in mechanics the increase of velocity in a moving body Accelerated motion is that which continually receives fresh accessions of velocity, and is either equally or unequally accelerated The word is particularly applied to falling bodies tending towards the centre of the earth by the force of gravity—**ACCELERATING FORCE**, being a sort of centripetal force is expressed by that velocity, generated in a given time, with which bodies (considered as physical points) move towards the central body attracting them by its absolute force This accelerating force is greater or less according to the distance of the centre of the force in a reciprocal duplicate proportion The word **ACCELERATION**, is also used astronomically and is applied to the moon, the planets, and fixed stars

ACCFIDENTES or **ACCENSORES**, in the church of Rome an inferior rank of ministers, whose business it is to light, snuff and trim the candles and tapers

ACCLNDONS in Roman antiquity officers in the gladiatorial schools who excited and animated the combatants during the entertainment

ACCLNBI in Roman antiquity certain supernumerary soldiers designed to supply the place of those who should be killed or otherwise disabled—**ACCENSE** also denoted a kind of inferior officers, appointed to attend the Roman magistratus

ACCENT a modification of the voice in pronouncing certain words or syllables also the marks on the words or syllables as the acute accent marked thus (´) the grave accent thus (˘) the circumflex thus (ˆ) This is called grammatical accent but there is also a rhetorical accent or emphasis which is designed to give to a sentence distinctness and clearness To a sentence therefore, the stress is laid on the most important word and in a word on the most important syllable When the accent falls on a vowel that vowel has its long sound as in *geræ* but when it falls on a consonant the preceding vowel is short as in *jofer* Accents also not only give a pleasing variety and beauty to the modulation of the voice but often serve to ascertain the true meaning of the word—In music, accent denotes a certain modulation or warbling of the sounds to express passions either naturally by the voice, or artificially by instruments Every

ACANTHOPTERYGII IS THE TERM APPLIED TO THOSE FISHES WHICH HAVE HARD, BONY, AND PRICKLY BACK FINS

THE ACCELERATION OF A PLANET, IS THE INCREASE OF ITS REAL DIURNAL MOTION, ABOVE ITS MEAN DIURNAL MOTION

[ACC.]

A New Dictionary of the Belles Lettres.

[ACC.]

MANY OF THE MINERAL ACIDS ARE FOUND IN GREAT ABUNDANCE IN NATURE, THOUGH GENERALLY COMBINED WITH OTHER SUBSTANCES

bar or measure is divided into the accents and unaccented parts the former being the principal on which the spirit of the music depends — In mathematics the accent is used to avoid the confusion of using too many letters in an algebraical problem

ACCENTOR a genus of birds which feed both on insects and seed, as the common hedge sparrow

ACCEPTANCE in commerce is when a man subscribes, signs and makes himself a debtor for the sum contained in a bill of exchange or other obligation drawn upon or addressed to him which is done by his writing the word Accepted on it, and signing his name

ACCEPTOR the person who accepts a bill of exchange by signing it and thereby becoming bound to pay its contents

ACQUITTANCE among civilians signifies an acquittance given by a creditor to a debtor without receiving any money

ACROSS, in a general sense denotes the approach of one thing towards another but it is more proper to say the approach of bodies the appulse of the planets &c —

ACCUSATION, or ACCUSATION in medicine is used to denote the beginning of a paroxysm, or a fit of some periodical disease

ACCESSARY in law a person who aids in the commission of some felonious action There are two kinds of accessaries to be fore the fact and after it The first is he who commands and procures another to commit an offence who though he be absent when it is committed is now regarded as much a principal as the actual offender The accessory after the fact is one who receives comfort or assists the offender knowing him to be such In the highest crimes as high treason &c and the lowest as riot forcible entries &c there are no accessaries but all concerned are principals

ACCOMPANIMENT in music a sweeping of the chords of the pianoforte and drop of sprinkled notes usual in accompaniment

ACCIDENTS or PER ACCIDENTS a term applied to the operations of natural bodies in distinction from per se thus fire is said to burn per se, but a heated iron per accident

ACCOMPLISH a display of the virtues of a people according to their government

ACCOMPLISHMENT that which belongs essentially to a thing as sweetness softness &c — ACCIDENTAL in heraldry an additional mark in a coat of arms which may be either omitted or retained without altering its character

ACCIDENTAL in philosophy a term applied to effects which result from causes occurring by accident — ACCIDENTAL POINT in perspective that point in the horizontal line where all lines parallel among themselves meet the perspective plane Accidental colours depend on the reflections of the eye in contradistinction to light itself

ACIPITRUS the first order of birds

including four genera of birds of prey, whose distinguishing characteristics are, that they have hooked bills, strong legs, and sharp claws

ACCLAMATION, in Roman antiquity a shout raised by the people to testify their applause or approbation of their prince, generals &c In ages when people were more accustomed to give full utterance to their feelings acclamations were very common whenever a mass of people was influenced by one common feeling We find therefore acclamations in theatres, senate, ecclesiastical meetings &c at nuptials triumphs &c In the early times of Christianity, the bishops were elected by acclamation The first German emperors were elected in the same way and at the present day wherever the forms of civilised life are least regarded approbation or disapprobation of proposed public measures is shown by acclamations of the assembled multitude

ACCOLA among the Romans signified a person who lived near some place in which senec it differed from incolae, the inhabitant of such a place

ACCOLADE the ancient ceremony of conferring knighthood, by the king's laying his arms about the young knight's neck, and embracing him This familiar expression of regard appears to have been exchanged for the more stately act of touching or gently striking with the royal sword the neck of the kneeling knight The present ceremony of conferring the honour of knighthood is evidently derived from it

ACCOMPANIMENT, an instrumental part added to a musical composition by way of embellishment and in order to support the principal melody When the piece may be performed with or without the accompaniment it is called *accompaniment ad libitum* but when it is indispensable *accompaniment obligato*

ACCOMPLICE in law a person who is privy to or aiding in, the perpetration of some crime

ACCOMPLISHMENT, in a general sense denotes the perfecting or entirely finishing and completing any matter or thing, but it more expressly denotes the acquirement of some branch of learning useful art or elegant amusement — ACCOMPLISHMENT is also particularly used for the fulfilment of a prophecy in which sense we read of a literal accomplishment a mystical accomplishment &c

ACCORDATO an Italian word, to express the tuning of an instrument

ACCORDION a new musical instrument of German invention but now also made in this country consisting of a double series of vibrating tongues acted on by a current of air from a sort of bellows and producing tones very similar to those of the organ

ACCOUNTANT or ACCOMPTANT in a general sense denotes one whose business it is to compute adjust and range in due order accounts in commerce In a

IN SCIENTIFIC TELESCOPES, THE COLOUR OF REFRACTION ARE CORRECTED BY COMBINING GLASS LENSES OF DIFFERENT DISPERSIVE POWERS

The Scientific and Literary Treasury;

[ACO]

AMONG PAINTERS, THE EXISTENT ACCESSORY IS GIVEN TO THOSE PARTS OF A HISTORICAL PIECE WHICH ARE MERELY ORNAMENTAL.

more restricted sense, the term is applicable to a person appointed to keep the accounts of a public company or office: thus, we say the accountant of the India-Company, the Custom-house, the Excise, &c.

—ACCOUNTANT-GENERAL, in the court of Chancery, is an officer appointed to receive all monies lodged in court.

ACCOUTREMENTS, the necessities of a soldier, as belts, pouches, cartridge-boxes, &c.

ACCRETION, the increase or growth of a body by an external addition of new parts; thus shells, stones, and various other substances are formed.

ACCUBATION, the posture used among the Greeks and Romans at their meals, which was with the body extended on a couch, and the head resting on a pillow, or on the elbow, supported by a pillow. This practice was not permitted among soldiers, children, and servants; nor was it known until luxury had corrupted manners. Their couches were called *ACCUBITA*.

ACEPH'ALI, a sect of Christians, so called because they admitted no head, or superior, either lay or ecclesiastic.

ACER'RA, in Roman antiquity, was a small altar erected near the bed on which a dead person was laid out. Incense and perfumes were burnt upon it, till the time of the funeral. The real intention, probably, was to prevent or overcome any offensive smells that might arise about the corpse.

ACETAB'ULUM, in anatomy, is a large round cavity in a bone, which receives the convex head of another, thereby forming that species of articulation termed *enarthrosis*.—Also the name of a Roman measure equal to about one-eighth of our pint.

ACETATES, certain neutral salts formed by the combination of acetic acid with a salifiable base, as the acetate of potash. These salts differ from acetites in this respect; the acid employed in the production of the former is fully saturated with oxygen, or the acidifying principle, that is, it is completely acid; while that which is used to form the latter, contains a less proportion of oxygen than is sufficient to saturate it.

ACETIC ACID, a vegetable acid, which is produced by distilling the acetous acid with metallic oxides. It is of a green colour, but becomes white by rectification; is extremely volatile and inflammable; corrodes and cauterizes the skin; and when heated in contact with air, takes fire. It is the sour principle, in fact, which exists in vinegar.

ACETIMETER, an apparatus for determining the strength of vinegar.

ACETITES, compound or neutral salts, formed by the union of the acetous acid, or distilled vinegar, with different bases: the most remarkable of these substances, and those whose properties are best known, are the acetite of alumine, copper and lead.

ACETOUS, an epithet applied to such substances as are sour, or partake of the nature of vinegar.—ACETOUS ACID, dis-

tilled vinegar, or the acid of vinegar, is obtained from mucilaginous substances by fermentation.

ACETUM, vinegar, or any acid liquor made from potable juices, particularly wine and beer.

ACHROMATIC, colourless; a term applied to telescopes which were first contrived by Dr. Bevis to remedy the aberrations of colour.

ACIC'ULÆ, in natural history, certain small spikes, or prickles, in form of needles, wherewith nature has armed several animals, as the hedge-hog, *echinus marinus*, &c.

A'CID, in a general sense, denotes such things as affect the palate with a sour, sharp, and tart taste; change blue vegetable colours to red; and combine with all the alkalis, and most of the metallic oxides and earths, so as to form the compounds called salts. Acids are distinguished according to the proportion of oxygen which they contain, by the terminations *ic* and *ous*, as nitric acid, and nitrous acid, sulphuric acid, and sulphurous acid; the former of which denotes the larger dose or portion of oxygen, and the latter the smaller. When the prefix *hypo* is put to either of these, it denotes a degree below it in point of oxidizement, as hyposulphuric acid, an intermediate between the sulphuric and the sulphurous acid. The principal acids are vinegar and its spirits; the juices of lemons, oranges, sorrel, citrons, &c.; also the spirits of nitre, alum, vitriol, sulphur, and sea-salt. Acid and alkali have been considered by some chemists as the two athletes of nature, the great instruments whereby all things were effected; and the cause not only of natural, but preternatural things, as diseases and cures.

ACIDIFIABLE, capable of being converted into an acid by an acidifying principle. An acidifiable base or radical is any substance that is capable of uniting with such a quantity of oxygen as to become possessed of acid properties.

ACID'ULÆ, or ACIDULATED WATERS, a species of mineral waters which contain a considerable quantity of carbonic acid, and which are known by the pungency of their taste, the sparkling appearance which they assume when shaken or poured from one vessel into another, and the facility with which they boil.

ACID'ULOUS, an epithet expressing either a slight degree of acid, or an excess of acid in a compound salt.

ACINESIA, the interval of rest which takes place between the contraction and dilatation of the pulse.

ACINUS, in botany, a name given to grapes or berries growing in clusters, in opposition to *bacca*, or such berries as grow single.

ACLI'DES, a missile weapon, in use amongst the Romans; it was of the form of a spear with a thong tied to it, by which, after the discharge, it was drawn back.

ACOLLE, in heraldry, a term sometimes used to denote two things joined to

WHEN HERO PLAYED IN THE THEATRE, FIVE THOUSAND SOLDIERS CHASTED ACCLAMATIONS, AND THE SPECTATORS WERE OBLIGED TO JOIN THEM.

[ACQ]

A New Dictionary of the Belles Lettres.

[ACR]

gether; at other times, animals with collars or crowns about their necks, and finally, batons, or swords, placed saltier-wise behind the shield.

ACOLYTHI, in ecclesiastical history, denotes candidates for the ministry, so called from their continually attending the bishop. It is also an appellation given to the stoics, on account of their steady adherence to what they had once resolved.

ACONITA, a vegetable poison extracted from the aconite, or wolfsbane.

ACONITE, the plant wolfsbane, or monkshood, the flower of which resembles the hood of a monk; the plant is a violent poison.

ACONTIAS, in zoology, a venomous serpent, otherwise called the *anguis fasciatus*, or dart-snake, from its vibrating its body in the manner of a dart.

ACONTIUM, in Grecian antiquity, a kind of dart or javelin, resembling the Roman pilum.

ACOUSMATICI, in Grecian antiquity, such disciples of Pythagoras, as had not finished their five years' probation. The *acusmatici* were instructed by bare positive precepts and rules, without reasons or demonstrations, and these precepts they called *acousmata*.

ACOUSTICS, that branch of science which treats of the nature and modifications of sound. It is usually divided into two parts, viz *diacoustics*, which explains the properties of those sounds that come directly from the sonorous body to the ear, and *catacoustics*, which treats of reflected sounds. Almost all sounds that affect us are conveyed to the ear by means of the air, but water is a good conductor of sound, so also are timber and flannel. It must be observed, that a body, while in the act of sounding, is in a state of vibration, which it communicates to the surrounding air and that the undulations of the air affect the ear, and excite in us the sense of sound. Sound, of all kinds, it is ascertained, travels at the rate of thirteen miles in a minute—the softest whisper travels as fast as the most tremendous thunder. The knowledge of this fact has been applied to the measurement of distances. Thus, if we see a vivid flash of lightning, and in two seconds hear a tremendous clap of thunder, we may be assured that the thunder cloud is not more than 760 yards distant.

ACQUITTALES, a discharge, deliverance, or setting free of a person from the guilt or suspicion of an offence. Acquittal is of two kinds, in law, and in fact. When two are indicted and tried for a felony, one as principal, the other as accessory, the principal being discharged, the accessory is, by consequence, also freed. In which case, as the accessory is acquitted by law, so is the principal in fact—Acquittal is also used for a freedom from entries and molestations of a superior lord, on account of services issuing out of land.

ACQUITANCE, a discharge in writing for a sum of money, witnessing that the party is paid the same.

ACRA'SIA, in medicine, the predominancy of one quality above another. It was also used to express excess of any kind, as the drinking of unmixed wine, which among the Greeks amounted to intemperance.

ACRE, a measure of land, very general in name, but varying in different places as to the extent which it is intended to denote. The English acre contains 4 square rods, or 160 square poles of 5 yards and a half, or 4840 square yards. The French acre is equal to one and a quarter of an English acre.

ACRID, an epithet to denote such substances as are hot, dry, and pungent to the taste.

ACRISIA, or **ACRISY**, the want of a crisis, or discriminating state, in a disorder which is very fluctuating.

ACROATIC, in the Aristotelean schools, a denomination given to such lectures as were calculated only for the intimate friends and disciples of that philosopher, being chiefly employed in demonstrating some speculative or abstruse part of philosophy. The acroatic lectures stood contradistinguished from the exoteric ones, which were adapted to a common auditory.

ACROBATICA, or **ACROBATICUM**, in Grecian antiquity, an engine on which people were raised aloft, that they might have the better prospect.

ACROERAUNIAN, an epithet applied to certain mountains, between Epiurus and Illyricum, which project into the Adriatic, and obtain their name from being often struck with lightning.

ACROCHIRISMUS, among the Greeks, was a sort of gymnastic exercise, in which the two combatants contended with their hands and feet only, without cloing or engaging the other parts of the body. It was, in fact, a species of wrestling.

ACRODRY, in natural history, all fruits that have rinds or shells, such as acorns, almonds, &c.

ACROMION, in anatomy, that part of the spine of the scapula which receives the end of the clavicle.

ACROMONOGRAPHICUM, a poetical composition, wherein each subsequent verse commences with that which the verse preceding terminates.

ACRONICAL, or **ACHRONICAL**, in astronomy, an appellation given to the rising of a star above the horizon, at sunset, or to its setting, when the sun rises. Acronical is one of the three poetical risings of a star, the other two being called *cosmical* and *heliacal*.

ACROPOLIS, the citadel of Athens. It was formerly the whole city, and at first called *Acropolis*, from *Acropolis* the founder, but, after the inhabitants were greatly increased in number, the whole plain around it was filled with buildings, and the original city became the centre under the denomination of *Acropolis*, or the upper city.

ACROSPIRE, the popular term for what among botanists is called the germ, plume, or plumule.

ACTIONS COPIED TO A SINGLE SHEET UPON THE EAR THE THUNDER ROARS; THOSE WHICH PRODUCE A CONTINUED SENSATION, SOUNDS.

IN ANCIENT THEATRES, ACROSTIC VERSES, OR LINES OF BRASS, WERE USED TO PROPEL THE VOICE OF THE ACTORS TO A GREAT DISTANCE.

ACTION, WHEN PRODUCED BY ONE BODY ON ANOTHER, IS CALLED MECHANICAL.

[ACT]

The Scientific and Literary Treasury;

[ACT]

ACROS TIC, a poem, the lines of which are so contrived, that the first letters of each, taken together, will make a proper name or other word.

ACROSTICUM, in botany, the name of a genus of the *cryptogamia* class of plants, and of that order called the *Alces*, the fructifications of which are collected into clusters, and cover the whole under-surface of the leaves.

ACROSTOLIUM, in the naval architecture of the ancients, the extreme part of the ornament used on the prows of their ships. It was usual to tear the *acrostolia* from the prows of vanquished ships, as a token of victory.

ACROTE RIA, in architecture, small pedestals, upon which globes, vases, or statues stand at the ends or middle of pediments. It also denotes the figures themselves placed in such situations. Among ancient physicians, the term *ACROTARIA* was used to denote the larger extremities of the body.

ACROTHYMIA, in surgery, a large tumour, usually rising in the shape of a wart, though sometimes depressed and flat.

ACT, in a general sense, denotes the exertion, or effectual application, of some power or faculty. Act is distinguished from power, as the effect from the cause, or as a thing produced, from that which produces it. — **ACT**, among logicians, more particularly denotes an operation of the human mind, in which sense, comprehending, judging, willing, &c. are called acts. — **ACT**, in law, is used for an instrument or deed in writing, serving to prove the truth of some bargain or transaction. Thus, records, certificates, &c. are called acts. — **ACT** is also used for the final resolution, or decree of an assembly, senate, council, &c. — **ACTS** of parliament are called statutes, acts of the royal society, transactions, those of the French academy of sciences, memoirs, those of the academy of sciences at Petersburg, commentaries, those of Leibniz, *acta eruditiorum*, the decrees of the lords of session, at Edinburgh, *acta sederunt*, &c. — **ACT**, in the universities, is the delivery of orations, or other exercises, in proof of the proficiency of a student who is to take a degree. At Oxford, the time when masters or doctors complete their degrees, is called the *act*. At Cambridge, the same period is called the *commencement*. — **ACT**, in a dramatic sense, is the name given to certain portions of a play, intended to give respite both to the spectators and the actors. In the ancient drama, five acts were required both in tragedy and comedy, and in what is termed the regular drama that rule is still observed, the acts being divided into smaller portions, called *scenes*.

ACT OF FAITH, or **AUTO-DA-FE**. In dark and barbarous countries, where the Spanish inquisition had power, the *act of faith* was a solemn murder of infidels and heretics, usually performed on some great festival, and always on a Sunday. — **ACT OF GRACE**, in English law, an extraordinary

act of the king in council, whereby, at the beginning of a new reign, or on other great occasions, a free pardon has been sometimes granted to criminals.

ACTS OF THE APOSTLES, a canonical book of the New Testament, which contains great part of the lives of St. Peter and St. Paul, commencing at the ascension of our Saviour, and continued down to St. Paul's arrival at Rome, after his appeal to Caesar, comprehending in all about thirty years. St. Luke has been generally taken for the author.

ACTA PUBLICA, in Roman history, the journal of the senate. It seems to have resembled the votes of the House of Commons amongst us, wherein a short account was given to the public of what passed in the senate house.

ACTA DIURNA, was a sort of Roman gazette, containing an authorised narrative of the transactions worthy of notice, which happened at Rome.

ACTA CONSISTORIA, the edicts or declarations of the council of state of the emperors.

ACTIAN GAMES, or **LUDI ACTIACA**, were instituted in commemoration of the victory obtained by Augustus over Anthony at Actium. They returned every fifth year, according to the general opinion, and were sacred to Apollo, who was then called Actus Apollo. Actian years became an era, commencing from the battle of Actium, called also the era of Augustus. The Actian games consisted of shows of gladiators, wrestlers, and other exercises, and were kept generally at Nicopolis, a city built by Augustus, near Actium, for that purpose, with a view to perpetuate the fame of his victory.

ACTINIA, or **SEA ANEMONE**, in zoology, a genus belonging to the order of *vermes mollusca*. They are viviparous, and form one of those wonderful links in the chain of creation, that connect the animal and vegetable kingdoms, by partaking of the nature of both.

ACTIN OLITE, a mineral, of which there are three varieties, the crystallized, the asbestous, and the glassy. It is principally found in primitive districts, with a magnesian basis.

ACTION, in mechanics and physics, is the pressure or percussion of one body against another. It is one of the laws of nature, that action and reaction are equal, that is, the resistance of the body moved is always equal to the force communicated to it, or, which is the same thing, the moving body loses as much of its force as it communicates to the body moved. — **ACTION**, in ethics, something done by a free or moral agent, capable of distinguishing good from evil. The essence of a moral action consists in its being done knowingly and voluntarily that is, the agent must not only be able to distinguish whether it be good or bad in itself, but he must likewise be entirely free from compulsion of any kind, and at full liberty to follow the dictates of his own understanding. Hence

AS THE CLOSE OF EACH SESSION, THE ACTS OF PARLIAMENT ARE COLLECTED INTO ONE VOLUME, AND ARRANGED IN SEPARATE CHAPTERS.

THE WORD ACTION IS GENERALLY USED FOR ORDINARY TRANSACTIONS; AND ACT, FOR SUCH AS ARE REMARKABLE OR DISTINGUISHED.

[ACT]

A New Dictionary of the Belles Lettres.

[ADA]

the actions of idiots, slaves, &c. cannot be called moral. Hence also appears the absurdity of fatalism, which undermines the very foundation of morality.—**ACTION**, in rhetoric, may be defined, the accommodation of the voice, but more especially the gesture of an orator, to the subject he is upon. Cicero tells us, "that it does not so much matter what an orator says, as how he says it." Horace, in his art of poetry, is no less explicit in setting forth its vast influence on mankind:

"With those who laugh, our social joy appears;

With those who mourn, we sympathize in tears;

If you would have me weep, begin the strain,
Then I shall feel your sorrows; feel your pain."

ACTION, in a theatrical sense, is nearly the same with action among orators; only the actor adapts his action to an assumed character, whereas the orator is supposed to be in reality what his action expresses.

—**ACTION**, in painting and sculpture, denotes the posture of a statue or picture, serving to express some passion, &c.—**ACTION**, in the military art, is an engagement between two armies, or between different bodies of troops belonging thereto.

ACTIONS, in law, are either criminal or civil. [For the various kinds, see *Dictionary of Law Terms*, in the "Treasury of Knowledge."]

ACTIONARY, in commerce, a term used among foreigners, for the proprietor of an action or share of a public company's stock.

ACTIVE, in a general sense, denotes something that communicates motion or action to another, in which sense it stands opposed to passive.—**ACTIVE**, among grammarians, an appellation given to words expressing some action, as I write, I read, &c.—**ACTIVE POWERS**, in metaphysics, the power of executing any work or labour; in contradistinction to speculative powers; as those of seeing, hearing, reasoning, &c.

—**ACTIVE PRINCIPLES**, in chemistry, those which act of themselves, without any foreign assistance: such are mercury, sulphur, and salt, supposed to be. Some authors contend that sulphur, or fire, is the only active principle and source of all the motion in the world; and there are others who call oil, salt, and spirit, active principles, merely because their parts are better fitted for motion than those of earth or water.

ACTOR, in a dramatic sense, is a man who enacts some part or character in a play. It is remarkable with what difference actors were treated among the ancients. At Athens they were held in such esteem, as to be sometimes sent on embassies to foreign powers; whereas, at Rome, if a citizen became an actor, he thereby forfeited his freedom. Actors in the present day have little to complain of, in regard to the treatment they receive: according as they contribute to the gratification of the public so are they rewarded;

and if their moral conduct be irreproachable, no persons are more esteemed or lauded.

ACTRESS, a female dramatic performer. They were unknown to the ancients, among whom men always took the parts of women. Nor were they introduced on the English stage till the days of the Stuarts.

ACTUARIUS, or **ACTARIUS**, in Roman antiquity, an officer, or rather notary, appointed to write down the proceedings of a court.—*Actuarii* were also officers who kept the military accounts, and distributed the corn to the soldiers.

ACTUARY, the chief clerk, or person, who compiles minutes of the proceedings of a company in business.

ACTUS, in antiquity, "a measure of length containing one hundred and twenty Roman feet.

ACUTEATE, or **ACUTEATED**, an appellation given to any thing that has *aculei*, or prickles: thus, in ichthyology, fishes are divided into *aculeated*, and *non-aculeated*.

ACUMEN, mental sharpness, or quick discernment; great intellectual capacity. In ancient music, *acumen* denotes a sound produced by raising the voice to a high pitch.

ACUMINA, in antiquity, a kind of military omen, taken from the points or edges of spears, swords, &c.

ACUPUNCTURE, an oriental practice of puncturing diseased parts of the body with fine needles, by which the morbid galvanic action of the parts is restored, and painful disorders removed. In China and Japan it has been a part of their system of surgery time out of mind, and of late years it has been in some repute in England.

ACUTE, an appellation given to such things as terminate in a sharp point, or edge: thus, we say an acute angle, acute-angled triangle, &c.—**ACUTE**, in music, an epithet given to sharp or shrill sounds, in opposition to those called grave.—**ACUTE DISEASES** are distinguished from chronic, by being attended with violent symptoms, and requiring immediate aid: chronic diseases, those which usually last long.

ACTYROLOGIA, in grammar, denotes an improper word, phrase, or expression: it differs a little from the catachresis.

AD, a Latin preposition, expressing the relation of one thing to another. It is frequently prefixed to other words: thus, **AD HOMINEM**, among logicians, an argument drawn from the professed belief or principles of those with whom we argue.—

AD LUNOS, in Roman antiquity, a kind of punishment, whereby the criminals entertained the people, either by fighting with wild beasts, or with each other.—**AD VALOREM**, in commerce, according to the value.—**AD INFINITUM**, indefinitely, or to infinity.

ADAGIO, a degree quicker than grave time, in music, but with graceful and elegant execution.

ADAMANT, a sort of diamond, and the

ACTIVE CAPITAL, IS PROPERTY THAT MAY READILY BE CONVERTED INTO MONEY, AND USED IN TRADE OR COMMERCE FOR PROFIT.

ACTIVE COMMERCE, IS THAT IN WHICH A NATION CARRIES ITS OWN PRODUCTIONS AND FOREIGN COMMODITIES IN ITS OWN SHIPS.

[ADJ.]

The Scientific and Literary Treasury;

[ADM]

hardest, most brilliant, and most valuable of the precious stones.

ADDER, a small poisonous serpent with plaits on the belly, and scales under the tail, it is by no means rare in Britain.

ADDICTI, in Roman history, those who were delivered over to their creditors to be made slaves until they discharged their debts.

ADDITION, in a general sense, is the uniting or joining several things together, or, it denotes something added to another.

ADDITION, in arithmetic, the first of the four fundamental rules of that art, whereby we connect into a total sum several small ones. When the number has only one kind of figures, it is called *simple addition*, when it has two or several denominations, it is *compound*.—**ADDITIONS** in law, denote all kinds of designations given to a man, over and above his proper name and surname, to show his estate, degree, profession, place of abode, &c.

ADENOGRAPHY, or **ADENOLOGY**, that part of anatomy which treats of the glands.

ADORS'ED, a term in heraldry, signifying back to back.

AD'EPS, in anatomy, denotes the fat found in the abdomen, differing from the common fat or *pinguedo*, as being thicker, harder, and of a more earthy substance.

ADIPS, among physicians, is used in a more general sense, for all kinds of animal fat.

ADHESION, the phenomenon by which the particles of bodies continue together. *Adhesion* denotes union to a certain part between two bodies, and *cohesion* retains together the component particles of the same mass.—**ADHESION**, among logicians, denotes the maintaining some tenet, merely on account of its supposed advantage, without any positive evidence of its truth.

In medicine, it signifies the junction of parts that ought to be separated.

ADIANTHUM, in botany, maiden-hair, a genus of plants of the order *fittices*, and class *cryptogamia*. They are perennials.

ADIPOCERE, a substance resembling spermaceti, which is torn'd from an animal in its progress towards decomposition.

ADIPOSE, in a general sense, denotes something belonging to the fat of the body. The term *adipose* is chiefly used by physicians and anatomists, in whose writings we read of *adipose cells*, *adipose ducts*, *adipose membranes*, *adipose vessels*, &c.

ADIT OF A MINE, the aperture whereby it is entered, and the water and ores carried away, it is distinguished from the air shaft, and usually made on the side of a hill.

ADIT OF A SHIP, in antiquity, was a space in the upper part, where the ship was widest, at which people entered.

ADITS OF A THEATRE, were doors on the stairs, whereby persons entered from the outer porticoes, and descended into the seats.

ADJECTIVE, in grammar, a word expressing some quality, or other accident, of the substantive with which it is joined.

ADJOURNMENT, the putting off a

court or other meeting till another day. In parliament, adjournment differs from prorogation, the former being not only for the shorter time, but also done by the house itself, whereas the latter is an act of royal authority.

ADJUNCT, some quality belonging either to body or mind, either natural or acquired. Thus, thinking is an adjunct of the mind, and growth of the body. It also denotes something added to another, without being any necessary part of it. Thus water absorbed by a sponge is an adjunct, but no necessary part of that substance.

ADJUTANT, a military officer, whose duty it is to carry orders from the major to the colonel and sergeants. When detachments are to be made, he gives the number to be furnished by each company or troop, and assigns the hour and place of rendezvous. He also places the guards, receives and distributes the ammunition to the companies, &c.

ADJUTANT-GENERAL, an officer of distinction, who assists the general, by forming the several details of duty of the army with the brigade majors.

ADLOCUTION, or **ADLOCUTIO**, in Roman antiquity, the address made by generals to their armies, in order to rouse their courage before a battle.

ADMINICLE, in Scotch law, signifies any writing or deed referred to by a party, in an action of law, proving his allegations.

ADMINISTRATION, the executive government of a country.

ADMINISTRATOR, in law, the person to whom the estate and effects of an intestate are committed, for which he is to be accountable when required.

ADMIRAL, the commander of a fleet of ships of war, having two subordinate commanders, as vice admiral and rear-admiral, and distinguished into three classes, by the colour of their flags, as white, blue, and red. The admiral carries his flag at the main top-mast head, the vice admiral at the fore top mast head, and the rear admiral at the mizen top-mast head.—The **LORD HIGH ADMIRAL OF GREAT BRITAIN**, called in some ancient records, *Capitaneus Marinarum*, is judge or president of the court of admiralty. He has the management of all maritime affairs, and the government of the royal navy, with power of deciding in all maritime causes, both civil and criminal. In short, his power is so extensive and absolute in all matters that come under his cognizance, that the office has usually been given to princes of the blood, or the most eminent persons among the nobility. For a short time it was filled by his late Majesty William IV. when duke of Clarence, after having been in abeyance just a century, during which period, as at present, the office was executed by a certain number of commissioners, called lords of the admiralty.

ADMIRALTY, COURT OF, in a sovereign court, instituted by Edward III. and held by the lord high admiral, or the commissioners of the admiralty, where cognizance

IN THE ROMAN LAW, THE MAKING OVER GOODS TO ANOTHER, EITHER BY SALE OR LEGAL DEVENUE, WAS TERMED *SONA ADICTA*.

AMONG THE JESUITS, A SELECT NUMBER WERE CALLED *ADJUTANTS GENERAL*, EACH OF WHOM HAD A PROVINCE OR COUNTRY ASSIGNED HIM.

[ADO]

[ADU]

is taken in all maritime affairs civil or criminal. All crimes committed on the high seas, or in great rivers beneath the bridge next the sea, are cognizable only in this court by judge and jury and before which they must be tried.—VICE ADMIRALTY COURTS, are established in all the dependencies of Great Britain, and have cognizance of all cases of captured vessels, misdemourours in merchant ships, &c.

ADMITTENDO (LITURGO) a writ granted to a person who has recovered his right of presentation in the common pleas by which the bishop, or metropolitan is ordered to admit his clerk.—ADMITTENDO IN SOCIUM a writ associating certain persons to the justices of assize already appointed.

ADMONITIO FUSIUM among the Romans a military punishment, not unlike our whipping, only that it was performed with vine branches.

ADMONITIA TION in the feudal customs, the reducing the property of lands or tenements to mortmain.

ADNATA in anatomy one of the tunics or coats of the eye otherwise called *conjunctiva* and *albuginea* and is the same with the white of the eye. Also an epithet for what grows upon animal or vegetable bodies inseparably as hair &c, or accidentally as fungus &c.

ADONAI one of the names of God used in the Scriptures and properly signifying *my lords* in the plural as *Adonai* does *my lord* in the singular number.

ADONIA solemn feasts in honour of Venus instituted in memory of her beloved Adonis and observed with great solemnity by the Greeks Phœnicians Lyones Syrians Egyptians &c. They lasted two days during the first of which the women carried about images of Venus and Adonis weeping tearing their hair beating their breasts and using every token of grief. On the second, they sang his praises and made rejoicings as if Adonis had been raised to life again.

ADOPTION a practice among the Greeks and Romans of making a person one's heir, and investing him with all the rights and privileges of a son. In Rome before adoption could take place the natural father was obliged to renounce all authority over his son and with great formality consent that he should be translated into the family of the adopter. The adoption of a person already free was called *adrogation*.—ADROGATION in a theological sense denotes an act of God's free grace whereby those who believe in Christ are accounted the children of God and entitled to a share in the inheritance of the kingdom of heaven.

ADORATION, a mode of reverence or worship anciently shown to the gods by raising the right hand to the mouth and gently applying it to the lips also in general any outward sign of worship by kissing the hand or feet walking barefoot or the like. Among the Jews, adoration consisted in kissing the hands, bowing,

knelling and even prostration. But the posture of adoration most common in all ages and countries is kneeling and it is by far the most natural as it implies humility and a consciousness of the necessity of self abasement.

ADORFA in Roman antiquity grain, or a kind of cakes made of fine flour and offered in sacrifice a delic or distribution of corn, as a reward for some service, whence, by metonymy, it is put for praise or rewards in general.

ADOS(UL)TION, the impregnation of plants effected by the falling of the farina succundans on the pistil.

ADOSI L in heraldry two animals placed back to back. It also denotes any other figure as axes keys, &c. placed with their heads facing different ways.

ADPONDISTOMIUM among physicians denotes that the last mentioned ingredient ought to weigh as much as all the before mentioned medicines together.

ADQUOD DAMNUM in law a writ issued before the king grants certain liberties as a fair market &c. ordering the sheriff to inquire what damage such a grant is likely to be attended with.

ADROGATION in antiquity that kind of adoption which took place in regard to a person already his own master. See ADOPTION.

ADSIDULLA in antiquity the table at which the priests sat during the sacrifices.

ADSTRICITION among physicians a term used to denote the too great tightness and closeness of the enunciations of the body particularly the pores of the skin also to signify the styptic quality of medicines.

AD TERMINUM QUI PRESTBIT in law a writ of entry that lies for the lessor or his heirs if after the expiration of a term for life or years granted by lease the tenant or other occupier of the lands &c. withholds the same from such lessor.

ADULTERATION in a general sense denotes the act of debasing by an improper mixture something that was pure and genuine. Thus adulteration of coin is the casting or making it of a metal inferior in goodness to the standard by using too great a proportion of alloy. Inferior ingredients put into bread beer wine &c. by bakers brewers and other traders for the purpose of imposing on the public is also called adulteration, and cannot be too severely reprehended or punished. The consequences often prove fatal to the health, and always greatly abridge the continuance of those who are the victims of such nefarious practices.

ADULTERY a violation of the nuptial bed a crime which has been regarded by all civilized nations with abhorrence and in ancient times was punished as a capital offence. By the Jewish law the penalty was death. In England it is at present considered a spiritual offence punishable by the spiritual court where it is punished by fine and penance, but by the common

THE CEREMONY OF ADOPTION WAS SOMETIMES PERFORMED BY CUTTING OFF THE HAIR OF A PERSON, AND GIVING IT TO THE ADOPTIVE FATHER

[ÆGO

law, the party aggrieved can only proceed by action for damages.

ADUST, an appellation given to such humours as are become of a hot and fiery nature. Thus blood is said to be adust, when, the more subtle and volatile part being evaporated, the remainder is vapid and impure.

ADUSTION, an inflammation of the parts about the brain and its membranes, attended with hollowness of the snout and eyes, a pale colour, and dryness of the body. Also, a surgical operation, of a nature similar to cauterization.

ADVANCE, in commerce, money paid before goods are delivered, work done, or any consideration given.

ADVANCED-GUARD, or **VAN-GUARD**, in the military art, the first line or division of an army ranged or marching in order of battle.

ADVENT, the coming of our Saviour, also the festival commemorative of the Advent, which falls about a month before Christmas.

ADVENTURE, BILL OF, in commerce, a writing signed by a merchant, to testify that the goods shipped on board a certain vessel belong to another person, he himself being answerable only for the produce. It also means, the goods sent out at a venture.

ADVERB, a word so called from its signification and connexion with verbs, though they are also frequently joined with adjectives and other parts of speech to modify their meaning.

ADVERSA'RIA, a memorandum-book, journal, or common place book.

ADVERTISEMENT, any printed publication of circumstances, either of public or private interest, particularly that inserted in the newspapers.

ADVOCATE, a barrister, a pleader in civil or ecclesiastical causes. Advocates were held in great honour during the first ages of the Roman commonwealth, being styled *comites*, *honores*, *clarissimi*, and even *patrons*. And in almost every civilized country, men of the first talents are found among its advocates.—The **Lord Advocate** is an officer of state in Scotland, who pleads in all causes of the crown, or where the king is concerned.

ADVOCATION, among civilians, the act of calling another to assist us by pleading some cause.—**LETTERS OF ADVOCATION**, in the law of Scotland, signify a writ issued by the lords of session, advocating or calling a cause from an incompetent judge to themselves.

ADVOWEE, in law, signifies the patron of a church, or he who has a right to present to a benefice.

ADVOWSON, in law, a right of presentation to a vacant church or benefice. He who possesses this right is called the patron of the living. This right is so called because it was first gained by such as were founders, benefactors, or maintainers of the church. Advowsons are either *presentative*, as when the patron presents or of-

fers his clerk to the bishop to be instituted, *collative*, as where the benefice is given by the bishop, as original patron thereof, or by means of the right he has acquired by lapse, or *donative*, as where the king, or other patron, by a simple donation in writing, puts the clerk into possession, without presentation, institution, or induction.

ADY, the palm-tree of the island of St. Thomas, the fruit of which is of the size and shape of a lemon, and contains an aromatic kernel, from which an oil, answering the purpose of butter, is prepared.

ADYTUM, the most retired and secret place of the heathen temples, into which none but the priests were allowed to enter. The adytum of the Greeks and Romans answered to the sanctum sanctorum of the Jews, and was the place from whence oracles were delivered. The term is purely Greek, signifying inaccessible.

ÆCÆA, in Grecian antiquity, solemn festivals and games in honour of Æacus, who, on account of his justice upon earth, was thought to have been one of the judges in hell. At the end of the solemnity, the victors in the games used to present a garland of flowers.

ÆCHMOLOTARCH, the title given to the principal leader or governor of the Jewish captives residing in Chaldaea, Assyria, and the neighbouring countries. The Jews themselves call this magistrate *Rosh-galuth*, or chief of the captivity.

ÆDES, in Roman antiquity, besides its more ordinary signification of a house, or the internal part of a house, where the family used to eat, likewise signified an inferior kind of temple, consecrated indeed to some deity, but not by the augurs. There were a vast number of these in ancient Rome: thus we read of the *ædes fortune*, *ædes pacis*, *ædes Herculis*, &c.

ÆDIC'ULA, a small ædes or temple, which was erected in every village or parish.

ÆDILES, a Roman magistrate, whose chief business was to superintend buildings of all kinds, but more especially public ones, as temples, aqueducts, bridges, &c., and to take care of the highways, weights, and measures, &c. The *Ædiles* were distinguished into the *ædiles pleben*, who were chosen from the plebeians, as assistants to the tribunes, and the *ædiles curules*, from the patricians, to provide for certain public games.

ÆDITUUS, an officer who had the charge of the Roman temples.

ÆGLOPS, an abscess in the canthus, or corner of the eye near the nose.—**ÆGLOPS**, in botany, is the *cerrus*, or holm oak.

ÆGIS, a shield, particularly the shield of Jupiter.—In anatomy, the term *Ægis* is used for an affection of the eye, when it has small cicatrices, which cause a dimness of sight.

ÆGOPHTHALMOS, the goat's-eye stone, those species of agate or other semipellucid gems which have circular spots in them, resembling the eye of the goat.

THE SOCIETY OF ADVOCATES, IN SCOTLAND, IS A SOCIETY OF EMINENT LAWYERS, CONSISTING OF ABOUT TWO HUNDRED MEMBERS.

[AER]

A New Dictionary of the Belles Lettres.

[AFF]

THE COMPARISON OF TIME, BY THE CHRISTIAN ERA, IS GENERALLY BELIEVED TO HAVE NOT BEEN INTRODUCED TILL THE SIXTH CENTURY.

ÆNEID, the title of Virgil's epic poem, in which he celebrates the adventures of *Æneas*, one of the bravest among the Trojan heroes. The author introduces him as sailing from Troy, after its destruction, in search of the shores of Italy, on which it had been promised by the gods that he should found an empire destined to be immortal; and the poem ends with the complete success of *Æneas* over Turnus, king of the Rutuli, whose dominions he had invaded, and who falls by his hand. The unrivalled force, elegance, and beauty of Virgil's style have been the theme of admiration in every succeeding age, and given him an indisputable right to a niche in the temple of Apollo, second only to that of Homer.

ÆOLIAN HARP, an arrangement of strings placed in a window and played upon by the wind. It produces the effect of a distant choir of music in the air, sweetly mingling all the harmonic notes, and swelling or diminishing its sounds according to the strength or weakness of the blast.

ÆOLIOPILE, a hollow metal ball, in which is inserted a slender neck, or pipe; from whence, after the vessel has been partly filled with water, and heated, issues a powerful gust of wind. It also serves to show the convertibility of water into steam.

ÆRA, or **ERA**, a fixed historical period whence years are reckoned: as the building of Rome, or the birth of Christ. *Era* and *Epoch* are not exactly synonymous. An *era* is a point fixed by a particular people or nation; an *epoch*, one determined by chronologists and historians. The idea of an era, also, comprehends a certain succession of years, proceeding from a fixed event; and an epoch is that event itself.

ÆRARIUM, in Roman antiquity, the treasury, or place where the public money was deposited. *Ærarium* and *fiscus* are sometimes used in a synonymous sense, although the latter, strictly speaking, contained only the money belonging to the emperor.—**ÆRARIUM LUTHEÆ**, or **JUNONIA LUTINÆ**, a place where the monies were deposited, which parents paid on the birth of each child. There are several other treasures mentioned by historians, as the *ærarium juventutis*, *veneris*, &c.

ÆRARIUS, in a general sense, denotes any person employed in coining, or managing the public monies; but the word was more particularly used by the Romans for a degraded citizen, whose name had been struck off the list of his century. The *ærarii* were so called on account of their being liable to all the taxes and other burdens of the state, without enjoying any of its privileges.

AERODYNAMICS, that branch of aerology which treats of the powers and motion of elastic fluids. Aerodynamics are often explained in connexion with hydrodynamics, a branch of hydrology.

AEROGRAPIIY, a description of the air, or atmosphere, its limits, dimensions, and other most obvious properties.

ÆROLITES, meteoric stones, which

fall in a state of combustion from the atmosphere.

AEROLGY, the doctrine or science of air, as connected with the animal economy. [See *AIR*, *ATMOSPHERE*, and *GAS*.]

ÆROMANCY, a kind of divination amongst the Greeks, and from them adopted by the Romans, whereby they pretended to foretell future events from certain spectral phenomena, or noises in the air. By aeromancy, in the present day, is meant the art of foretelling the changes and variations of the air and weather, by means of meteorological observations; but, judging by the attempts which have hitherto been made, the science, as it is called, seems to be little better than guess-work.

AEROMETRY, the art of measuring the air, so as to ascertain its pressure or weight, its elasticity, rarefaction, &c.

ÆRONAUT, one who sails in the air in a balloon.

AERONAUTICS, or **AEROSTATION**, the art of navigating the air, by employing air-balloons, or silken globes, filled with gas lighter than atmospheric air.

ÆRUGO, in natural history, properly signifies the rust of copper. *Ærugo* is either natural, as that found about copper-mines; or artificial, like verdigris.

ÆRUGINOUS, an epithet given to such things as resemble, or partake of the nature of, the rust of copper.

ÆSCHYNOMENOUS, an epithet for "sensitive" plants, or such as move upon being touched. The term *Æschynomene* is used to denote this genus of plants, of which there are many species.

ÆSTIVA, summer encampments for the Roman soldiers, in distinction from the *hibernia*, or winter quarters.

ÆSTIVAL, in a general sense, denotes something connected with, or belonging to summer. Hence we say æstival point, æstival sign, æstival solstice, &c.

ÆSTIVATION, in botany, the state of the bud in summer, or the disposition of the petals within the flower-bud when they have arrived at perfection.

ÆTHIER, the most subtle of all fluids, which, commencing from the limits of our atmosphere, occupies the firmament which is above the region of the air. The term is used by natural philosophers ancient and modern; but not always in the same signification. According to electricians, it is the electric fluid, or solar light. It may, however, generally be understood to be a fluid that fills all space; in which the stars revolve; and which, when impregnated with earthy exhalations, forms the air or atmosphere.

ÆTHIOPS, a medicine, so called from its black colour, of which there are various kinds, as *Æthiop's mineral*, *antimonial* *Æthiops*, &c.

ÆTITÆ, or **EAGLE-STONES**, a name given to pebbles or stones of any kind, which have a loose nucleus rattling within them. These eagle-stones are frequently found in our gravel-pits.

ÆFFETUOSO, *affetto*, Ital., in a tender

IT IS A DOCTRINE OF HYDROSTATICS, THAT IF A BODY BE LIGHTER THAN A FLUID, THAT FLUID WILL BEAR IT UP; HENCE CAME AEROSTATION.

[ACA]

The Scientific and Literary Treasury;

[ACK]

and affecting style; a term employed in music-books, at the beginning of a movement.

AFFIANCE, in law, denotes the mutual plighting of troth, between a man and a woman, to bind one's self to the performance of a marriage contract.

AFFIDAVIT, an oath in writing, taken before some person who is legally authorized to administer the same.

AFFINITY, in civil law, the relationship in which each of the parties married stand to the kindred of the other. Affinity is distinguished into three kinds. 1. Direct affinity, or that subsisting between the husband and his wife's relations by blood, or between the wife and her husband's relations, by blood. 2. Secondary affinity, or that which subsists between the husband and his wife's relations, by marriage. 3. Collateral affinity, or that which subsists between the husband and the relations of his wife's relations. It should, however, be observed, that a person cannot, by legal succession, receive an inheritance from a relation by affinity, neither does it extend to the nearest relations of husband and wife, so as to create a mutual relation between them.—**AFFINITY**, in chemistry, the attractive power observable in the different parts of bodies, by which they combine, as the affinity of sulphuric acid for potash and lime.

AFFION, an Arabic name for opium.

AFFIRMATION, a simple asseveration, which, according to a set form of words, is allowed to the Quakers in lieu of taking an oath. False affirmation is subject to the same penalties as perjury.

AFFIRMATIVE, an epithet used by logicians for a species of proposition when in any predicate is affirmed of its subject, as, "a dog is a quadruped" here "quadruped" is affirmed of a dog.

AFFIX, in grammar, a particle added at the close of a word, either to diversify its form, or alter its signification.

AFFLATUS, in a general sense, a divine influence communicating to the receiver supernatural powers, particularly the gift of prophecy. Among heathen mythologists and poets, it denotes the actual inspiration of some divinity, thus Virgil, "afflatus est numine quando Jam propere diti."

Tully, however, extends the meaning of the word further, by attributing all great actions to a divine *afflatus*.

AFFRONTÉ, in heraldry, an appellation given to animals facing each other.

AFFLOAT, a term used to denote that a ship is in water sufficiently deep to buoy her up.

AFFORA, in botany, an epithet for the pericarp of plants that are without valves. A **FORTIORI**, a term implying that what follows is a more powerful argument than what has been before adduced.

AFTERMATH, the grass which springs or grows up after mowing, or the grass, or stubble, cut after corn.

AGA, in the Mogul language, a great

lord or commander; in the Turkish, it is applied, in courtesy, to a gentleman or wealthy landholder; or on account of post or rank, as to the commander-in-chief of the janissaries. The chief officers under the Khan of Tartary are also called *agas*.

AGALMATOLITE, a soft mineral substance, chiefly found in China, where it is wrought into various ornaments.

AGAPÆ, love-feasts kept by the ancient christians, as a token of brotherly charity and mutual benevolence. In course of time abuses crept in, and rendered the abolition of them necessary.

AGAPETÆ, a society of unmarried women among the primitive christians, who attended on and served the clergy. At first there was nothing improper in these societies, though they were afterwards charged with gross immoralities, and were wholly abolished by the council of Lateran, in 1143.

AGARIC, or **AGARICUM**, a genus of plants, of the cryptogamia algae class, growing on the trunks of trees, and resembling the common mushroom, both in substance and structure.

AGATE, a precious stone, or mineral, composed of various substances, as chalcodon, cornelian, jasper, &c. also a stone of the agate kind engraved by art, which constitutes, among antiquarians, a species of gems.

AGE, a certain period or limit of time, marked for the convenience of chronology and history by some remarkable events. Chronologers usually reckon seven such ages, namely, 1. From the creation to the deluge. 2. From the deluge to the birth of Abraham. 3. From the birth of Abraham to the departure of the Israelites out of Egypt. 4. From the departure of the Israelites to the building of the temple by Solomon. 5. From the laying the foundation of the temple to the reign of Cyrus in Babylon. 6. From the reign of Cyrus to the coming of Christ. 7. Since the birth of our Saviour.—Among ancient historians, the duration of the world was also subdivided into three periods, or ages. The first, reaching from the creation to the deluge which happened in Greece during the reign of Ogyges, is called the obscure or uncertain age, the second, called the fabulous or heroic, terminates at the first olympiad, where the third, or historical age, commences. The poets also distinguished the period of the world into four ages, the *golden age*, or the age of simplicity and happiness, the *silver age*, which was less pure than the golden age, and in which men began to till the ground for their sustenance, the *brass age*, when strife and contentions began, and the *iron age*, when justice and honour had left the earth.—**AGE**, in law, signifies certain periods of life, when persons of both sexes are considered competent to perform certain acts, which, for want of years and discretion, they were incapable of before. Thus a man may take the oath of allegiance at twelve years of age, is at the age of discretion at fourteen

AFFINITY OF AGGREGATION, IS THE POWER THAT CAUSES TWO HOMOGENEOUS BODIES TO UNITE AND COHERE, AS TWO DROPS OF WATER.

AFFINITY OF COMBUSTION, IS THE TENDENCY OF BODIES TO UNITE AND FORM NEW COMBINATIONS, AS IN ACIDS AND ALKALIES.

[AGG]

A New Dictionary of the Belles Lettres.

[AGM]

AGENTS, AT COURTS, DIFFER FROM AMBASSADORS; FOR THOUGH DELEGATED, THEY ARE NOT INVESTED WITH ANY REPRESENTATIVE CHARACTER.

to choose his guardian and contract a marriage; and is at full age at twenty-one. A woman at the age of nine is dowable; at twelve may confirm her consent to marriage; at fourteen may receive her land into her own hands; and at twenty-one may alienate her lands and tenements. Among ancient physiologists, the life or age of man was divided into six stages: *pueritia*, or childhood, extending from birth to the year 5; *adoloescentia*, or boyhood, to the year 13; *juventus*, or youth, to the year 30; *virilis etas*, manhood, to 50; *senectus*, old age, to 60; *crepita etas*, decrepitude, to death.—By the Roman law, different ages were ascertained for different purposes. Thus the consular age, or that at which a person might hold the consulship, was the 43rd year; the judiciary age, between the 30th and 60th year; the military age, 17 years; the prætorian age, 40 years.

AGENDA, among divines, sometimes signifies things which a man is bound to perform, in opposition to *credenda*, which he is bound to believe. It also denotes the service or offices of the church.

A'GENT, in a general sense, denotes any thing which acts, or produces an effect. Agents are either *natural* or *moral*. Natural agents are all such inanimate bodies as have a power to act upon other bodies, in a certain and determinate manner: such is fire, which has the invariable property or power to warm or heat. Moral agents, on the contrary, are rational creatures, capable of regulating their actions by a certain rule.—AGENT, free or voluntary, in metaphysics, is he who may equally do any thing, or its opposite, as acting not from any predetermination, but from choice.—AGENT is also used to denote a person entrusted with the management of an affair, whether belonging to a society, company, or private person. Thus there are *army agents*, through whom every regimental concern of a pecuniary nature is transacted; and *navy agents*, who are employed by officers and seamen to manage their concerns in regard to pay, prize-money, &c.

A'GER, a certain portion or measure of land anciently allowed in the division of grounds to each citizen of Rome.

AG'GER, in the ancient military art, a bank or rampart, composed of various materials, as earth, boughs of trees, &c. The agger of the ancients was of the same nature with what the moderns call lines. It was also used in several other senses, as for a wall or bulwark, to keep off the sea; for the middle part of a military road, usually raised into a ridge, &c.

AGGLUTINATION, among physicians, signifies either the adherence of new substance, or the giving a glutinous consistence to the animal fluids, whereby they become more fit for nourishing the body. It is also used by astronomers, to denote the formation of nebulae by the seeming coalition of several stars.

AG'GREGATE, in a general sense, de-

notes the sum of several things added together, or the collection of them into one whole.—AGGREGATE is also used to denote an order of plants in the Linnean system, having compound flowers with separate anthers.

AGGREGATION, in physics, a species of union, whereby several things, which have no natural dependence or connexion with each other, are collected together; thus, a heap of sand, or a mass of ruins, are bodies by aggregation.—In chemistry, it means the adhesion of parts of the same kind; as pieces of sulphur united by fusion form an aggregate.

A'GIO, in commerce, a term chiefly used in Holland and at Venice, to signify the difference between the value of bank-stock and the current coin.

AGIOSYMANDRUM, a wooden instrument used by the Greek and other churches under the dominion of the Turks, to call together their congregations; the use of bells having been prohibited.

AGIST, AGISTMENT, AGIST'AGE, or AGISTATION, in law, the taking in other people's cattle to graze, at so much per week. The term is peculiarly used for the taking in cattle to be fed in the king's forests, as well as for the profits thence arising.—AGISTMENT is also used in a metaphorical sense, for any tax, burden, or charge.

AGISTOR, or AGISTA'TOR, an officer belonging to forests, who has the care of the cattle taken in to be grazed, and collects the money due on that account.

A'GITATOR, in antiquity, a term sometimes used for a charioteer, especially those who drove in the circus at the curule games.—AGITATORS, in English history, were certain persons appointed by the army in 1647, to take care of its interests, and to control the parliament. Two private men, or inferior officers, were chosen from each troop or company; and this body, when collected, was presumed to equal the house of commons; while the peers were represented by a council of officers of rank. Cromwell at first found it convenient to league with them; but when his authority was confined, he quickly found means to put down these *levellers*, as they were then called on account of their wish to abolish royalty and introduce an universal equality both of property and power. At the present day, the term *agitator* is applied to any political demagogue, and he is generally bold in proportion to the want of firmness in those against whom he declaims.

AGITATO'RES, those who drove the chariots at the public games at Rome.—This name was also given to players in the middle ages, who were forbidden church communion.

AG'MEN, in the Roman art of war, denoted an army, or rather a part of it, in march, thus we read of the *primum agmen*, or van-guard; *medium agmen*, or main body; and the *postremum agmen*, or rear-guard.

OLIVER CROMWELL SEIZED THE CHIEF AGITATORS IN PRESENCE OF THEIR COMPANIONS, AND HAD THE RINGLEADER INSTANTLY SHOT.

AGNATE, any male relation by the father's side

AGNATION, the relationship subsisting between the descendants of the same man, in the male line

AGNOSTIC, in church history, a sect of heretics, in the sixth century, who maintained that Christ, with respect to his human nature, was ignorant of many things, and particularly of the day of judgment.

AGNOMEN, in Roman antiquity, was the fourth or honorary name bestowed on account of some extraordinary action, virtue, or accomplishment. Thus the agnomen *Africanus* was given to Publius Cornelius Scipio, on account of his exploits in Africa

AGNUS DEI, the Lamb of God. A prayer of the Romish liturgy, beginning with those words. Also, a round piece of wax, on which is impressed the figure of the sacred Lamb, and which is consecrated by the pope with great solemnity.

AGON, in the public games of the ancients, a term used indifferently for any contest or dispute, whether respecting bodily exercise, or accomplishments of the mind. Thus poets, musicians, &c., had their *agones*, as well as the athletes—AGON was also used for one of the ministers employed in the heathen sacrifices, whose business it was to strike the victim.

AGONALIA, festivals in Rome, celebrated in honour of Janus, or Agonius, three times a year

AGONIOLITE, officers appointed at the Grecian games to take care that all things were performed according to custom, to decide controversies amongst the antagonists, and adjudge the prizes

AGONIA, among physicians, a struggle as between life and death

AGONISTICUM, in medicine, an application of excessively cold water in cases of fever

AGORANOMUS, in Grecian antiquity, a magistratus of Athens who had the regulation of weights and measures, of the prices of provisions, &c

AGORÆUS, an appellation given to such deities as had status in the market places—*Agoræus* was also a term for very coarse bread

AGRAULE NA'VE'S, in ancient history, vessels which were placed to keep watch on guard

AGRAULE STATIONES, in the ancient military art, corps of guards posted in the fields

AGRARIAN LAWS, statutes, which forbid the possession of more than a certain extent of land by any single individual. That law of the Romans, called, by way of eminence, the *agrarian law*, was published by Spurius Cassius, about the year of Rome, 288, enjoining a division of the conquered lands, in equal parts, among the citizens, and limiting the number of acres that each might enjoy.

AGREEMENT, in law, signifies the consent of two or more persons to any thing done, or to be done

AGREMORE, a term used by the artificers in a laboratory for the charcoal when in a state fitted for the making of powder.

AGRICULTURE, in a general sense, denotes the art of rendering the earth fertile, by tillage and culture. Its theory includes the nature and properties of land, the different sorts of plants fitted for it, and the rotation of crops. The practical part comprehends the labours of husbandry, with the implements and animals appertaining thereto. Since the revival of the arts, the science of agriculture has been zealously cultivated by the higher orders. The writers likewise on this subject have within the last century been more numerous than at any former period, and every effort has been made by experiments, inventions, and improvements, to render the land productive. Nor can this be a matter of wonder, since it is the most important science to which the human intellect can be directed, alike interesting all nations and all ages, and spreading an influence over the whole circle of our wants, comforts, pleasures, luxuries, arts, and commerce. It is the basis of all other arts, and in all countries coeval with the first dawn of civilization. It is not only indispensable to national prosperity, but is eminently conducive to the welfare of those who are engaged in it. It gives health to the body, energy to the mind, is favourable to virtuous and temperate habits, and to purity of moral character. In the energetic language of Dr Johnson, we may truly say, that "though mines of gold and silver should be exhausted, and the species made of them lost, though diamonds and pearls should remain concealed in the bowels of the earth and the womb of the sea, though commerce with strangers be prohibited, though all arts, which have no other object than splendour and embellishment, should be abolished, yet the fertility of the earth alone would afford an abundant supply for the occasions of an industrious people, by furnishing subsistence for them, and such arms as should be mustered in their defence. We, therefore, ought not to be surprised that agriculture was in so much honour among the ancients, for it ought rather to seem wonderful that it should ever cease to be so, and that the most necessary and most indispensable of all professions should have fallen into any contempt." It must not, however, be forgotten, that the husbandmen of antiquity, as well as those of the middle ages were destitute of many advantages enjoyed by the modern cultivator. Neither the practical nor the theoretical agriculturists of those periods had any correct knowledge of geology, mineralogy, chemistry, botany, vegetable physiology, or natural philosophy, but these sciences have given the modern husbandman the command of important agents, elements, and principles, of which the ancients had no idea. Nature's most simple modes of operation were to them unperceivable, and their ignorance of causes often led to erro-

AIR

A New Dictionary of the Belles Lettres.

[A 141]

IN PROPORTION AS THE ATMOSPHERE IS CLEAR AND TRANSPARENT, THE BLUE APPEARANCE OF THE SKY WILL BE MORE INTERESTING.

neous calculations with regard to effects. To modern science we are indebted, among numerous other advantages, for the knowledge and means of chemically analyzing soils, by which we can ascertain their constituent parts, and thus learn what substances are wanted to increase their fertility, for immense improvements in the implements used in husbandry; and for the art of breeding the best animals and obtaining the most nutritive vegetables, by a judicious selection of individuals and species to propagate from. These, and many other things of nearly equal importance, have rendered the agriculture of the present period infinitely superior to that of the middle ages, and even greatly surpassing the degree of perfection it had attained during the days of Roman greatness.

AGRIOTNIA, a Grecian nocturnal festival, annually celebrated by the Boeotians in honour of Bacchus.

AGROTIERA, an annual sacrifice at Athens in honour of Diana.

AGROUND, a term applied to a ship when any part of it rests on the ground so as to render it immovable.

AGRIPTNIA, among physicians, a privation of sleep, a troublesome symptom of nervous and fibrile diseases.

AGUE, a general name for all periodical fevers, which, according to the different times of the return of the feverish paroxysm, or fit, are denominated quotidian, tertian, or quartan agues. They occur chiefly in situations where there are shallow, stagnant waters.

AGUTI, or LONG-EARED CAT, an American animal, very much resembling a guinea-pig. They live on vegetables, inhabit hollow trees, and burrow in the ground.

AHEAD, in naval language, signifies, farther on than the ship, in opposition to *astern*, or behind the ship.

A HULL, a term for a ship when all her sails are furled, and she lies with her helm lashed on the lee-side.

AID, in a general sense, denotes any kind of assistance given by one person to another.—*Aid* (*auxilium*), in feudal times, a subsidy paid by vassals to their lords on certain occasions.

AID DE CAMP, an officer that always attends on each of the generals in his camp, to receive and carry orders.

AIGUILLE, an instrument used by engineers to pierce a rock for the lodgment of powder as in a mine.

AILANTHUS, a Chinese tree, called the tree of heaven, on account of its lofty growth, it rises with a straight trunk 60 or 80 feet high.

AIR, a subtle, invisible, elastic fluid, surrounding our globe, and supposed to reach about 40 miles above the earth's surface. It is the great laboratory in which most of the actions of life go on, and on the composition of which they depend, for every alteration it undergoes must induce some great change on the animal machine. The different degrees of heat and elasticity

in the air must have effects proportionable to the causes upon the bodies of animals. The various contents also of the air must of course induce great changes, as it some way or other finds means to communicate the qualities it borrows from them to the blood and juices of animals. Hence it becomes the vehicle of contagion, and the propagator of diseases, both epidemical and endemial, which admit of infinite variety, because the alterations of the air, with respect to its properties, and to the innumerable combinations of bodies contained in it, are infinite. Lord Bacon thinks the best air is to be met with in open campaign countries, where the soil is dry, not parched or sandy, and spontaneously produces wild thyme, wild marjoram, and the like sweet-scented plants. That near rivers he thinks rather prejudicial, unless they are small, clear, and have a gravelly channel. The morning air is deemed more refreshing than that of the evening, and air agitated with breezes, than that which is serene and still. Though invisible, except in large masses, without smell or taste, yet it is a substance possessing all the principal attributes of matter, it is impenetrable, ponderable, compressible, dilatible, perfectly elastic, and its particles are operated on like those of other bodies, by chemical action. It is indispensable to the life of all organic beings, it is the agent of combustion, devolves heat and light, and is the principal medium of sounds.—In the elegant fables of the Greeks, *Ara* was personified under the names of Jupiter and Juno. Jupiter was said to reign in the upper atmosphere, and Juno in the lower. The air is sometimes, also, represented as a divinity, whose wife is the moon, and whose daughter the dew.—*Air*, in music, is properly the tune which is adapted to the words of a song, or piece of poetry intended to be sung, and, by the extension of the term, the song itself is called an *air*. In operas, the name of *air* is given to all measured music, to distinguish it from the recitative, and, generally, to every piece of music, whether vocal or instrumental, which has its beginning and end.—*Air* (*aria*) signifies a short, less elaborate air, designed to express a more simple and transient emotion.

AIR-BLADDER, or the SWIMMING-BLADDER, a vehicle found in the bodies of all fishes, the cartilaginous, cetaceous, and perhaps a few other kinds excepted. By this bladder, which is always more or less replete with air, the fish is enabled to sustain its body at any depth. Near the bottom, the great weight of the incumbent water compresses the body of the fish, or rather the inclosed air bladder, till it becomes equiponderant with an equal bulk of water. In the middle region, where the pressure is less, the air bladder expands; and thereby increases the bulk of the fish, without adding anything to its weight, till it becomes equipondant with an equal bulk of water. As the fish continues to rise, the air-bladder still expands and sus-

THE AIR IN SALTDRIOL'S AT SEA, FACILITATES THE CONTINUAL MOTION OF THE WATERS PRESERVES THE OXYGEN AND NITROGEN IN THE PROPORTIONS.

[AJU]

The Scientific and Literary Treasury ;

[ALB]

tains it, thus according to the different degrees of contraction and dilatation of this bladder they can keep higher or lower in the water at pleasure

AIR GUN a gun constructed so as to propel bullets solely by means of condensed air which is ejected without causing any explosion

AIR JACKET a sort of jacket made of leather, in which are several bags or bladders containing air By the help of these bladders which are placed near the breast a person is supported in the water without making the efforts used in swimming

AIR PUMP a machine for exhausting the air out of vessels in the same manner as water is drawn up by a pump The operation of this machine depends on the elasticity of the air for by working the pump the air in the receiver will expand itself by which means part of it will be forced into the barrel of the pump to be carried off By thus continuing to work the pump the air in the receiver will be gradually exhausted but can never be wholly drawn out so as to leave a perfect vacuum within the vessel for it must be considered that the air which is exhausted is only pushed out by the spring of that which remains behind if therefore every particle were supposed to be exhausted the last would be expelled without an agent or there would be an effect without a cause

AIR SHAFTS in mining holes or shafts let down from the open air to discharge the foul air or gases

AIR THREADS in natural history the long filaments seen floating in the air at the autumnal season of the year These threads are the work of spiders especially of that species called the long legged field spider This animal having gained the summit of a bush or tree darts from its tail several of these threads till at length it produces one capable of sustaining it in the air on this it mounts in quest of prey and frequently rises to considerable heights

AIR VESSELS spiral ducts or canals in the leaves and other parts of plants which are supposed to supply them with air after the manner of lungs in animals

—In navigation the term **AIR VESSELS** has been applied to a late invention for rendering life boats of more service and ships in general more safe It consists of a set of tubic formed air vessels carried round the planking

AIR LAMP, a pneumatic machine formed by the combination of inflammable air and electricity to produce a flame which by means of a stop cock may be repressed or continued at pleasure

AJUTAGE or **ADJUTAGE** in hydraulics part of the apparatus of a jet d'eau or artesian fountain being a kind of tube fitted to the aperture or mouth of the cistern or the pipe through which the water is to be played in any direction

AL an Arabian particle answering to the English *the* and employed in the same manner to mark any thing definitely

ALA, or **ALÆ** in ancient military affairs the wings of an army or the horse on each side flanking the foot

ALABASTER a well known sulphate of lime, forming a soft granular, imperfectly transparent, marble used for ornaments in houses, and by statuesque It is found in Germany France, and Italy—**ALABASTER** in antiquity, a term not only used for a box of precious ointment, but also for a liquid measure containing ten ounces of wine or nine of oil

ALBASTRA in plants are those little herbaceous leaves which encompass the bottoms of flowers particularly the rose

ALABASTRUM DENDROIDES the name of a species of laminated alabaster beautifully variegated with the figures of trees, shrubs &c

ALANA TERRA the *ochra ferri* of Linnæus or red ochre supposed to be what the ancients called *Samus lapis*, the Samian stone

ALARIA in Roman antiquity an epithet given to the cavalry on account of their being placed in the two wings, or ala of the army

ALARAI according to the Mahometan creed the party wall which separates heaven from hell

ALARUM any contrivance for the purpose of alarm A bell or rattle to call for assistance A bell fastened to or communicating with a door or window

ALB or **ALBE** (*alba*) in the Romish church a vestment of white linnen hanging down to their feet and answering to the surplice of our clergy In the ancient church it was usual with those newly baptized to wear an alb or white vestment and hence the Sunday after Easter was called *dominica in albis* on account of the albs worn by those baptized on Easter day

ALBATROSS or Man of War Bird the *Diomedes* of Linnæus a large and voracious bird which inhabits many countries between the tropics

ALBIGENSI a name common to several sects particularly the Cathari and Waldenses who agreed in opposing the dominion of the Romish hierarchy and in endeavouring to restore the simplicity of primitive Christianity They endured the severest persecutions and after the middle of the 13th century the name of Albigenes altogether disappeared but fugitives of their party formed in the mountains of Piedmont and in Lombardy what is called the *French Church* which was continued through the Waldenses, to the era of the Reformation

ALBINOS or **LEUCÆTHIOPS** a variety of the human species that frequently occurs in Africa The Portuguese first gave the name of Albino to the white negro, and they formerly described them as a distinct race but modern naturalists have discovered them in various countries of Europe viz in Switzerland among the Savoyards in the valley of Chamouni, in France in the tract of the Rhine in Tyrol, &c Their characteristics are now said to

AIR PIPES ARE A RECENT INVENTION FOR THE VENTILATION OF SHIPS, BY MEANS OF THE HEATING POWER OF HEAT

AIR TREES ARE A RECENT INVENTION FOR PREVENTING THE EVAPORATION OF PURE EPIDEMIA IN JAILS, OR CROWDED APARTMENTS

[A.L.C.]

A New Dictionary of the Belles Lettres.

[ALE]

TO ESTIMATE THE QUANTITY OF ALCOHOL IN ANY SPIRIT, THE SPECIFIC GRAVITY OF THE ALCOHOL AND WATER SHOULD BE ASCERTAINED.

be owing to a disease which may attack men in every climate, and to which even certain animals are subject. Their skin has a dull white or cadaverous appearance; the iris of the eye is of a bright red, or of a blue colour; and the hair is either white and silky, or of a very flaxen colour. When this variety is found among the negroes, the woolly excrescence which covers the heads of that race is white.

ALBULA, mineral waters of an aluminous kind, hence of an astringent quality, and of use in wounds.

ALBUGO, a disease of the eye, which consists of a white speck.

ALBUM, a white table or register, whereon the Roman prætors had their decrees written. There were many of them in use, and they received their appellations from the various magistrates whose names were thereon entered, as the *album judicum*, the *album decurionum*, &c. — The fashionable **ALBUMS** of the present day are derived from the practice adopted in many foreign countries of having a white paper book, in which strangers of distinction or literary eminence were invited to insert their names, or any observation in prose or verse, as a memorial of their visit.

ALBUMEN, a white or transparent viscous fluid, without taste or smell, which is the substance of the nerves, the serous part of the blood, and the white of eggs, and of milk.

ALBURNUM, the soft white substance between the inner bark and the wood of shrubs and trees.

ALCAÏUS, a term given to several kinds of verse, from their inventor, the poet Alcaeus.

ALCAIDE, or **ALCALDE**, a Spanish or Portuguese magistrate, or officer of justice, answering nearly to the French prévost, and the British justice of peace. Both the name and office are of Moorish origin.

ALCHEMY, or **ALCHYMY**, that obsolete branch of chemistry which had for its object the transmutation of metals into gold, the finding the panacea, or universal remedy, and other things equally ridiculous in the eyes of philosophers of a more enlightened age. Though designing men have often used alchemy as a means of defrauding the credulous of their money, many have laboured in the fruitless search with indefatigable patience and purity of heart, and various discoveries of real value to science have been the accidental results of their labours.

ALCOHOL, an Arabian word, signifying any thing reduced into thin parts, or rendered extremely subtle by distillation. The word, at present, is used for a highly rectified spirit. This preparation is extremely light and inflammable: it is colourless and transparent, appearing to the eye like pure water. To the palate it is exceedingly hot and burning, but without any peculiar taste. It is chiefly employed in preparing varnishes, and dissolving gums, resins, &c. Its antiseptic power makes it also useful in preserving anatomical preparations. [Much

valuable information respecting the nature, properties and methods for procuring and concentrating alcohol, together with various alchemical tables, will be found on referring to Dr. Ure's Dictionary of Arts.]

ALCOHOLIZATION, the process of rectifying any spirit, or reducing it to a perfect alcohol.

ALCOR, a small star, adjoining the bright one in the middle of the tail of Ursa Major.

ALCORAN, or the **KORAN**, the name of the volume containing the revelations, doctrines, and precepts of Mahomet, in which his followers place implicit confidence. The general aim of the Alcoran was to unite the professors of the three different religions then followed in Arabia, idolaters, Jews, and Christians, in the knowledge and worship of one God, under the sanction of certain laws, and the outward signs of ceremonies, partly of ancient, and partly of novel institution, enforced by the consideration of rewards and punishments, both temporal and eternal, and to bring all to the obedience of Mahomet, as the prophet and ambassador of God, who was to establish the true religion on earth. [The reader has an easy opportunity of gratifying his curiosity with regard to the doctrines of the Koran, by consulting an English translation of that work by G. Sale.]

ALCYONIUM, in botany, a genus of submarine plants, consisting of a rigid fibrous substance, disposed in various forms, and sometimes coated over with a crust of a similar but more compact matter than the rest.

ALDEBARAN, a star of the first magnitude, vulgarly called the Bull's Eye, as making the eye of the constellation Taurus.

ALDER, the *betula alnus*, of Linnaeus, a tree which thrives particularly in moist places. The principal sorts of alder are the round leaved, or common alder, the long-leaved, and the dwarf alder.

ALDERMAN, a magistrate next in authority to the mayor, in a city or borough. Their number is not limited, but differs according to the magnitude of the place, where they exercise the authority of commissioners of the peace. In London, their number is twenty six, each having a ward, or district of the city committed to his more peculiar care, but, serving by rotation, as sitting magistrate for the whole. — **ALDERMAN**, among our Saxon ancestors, was a degree of nobility, from which is derived the earl of the present day.

ALE, a fermented liquor, obtained from an infusion of malt and hops. *Pale ale* is brewed from slightly dried malt, and *brown* from malt highly dried. Ale is thought to be the same kind of liquor with the *cerevisia*, *cythum*, and *carnis* of the ancients.

ALEA, in antiquity, denotes in general all kinds of games of chance, but, in a more restricted sense, was used for a particular game played with dice and tables, not unlike our backgammon, and wherein

A DEFINITE MIXTURE OF ALCOHOL AND WATER IS INEVITABLE IN ITS VALUE, AND CAN BE ACCURATELY ASCERTAINED BY THE HYDROMETER.

[ALG.]

The Scientific and Literary Treasury ;

[ALI]

black and white stones were used instead of wooden men.

ALECTOROMANTIA, in Grecian antiquity, a species of divination performed by means of a cock, in the following manner. A circle being described on the ground, and divided into twenty-four equal portions, in each of these spaces was written one of the letters of the alphabet, and on each of the letters was laid a grain of wheat, after which a cock being turned loose in the circle, particular notice was taken of the grains picked up by the cock, because the letters under them being formed into a word, made the answer desired.

A-LEE', a sea term, used when the wind, crossing or flanking the line of a ship's course, presses upon the masts and sails so as to make her incline to one side, which is called the lee-side. Hence, when the helm is moved over to this side, it is said to be *a-lee*.

ALEM BIC, a vessel formerly used for distilling, in the place of which retorts are now mostly in use.

ALEU'ROMANCY, a species of divination performed by meal or flour. It is sometimes called alphantomancy and crythomancy.

ALEXAN'DRIAN LIBRARY. This celebrated library was founded by Ptolemy Soter, for the use of an academy that he instituted in Alexandria, and, by continual additions by his successors, became at last the finest library in the world, containing no fewer than 700,000 volumes. The method followed in collecting books for this library, was, to seize all those which were brought into Egypt by Greeks or other foreigners. The books were transcribed in the museum by persons appointed for that purpose, the copies were then delivered to the proprietors, and the originals laid up in the library. It was eventually burnt by order of the caliph Omar, A. D. 624.

ALEXAN'DRIAN MANUSCRIPT, or **CODEx ALEXANDRINUS**, a famous copy of the Scriptures, consisting of four volumes, in a large quarto size, which contains the whole Bible, in Greek, including the Old and New Testament, with the Apocrypha, and some smaller pieces, but not quite complete. This manuscript is now preserved in the British Museum. It was sent as a present to king Charles I., from Cyrillus Lucaris, patriarch of Constantinople, by Sir Thomas Rowe, ambassador from England to the grand seignior, about the year 1624.

ALEXAN'DRIAN, or ALEXAN'DRINE, in poetry, a kind of verse, consisting of twelve, or of twelve and thirteen syllables alternately, the pause being always on the sixth syllable. It is so called from a poem on the life of Alexander, written in this way, by some French poet.

AL'GAROTH, **POWDER**, or, a precipitate obtained by pouring water into the acidulous chloride of antimony.

AL'GIZ, in botany, an order of the cryptogamia class of plants. It is one of the seven families or natural tribes into which

the vegetable kingdom is distributed. The plants belonging to this order have their root, leaf, and stem entire. Under this description are comprehended all the seaweeds, and many other aquatic plants.

AL'GEBRA, a species of abstract arithmetic, in which letters are put for any numbers, and any desired operations performed in a short and simple manner. The first letters of the alphabet are generally adopted for known quantities, and the last for unknown, and the operations are performed by characters, as + for addition, - for subtraction, x for multiplication, and ÷ for division, with = for equality. Thus, *a, b, c*, &c., are commonly put for known quantities, and *x, y, z*, &c., for unknown or indeterminate quantities: thus if *a + x* be equal to 9 and *a* is known to be equal to 4, then *x = 9 - 4 = 5*. Again, if *a + x = 12*, and *a - x = 8*, then by adding the two quantities together I got *2a = 20* (because these being + *x* and - *x* they destroy one another) and *a = 10*, of course *x = 2*. On such operations as these, extended almost infinitely, algebra depends, and by them every problem in arithmetic, and almost all in geometry may be solved.

AL'GOL, a fixed star in Caput Medusæ, and marked β in Perseus. This star is subject to periodic variations in its brightness. It changes from the second magnitude to the fourth in about three hours and a half, and back again in the same time, when it continues of the greatest brightness for about two days and seven hours, then it changes again.

AL'GENEB, the name of two fixed stars of the second magnitude, one on the wing of Pegasus, the other on the right shoulder of the constellation Perseus.

AL'GORITHM, a term frequently used to denote the practical rules of algebra, and sometimes for the practice of common arithmetic.

AL'GUAZIL, the title of one of the lower orders of Spanish officers of justice, whose business is to execute the orders of the magistrate.

AL'IAN, in law, a Latin word signifying otherwise, often used in describing the accused, who has assumed other names beside his real one.

AL'IBI, in law, a Latin word signifying, literally, elsewhere. It is used by the accused, when he wishes to prove his innocence, by showing that he was in another place when the act was committed.

ALIC'ONDA, a tree of immense size, which grows at Congo, on the coast of Africa. It bears a melon-like fruit, which affords pulpy nutritious food, and the bark yields a coarse thread, with which the Africans weave a kind of cloth.

AL'LEN, in law, a person born in a foreign country, in contradistinction to a denizen or natural subject. An alien is incapable of inheriting lands in England, till naturalized by an act of parliament. No alien is entitled to vote in the choice of members

IN THE ALEXANDRIAN SCHOOL, CORRECTNESS, PURITY, AND ELEGANCE WERE SUCCESSFULLY CULTIVATED; BUT TRUE GENIUS WAS RARE.

THE LEGISLATION OF A NATION IN REGARD TO ALIENS, IS A CRITERION OF ITS LIBERALITY, AND CONSEQUENTLY OF ITS CIVILIZATION.

[ALK]

A New Dictionary of the Belles Lettres.

[ALL]

TO DETERMINE WHAT ALIMENT IS MOST WHOLESOME IN ANY GIVEN CASE, THE DIGESTIVE POWER OF THE INDIVIDUAL IS TO BE CONSIDERED.

of parliament, has a right to enjoy offices, or can be returned on any jury, unless where an alien is party in a cause; and then the jury is composed of an equal number of denizens and aliens.

ALIENATION, in law, the act of making a thing another man's: or the altering and transferring the property and possession of lands, tenements, or other things, from one man to another. To alienate, in mortmain, is to make over lands or tenements to a religious community, or other body politic. To alienate in fee, is to sell the fee-simple of any land, or other incorporeal right.

ALIGNMENT, in naval affairs, a supposed line drawn to preserve a fleet in its just direction.

ALIMENT, whatever serves as nutriment to animal life. Climate, custom, and the different degrees of want and of civilization, give rise to an innumerable diversity of food and drink, from the repast of a savage to that of an epicure; or from the diet of the carnivorous native of the north to that of the Brahmin, whose appetite is satisfied with vegetables; but all kinds of aliment must contain nutritious substance, which, being extracted by digestion, enters the blood, and effects the repair of the body.

ALIMENTARY, in a general sense, is a term applied to whatever belongs to aliment or food.—**ALIMENTARY DUCT**, a name by which some call the intestines, on account of the food passing through them.

—**ALIMENTARY LAW**, among the Romans, that whereby children were obliged to maintain their aged parents.

ALIMONY, in law, the maintenance sued for by a wife, in case of a legal separation from her husband, wherein she is neither chargeable with elopement nor adultery.

ALIPTA, amongst the Romans, was a slave; whose province it was to anoint his master when he bathed.

AL'QUANT PARTS, such numbers in arithmetic as will not divide or measure a whole number exactly, as 7, which is the aliquot part of 16.

AL'QUOT PARTS, such parts of a number as will divide or measure a whole number exactly, as 2 the aliquot part of 4, 3 of 9, and 4 of 16. Aliquot parts must not be confounded with commensurable ones; for though the former be all commensurable, yet these are not always aliquot parts: thus 4 is commensurable with 6, but is not an aliquot part of it.

AL'ITES, in Roman antiquity, a designation given to such birds as afforded matter for auguries by their flight; in which sense, they are contradistinguished from those called *oscines*, or those which gave auguries by singing or croaking.

AL'KA, in ornithology, a bird of the anseres, or goose-kind, about the size of a duck, and quite black, except on the breast and belly, which are white: it is commonly called the *awk* or *razor-bill*.

AL'KAHEST, an universal menstruum possessing the virtue of pervading every

substance, and capable of resolving all bodies into their *ess primum*, or first matter. It is explained by Van Helmont to signify a salt of the highest sort, that had attained to the highest state of purity and subtilty.

AL'KALI, among chemists and physicians, an appellation given to all substances which excite a fermentation when mixed with acids. Originally the term alkali signified only the salt extracted from the ashes of kali or glass-wort; afterwards, it was used for the salts of all plants, extracted in the same manner; and as these were observed to ferment with acids, the signification of the term was still farther extended, so as to comprehend whatever substances had this effect. Potash is called the *vegetable alkali*, because it is procured from the ashes of all vegetables, in a greater or less proportion, except marine plants, and a few that grow near the sea-shore, which yield *sona*. This latter is termed the *mineral alkali*, because it is not only obtained from the ashes of the last-mentioned plants, but is sometimes found native in the earth. Ammonia, or the *volatile alkali*, is procured by decomposition, from all animal, and from some vegetable substances; and by putrefaction from all these matters. It is distinguished from the fixed alkalies by its volatility, which is so great that it very easily assumes a gaseous form, and is dissipated by a very moderate degree of heat; and by its pungent smell. Its purest form is that of a gas: it is never solid, unless combined with some other substances; nor liquid but when it is united with water. It is weaker in all its affinities than the fixed alkalies; and is composed of hydrogen and azote, in the proportion of 193 parts of the former to 807 of the latter.

ALKAKEN'GI, or **WINTER CHERRY**, the fruit of which is a species of nightshade. —**ALKAKENOI**, in medicine, is used as an abstergent, dissolvent, and diuretic, and is celebrated for its lithotropic quality.

ALKALIMETER, a scientific instrument invented by Desormettes to measure the purity of different alkalies.

AL'KALINE, in a general sense, is applied to all such things as have the properties of an alkali.

ALKALIZATION, the impregnating a liquor with alkaline salts.

AL'KANET, the bark of a root used in dyeing; also for the colouring of oils, in compositions for giving colour to mahogany furniture, and other purposes. It imparts a fine deep-red colour to all unctuous substances and to spirits of wine; but it tinges water with a dull, brownish hue. It is chiefly imported from the Levant, and the plant is a species of buglossa.

ALKER'MES, in pharmacy, a compound cordial medicine, of the form and consistence of a confection.

AL'LAI, the Arabian name of God.

ALLE'GIANCE, in law, the faithful obedience which every subject owes to his prince; being the tie or bond of fidelity

IT IS SUPPOSED THAT THE VEGETABLE ALKALIES MAY BE FOUND TO BE AS NUMEROUS AS THE VEGETABLE ACIDS.

[ALL]

The Scientific and Literary Treasury ;

[ALM]

which binds the governed to the governor. The oath of allegiance is that which every person is required to take before he enters on any office.

ALLEMANNIC, in a general sense, denotes any thing belonging to the ancient Germans. Thus we meet with Allemannic history, Allemannic language, Allemannic law, &c.

ALLEGORY, a series or chain of metaphors continued through a whole discourse. The great source of allegory, or allegorical interpretations, is some difficulty, or absurdity, in the literal and obvious sense.

ALLEGRO, an Italian word used in music, to denote that the part is to be played in a brisk and sprightly manner. The usual distinctions succeed each other in the following order *grave, adagio, largo, moderato, allegro, presto*. Allegro time may be heightened, as *allegro assai* and *allegroissimo*, very lively, or lessened, as *allegretto* or *poco allegro*, a little lively. *Piu allegro* is a direction to play or sing a little quicker.

ALL-HALLOW'S, OR ALL SAINTS, a festival observed by many denominations of Christians, in commemoration of the saints in general. It is kept on the first of November, Gregory IV. having in 835 appointed that day for its celebration.

ALLIANCE, in the civil and canon law, the relation contracted between two persons or two families by marriage—**ALLIANCE** is also used for a treaty entered into by sovereign princes and states, for their mutual safety and defence—**ALLIANCE**, in a figurative sense, is applied to any kind of union or connection thus we say, there is an alliance between the church and state.

ALLIGATION, a rule in arithmetic, teaching how to compound several ingredients for any design proposed. It is either medial or alternate. The former shows the rate or price of any mixture, when its several quantities and their rates are known. The latter is the method of finding the quantities of ingredients necessary to form a compound of a given rate.

ALLIGATOR, an amphibious animal, so nearly resembling the crocodile of the Nile as to be considered a mere variety. It abounds in the torrid zone, will sometimes grow to the length of 18 or 20 feet, and is covered by a dense hardness of horny scales, impenetrable in most parts to a musket-ball.

ALLITERATION, a figure or embellishment of speech, which consists in the repetition of the same consonants, or of syllables of the same sound, in one sentence. The Greek and Roman literature afford many instances of this, and in English poetry there are also many beautiful specimens of alliterations, though it must be confessed that it is too often used without the requisite skill, and carried too far. In burlesque poetry it is frequently used with excellent effect; though even there the abuse should never be sacrificed to the sound. Tastefully used, it is a most en-

chanting ornament, and will equally contribute to softness, to energy, and to solemnity.

ALLODIAL LANDS, are those which, under the feudal system, were free. Their owners owed no service to a superior lord.

ALLOPHANE, a mineral, or aluminous earth, of a blue, and sometimes of a green or brown colour, which occurs massive, or in imitative shapes. It gelatinizes in acids.

ALLOY, a proportion of any baser metal mixed with one that is finer; thus the gold coin has an alloy of silver and copper, as silver has of copper alone. Alloy also means any compound of any two or more metals whatever; thus, bronze is an alloy of copper and tin, brass, an alloy of copper and zinc, &c. One metal however, does not alloy indifferently with every other metal, but it is governed in this respect by peculiar affinities.

ALLSPICE, so called from its flavour, which unites that of the cinnamon, of the nutmeg, and of the clove, is the *pimenta*, or Jamaica pepper.

ALLUVIAL, a term used by mineralogical and geological writers. By alluvial depositions is meant the soil which has been formed by the destruction of mountains, and the washing down of their particles by torrents of water. The alluvial formations constitute the great mass of the earth's surface.

ALLUVION, in law, a gradual increase of land along the sea-shore, or on the banks of rivers. This, when slow and imperceptible, is deemed a lawful means of acquisition, but when a considerable portion of land is torn away at once, by the violence of the current, and joined to a neighbouring estate, it may be claimed again by the former owner.

ALMACANTAR, in astronomy, a name for the parallels of altitude on the celestial globe, whose zenith is the pole or vertical point—**ALMACANTAR'S STAFF** is an instrument for observing at sea the sun's amplitude rising and setting.

ALMADIE, a kind of canoe, or small vessel, about four fathom long, usually made of bark, and used by the negroes of Africa.

ALMAGEST, the name of a celebrated book, composed by Ptolemy, being a collection of many of the observations and problems of the ancients, relating both to geometry and astronomy.

ALMAGRA, a fine deep red ochre, with a faint admixture of purple, used both in painting and medicine.

ALMA MATER, a title given to the universities of Oxford and Cambridge by their several members who have passed their degrees in either of these universities.

ALMANAC, a calendar or table, containing a list of the months, weeks, and days of the year, with an account of the rising and setting of the sun and moon, the most remarkable phenomena of the heavenly bodies, the several festivals and fasts, and other incidental matters.—**The Nautical Almanac**, a most valuable work for

THOSE IS DISTINGUISHED FROM ALLEGORY BY CONVEYING A MEANING DIRECTLY CONTRARY TO THE TRUE SIGNIFICATION OF THE WORDS.

WHOLE FORMS ARE SOMETIMES ALLEGORICAL; AS "SPENSER'S FAIRY QUEEN," AND "BUTY'S VILGIAN'S PROGRESS."

[ALP]

A New Dictionary of the Belles Lettres.

[ALT]

mariners, is published in England two or three years in advance. It was commenced in 1767, by Dr. Maskelyne, the astronomer royal, and has been regularly continued ever since.

ALMONER, an ecclesiastical officer of the king, appointed to distribute the king's alms to the poor every day.

ALMS, a general term for what is given out of charity to the poor. In the early ages of Christianity, the alms of the charitable were divided into four parts, one of which was allotted to the bishop, another to the priests, and a third to the deacons and sub-deacons, which made their whole subsistence; the fourth part was employed in relieving the poor, and in repairing the churches.

ALMS-HOUSE, a building erected for the maintenance of a certain number of poor, aged, or disabled persons. Of these there are a great number in London, Westminster, and other towns of note in England; some endowed by public companies, and others by charitable individuals.

ALMUTEN, in astrology, the lord of a figure, or strongest planet in a nativity.

A'LOA, in Grecian antiquity, a festival kept in honour of Ceres, by the husbandmen, and supposed to resemble our harvest-home.

A'LOE, a tree which originally came from India, remarkable for a bitter juice, called aloes, which is extracted from its leaves, and is very useful in medicine as a purgative. The Socotrine aloes, the leaves of which afford a beautiful violet colour, is an European species much cultivated in Spain. Aloes are an extensive tribe of plants; and while some of them are not more than a few inches in height, others occasionally exceed thirty feet. All the leaves are fleshy, thick, and more or less spinous at the edges or extremity. The great American aloes (*agave Americana*), when in full flower, presents a most splendid appearance. The stem, which bears the blossoms, rises from the centre of the leaves, branching out on all sides in such a manner as to form a kind of pyramid, composed of greenish-yellow flowers, which stand erect, and are seen in thick clusters at every joint. It is an erroneous notion, though a very generally received one, to suppose that the American aloes does not bloom till it is 100 years old; the fact is, in hot countries it will flower in a few years; but in colder climates, the growth being slower, it is necessarily longer in arriving at maturity.

ALOETICS, a general term for all medicines, the basis or principal ingredient of which is aloes.

ALOGOTROPHIA, in medicine, unequal growth or nutrition in different parts of the body.

ALOPECIA, in medicine, a falling off of the hair, occasioned either by a defect of nourishment, or by a bad state of the humours.

ALPHABET, the natural or customary series of the several letters of a language. The word is formed from *alpha* and *beta*,

the first and second letters of the Greek alphabet. It is undoubtedly the most important of all inventions, for by means of it sounds are represented, and language made visible to the eye by a few simple characters. The five books of Moesa are universally acknowledged to be the most ancient compositions, as well as the most early specimens of alphabetical writing extant; and it appears that all the languages in use amongst men which have been conveyed in alphabetical characters, have been the languages of people connected, ultimately or immediately, with the Hebrews. Hence a most extensive controversy has existed amongst learned men, whether the method of expressing our ideas by visible symbols, called letters, be really a human invention; or whether we ought to attribute an art so exceedingly useful, to an immediate intimation of the Deity. An opinion upon such a subject would necessarily be mere conjecture, and therefore useless; but we feel that we could not properly pass over in silence a matter which has so often engaged the attention of the most erudite controversialists.

ALPHON'SINE TABLES, astronomical tables made in the reign of Alphonsus X., king of Arragon, who was a great lover of science, and a prince of rare attainments; but though these tables bear his name, they were chiefly drawn up by Isaac Hazzan, a learned Jewish rabbi.

ALT, in music, that part of the great scale lying between F above the treble clef note, and G in *altissimo*.

ALTAR, a place upon which sacrifices were anciently offered to the Almighty, or some heathen deity. Before temples were in use, altars were erected sometimes in groves, sometimes in the highways, and sometimes on the tops of mountains; and it was a custom to engrave upon them the name, proper ensign, or character of the deity to whom they were consecrated. Thus St. Paul observed an altar at Athens, with an inscription, *To the unknown God*. In the great temples of ancient Rome, there were ordinarily three altars; the first was placed in the sanctuary, at the foot of the statue of the divinity, upon which incense was burnt and libations offered; the second was before the gate of the temple, and upon it they sacrificed the victims; and the third was a portable altar, upon which were placed the offerings and the sacred vessels. The principal altars of the Jews were those of *succae*, or *burnt-offerings*, and the altar, or table, for the *show-bread*.—**ALTAR** is also used among Christians, for the communion-table.

ALTARAGE, the profits arising to a priest on account of the altar, as well as the offerings themselves made upon it.

ALTERATIVES, such medicines as induce a favourable change in the system, without any manifest operation or evacuation.

ALTERNATION, a rule in arithmetic, by which the changes in any number of things may be determined. It consists of

ALPHA AND OMEGA, THE FIRST AND LAST LETTERS OF THE GREEK ALPHABET, ARE USED IN SCRIPTURE AS A SYMBOL OF THE DIVINE BEING.

DURING THE CIVIL WARS OF CHARLES I. AND UNTIL VERY LATELY, ENGLISH ALMANACS HAVE BEEN CONSPICUOUS FOR ASTROLOGICAL PREDICTIONS.

[ALU]

The Scientific and Literary Treasury ;

[AMA]

multiplying the numbers one into another, and the product is the number of possible changes.

ALTHÆA, a plant, the root of which abounds with a mild mucilage, and is of great efficacy in medicine as an emollient. It is well known by its English name, the Marsh-mallow.

ALTIMETRY, the art of taking heights by means of a quadrant, and founded on the principle that the sides of triangles having equal angles, are in exact proportion to one another.

ALTISIMO, in music, an Italian epithet for notes above F in alt.

ALTISTA, in music, an Italian name for the vocal performer who takes the *alto primo* part.

ALTITUDE, the height of an object, or its elevation above that plane to which the base is referred; thus in mathematics, the altitude of a figure is the perpendicular or nearest distance of its vertex from the base. The altitude of an object is the elevation of an object above the plane of the horizon, or a perpendicular let fall to that plane.

ACCESSIBLE ALTITUDE of an object, is that to whose base there is access, to measure the nearest distance to it on the ground, from any place.—**INACCESSIBLE ALTITUDE** of an object, is that to whose base there is not free access, by which a distance may be measured to it, by reason of some impediment, such as water, wood, or the like. The instruments mostly used in measuring altitudes, are the quadrant, theodolite, geometrical square line of shadows, &c.—**ALTITUDE OF THE EYE**, in perspective, the perpendicular height of the eye above the geometrical plane.—**ALTITUDE OF A STAR**, &c., in astronomy, the height of any star, &c. above the horizon, or an arc of a vertical circle, intercepted between the star and the horizon. This altitude is either true or apparent, according as it is reckoned from the rational or sensible horizon, and the difference between these two is termed, by astronomers, the parallax of altitude.—**ALTITUDES OF MOUNTAINS** may be determined either by trigonometry or by the barometer; for as the weight and elasticity of the atmosphere diminishes as we rise, so the fall of the barometer determines the elevation of any place. If very great accuracy is not required, their altitude may be ascertained by the length of shadows, moveable staves, &c.

ALTO, or **ALTO TENORE**, in music, is the term applied to that part of the great vocal scale which lies between the *mezzo soprano* and the tenor, and which is assigned to the highest natural adult male voice. In scores, it always signifies the counter-tenor part.

ALTO RELIEVO, in sculpture, a representation of figures and other objects against a flat surface; differing from *bas-relievo* only in the work being much more brought forward.

ALUM, a fossil, salt, and mineral, of an acid taste, which leaves in the mouth a

sweetness, accompanied by considerable astringency. There are two sorts of alum, the natural and the artificial. In a natural state, it is said to be met with in Egypt, Sardinia, Spain, Bohemia, and other places, and the counties of York and Lancaster, in England. On account of its astringent qualities, it is used in several mechanic arts, and in medicine.—**ALUM SLATE**, a slaty rock, found abundantly in most European countries, and from it is obtained, by a complicated process, the largest part of the alum of commerce.—**ALUM STONE**, a mineral, of a greyish or yellowish-white colour. It is found at Tolfa, in Italy, and from it is obtained a very pure alum, by simply subjecting it to roasting and lixiviation.

ALUMINA, an earth which is the basis of clay, basalt, slate, &c. It is of the greatest importance to mankind, for it enters largely into the composition of the best arable land, and is the base of all earthenware and porcelain.

ALUMINITE, a mineral, of a snow-white colour, dull, and opaque; found chiefly near Halle, in Saxony.

ALUMINOUS, an appellation given to such things as partake of the nature and properties of alum.

ALVEARIUM properly signifies a beehive, from *alveus*, a channel, or cavity. Hence, **ALVEARIUM**, among anatomists, denotes the hollow of the auricle, or outer ear.

ALVEOLATE, in botany, an epithet applied to the receptacle when it is divided into open cells, like a honey-comb, with a seed lodged in each.

ALVEOLUS, in natural history, properly denotes one of those waxen cells, whereof the combs in bee-hives consist.

ALVEOLUS, in anatomy, is the socket-like cavity in the jaws, wherein each of the teeth is fixed.—**ALVEOLUS** is also the name given to a marine fossil. The *alveoli* are of a conic shape, and composed of a number of cells, like so many bee-hives, jointed into one another, with a siphunculus, or pipe of communication, like that of the nautilus.

ALVEUS, a boat formed from the trunk of a tree hollowed out, which was in use among the ancients, and in one of which, according to Ovid, Romulus and Remus were exposed.

ALYS MOS, a term frequently used by Hippocrates to express the restless uneasiness attendant on sickness.

ALYS'SUM, the plant madwort; so called because it was supposed to cure the bite of a mad dog.

AMALGAM, or **AMALGAMA**, the mixture of mercury with some other metal. Amalgams are used either to render a metal fit to be spread on some works, as in gilding, or else to reduce it to powder. There are two methods generally used in the making of amalgams. The first is merely by trituration in a mortar, and without heat; the second is by fusing the metal which is to be amalgamated, and by

ALUM WORKS EXISTED MANY CENTURIES AGO AT ROCCHA, IN SYRIA, WHENCE THE ANCIENT NAME OF ROCH ALUM IS DERIVED.

THE ALUM MANUFACTURE IN GREAT BRITAIN CONTAINS POTASH AS ITS ALKALINE CONSTITUENT; THAT MADE IN FRANCE, AMMONIA.

[AMA]

A New Dictionary of the Belles Lettres.

[AMB

adding to it, when fused, the intended quantity of mercury. An amalgam of tin and mercury is used for looking glasses.

AMALGAMATION, the operation of mixing quicksilver with some other metal. AM'ARANTH, a plant cultivated in the Indies and South America, and famed for the beauty with which the colours are elegantly mixed in its leaves. By ancient poets the amaranth was made the emblem of immortality, in consequence of its flowers retaining their colours after they were plucked and dried.—AMARAN'THUS, in the Linnaan system, is a genus of plants, of which there are many varieties.

AMA'RUM, in mineralogy, sulphate of magnesia, or Epsom salts, a genus of mineral substances, class *salts*, of a bitter taste, easily soluble in water, and melting in heat.

AMA'RUS, in mineralogy, a genus of earths, of the class *silice*, consisting of silica, with a small proportion of magnesia, alumina, and carbonate of lime.

AMARIL'LIS, LIT' ARIHODPI, a genus of perennal plants, of which there are several species, mostly natives of the East and West Indies.

AMARIN THIA, festivals anciently celebrated in honour of Diana at Amaryn thusa, a village of Eubœa.

AM'ATEUI, a person having a taste for a particular art, yet not professing, nor being dependent on it.

AMATO'RII MUSCULI, in anatomy, a term sometimes used for those muscles of the eyes that draw them sideways, and assist in ogling. The AMATO'RII MUSCULI are generally called the *obliquus superior*, or *trochlearis*, and the *obliquus inferior*.

AMAURO'SIS, among physicians, a disease of the eye, otherwise called *gutta serena*.

AM AZONS, a nation of female warriors, who are said to have founded an empire in Asia Minor. According to tradition, supported by the authority of the most ancient Greek writers, they permitted no males to reside among them, but had intercourse with the men of the neighbouring nations merely for the sake of preserving their community. Their male children they either killed or sent back to their fathers, but they brought up the females to war, and burned off the right breast, that this part of the body might not impede them in the use of the bow. It was from this practice that they derived the name of Amazons, i. e. wanting a breast. Their existence, however, has not only been controverted, but ridiculed and treated as fabulous, by Dr Bryant, in his Analysis of Ancient Mythology, and even by some ancient writers. But still there are too many concurrent testimonies in their favour for us to suppose that they were altogether creations of the fancy. The last account we have of them is about 330 years before Christ, when their queen, Thalestris, made a visit to Alexander of Macedon, at the head of 300 of her Amazons, having left the rest of her troops behind.—The old geo-

graphers gave the name of AMAZONIA to a large tract of country in the interior of South America, because Orellana, the first discoverer of the country, relates, that as he sailed up the stupendous river Marañon, or Amazon, which inundates and fertilizes the land as the Nile does Egypt, he found on its banks a nation of armed women, who made war on the neighbouring people.

AMBARVA'LIA, a festival among the Romans, celebrated annually in honour of Ceres, in order to procure a plentiful harvest.

AMBAS SADOR, the representative of one sovereign power to another, to which he is sent properly accredited. Ambassadors are either ordinary or extraordinary. The chief duties of an ordinary ambassador consist in the signing and countersigning of passports, the general protection of trade, and the transmission of such intelligence as can interest his court. Ambassadors extraordinary are sent on some important occasion, and are generally surrounded with superior pomp and splendour, but they quit the country as soon as the affair is despatched. The persons of ambassadors are sacred, both in peace and war, so that according to the law of nations, if hostilities break out between two nations, the respective ambassadors are permitted to depart without molestation.

AM BER, a hard, brittle, tasteless substance, mostly semitransparent, or opaque, and of a glossy surface. This curious production of nature is inflammable, and, when heated, yields a strong and bituminous odour. Its most extraordinary properties are those of attracting, after it has been exposed to a slight friction, straw, and other surrounding objects, and of producing sparks of fire, visible in the dark. Many thousand years before the science of electricity had entered the mind of man, these surprising qualities were known to exist in amber, and hence the Greeks called it *electron*. The Romans supposing it to be a vegetable juice, named it *succinum*, by the Arabs it is denominated *ambra*, whence the French write it *ambre*, and the English *amber*. Several hypotheses have been set up, respecting the nature of amber. By some, it is supposed to be resinous gum, oozing from pines, and falling on the earth, or into the sea; by others, a fossil formed in the earth, and washed ashore by the sea, and, by Dr Girtanner, an animal product, nearly resembling wax. He relates, that the old pine forests are inhabited by a large species of ants which form hills of about six feet in diameter, and that it is generally in these ancient forests, or in places where they have been, that fossil amber is found. This substance is not hard, like that taken up on the shores of Prussia; it has the consistence of honey, or of half melted wax, but it is of a yellow colour, like common amber; it gives the same produce by chemical analysis, and it hardens, like the other, when it is suffered to remain for some time in a solution of common salt. Insects are found in amber, among the se,

THE RIVER AMARON RISES IN THE MOUNTAINS OF QUITO, AND RUNS 3400 MILES BEFORE IT DISCHARGES ITSELF INTO THE ATLANTIC.

WHY JOINED BY THE AFRICAN, THE RIVER AMARON IS 150 MILES WIDE, AND IT IS FORTY FATHOMS DEEP 1800 MILES FROM THE SEA.

[AMB]

The Scientific and Literary Treasury ;

[AME]

ants are always the most general, circumstances that undoubtedly support Dr. Girtanner's opinion.

AMBERGRIS, a solid, opaque, ash coloured inflammable substance, variegated like marble, remarkably light, and when heated emitting a fragrant odour. It is found floating in the sea, near the coast of various tropical countries, and is supposed to be the excrement of the spermatic whale, having frequently been met with in the intestines of that ash. It is very much admired in Asia and Africa, where it is made use of to flavour luxurious dishes in Europe, it is highly valued as an article of perfumery.

AM HIDEATER, a person who can use both hands with equal facility, and for the same purposes that the generality of people do their right hands.—In law, a juror who takes money for giving his verdict.

AMBIENS N E OVES, in the heathen sacrifices an appellation given to such ewes as, having brought forth twins, were sacrificed together with their two lambs, one on each side. We find them mentioned among other sacrifices to Juno.

AMBIENT, a term used for such bodies, especially fluids, as encompass others on all sides: thus, the air is frequently called an ambient fluid, in consequence of being diffused round all terrestrial bodies.

AMBI GENERAL HYPERBOLA, in mathematics, a name given by Sir Isaac Newton to one of the triple hyperbolas of the second order.

AMBIT OF A FIGURE, in mathematics, the perimeter, or the sum of the lines by which the figure is bounded.

AMBITUS, in Roman antiquity, the act of setting up for some magistracy, or office, and formally going round the city to solicit the interest and votes of the people.

AUBITTUS, in music, signifies the particular extent of each tone, or modification of grave and sharp.

AMBIGUOUS, in geometry, an epithet for a figure that contains an obtuse angle.

AMBLAGONITE, a pale green mineral, marked superficially with reddish and dark yellow spots.

AMBLYGON, in geometry, an obtuse angled triangle.

AMBLYOPIA, in medicine, a term for dimness of sight.

AMBROSIA, in heathen antiquity, denotes the food of the gods. Hence, whatever is very gratifying to the taste or smell has been termed *ambrosial*.—Also, the name of a small shrub, which has a grateful smell and a very astrigent taste.

AMBRY, a place in which are deposited all utensils necessary for house keeping. In the ancient abbeyes and priories there was an office under this denomination, wherein were laid up all charities for the poor.

AMBUBALIE, in Roman antiquity, were immodest women, who came from Syria to Rome, where they appeared as minstrels, and lived by prostitution.

AMBULON, a tree, the fruit of which is very small and sweet.

AMBURBIUM, or **AMBURVIA**, in Roman antiquity, a solemn procession made by the Romans round the city, in which they led a victim, and afterwards sacrificed it, in order to avert some calamity that threatened the city.

AMBUSCADE, or **AMBUSH**, in the military art, properly denotes a place where soldiers may be concealed, till they find an opportunity to surprise the enemy. These words are also applied literally and metaphorically to any mode of concealment adopted for the purpose of stratagem.

AMEN, in Scripture language, a solemn formula, or conclusion to all prayer, signifying *verily*, or *so be it*.

AMENDE HONORABLE, (French), an infamous kind of punishment formerly inflicted in France on traitors, parricides, or sacrilegious persons, who were to go naked to the shirt, with a torch in their hand, and a rope about their neck, into a church or a court, to beg pardon of God, the court, and the injured party.—The modern acceptance of the term indicates that an open apology is made for an offence or injury done.

AMENTA'CEÆ, a natural order of plants, bearing catkins, as the poplar, hazel, beech, &c.

AMER CEMENT, a pecuniary punishment imposed on offenders at the mercy of the court. Amercements differ from fines, inasmuch as the latter are defined, and the former are proportioned to the fault, or more properly at the discretion of the court. The statute of Magna Charta ordains, that a freeman is not to be amerced for a small fault, but in proportion to the offence, by his peers and equals.

AMERICANISM, any word or phrase in general use among the inhabitants of the United States, which deviates from the English standard. Of these, a great proportion are mere vulgarisms and technical words of local character, originally taken from different counties in England, by the first emigrants—to whom also that drawing nasal pronunciation may be attributed; others are words formerly used by the English writers, but which have become obsolete, while many are of modern coinage, and owe their origin to the caprice or affectation of their transatlantic inventors, who seem to delight in the use of extravagant and far-fetched terms and metaphors. But every living language is subject to continual changes, and it is not to be expected that a large community, in a state of social and political activity, who are daily developing new and characteristic features, will fail to exercise their share of influence upon that which they naturally consider as a part of their inheritance. Indeed, although these idiomatic infringements on the purity of our language deserve, and have incurred, severe reprobation, both from English and American critics, and the lash of ridicule has been unsparingly applied, we find, as children say, that "mocking is catching," and the colloquial use of *Americanisms* is growing almost as common in Great Britain.

IN AMBERGRIS ARE FOUND THE SEEDS OF THE CUTLER-FISH, ON WHICH THE SPERMATIC WHALE IS KNOWN TO FEED.

AMONG THE AMERICAN AUTHORS WHO HAVE MOST STRONGLY CONTRIBUED THEIR COUNTRYMEN FOR THE USE OF VULGARISMS, IS DR. FRANKLIN.

[AMM]

A New Dictionary of the Belles Lettres.

[AMP]

tain, as it is to attribute to "brother Jonathan" every marvellous story or monstrous action of the press. We will conclude our brief observations in the words of Dr. Webster of New York, who, in alluding to the prevalence of certain ungrammatical forms of speech, says, "Barbarous nations may indeed form languages; but it should be the business of civilized men to purify their language from barbarisms."

AMETHYST, a precious stone, generally of a violet or purple-violet colour, and of a transparent and shining nature. The hues of different amethysts are as various as the tints of purple; that is, as all the mixtures of blue and red. It is also found colourless, and may easily be made so by putting it into the fire; in which state it so resembles the diamond, that its want of hardness seems the only way of distinguishing it. Amethysts are found in the East and West Indies, and in several parts of Europe; the oriental ones, at least some of the finer specimens, being so hard and bright, as to equal any of the coloured gems in value.

AMETHYSTEA, in botany, a genus of plants of the monogynia order, belonging to the diandria class.

AMETHYSTINA, ancient garments of a purple or violet colour.

AMETHYSTINUS, in conchology, a species of *Venus*, of an ovate shape and violet colour, with perpendicular striae. It is about two inches in length and breadth.

—AMETHYSTINUS, in ornithology, a beautiful species of *trochilus*, or humming-bird, of Cayenne. **—AMETHYSTINUS**, in entomology, an insect of the *apis* genus, with black body and violet wings.

AMIANTHUS, an incombustible mineral flax, which may be drawn into threads and wove into cloth. It is mostly found among rocks.

AMICTUS, in Roman antiquity, was any upper garment worn over the tunic.

AMID-SHIPS, a naval term, signifying, in the middle of the ship, applied either to length or breadth.

AMMON, the title under which Jupiter was worshiped in Libya, where a temple was erected to him, from which oracles were delivered for many ages.

AMMONIA, a volatile alkali, which, when in its purest state, exists only in the form of a gas. It forms a liquid when cooled, and is known in medicine by the name of *spirits of hartshorn*, the effect of which on the nervous system, in fainting-fits, is well known. **—NITRATE OF AMMONIA** is formed by diluting nitric acid with carbonate of ammonia; and from it is obtained the nitrous oxyde, or exhilarating gas.

AMMONIAC, or **GUM AMMONIAC**, is a resinous substance brought from the East Indies in drops or granules. The best kind is of a yellowish colour without, and white within. **—SAL AMMONIAC**, a volatile salt, of which vast quantities are thrown out by Mount Etna. The sal-ammoniac used in the shops is artificial, being

composed of a volatile alkaline and the acid of sea-salt, and is therefore called *Muriate of Ammonia*. When pure, this salt promotes perspiration.

AMMONITE, in natural history, the *cornua ammonis*, or snake-stones, which are found in considerable quantities in the alum works in Yorkshire, and other parts of England. They are made up of circles, like the rings of a snake rolled up.

AMMUNITION, all warlike stores, and especially powder, ball, bombs, guns, and other weapons necessary for an army.

AMNESTY, an act by which two parties at variance promise to pardon and bury in oblivion all that is past. It is more especially used for a pardon granted by a prince to his rebellious subjects.

AMOMUM, one of the aromatic herbs formerly used for the preservation of dead bodies; whence is derived the word *mummy*. In the Linnæan system, it is the name of a genus of plants of the monandria class.

AMORTIZATION, in law, an alienation of lands or tenements in mortmain.

AMPELITES, called also *Pharmacitis*, or *Canal Coal*, is a hard, opaque fossil, inflammable substance, of a black colour. It is dug in many parts of England, but the finest is in Lancashire and Cheshire. In the fire it flames violently at first, continues red and glowing hot a long time, and finally is reduced into a small portion of gray ashes. It is capable of a very high polish; and is manufactured into toys, snuff-boxes, &c., which are made to pass for jet.

AMPHIARTHIROSIS, in anatomy, a term for such junctures of bones as have motion similar to that of the articulation of the ribs with the vertebrae.

AMPHIBIA, a class of animals which live equally well in air or water, such as the phocæ or seal tribe, *frogs*, lizards, crocodiles, eels, water serpents, and snakes. They are remarkable for their tenacity of life. Cuvier and other zoologists of the present day have superseded this term by that of *Reptilia*.

AMPHIBIOLITHUS, a genus of petrifications in the Linnæan system, so called from its being the part of an amphibious animal petrified.

AMPHICTYONS, in Grecian antiquity, an assembly composed of deputies from the different states of Greece. The amphictyons at first met regularly at Delphi, twice a year, viz. in spring and autumn; but in later times they assembled at the village of Anthela, near Thermopylæ; and decided all differences between any of the Grecian states, their determinations being held sacred and inviolable.

AMPHIPPI, in Grecian antiquity, soldiers who, in war, used two horses without saddles, and were dextrous enough to leap from one to the other.

AMPHIBOLIA, or **AMPHIBIOLOGY**, in rhetoric, ambiguity of expression, when a sentence conveys a double meaning. It is distinguished from an equivocation, which lies in a single word.

THE AMETHYSTINE COLOUR, AMONG THE ANCIENTS, DISTINGUISHED CERTAIN GARMENTS FROM THE TRYAN AND HYACINTHINE PURPLE.

NATIVE MURIATE OF AMMONIA IS FOUND IN EGYPT. AND IS SAID TO BE GENERATED IN CANARY ISLANDS, FROM THE EXCREMENTS OF CAMELS.

[AMP]

The Scientific and Literary Treasury;

[ANA]

AMPHIDROMIA, an Athenian festival celebrated on the fifth day after the birth of a child, when it was carried round the fire, and presented to the household gods.

AMPHIMASCHALI, in antiquity, a name given to coats with two sleeves, worn only by freemen.

AMPHISBÆNA, a serpent which moves with either end forward, a power produced by an arrangement of 200 or 300 rings, through its length.

AMPHISCII, the name applied to the inhabitants of the torrid zone. Amphiscii, as the word imports, have their shadows one part of the year towards the north, and at the other towards the south, according to the sun's place in the ecliptic. When the sun is in its zenith they have no shadow, wherefore Pliny calls them *Aceti*.

AMPHITHEATRE, in antiquity, a spacious edifice, built either round or oval, with a number of rising seats, upon which the people used to sit and behold the combats of gladiators, of wild beasts, and other sports. Some of them, as the Coliseum at Rome, were capable of containing from 50,000 to 80,000 spectators. The principal parts of the amphitheatre were the *arena*, or place where the gladiators fought, *cavea*, or hollow place where the beasts were kept, *podium*, or projection at the top of the wall which surrounded the arena, and was assigned to the senators, *gradus*, or benches, rising all round above the podium, *aditus*, or entrances, and *vomitoria*, or gates which terminated the aditus.

AMPHITRITE, in zoology, the name of a small naked sea insect, of an oblong figure, with only one tentaculum, resembling a piece of thread.

AMPHORA, in antiquity, a liquid measure in use among the Greeks and Romans. The Roman amphora contained forty-eight sextaries, and was equal to about seven gallons one pint, English wine-measure, and the Grecian, or Attic amphora, contained one third more. Amphora was also a dry measure in use among the Romans, and contained three bushels.

AMPHORITIS, in antiquity, a sort of literary contest in the island of Ægina, where the poet who made the best dithyrambic verses in honour of Bacchus was rewarded with an ox.

AMPHOTIDES, in antiquity, a kind of armour or covering for the ears, worn by the ancient pugiles, to prevent their adversaries from laying hold of this part.

AMPLIFICATION, in rhetoric, part of a discourse or speech, wherein a crime is aggravated, a praise or commendation heightened, or a narration enlarged, by an enumeration of circumstances, so as to excite the proper emotions in the minds of the auditors.

AMPLITUDE, in astronomy, an arc of the horizon intercepted between the east or west point and the centre of the sun, or a planet, at its rising or setting.—**AMPLITUDE MAGNETICAL**, is an arc of the horizon contained between the centre of the

celestial body when rising or setting, and the east or west point of the compass. It is always equal to the difference between the true amplitude and the variation of the compass.

AMPULLA, an ancient drinking vessel; and among ecclesiastical writers it denotes one of the sacred vessels used at the altar. The ampulla is still a distinguished vessel in the coronation of the kings of England and France. The vessel now in use in England is of the purest chased gold, and represents an eagle with expanding wings standing on a pedestal, near seven inches in height, and weighing about ten ounces. It was deposited in the Tower by the gallant Edward, surnamed the Black Prince.

AMPIX, in antiquity, a kind of golden chain, which served to bind the hair of horses, and sometimes of men and women, on the forehead.

AMULET, a superstitious charm or preservative against mischief, witchcraft, or diseases. They were made of stone, metal, animals, and, in fact, of every thing which fancy or caprice suggested. Sometimes they consisted of words, characters, and sentences, ranged in a particular order, and engraved upon wood, &c., and worn about the neck, or some other part of the body. At other times they were neither written nor engraved; but prepared with many superstitious ceremonies, great regard being usually paid to the influence of the stars.

AMINETTE, a small one pound cannon, employed in war, in mountainous regions, and which for lightness and facility of movement, possesses great advantages.

AMYGDALOID, a compound mineral, composed of spheroidal particles or vesicles of lithomarge, green earth, calc spar, and stearite, imbedded in a basis of fine-grained green stone, or wacke.

AMYGDALOIDES LAPIS, in natural history, a stone which resembles the kernel of an almond. It is the petrified spirit of the sea urchin.

AMZEL, in ornithology, the English name of two species of mecalix, or black-birds.

ANA, a name given to amusing miscellanies, consisting of anecdotes, traits of character, and incidents relating to any person or subject.—**ANA**, among physicians, denotes an equal quantity of the ingredients which immediately precede it in prescriptions, as *xyup* and water, and *aa* or *a 3i* that is, of *xyup* and water each two ounces.

ANABAPTISTS, a name given to a Christian sect, because they objected to infant baptism, and baptized again those who joined them. They appeared in Germany in 1521, immediately after the rise of Lutheranism. At first they preached up an entire freedom from all subjection to the civil as well as ecclesiastical power; but the tenet from whence they take their name, and which they still maintain, is their re baptizing all new converts to their sect. The Baptists of England form a dis-

THERE ARE TWO SPECIES OF AMPHIBIENÆ, ONE WITH BLACK AND WHITE SPOTS, THE OTHER WHITE; BOTH ARE HARMLESS.

AMULETS, CHARMS, PALMISTRY, AND LUCKY OR UNLUCKY DAYS, ARE THE RELICS OF AGES OF IGNORANCE AND MENTAL SLAVERY.

A New Dictionary of the Belles Lettres.

[ANA

ANAGRAM (MILITARY), FOR "HIS GRACE THE DUKE OF WELLINGTON!" READ "WELL FOUGHT, E——! NO DISGRACE IN THERE." [E. C. KNIGHT.]

tinct sect, without any connexion with the ancient Anabaptists here spoken of.

ANABA'SIS, the title of Xenophon's description of the younger Cyrus's expedition against his brother, in which the writer bore a principal part.—ANABASIS, among physicians, denotes either the increase or augmentation of a fever in general, or of any particular paroxysm.

ANABRO'SIS, in medicine, a corrosion of the solid parts by acrid humours.

ANACALYPTERIA, in antiquity, festivals among the Greeks on the third day after marriage, when the bride was allowed to take off her veil, which she had till that time worn.

ANACARDIUM, or CASHW-NUT TREE, a native of the West Indies, where it grows to the height of 20 feet. The fruit is as large as an orange, and full of an acid juice, which is frequently used in making punch; and at the apex grows a kidney-shaped nut, the kernel of which is sweet and pleasant; but between it and the shell is a thick liquid, of such a caustic nature in the fresh nuts, that if the lips touch it they will be immediately blistered.

ANACATHARSIS, in medicine, a cleansing of the lungs by expectoration.—This term is likewise applied by divines to the clearing up of obscure passages of Scripture, by a spiritual interpretation.

ANACAMPTERIA, in ecclesiastical antiquity, edifices adjacent to churches, designed for the entertainment of strangers and the poor.

ANACAMPTICS, the term formerly used to denote that branch of the science of optics which is now called *catoptrics*.

ANACHRONISM, in literature, an error with respect to chronology, whereby an event is placed earlier than it really happened; in which sense it stands opposite to *parachronism*.

ANACLASTICS, that part of optics which considers the refraction of light.

ANACLETE'RIA, a solemn festival celebrated by the ancients, when their kings or princes came of age, and assumed the reins of government.

ANACLINO'PALE, among the ancient athletes, a kind of wrestling, performed on the ground; the combatants voluntarily throwing themselves down for that purpose.

ANACREONTIC VERSE, in ancient poetry, a kind of verse, so called from its being much used by the poet Anacreon. It consisted of three feet, generally spondee and iambics, sometimes anapaests, and was peculiarly distinguished for softness and tenderness.

ANACLINTERIA, in antiquity, a kind of pillows on the dining-bed, whereon the guests leaned.

ANACOLU'THON, in grammar or rhetoric, a want of coherency, generally arising from inattention on the part of the writer or orator.

ANACOLY'PPA, an Indian plant, the juice of which is a preservative against the bite of the cobra capilla.

ANADE'MA, in antiquity, an ornament

of the head, wherewith victors at the sacred games had their temples bound, and also worn by the Grecian women.

ANADIPLO'SIS, a figure in rhetoric and poetry, in which the last word or words of a sentence are repeated at the beginning of the next.

ANAGNOSTA, or ANAGNOSTES, in antiquity, a servant kept by families of distinction, whose office was to read to them at meals, or whenever they had leisure to listen to him.

ANAGRAM, the change of one word or phrase into another, by the transposition of its letters. They were very common among the ancients, and occasionally contained some happy allusion; but, perhaps, none were more appropriate than the anagram made by Dr. Burney on the name of the hero of the Nile, just after that important victory took place: HONATIO NELSON, "*Honor est a Nilo*." They are frequently employed satirically, or jestingly, with little aim beyond that of exercising the ingenuity of their authors. Thus, if the reader were to transpose the letters contained in the title of our youthful Queen, HER MOST GRACIOUS MAJESTY ALEXANDRINA VICTORIA! he would find that the following anagram might be formed of them: "*Ah! my extravagant joco-serious radical Minister*." Now it may be difficult to imagine any thing more ridiculous or inapplicable than such an exclamation, yet one half of the anagrams in existence are not a whit less absurd; and it is therefore surprising that pastime so puerile and trifling should have been treated seriously by the literati of any age. [A few more anagrammatical specimens are inserted between the marginal rules, but the only ones for which we claim the merit of originality are those on the Queen and the Duke of Wellington: in the latter the redundant letter *k* may well be allowed to stand for his numerous orders of knighthood, and his long career of successful valour entitles him to the appellation of a Knight *par excellence*.]

ANALEC'TA, a collection of extracts from different works.—With the ancients, *Analec'ta* signified a servant whose business it was to gather up what fell from the table at meals.

ANALEM'MA, in geometry, a projection of the sphere on the plane of the meridian, orthographically made by straight lines and ellipses, the eye being supposed at an infinite distance, and in the east or west points of the horizon.—ANALEMMA is also a kind of astrolabe.

ANALEPTICS, in medicine, restoratives which serve to repair the strength, and to raise the depressed spirits.

ANAL'OGY, a certain relation and agreement between two or more things, which in other respects are entirely different. Or it may be defined, an important process of reasoning, by which we infer similar effects and phenomena from similar causes and events. A great part of our philosophy has no other foundation than analogy.

ANALY'SIS, in chemistry, is the sepa-

ANAGRAMS (OLD POLITICAL ONES), FOR "PATRIOTISM," READ "O 'TIS A WE. PITY;" AND FOR "OPPOSITION," READ "O POISON PITY." [EACH WANTS A T.]

ration of any substance into its constituent parts, to ascertain their nature, relative proportions, and their mode of union.—

ANALYSIS, among mathematicians, is the art of discovering the truth or falsehood of a proposition, or its possibility and impossibility. This is done by supposing the proposition, such as it is, true; and examining what follows from thence, until we arrive at some evident truth, or some impossibility, of which the first proposition is a necessary consequence; and from thence establish the truth or impossibility of that proposition.—**ANALYSIS**, among grammarians, is the explaining the etymology, construction, and other properties of words.

—The analysis of finite quantities is properly called specious arithmetic, or algebra; the analysis of infinite quantities is the method of fluxions or differential calculus.

—**ANALYSIS** is also used for a brief, but methodical, illustration of the principles of a science; in which sense it is nearly synonymous with what is termed a synopsis.

ANAMNESIS, in rhetoric, an enumeration of the things treated of before; which is a sort of recapitulation.

ANAMORPHOSIS, in perspective and painting, the representation of some image, either on a plane or curved surface, deformed, or distorted; which in a certain point of view appears regular and in just proportion.

ANA'NAS, in botany, a species of *bromelia*, commonly called pine-apple, from the similarity of its shape to the cones of firs and pines.

ANAPHORA, a rhetorical figure, which consists in the repetition of the same word or phrase at the beginning of several successive sentences.—**ANAPHORA**, in astronomy, an ascension or rising of the twelve signs of the zodiac from the east to the west, by the daily course of the heavens.

ANAPLEROTICS, in pharmacy, such medicines as promote the growth of flesh in wounds and ulcers.

ANARCHI, in antiquity, an epithet applied by the Athenians to the four supernumerary days in their year, in which they had no magistrates.

ANARCHY, a society without a government, or where there is no supreme governor.

A'NAS, in ornithology, a species of birds belonging to the order of *anseræ*, of which there are about 100 species.

ANASTALTICS, in pharmacy, astringent or styptic medicines.

ANASTATICA, in botany, the rose of Jericho.

ANASTROPHE, in rhetoric, the inversion of words in a sentence, or the placing them out of their natural order.

ANATH'EMA, among ecclesiastical writers, imports whatever is set apart, separated, or divided; but the word is most usually intended to express the cutting off a person from the privileges of society, and from communion with the faithful. The anathema differs from simple excommunication, inasmuch as the former is attended

with curses and execrations. **Anathemas** are judiciary and abjuration: the former can only be denounced by a council, a pope, or a bishop; the latter makes a part of the ceremony of abjuration, the convert being obliged to anathematize the heresy he abjures.

ANATOMY, the act of dissecting bodies for the purpose of examining their structure, and the nature, uses, and functions of their several parts; also the knowledge of the human body derived from such dissections and examinations. Anatomy is divided into *human* and *comparative*. Human anatomy is that which is employed on the human body; comparative anatomy, that which is employed upon the bodies of other animals, these serving for the more accurate distinctions of several parts, and supplying the defects of human subjects. As a philosophic inquiry, it may be observed, that it is impossible not to be interested in the conformation of our own bodies: as a religious one, it will not fail to impress us with the most becoming ideas of our Creator.

ANCESTORS, those from whom a person is descended in a direct line, the father and mother not included. The law makes a difference between ancestors and predecessors, the first being applied to a natural person, as a man and his ancestors, and the latter to a body politic, as a bishop and his predecessors. We say likewise, a prince and his predecessors, to signify the kings that have reigned before; but we never say a king and his ancestors, unless he is by birth descended of his predecessors.

ANCESTRY, the line of ancestors or forefathers from which any person is descended.

ANCHOR, a heavy, strong, crooked instrument of iron, cast or dropped from a ship into the water to retain her in a convenient station in a harbour, road, or river. Anchors were originally mere weights; at present they are intended to fasten in the ground as hooks. They are contrived so as to sink into the earth as soon as they reach it, and to hold a great strain before they can be loosened or dislodged. Every ship has, or ought to have, three principal anchors, with a cable to each, viz. the *sheet*, the *best bower*, and the *small bower*, so called from their usual situation on the ship's bows. There are besides small anchors for moving a ship from place to place in a harbour or river, where there may not be room or wind for sailing; these are the *stream-anchor*, the *kedg*, and the *grapple*. The last, however, is chiefly designed for boats.

ANCHORAGE, the ground that is fit for holding the anchor; also the duty taken of ships for the use of the haven where they cast anchor.

ANCHORET, **ANCHORITE**, or **ANCHORET**, in a general sense, means a hermit, or one who voluntarily lives apart from the world. In all ages and in all countries, retirement from the world has been considered as facilitating the attainment of

[AND]

THE PYTHAGOREANS, STOICS, CYNICS, AND PLATONISTS, RECOMMEND THE SELF-DEIAL AND QUIET OF THE SOLITARY SAGE.

a virtuous life. In Egypt and Syria, where Christianity became blended with the Grecian philosophy, and strongly tinged with the peculiar notions of the East, the anchorites were most numerous; and from those who lived in cells, in the vicinity of a church, the convents of a later period sprung, which were filled with inmates anxious to escape from the tumult and bloodshed which marked the beginning of the middle ages.

ANCHOVY, a small sea-fish much used in sauce; it is so like the common sprat, that the latter is often pickled and sold under its name.

ANCHYLOSIS, in medicine, a stiffness or immobility of the joints, arising from various causes, and often connected with deformities of the limbs. For the most part it is the result of inflammation in the membrane lining the joints.

ANCONY, in the iron works, a piece of half-wrought iron, of about three quarters of a hundred weight, of the shape of a bar at the middle, but rude and unwrought at the ends. It is afterwards sent to a forge called a chafery, where the ends are wrought into the shape of the middle, and the whole is made into a bar.

ANCUTEL, in surgery, the fibula or button by which the lips of wounds are held together.

ANCUBITUS, in medicine, that affection of the eyes in which they seem to contain sand.

ANCYLE, or **ANCYLE**, in antiquity, a small brazen shield which fell, as was pretended, from heaven in the reign of Numa Pompilius, when a voice was heard, declaring that Rome should be mistress of the world as long as she should preserve this holy buckler.

ANCYLOBLEPHARON, in medicine, a disease of the eye which closes the eyelids.

ANCYLOGLOSSUM, in medicine, a contraction of the ligaments of the tongue, so as to hinder the speech.

ANDABATE, in antiquity, gladiators, who, mounted on horseback, or in chariots, fought blindfold, the helmet covering their eyes.

ANDANTE, in music, the Italian term for exact and just time in playing, so as to keep the notes distinct from each other.

—**ANDANTE LARGO**, signifies that the music must be slow, the time exactly observed, and each note distinct.

ANDANTINO, in music, an Italian word for gentle, tender; somewhat slower than *andante*.

ANDRAPODISTES, in antiquity, dealers in slaves, being in general kidnappers that stole children for the purpose of selling them.

ANDROIDES, in mechanics, a term used to denote an automaton in the figure of a man, which, by means of certain springs and other mechanical contrivances, is enabled to walk, and perform other actions of a man. The construction of an androideus is justly supposed to indicate great skill in mechanics, and, with that of various

other automata, has frequently engaged the attention of ingenious minds.

ANDROGYNOUS, in botany, an epithet for plants bearing male and female flowers on the same root, without any mixture of hermaphrodites.

ANDROMEDA, in astronomy, a small northern constellation consisting of numerous stars. It is represented by the figure of a woman chained, and is situated behind Pegasus, Cassiopeia, and Perseus. —**ANDROMEDA**, in botany, is the marsh cystus. In entomology, a species of *papilio*, found in Italy.

ANEMOMETEL, an instrument used for measuring the force and velocity of the wind. Various instruments have been invented for this purpose; the first of which is attributed to Wolfius, who described it in 1709; but considerable improvements have been since made upon its construction. In the experiments made by Dr. Lind with his anemometer, he found, in one instance, that the force of the wind was such as to be equal to upwards of 34 lbs. on a square foot, answering to a velocity of 93 miles per hour!

ANEMONE, a beautiful flower, originally brought from the East, but now much cultivated in our gardens. The word signifies properly wind-flower, because it was supposed that it opened only when the wind blew.

ANEMOSCOPE, a machine showing from what point of the compass the wind blows. This is done by means of an index moving about an upright circular plate, the index being turned by an horizontal axis, and the axis by an upright staff, at the top of which is the fan moved about by the wind. Some are so made as, even in the absence of the observer, to note down the changes of the wind! But any contrivance, however simple, which indicates the direction of the wind, is properly an anemoscope.

ANEURISM, in surgery, a diseased swelling of an artery, attended with a continued pulsation. Though aneurisms most frequently happen in the brachial artery, yet the disorder is not restrained to that part alone; for they may arise from an infinite number of cases, both external and internal, in all parts, where there are any arterial trunks or considerable branches distributed.

ANGARI, or **ANGARII**, in antiquity, public couriers appointed for the carrying of messages, and stationed at certain distances from each other on the public roads.

ANGARIA, in Roman antiquity, was a kind of public service imposed on the provincials, which consisted in providing horses and carriages for the conveyance of military stores, &c.

ANGEL, the name given to those spiritual, intelligent beings, who are supposed to execute the will of God, in the government of the world. It is sometimes used in a figurative, and at others in a literal sense. The number of angels is no where

ONE OF THE MOST CELEBRATED ANDROIDES REPRESENTED A FAUTE-PLAYER, WHICH EXHIBITED AT PARIS A CENTURY AGO.

[ANG]

The Scientific and Literary Treasury ;

[ANI]

mentioned in scripture; but it is always represented as immensely great, and also that there is a subordination among them. Hence ecclesiastical writers make an hierarchy of nine orders of angels. But besides these, we read of evil angels, the ministers of God's wrath; as the destroying angel, the angel of death, the angel of Satan, the angel of the bottomless pit, and the fallen angels, or those who kept not their first estate, but fell from their obedience into sin, and were expelled the regions of light. In general, good and bad angels are distinguished by the opposite terms of angels of light, and angels of darkness.—**ANGEL**, the name of an ancient gold coin in England, so called from the figure of an angel upon it. It weighed four pennyweights.

ANGELICA, in botany, a genus of the digynia order, and pentandria class of plants. All the parts of angelica, especially the root, have a fragrant aromatic smell, and a pleasant bitterish taste. It is highly valuable in medicine.—**ANGELICA**, in Grecian antiquity, a celebrated dance performed at their feasts, so called, because the dancers were dressed in the habit of messengers.

ANGINA, the quinsy; an inflammatory disease of the throat.—**ANGINA GANGRENOZA**, or **ANGINA**, the ulcerated, malignant, putrid sore throat.

ANGIOSPERMIA, a term for such plants of the class dymnasia as have their seeds enclosed in a capsule or seed vessel.

ANGLE, in geometry, the opening, or mutual inclination, of two lines, or of two or more planes, meeting in a point called the vertex, or angular point. Angles are of great use in almost every branch of mathematics. They make one half the subject of trigonometry, and have much to do in geography, astronomy, &c. When they meet perpendicularly, it is called a *right angle*, and is 90 degrees; when less than a right angle, it is called an *acute angle*; and when larger than a right angle, an *obtuse angle*; when two circles cross each other, it is called a *spherical angle*; or two curves, a *curvilinear angle*; and the angles made by solids, are called *solid angles*.—**ANGLES** IN MECHANICS. 1. *Angle of direction*, is that comprehended between the lines of direction of two conspiring forces. 2. *Angle of elevation*, is that which is comprehended between the line of direction, and any plane upon which the projection is made, whether horizontal or oblique.—**ANGLE OF INCIDENCE**, in optics, the angle which a ray of light makes with a perpendicular to that point of the surface of any medium on which it falls.—**ANGLE OF LONGITUDE**, in astronomy, the angle which a circle of a star's longitude makes with the meridian at the pole of the ecliptic.—**ANGLE OF PARALLAX**, the angle made by two lines supposed to be drawn from the centre of a planet to the surface of the earth.—**ANGLES**, in FORTIFICATION, are understood of those formed by the several lines used in fortifying, or making a place defensible.

ANGLER, in ichthyology, the *Lophius Piscatorius* of Linnaeus; a singular fish, which is also known by the name of the fishing-frog, from the resemblance it bears to that animal in the tadpole state. Its head is much bigger than its whole body, and its mouth is prodigiously wide.

ANGLICISM, an idiom of speech, or manner peculiar to the English.

ANGLING, the art of ensnaring fish with a hook, which has been previously baited with a small fish, a worm, or a fly, &c. The best season for angling is from April to October: the cooler the weather, in the hottest months, the better; but in winter, on the contrary, the warmest day is the most promising. A cloudy day, after a moonlight night, is always favourable; as the fish avoid feeding by moonlight, and are therefore hungry. Warm, lowering days are always covered by anglers.

ANGLO-SAX'ON, the name of the people called Angles, who with the Saxons and some other German tribes, flourished in England after it was abandoned by the Romans, about the year 400; and who introduced their language, government, and customs.—**ANGLO-SAXON LANGUAGE**. After the conquest of England by the Angles and Saxons, the Saxon became the prevalent tongue of that country; and after the Norman conquest, the English language exhibits the peculiar case, where languages of two different stocks are blended into one idiom, which by the cultivation of a free and active nation and highly-gifted minds, has grown to a powerful, organized whole.

ANGUINE'AL, denotes something belonging to or resembling a snake, *anguis*. Hence we say, *anguineal curve*, *hyperbola*, *verse*, &c.

ANGUIS, or **SNAKE**, in zoology, a genus belonging to the class *amphibia*, order *serpentes*.

ANGUSTURA CORTEX, a bark, which comes from the Spanish man, and is a powerful bitter.

AN'HIMA, in ornithology, a Brazilian bird, resembling in some degree a crane; from which, however, as well as from all other birds, it is distinguished by a slender horn, inserted a little above the origin of its beak; its wings too have each a horn of this kind, growing out of the fore-part of the bone.

ANHINGA, in ornithology, an extremely beautiful water-fowl of the Brazils, about the size of a common duck. It feeds on fish, and is a species of the plover.

AN'IMA, among divines and naturalists, denotes the soul, or principle of life in animals.—**ANIMA MUNDI**, a phrase formerly used to denote a certain pure ethereal substance or spirit which is diffused through the mass of the world, organizing and actuating the whole and the different parts.—**ANIMA**, among chemists, denotes the volatile or spirituous part of bodies.—**ANIMA** is also used for the principle of vegetation in plants.

ANIMAL, a living body endued with sensation and spontaneous motion. In its

THE ANGLO-SAXON LANGUAGE, AND EVEN ENGLISH AS NOW SPOKE, BEAR A STRIKING RESEMBLANCE TO THE LOW GERMAN.

"ANIMAL ECONOMY," IS UNDERSTOOD THE SYSTEM OF LAWS BY WHICH THE BODIES OF ANIMALS ARE GOVERNED.

[ANI]

A New Dictionary of the Belles Lettres.

[ANI]

THE LARGER KINDS OF POLYI ARE CALLED ANIMAL-FLOWERS, AND WHEN SEEN ON ROCKS THEY OFTEN RESEMBLE A FLOWER GARDEN.

limited sense, any irrational creature, as distinguished from man.—ANIMAL, according to the definition of Linnæus, is an organized, living, and sentient being. If, however, the term be disputed, it is very difficult to define what classes of created things are strictly animal: in a general sense, it is applied to every thing that is supposed to be alive to the sensations of pain and pleasure. Under the name of animal, therefore, are included men, quadrupeds, birds, fishes, reptiles, and insects. Linnæus has formed a climax of the grand departments of creation: thus, says he, stones *grow*; vegetables *grow and live*; animals *grow, live, and feel*. Still, the animal and vegetable kingdoms are blended in so many ways, and separated from each other by such imperceptible gradations, that it is impossible to draw a line, at which we can affirm that animal life ends and vegetable begins. We can, however, point out certain general characteristics, which clearly distinguish this from the other kingdoms of nature: for instance, they are composed of bones for strength, of muscles for motion, of nerves for sensation, and of fluids for distributing heat and food, within the package of a skin, which evacuates superfluities. The Linnæan system comprehends six classes of animals; namely, *Mammalia*, or such as suckle their young, mostly quadrupeds; *Aves*, birds, which are oviparous; *Amphibia*, amphibious animals; *Pisces*, fishes, such as live only in the water, and are covered with scales; *Insecta*, insects, which have few or no organs of sense, and a bony coat of mail; and *Vermes*, worms, which have mostly no feet. In this systematic classification man was included; but Cuvier has assigned him a distinct order, which he terms *Bimana*, thus separating him from monkeys, with whom he had been derogatively classed.

ANIMAL FUNCTIONS, are those by which the materials that constitute and support the bodies of animals, are prepared and supplied. The principal of these functions are the following: circulation, digestion, nutrition or assimilation, respiration, and secretion, which are employed in producing animal matter from the substances that compose it. But, besides these, there are others, which though they do not act chemically, like the foregoing, are in many animals subservient to various important purposes.

ANIMAL HEAT, is that property of all animals by which they preserve a certain temperature, which is quite independent of that of the medium by which they are surrounded, and is essentially necessary to life. That of a man in health is from about 94° to 100° Fahrenheit. It appears to depend upon the absorption of oxygen in the lungs, and is most intimately connected with the state of the nervous system; for the heat of the human body remains the same when exposed to the most extreme degrees of temperature.

ANIMAL/CULA, or ANIMAL/CULE (a little animal), is a term which may be ap-

plied to any living creatures, whose existence cannot be discovered without the aid of glasses. Naturalists suppose, and with great reason, that there is a farther order of animalcules which escape the cognizance of even the best microscopes. The naked eye takes in a series from the elephant to the mite: at this point commences a new class of animals, which comprehends all those from the mite to such as are said to be many millions of times smaller than the mite! As to the origin and propagation of animalcules, we find naturalists extremely at a loss, and therefore advancing conjectures and hypotheses, each more chimerical than the other. The system of putrefaction solves the difficulty quickly; but the supposition is unphilosophical, and contrary to observation and analogy. Yet how such vast numbers of animals can be, as it were, at pleasure produced, without having recourse to something like equivocal generation, is very difficult to say! To produce a million of living creatures in a few hours, by only exposing a little water in a window, or by adding to it a few grains of some seed, or leaves of a plant, seems difficult to believe. We therefore must suppose them to have been pre-existent. With regard to their structure and economy, animalcules are found of various sorts; some formed like fishes, others reptile, others hexapedal; some horned, &c. In several kinds, however small, it is easy to discover the form of their mouths, their proboscides, horns, &c. the motions of their hearts, lungs, and other parts. Lewenhoeck computed that three or four hundred of the smallest animalcules which he had at the time under his observation, if placed contiguous to each other in a line, would only equal the diameter of an ordinary grain of sand!

ANIMAL/CULA INFUSORIA, or ANIMALCULES OF INFUSION, take their name from being found in all kinds, either of vegetable or animal infusions. Indeed, there is scarcely any kind of water, unless impregnated with some mineral substance, but what contains living creatures; and so exquisitely minute are they, that the most powerful microscopes can only discover points in motion in the fluid, gradually decreasing till they become imperceptible to the view!—ANIMALCULES are said to be the cause of various disorders. The itch, from several experiments, is affirmed to be a disorder arising from the irritations of a species of animalcula found in the pustules of that disease, whence the communication of it by contact from one to another is easily conceived, as also the reason of the cure being effected by cutaneous applications.

AN/IMATED, or AN/IMATE, in a general sense, denotes something endowed with animal life. It also imports a thing to be impregnated with vermin, or animalcules; in which sense, all terrestrial bodies whatever may be said to be animated.—AN/IMATE POWER, in mechanics, signifies a power in animal beings, in distinction from that which exists in inanimate bodies, as

SPONGES ARE CITIES OF ANIMALCULES, THEIR PARASITES BEING LIKE STREETS AND LANES, AND THE ANIMALS LIVING IN THE HOLES.

[ANN]

The Scientific and Literary Treasury ;

[ANN]

THE WORD ANNALES COMES FROM THE FIRST ANNUAL RECORDS OF THE ROMANS, THE "ANNALES FORTIFICUM," OR "ANNALES MAXIMI."

springs, &c.—**ANIMATED MERCURY**, a chemical term for quicksilver impregnated with some subtle and spirituous particles, so as to render it capable of growing hot when mixed with gold.

ANIMATION, in physiology, signifies life itself: to the complete existence of which, the healthful condition of all the organs of the body, and the due concurrence of all the elements, are necessary.

—**SUSPENDED ANIMATION**. Life may suffer considerable diminution of its powers, and even a total suspension, without being absolutely destroyed. The action of the lungs, and consequently all the functions of the body, depend upon the free use of air. The want of this great principle of life causes faintings in crowded assemblies; and it is from the same privation of air, that drowning and suffocation produce death.

ANIME, or **GUM ANIME**, a resinous substance imported from New Spain and the Brazils, which is obtained by incision from a tree. It is said to be an inferior kind of myrrh, and is good for pains in the head.—**ANIME**, in heraldry, a term used when the eyes of any rapacious creature are borne of a different tincture from the creature itself.

ANIMUS, in metaphysics, the mind or reasoning faculty, in distinction from *anima*, the being or faculty in which the faculty exists.

ANINGA IRIS, an Indian bulbous aquatic plant, five or six feet high, with leaves similar to the water-lily. From its root is expressed an oil of great medicinal use for fomentation.

ANISE-SEED, in the materia medica, a small seed, of an oblong shape, ending each way in an obtuse point, with a surface very deeply striated, and of a lax and brittle substance. It is the production of an umbelliferous plant (*pimpinella anisum*) which grows wild in Egypt, Syria, and other countries of the East. Anise-seeds are imported from Spain and Italy, where they are cultivated to a considerable extent.

ANLACE, a falchion or sword, shaped like a scythe.

ANNALS, a species of history, in which events are related in the exact order of chronology. They differ from perfect history in this, that annals are a bare relation of what passes every year, as a journal is of what passes every day; whereas history relates not only the transactions themselves, but also the causes, motives, and springs of actions.

ANNATES, in ecclesiastical law, first-fruits paid out of spiritual benefices to the pope, being the value of one year's profit.

ANNEA LING, the process of heating steel and other metal bodies, and then suffering them to cool again gradually. The greater number of metals diminish in bulk when they pass from a fluid to a solid state: iron, on the contrary, expands.

ANNO DOMINI, abbreviated A.D., the year of our Lord; the computation of time from our Saviour's incarnation. It is used

as the date for all public deeds and writings in England, on which account it is called the "Vulgar Era."

ANNO'NA, in Roman antiquity, signified properly, a year's produce from land; but it is also taken for the yearly quantum of food necessary for the sustenance of man.—**ANNO'NA** is likewise the allowance of oil, salt, bread, flesh, corn, wine, hay, and straw, which was annually provided by contractors for the maintenance of an army.—**ANNO'NA**, in botany, the custard-apple, of which there are eight species.

ANNO'NE PREFECTUS, in antiquity, an extraordinary magistrate, whose business it was to prevent a scarcity of provision, and to regulate the weight and fineness of bread.

ANNONA'RII, in antiquity, foretellers of the market, who bought up all the provisions beforehand, in order to raise the prices.

ANNOTATION, a brief commentary, or remark upon a book or writing, in order to clear up some passage, or draw some conclusion from it.—**ANNOTATION**, in medicine, is the beginning of a febrile paroxysm, when the patient grows chilly, yawns, shudders, or the like.

ANNOTTO, or **ARNOTTA**, in dyeing, an elegant red colour, formed from the pellicles or pulp of the seeds of the *bixa*, a tree common in South America. It is also called *Terra Orleana*, and *roucou*. To rectified spirit of wine it very readily communicates a high orange or yellowish red, and hence is used as an ingredient in varnishes for giving an orange cast to the simple yellows. Alkaline salts render it perfectly soluble in boiling water, without altering its colour. Wool or silk boiled in the solution acquires a deep, but not a very durable, orange dye. It is used for colouring cheese.

ANNUAL, an epithet for whatever happens every year, or lasts a year: thus we say, the annual motion of the earth, annual plants, annual publications, &c.

ANNUITY, the periodical payment of money, either yearly, half-yearly, or quarterly; for a determinate period, as ten, fifty, or a hundred years; or for an indeterminate period, dependant on a certain contingency, as the death of a person; or for an indefinite term, in which latter case they are called perpetual annuities. As the probability of the duration of life at every age is known, so annuities may be purchased for fixed sums during the life of the party. An annuity is said to be in *arrear* when it continues unpaid after it is due, and in *reversion*, when it is to fall to the expectant at some future time.

AN'NULAR, anything in the form of, or resembling, a ring. Hence, **ANNULAR**, in anatomy, is an appellation given to several parts of the body: thus, the *annular cartilage* is the second cartilage of the larynx; the *annular ligament* is a strong ligament encompassing the wrist, after the manner of a bracelet; and *annular process* is that which surrounds the medulla oblongata.

AN'NULATE, in botany, an epithet for

OUR SPLENDID "ANNALS" ARE THOUGHT TO EXCEED THE NATIONAL TASTE FOR WORKS OF ART; BUT Critics CALL THEM SAFETY-VALVES FOR POETS.

[ANT]

The Scientific and Literary Treasury ;

[ANT]

ANTEDATE, a spurious, or false date, prior to the true date of a bond, bill, &c.

ANTEDILUVIAN, whatever existed before the deluge; thus, the inhabitants of the earth from Adam to Noah are called the antediluvians.

ANTELOPE, an animal partaking of the nature both of the deer and the goat, common in Africa, and other hot climates. They are remarkable for swiftness and elegance, and live in herds in hilly districts.

ANTEM BASIS, in anatomy, a mutual insertion of the bones.

ANTEMERIDIAN, in astronomy, abbreviated A.M., the time before noon.

ANTEMURALE, in antiquity, the name for what is now called the counterscarp, or outwork, in fortification.

ANTENNAE, in entomology, slender bodies with which nature has furnished the heads of insects; being the same with what are called horns or feelers.

ANTEPENULTIMA, **ANTEPENULTIMATE**, or, **ANTEPENULT**, in grammar, the third syllable of a word from the end, or the last syllable but two.

ANTECLEMA, in oratory, is where the whole defence of the person accused, turns on criminating the accuser.

ANTHELIX, in anatomy, the inward protuberance of the external ear, being a semicircle within, and almost parallel to the helix.

ANTHELMINTICS, medicines proper to destroy worms.

ANTEPOSITION, a grammatical figure, whereby a word, which by the ordinary rules of syntax ought to follow another, comes before it.

ANTHER, that part of the stamen of a flower which is at the top of the filament, opening and discharging the pollen, or farina, when ripe.

ANTHESIS, in botany, efflorescence, or that state of vegetation in which the flower is completely developed.

ANTIESPHORIA, in antiquity, a Sicilian festival, instituted in honour of Proserpine.

ANTHESTERIA, in Grecian antiquity, festivals celebrated in the Spring by the Athenians, in honour of Bacchus, during which the masters feasted their slaves, as the Romans did in the time of the Saturnalia.

ANTHOLOGY, a collection of choice poems, particularly a collection of Greek epigrams so called. The word in its original sense simply means a collection of flowers.

ANTHRACITE, in mineralogy, a valuable kind of coal, consisting wholly of carbon, mixed with a slight and variable proportion of oxide of iron, silica, and alumina. It is inflammable with some difficulty, and burns without smell or smoke, leaving a more or less earthy residue. It is scarce in Europe, and consequently but little used; but in the United States of America, where it abounds, it has lately acquired a high degree of importance.

ANTHACO'SIS OC'ULI, in medicine, a scaly corrosive ulcer in the eye.

ANTHROPOPHAGI, or cannibals, persons who eat the flesh of men as well as animals. Abhorrent and unnatural as the practice is, there is no doubt that whole nations have been addicted to this practice, and that it still prevails in the South Seas.

ANTHROPHOLITUS, or **ANTHROPHOLITES**, petrefactions of human bodies, or parts of the body. Those of animals are called *oolites*.

ANTHROPOLOGY, the science which treats of human nature, either in a physical or an intellectual point of view.

ANTHROPOMORPHITE, one who ascribes a human figure and a bodily form to God.

ANTI, a Greek particle, which enters into the composition of several words, both Latin, French, and English, and signifies opposite or contrary to, as in *anticorbutives*.

ANTICARDIUM, in anatomy, that hollow part under the breast, just against the heart, called the pit of the stomach.

ANTI-CLIMAX, in literary composition and oratory, when a writer or speaker suddenly descends from the great to the little.

ANTIDIASTOLE, in medicine, a discrimination of one disease or symptom from another.

ANTIDOTE, a counter-poison, or any medicine generally that counteracts the effects of what has been swallowed.

ANTILOGY, an inconsistency between two or more passages of the same book.

ANTIMETABOLE, in rhetoric, a setting of two things in opposition to each other.

ANTIMETATHESIS, in rhetoric, an inversion of the parts or members of an antithesis.

ANTIMONY, a metallic substance of a greyish white colour, considerable brilliancy, and strongly resembling tin, or silver. Its texture is laminated, and the lamina appear arranged one over another, and crossing in every direction. Its surface often exhibits a kind of crystal, in the form of stars, or six-leaves. It is very brittle, and easily pulverized; melts, when heated just to redness. In its pure state it is called the regulus of antimony. Crude antimony, in commerce, is a metallic ore, consisting of the metal called antimony combined with sulphur.

ANTINOMIANS, a sect who reject the moral law as a rule of conduct to believers; and who, regarding virtuous conduct as insufficient to deserve or obtain salvation, teach that no attention to its precepts is necessary.

ANTI-PATHY, in physiology, a natural aversion of one body to another, in contradistinction to sympathy. In a more restricted sense, it is an involuntary aversion which an animated and sensitive being feels towards some object presented to it either in reality or imagination, although the person who feels this abhorrence is entirely ignorant of its cause, and can by no means account for it.

ANTIPODES, the name given to those inhabitants of the earth who are diametri-

THE ANTELOPE, FROM THE EXQUISITE BEAUTY AND VIVACITY OF ITS EYES, IS A FAVOURITE IMAGE IN ORIENTAL POETRY.

SOME ASSERT THAT ANTHROPHILITES HAVE BEEN FOUND IN OLD MINES, BUT THE EXISTENCE OF SUCH PETREFACTS IS NOT CREDITED.

[ANT]

A New Dictionary of the Belles Lettres.

[APE]

cally opposite to each other, as it were feet to feet. They have equal latitudes, the one north, and the other south; but opposite longitudes; consequently when it is day to the one, it is night to the other, and when summer to the one, winter to the other.

ANTIPHONA, or ANTIPHONY, in music, the answer made by one choir to another, when the psalm or anthem is sung verse for verse alternately.

ANTIPIRASIS, in rhetoric, a figure of speech, or kind of irony, whereby we say a thing by denying what we ought rather to affirm it to be; as when we say, "he is no fool," we mean "he is a man of sense."

ANTIQUARY, a person who studies and searches after monuments and remains of antiquity. There were formerly in the chief cities of Greece and Italy, persons of high distinction called antiquaries, who made it their business to explain the ancient inscriptions, and give every other assistance in their power to strangers who were lovers of that kind of learning.—The monks who were employed in making new copies of old books were formerly called *antiquarii*.

ANTIQUITIES, all such documents of ancient history as industrious and learned men have collected; genealogies, inscriptions, monuments, coins, names, etymologies, archives, mechanical instruments, fragments of history, &c. Antiquities form a very extensive science, including an historical knowledge of the ancient edifices, magistracies, habiliments, manners, customs, ceremonies, religious worship, and other objects worthy of curiosity, of all the principal nations of the earth. In England, we have British, Roman, Saxon, and Norman antiquities, many of which are highly interesting, and serve to throw a light on the manners and customs of the people.

ANTISABBATARIANS, a modern religious sect, who deny the necessity of observing the Sabbath, chiefly because it was a Jewish institution.

ANTIS'CII, or ANTIS'CIIANS, in geography, the people who live on different sides of the equator, and have their shadows at noon fall directly opposite ways.—*Antiscii* is also used among astrologers, for two points of the heavens equally distant from the tropics.

*ANTISEPTICS, in chemistry, remedies against putrefaction. Of all the antiseptics which have been discovered, none has been found so effectual as chloride of lime in arresting the progress of putrefaction, for when placed in contact with the affected parts, it destroys the offensive odour which they exhale, and prevents the extension of the corruption.

ANTISPASMODICS, medicines proper for the cure of spasms and convulsions. Opium, balsam of Peru, and the essential oils of many vegetables, are the most useful.

ANTISTROPHE, the alternate verse in ancient poetry, which was divided into the *strophe* and *antistrophe*. In reciting their odes the chorus turned from the left to the right at the antistrophe, and *vice versa*.

ANTISYPHILITIC, a term applied to

remedies used in cases of syphilis, the most efficacious of which are said to be preparations of mercury.

ANTITHESIS, in rhetoric, a figure of speech, by which two things are attempted to be made more striking, by being set in opposition to each other. "Antithesea, well managed," says Bobours, "give infinite pleasure in the perusal of works of genius; they have nearly the same effect in language as lights and shadows in painting, which a good artist distributes with propriety: or the flats and sharps in music, which are mingled by a skilful master." The beautiful antithesis of Cicero, in his second Catilinarian, may serve as an example: "On the one side stands modesty, on the other impudence; on the one fidelity, on the other deceit; here piety, there sacrilege; here continency, there lust," &c.

ANTITRINITARIANS, all those who deny the doctrine of the Trinity.

ANTITYPE, among ecclesiastical writers, denotes a type corresponding to some other type or figure. In the Greek church it is also an appellation given to the symbols of bread and wine in the sacrament.

ANTE'CI, in geography, those inhabitants of the earth who live under the same meridian, but on different sides of the equator, and at equal distances from it.

ANTONOMA'SIA, a mode of speaking in which a person is addressed or described by some appropriate or official designation, but not by his surname; as, in the House of Lords, "the noble lord;" in the House of Commons, "the honourable gentleman."

ANUS, in anatomy, the extremity of the *intestinum rectum*, or orifice of the fundamen. Also a small cavity in the third ventricle of the brain.—*Anus*, in botany, signifies the posterior opening of a monopetalous flower.

AORISTIA, in the sceptic philosophy, denotes that state of the mind wherein we neither assert nor deny anything positively, but only speak of things as seeming or appearing to us in such a manner.

AOERTA, or MAGNA ARTERIA, the great artery proceeding from the left ventricle of the heart, from which all the other arteries proceed mediately or immediately. It is distinguished into the descending or ascending, according to the manner in which it runs.

APATHY, a term expressive of an utter privation of passion, and an insensibility of pain. Thus, the stoics affected an entire apathy, so as not to be ruffled, or sensible of pleasure or pain.

APAULIA, in antiquity, the second day of the marriage festival, when the bride's departure from her father's house was celebrated. On this day the bridegroom presented the bride with a garment called *Apauleria*.

APAU'ME, in heraldry, a hand opened, and the full palm appearing, with the thumb and fingers extended, as may be seen in the arms of a baronet.

AP'E, a name for different species of the monkey tribe, which are without tails or

FETIDICHOUS ACID, OR CONDENSED STEAM OF GREEN WOOD BARK, IS THE MOST POWERFUL ANTISEPTIC IN THE VEGETABLE KINGDOM.

THOSE WHO LIVE NORTH OF THE EQUATOR ARE ANTISCIIANS TO THOSE WHO LIVE SOUTH, AND VICE VERSA.

[APH]

The Scientific and Literary Treasury ;

[APH]

cheek pouches. Like all the four-handed animals, the apes are destined to live among the branches of trees, and are especially adapted, from their size and strength, to occupy large forests. All of them have the power of assuming a nearly erect position. They generally live in troops, and some of the species are said to construct a sort of hut of leaves, as a defence against the weather. They defend themselves with clubs, and employ these weapons with considerable effect, even against man. Some of them, called *gibbons*, have arms of prodigious length. On the loftiest branches of the gigantic eastern forest trees, troops of these animals are seen sitting in perfect security, or springing from tree to tree, and swinging themselves to great distances by their long arms. There are various species, but the most terrible is the *orang-outang* of Africa. Lascivious, filthy, gluttonous, and ferocious, they offer to man an instructive lesson on the inestimable worth of that divine faculty with which his Creator beneficently endowed him; and which, while it controls the impulses of his organization, convinces him that he is made for a nobler end than the "brutes which perish."

APEAK.—A ship is said to be *apeak*, when the cable is drawn so tight as to bring her directly over the anchor.

APE'NE, in antiquity, the chariot in which the images of the gods were carried on solemn occasions.

APEPSIA, in medicine, a bad digestion; the more usual term for which is *dyspepsia*.

APE'RIENTS, in the materia medica, an appellation given to such medicines as facilitate the circulation of the juices, by removing all obstructions.

APERTURE, in optics, a hole next to the object-glass of a telescope.—In architecture, an opening in any building, as a window, door, &c.—In geometry, the opening or angle formed by the meeting of two right lines.

APETALOUS, in botany, a term for plants whose flowers have no flower leaves or corolla; as the hippuris, or fox-tail grass.

A'PEX, in its general sense, is the top, summit, or highest degree of anything.—In antiquity, a little woollen tuft on the cap of the flamen, or high priest.—In mathematics, the angular point of a cone or conic section.

APH'ERE'SIS, in grammar, the taking away a letter or syllable from a word.—In surgery, it signifies an operation whereby something is taken away that is superfluous.

APHELION, in astronomy, that point at which the earth, or any planet, is at the greatest distance from the sun.

APHEL'LAN, in astronomy, the name of a bright star in the constellation Gemini.

A'PHIS, in entomology, the general name for a very extensive genus of insects of the Linnæan order *hemiptera*, called also plant-louse, vine-fretter, &c. The aphid has four erect wings, or none at all; its trunk is reflex; and the body is formed into two horns behind. It has been generally believed that

each species is attached to one kind of vegetable only. They abound with a sweet and grateful moisture, and are, therefore, eagerly devoured by ants, the larva of coccinellæ, and many other creatures, or they would very probably become more destructive to the whole vegetable creation than any other race of insects. The production of this moisture, generally called honey-dew, and their equivocal generation, are the circumstances which have attracted the particular attention of modern naturalists, and in which they seem to be distinguished from all other parts of the animal world. Numerous experiments have been tried, and it is now ascertained that the male aphides are produced only in the tenth generation, and are but few in number; that these, soon arriving at their full growth, copulate with the females; that the virtue of this copulation is not exhausted at least until the tenth generation; that all these generations, except the first from the fecundated eggs, are produced viviparous; and all the individuals are females, except those of the last generation, among whom some males make their appearance, to lay the foundations of a fresh series. But the excremental fluid voided by these insects is equally extraordinary. The honey-dew of plants is nothing more than this secretion: it neither falls from the atmosphere, nor issues from the plant itself; for wherever honey-dew is observable upon a leaf, aphides will be found on the underside of the leaf or leaves immediately above it, and under no other circumstance whatever. Among them is the *aphis rose*, found in great numbers on the leaves, stalks, and buds of roses; and the common *green aphid*, which is called *the fly* when it infests hop-gardens.

APH'ODOS, in medicine, the excrements of the aliment which pass off by stool.

APHOXIA, in medicine, a deprivation of voice, or palsy of the tongue.

APHORISM, a maxim or principle of a science; or a sentence which comprehends a great deal in a few words. The aphoristic method has great advantages, as containing much matter in a small compass; sentiments are here almost as numerous as expressions; and doctrines may be counted by phrases.

APHRACTA, in antiquity, open vessels which were used in naval engagements.

APHRI'E, a mineral substance, so called from its frothy appearance; silvery chalk.

APH'THÆ, in medicine, the thrush; small, round, and superficial ulcers arising in the mouth. The principal seat of this disease, is the extremity of excretory vessels, salivary glands, &c.

APHTHARDOCITES, or **APHITHARDOCETÆ**, a sect of heretics which branched off from the Eutycheians in the sixth century. They denied the passion of our Saviour, maintaining that his body was immortal from the moment of his conception.

APHY'LOUS, in botany, an epithet applied to the stem or leaf of a flower; as *aphyllus caulis*, a leafless stem; *aphyllus flos*, a flower having no calyx.

APES HAVE FOUR CUTTING TEETH IN EACH JAW, AND TWO CANINE TEETH, WITH OBTUSE GRINDERS.

LADY-BIRDS FEED ON APHIDES, AND NEVER DESTROY VEGETABLES; HENCE THEY ARE USEFUL IN OUR GARDENS.

[APO]

A New Dictionary of the Belles Lettres.

[APO]

THE NAVAL ORNAMENT, CALLED AN APLUSTRE, WAS SOMETIMES SHAPED LIKE A PLUME OF FEATHERS, AND FASTENED ON A SWAN'S NECK.

A'PIARY, a place where bees are kept, which should be selected with great care. It should be sheltered from the wet as well as from the extremes of heat and cold; it should face the south, be defended from high winds, and not within the sphere of offensive smells, or liable to the attacks of any hostile vermin.

A'PIS, in entomology, a genus of four-winged insects, with wings entirely membranaceous, and their tails furnished with a sting; comprehending the bee, hornet, wasp, and humble-bee.—In mythology, *apis* was the name of a bull to which divine honours were paid by the Egyptians, chiefly at Memphis.

APLANATIC, in optics, a term applied to that kind of refraction which completely corrects the aberration of the rays of light, and the colour depending thereon, in contradistinction to *achromatic*, in which there is only a partial correction of colour.

APLUSTRE, or **APLUSTRIA**, in the naval architecture of the ancients, an ornament resembling a shield fixed in the poop of a ship, in which case it differed from the *acrostolium*.

APOC'ALYPSE, the Greek name of the last book of the New Testament, so called from its containing revelations concerning several important doctrines of Christianity. It is generally attributed to the apostle St. John, who wrote it in the isle of Patmos, whither he had been banished by the emperor Domitian; though there have not been wanting those who ascribe it to other authors, and even wholly reject it as spurious. On account of its metaphorical language, the Apocalypse has been explained differently by almost every writer who has ventured to interpret it; and for the same reason it is one of those parts of the Bible which has furnished all sorts of sects and fanatics with quotations to support their creeds or opinions. But in the metaphors and symbolical expressions with which the Apocalypse abounds, the author seems to have had in view the then existing state of the church of Christ, and its future prospects.

APOC'OPE, in grammar, a figure by which the last letter or syllable of a word is cut off.

APOC'RYPHA, in theology, certain books of doubtful authority which are not received into the canons of holy writ; being either spurious, or not acknowledged as of divine origin.

APODICTICA, in rhetoric, an epithet for arguments which are fitted for proving the truth of any point.

APODIOX'IS, in rhetoric, a figure whereby we either pass over a thing slightly, or reject it as unworthy of notice.

APODIX'IS in rhetoric, an evident demonstration.

APOD'OSIS, in rhetoric, the latter part of a complete exordium, or application of a simile.

AP'ODES, the name of one of the orders of fishes in the Linnæan distribution of animals. Their leading character is, that

they have no ventral fins. There are twelve genera, among which is the eel tribe.

APOGEE', in astronomy, that point of the orbit at which the sun, moon, or any planet is most distant from the earth. This term, as well as the *perige*, was most in use among the ancients; modern astronomers, making the sun the centre of the universe, mostly use the terms *aphelion* and *perihelion*.

APO'GRAPH, a copy or transcript of some book or writings. It is opposed to *autograph*.

APOLIDES, in Roman history, those who were banished to some remote part, and condemned to hard labour, with the loss of citizenship.

APOLLINARES, **LU'DI** or **APOLLINARIAN GAMES**, in Roman antiquity, were instituted v. c. 542. They were celebrated in honour of Apollo, by a decree of the senate, in consequence of a prediction of the prophet Marcius relative to the battle of Cannæ.

APOLLINARIANS, in church history, a sect of heretics, who maintained that Jesus Christ had neither a rational human soul, or a true body.

APOLLO BELVIDERE, an ancient marble statue of Apollo most exquisitely finished. It was found in the ruins of Antium, in the 15th century, and placed in the Belvidere gallery of the Vatican palace at Rome.

APOLLO'NIA, in antiquity, an annual festival celebrated by the Ægialians in honour of Apollo.

APOLOGUE, a poetical fiction, the purpose of which is the improvement of morals. Some writers are of opinion, that this term ought to be confined to that species of fable in which brute or inanimate things, as beasts or flowers, are made to speak; but this distinction, so far from being followed, is generally reversed. It is, in reality, more usual to give the name of apologue where human actors only are introduced.

APOL'LYON, a name in Scripture given to the devil, or angel of the bottomless pit.

APOPH'ASIS, a figure of speech in which the orator briefly alludes to, or seems to decline stating, that which he wishes to insinuate.

APOPHLEG'MATISM, a medicine to promote the carrying off phlegmatic humours.

APOPHORETA, in antiquity, presents made to the guests at feasts, or other entertainments, which they carried away with them.

APOPH'RADES, in medicine, an epithet for the day in which a disorder comes to the crisis.

APOPTH'EGM, or **AP'OTHEGM**, a short, sententious, and instructive remark, especially if pronounced by a person of distinguished character.

APOPH'YAS, in medicine, the ramification of the veins.

APONEURO'SIS, in surgery, the extension of a nerve or tendon. The same term is also used for the cutting off a nerve, &c.

APOPH'YSIS, in anatomy, an excres-

The Scientific and Literary Treasury ;

[APP]

ence from the body of a bone, of which it is a true continuous part, as a branch is of a tree

AP OPLEXY, a disorder in which the patient is suddenly deprived of the exercise of all the senses, and of voluntary motion, while a strong pulse remains with a deep respiration, attended with a stertor, and the appearance of a profound sleep. It arises from whatever cause is capable of preventing, either totally or in part, the influx of the nervous fluid to the organs of sense, and the reflux of the same fluid from these organs to the common sensory in the brain. From the appearance of every symptom, there is scarcely room to doubt that complete apoplexy is produced by the pressure of blood (whether extravasated or not) upon the brain, and it is most usually found to accompany persons of a full habit of body, who have a short neck and a system disposed to a too copious sanguification.

APOPLECTA, in anatomy, the internal jugular vein.

APOS TACY, is the quitting any system of thinking or acting, good or bad. but the word is generally used, in a reproachful sense, of one who has changed his religious opinions

A POSTERIO'RI, in logic, a mode of reasoning from the effect to the cause

APOSTAXIS, in medicine, and defluxion, but particularly of blood from the nose

APOSTLE, properly signifies a person delegated or sent by another upon some business, and hence, by way of eminence, denotes one of the twelve disciples commissioned by Jesus Christ to preach the gospel

APOSTOL'IC, or APOSTOL'ICAL, an epithet for what pertained to the apostles, their doctrine, &c. It is now applied by the catholics to the Romish church only, as the apostolic see, an apostolic brief, &c.

APOS TROPHE, a figure of speech, by which the orator turns from his subject to address a person either absent or dead, as if he were present — APOSTROPHÉ, in grammar, a mark of contraction in a word, thus, lov'd for loved.

APOTHEOSIS, deification, or the cere mony of placing among the gods, which was frequent among the ancients. It was one of the doctrines of Pythagoras, which he had borrowed from the Chaldees, that virtuous persons, after their death, were raised into the order of the gods. And hence the ancients deified all the inventors of things useful to mankind, and who had done any important service to the commonwealth. This honour was also conferred on several of the Roman emperors at their decease

APOTH'ESIS, in surgery, the placing of a fractured limb in the position in which it ought to remain.

APOTOME, in music, the difference between the greater and the less semitone, being expressed by the ratio of 124 to 125

APPARATUS, the component parts of machinery, or a set of instruments or utensils necessary for practising any art.

APPARENT, in a general sense, something that is visible to the eyes, or obvious to the understanding.— APPARENT, among mathematicians and astronomers, denotes things as they appear to us, in contradistinction from what they really are. thus we say, the apparent diameter, distance, magnitude, place, figure, &c. of bodies.— APPARENT conjunction of the planets, is when a right line, supposed to be drawn through their centres, passes through the eye of the spectator, and not through the centre of the earth. And, in general, the apparent conjunction of any objects, is when they appear, or are placed in the same right line with the eye.— APPARENT, in law, is an epithet for an heir, whose right of inheritance is indismissible, as the heir apparent, or immediate heir to the crown, in distinction from the heir presumptive

APPARITION, a term used for an effect by which the mind operates on the sense, instead of the sense on the mind, or when the sense is diseased and transmits false ideas to the mind, two causes which have been the fruitful source of numberless superstitions and takes among the credulous and ignorant. Hence the idea of ghosts, spectres, and supernatural visions.— APPARITION, in astronomy, signifies a star or other luminary's becoming visible, which before was hid. It stands opposed to occultation. The circle of apparition is an imaginary line, within which the stars are always visible in any given latitude.

APPARITORES, among the Romans, a general term to comprehend all attendants of judges and magistrates appointed to receive and execute their orders.— APPARITION, in English law, is a messenger that serves the process of a spiritual court.

APPEAL, in law, the removal of a cause from an inferior to a superior court or judge, when a person thinks himself aggrieved by the sentence of the inferior judge. Appeals lie from all the ordinary courts of justice to the House of Lords

APPEARANCE, in perspective, the projection of a figure or body on the perspective plane.—In astronomy, the same as phenomenon, or phasis.—In law, it signifies a defendant's hiring a common or special bail, on any process issued out of a court of judicature.

APPEL'LANT, or APPEL'LOR, in law, he who makes or brings an appeal. It was formerly much used for one who brought an appeal in a criminal prosecution.

APPEL'LATIVE, in grammar, a noun or name applicable to a whole species or kind, as, a man, a horse

APPELLEE, in law, he of whom the appeal or accusation is made

APPENDANT, in law, any thing that is inheritable, belonging to some more worthy inheritance, as an advowson, common, or court, may be appendant to a manor, land to an office, &c.

APPENDICULATE, in botany, append ed at the extremity, as petiolus appendiculus, a petiole that has a small leaf or leaves at the base.

THE PROCESS OF "APPEAL" WAS ANCIENTLY GIVEN TO A PRIVATE PERSON, TO OBTAIN PECUNIARY SATISFACTION FOR A PERSONAL INJURY.

APP]

A New Dictionary of the Belles Lettres.

[AQU]

APPENDIX, in literature, a treatise or supplement added at the end of a work, to render it more complete.

APPLICATION, in geometry, is used either for division, for applying one quantity to another, whose areas, but not figures, shall be the same, or, for transferring a given line into a circle, or other figure, so that its end shall be in the perimeter of the figure.—**APPLICATION** of one science to another, is the use made of the principles of the one in perfecting the other as in the application of algebra and geometry to mechanics, of mechanics to geometry, of geometry and astronomy to geography, of geometry and algebra to natural philosophy.—**APPLICATION**, in medicine, any communication to the body, externally or internally, by way of a remedy.

APPOGIATURA, in music, a small note inserted by the practical musician, between two others, at some distance, or a note inserted by way of embellishment.

APPOSITION, in grammar, the placing two or more substantives together, without any copulative between them, as, Wellington, the conqueror.

APPRAISING, the valuing or setting a price on goods. Appraisers are sworn to value goods fairly, for which reason they are often termed *sworn appraisers*.

APPRHENSION, in logic, the first or most simple act of the mind, whereby it perceives, or is conscious of some idea. it is more usually called perception.

APPRENTICE, a young person bound by indentures or articles of agreement to a tradesman or artificer, to learn his trade or mystery.

APPROACHES, in fortification, the works thrown up by the besiegers, in order to get nearer a fortress without being exposed to the enemy's cannon.

APPROPRIATION, in ecclesiastical law, the annexing a benefice to the proper and perpetual use of a religious house, bishopric, college, &c. in the same way as *appropriation* is the annexing a benefice to the use of a lay person, or corporation, that which is an appropriation in the hands of religious persons, being usually called an *impropriation* in the hands of the laity.

APPROVER, in law, one who, confessing that he has committed a felony, accuses one or more of his accomplices.

APPROXIMATE, in botany, an epithet for a leaf, *approximatum folium*, a leaf that stands close to the stem.

APPROXIMATION, in a general sense, the getting near to an object.—In mathematics, a continual approach to a root or quantity sought, but not expected to be found.

AP PULSE, in astronomy, the approach of a planet towards a conjunction with the sun or any of the fixed stars.

APPUI, in the manege, the sense of the action of the bridle in the horseman's hand. Thus a horse has *no appui*, when he cannot suffer the bit to bear even slightly upon the parts of the mouth, or *too much appui*, when he throws himself too much upon the

bit, &c.—**APPUI**, in the military art, is a term for any particular given point or body upon which troops are formed, or by which they are marched in line or column.

APRIL, the fourth month of the year, according to European computation. The word is derived from the Latin *aprilis*, or *aperio*, I open, because in this month the leaves and blossoms open.

A PRIORI, a mode of reasoning from the cause to the effect.

APSIDES, or **APSES**, in astronomy, the two points of a planet's orbit in which it is at its greatest and least distance from the sun; and the line which joins them, is called the line of apses.

APTERA, the seventh order of insects, without wings or transformation. This includes spiders, fleas, bugs, termites, earwigs, &c., and, also, lobsters, crabs, prawns, and shrimps.

APUS, in astronomy, a constellation near the north pole.—In ornithology, a species of hirundo, commonly known by the name of swift, or black marten.

APYREXIA, in medicine, the abatement of a fever.

A QUA, a Latin word, much used in chemistry, signifying water. It is an insipid, ponderous, transparent, colourless, unflammable, and fluid body, formed by the union of oxygen and hydrogen.—**Aqua PURA**, pure or common water, is distinguished into *Aqua pluvia*, rain water, *Aqua fontana*, spring-water, *Aqua puteana*, well-water, *Aqua fluvialis*, river-water, *Aqua marialis*, snow-water, *Aqua palustris*, marsh-water, *Aqua marina*, sea water, and *Aqua mineralis*, mineral-water.

AQUAFORTIS, the common name of nitric acid.

AQUAREGIA, a combination of nitric and muriatic acids, so called, because it dissolves gold. It will also dissolve iron, copper, tin, mercury, regulus of antimony, bismuth, and zinc. It is now generally called *nitro muriatic acid*.

AQUAVITÆ, a name familiarly (though most absurdly) applied to ardent spirits, answering to the *raw de vie* or brandy of the French.

AQUATINTA, a style of engraving, or rather etching, by which an effect is produced similar to that of a drawing in Indian ink.

AQUARIUS, in astronomy, a constellation, which makes the eleventh sign in the zodiac. It is said to have been called *Aquarius*, or the water bearer, because when it appears in the horizon, the weather usually proves rainy. The stars in this constellation, in Ptolemy's catalogue, are 45, in Tycho's, 41, in Hevelius's, 47, in Flamsteed's, 104.

AQUATIC, in natural history, an appellation given to such things as live or grow in the water. thus we say, aquatic animals, aquatic plants, &c.

AQUEDUCT, a conduit of water, is a construction of stone or timber, built on uneven ground, to preserve the level of water, and convey it, by a canal, from one

THE "APPLICATION" IS REMOVED, BE THAT PART OF THE DISCOURSE IN WHICH THE DOCTRINE IS APPLIED TO PRACTICAL USES.

SOME AQUEDUCTS HAVE BEEN FORMED WITH THREE CONDUITS OF THE SAME LINE, ELEVATED ONE ABOVE ANOTHER.

[ARA]

The Scientific and Literary Treasury;

[ARA]

place to another. There are aqueducts under ground, and others raised above it supported by arches. The Romans were very magnificent in their aqueducts. In the time of the emperor Nerva there were nine, which emptied themselves through 13,594 pipes of an inch diameter. That constructed by Louis XIV. for carrying the Burg to Versailles, is 7000 fathoms long, with 2560 fathoms of elevation, and contains 212 arcades. The three chief aqueducts now in being, are those of the Aqua Virginea, Aqua Felice, and Aqua Paulina.—AQUADUCT, in anatomy, a term applied by anatomists to certain canals, on account of their form or use.

AQUILA, in astronomy, a constellation of the northern hemisphere.—The Eagle (*Aquila*) was reckoned by the ancients not only the king of the birds, but the minister of Jupiter, who is said to have carried Ganymede up into heaven in the form of an eagle. It was also chosen as the symbol of empire, first by the Persians, and afterwards by the Romans, in consequence of which the eagle is represented on coins in a variety of forms. But the most frequent representation of the eagle was that of the *Aquila legionaria*, (which the Romans chose as their ensign) an eagle, with expanded wings, and made either of gold or silver.

AQUILÆ, in anatomy, the veins which pass through the temples into the head.

AQUILARIA, in botany, eagle-wood, a large tree, class, *decandru*, order, *monogynia*. This tree is a native of the mountains of Cochin China and Malacca. The wood has been long used as a perfume, and was formerly an article of the materia medica, under the name of *agallochum*, and *lignum aloë*.

AQUILIGIA, COLUMBINE, a plant so called from *aquila*, an eagle, because of the resemblance its petalaries are supposed to bear to the eagle's claws.

AQUILO, the north west wind, so called from its rapidity and vehemence resembling the flight of an eagle.

ARABESQUE, or MORESCQUE, a style of ornament in painting and sculpture, so called from the Arabians and Moors, who rejected the representation of animals.

ARABIC FIGURES, the numeral characters now used in our arithmetic, which were borrowed from the Arabians, and introduced into England about the eleventh century.

ARABIC, or GUM ARABIC, a transparent gum which exudes from the Egyptian acacia.

ARABICUS LAPIS, in mineralogy, a stone like ivory blemished with spots.

ARABO-TEDES ('O), a style of architecture, in which the Moorish and Gothic are combined.

ARACHNOIDES, in zoology, a name given to those *echini marini*, or sea-hedgehogs, which are of a circular form, but variously indented at the edges.—ARACHNOIDES, in anatomy, an appellation given to several different membranes, as the tunic of the crystalline humour of the eye, the

external lamina of the pia mater, and one of the coverings of the spinal marrow.

ARACK, AR'RAK, or RACK, a spirituous liquor imported from the East Indies, used in making punch. It is procured by distillation from a vegetable juice called toddi, which flows by incisions out of the cocoanut tree. But the word arack appears to be an Indian name for strong liquor of any kind, whether distilled from the juice of the cocoanut, or from sugar, rice, &c.

ARA'NEA, in entomology, the SPIDER, a genus of insects belonging to the order *aptera*, or insects without wings. Spiders have five tubercles or papilla at the extremity of the belly, whose apertures they can enlarge or contract at pleasure, and it is through these they spin a gluey substance, of which their bellies are full. They fix the end of their threads by applying these papilla to any substance, and the thread lengthens in proportion as the spider recedes from it. The whole workmanship of a spider's web is most curious, but the darting out of long threads, which has been observed by naturalists, and by means of which some spiders can convey themselves to great distances, deserves particular notice. Dr Lister remarks, that while he was attending closely to a spider weaving a net, he observed it suddenly to desist, and turning its tail to the wind, it darted out a thread with the violence and stream we see water spout out of a jet. This thread, taken up by the wind, was immediately carried to some fathoms long, still issuing out of the belly of the insect. By and by the spider leaped into the air, and the thread mounted her up swiftly. He made a similar observation on near thirty different species of spiders, and found the air filled with young and old, sailing on their threads, and doubtless seizing gnats and other insects in their passage, there being often manifest signs of slaughter, legs and wings of flies, &c. on these threads, as well as in their webs below. It is scarcely credible to what height they will mount, but in fair calm weather during autumn, if a person will fix his eye some time on any part of the heavens, he may perceive the white webs, at a vast distance, very distinctly appearing from the azure sky. Leuwenhoek has computed that 100 of the single threads of a full grown spider are not equal to the diameter of the hair of his beard, and consequently, if the threads and hair be both round, ten thousand such threads are not bigger than such a hair. He calculates farther, that when young spiders first begin to spin, 100 of them are not larger than one of a full grown spider's threads are not so big as the single hair of a man's beard. Our limits will not permit us to particularize the different species, but there is one which deserves to be mentioned for its size and strength, called ARANEA ARICULARIA, or Bird-catching Spider, a gigantic species, not uncommon in the East Indies, where it is of sufficient size to seize on small birds, which it destroys by wounding with its fangs.

"AQUA MARINA" IS A NAME WHICH JEWELLERS GIVE TO THE BERYL, ON ACCOUNT OF ITS SEA-GREEN COLOUR.

THE WORD ARCANUM IS GENERALLY USED BY THE FRUITS, "ARCANUM," AND SIGNIFIES SECRET THINGS OR MYSTERIES.

CERTAIN PLANTS ARE SAID TO HAVE TREE-LIKE AND ARBORESCENT STEMS; BECAUSE, THOUGH AT FIRST HERBACEOUS, THEY BECOME WOODY.

ARÆOMETER, an instrument wherewith to measure the density or gravity of fluids. The aræometer, or water poise, is usually made of glass; consisting of a round hollow ball, which terminates in a long slender neck, hermetically sealed at top: there being at first as much quicksilver put into it as will serve to balance, or keep it swimming in an erect position. The stem, or neck, is divided into degrees or parts, which are numbered, to show, by the depth of its descent into any liquor, the lightness or density of it: for that fluid is heaviest in which it sinks least, and lightest in which it sinks deepest.

ARBITER, in civil law, a judge appointed by the magistrate, or chosen by the parties to decide any point of difference. An arbiter must judge according to usages of the law, but the arbitrator is permitted to use his own discretion, and accommodate the difference in the manner that appears to him most just and equitable.

ARBITRATION, or ARBITREMENT, a power given by two or more contending parties to some person or persons to determine the dispute between them.

ARBOR, in mechanics, the principal part of a machine which serves to sustain the rest: also the axis or spindle on which a machine turns.

ARBOR DIAN'E, or Silver Tree, is the result of an experiment in chemistry, by which the branches and figure of a tree are represented by an amalgum of silver and mercury, which appear to vegetate in a very beautiful manner. The experiment is thus performed. Take one part of silver, and with it saturate a certain portion of nitrous acid: this is to be diluted with 20 parts of clean water, and poured upon two parts of mercury. After a short time a crystallization will take place, in the shape of a tree, with its branches, &c.

ARBOR SCIENTIÆ, a general distribution or scheme of science, or knowledge.

ARCEOSTYLE, in architecture, a sort of intercolumniation, in which the columns are at a distance from each other.

ARBORESCENT, a term applied to all such things as resemble trees; thus we read of arborescent shrubs, arborescent animals, &c. of which last kind is that great natural curiosity the star-fish.

ARBORIST, a person skilled in that part of botany which treats of trees.

ARBOR VITÆ, an evergreen shrub.

ARBU'TUS, the strawberry-tree; a beautiful shrub, bearing a red roundish berry.

ARC, any part of a curve line, as of a circle, ellipse, &c.

ARC, or ARCH DIURNAL, in astronomy, that part of a circle described by a heavenly body, between its rising and setting. The nocturnal arch is that which is described between its setting and rising.

ARCANUM, among physicians, any remedy, the preparation of which is industriously concealed, in order to enhance its value.

ARCH, a concave building with a mold bent in form of a curve, erected to support

some structure. Arches are either circular, elliptical or straight, as they are improperly called by workmen. Elliptical arches consist of a semi-ellipse, and have commonly a key-stone and impost; they are usually described by workmen on three centres. Straight arches are those used over doors and windows, and having plain straight edges, both upper and under, which are parallel, but both the ends and joints point towards a centre. The term arch is peculiarly used for the space between the two piers of a bridge, for the passage of water, vessels, &c.—**TRIUMPHAL ARCH**, a stately gate of a semicircular form, adorned with sculpture, inscriptions, &c. erected in honour of those who had deserved a triumph.—**ARCUS**, as a syllable prefixed to another word, denotes the highest degree of its kind, whether good or bad; as *archangel*, *archduke*, *archbishop*, *archfiend*, &c. Many of the highest offices in different empires have this syllable prefixed to them.

ARCHAISM, any antiquated word or phrase. The use of archaisms, though generally objectionable, occasionally add to the beauty and force of a sentence.

ARCHBISHOP, a metropolitan prelate, having several suffragan bishops under him. In England there are two archbishops—the archbishop of Canterbury, who is primate of all England; and the archbishop of York, who is only styled primate of England. The first establishment of archbishops in England, according to Bede, was in the time of Lucius, said to be the first Christian king in Britain; but the first archbishop of Canterbury was Austin, appointed A.D. 598, by Ethelbert, when he was converted. An archbishop consecrates the inferior dioceses, as those ordain priests and deacons, and when invested with his dignity, he is said to be enthroned; a term which probably originated with that period of English history, in which the archbishop of Canterbury had some of the privileges of absolute royalty.

ARCHDEACON, an ecclesiastical officer, next in rank below a bishop. Every diocese has one, and the generally more. They are usually appointed by their dioceses; but their authority is independent. They visit the clergy, and have courts for the punishment of offenders by spiritual censures, and for hearing all other causes that fall within ecclesiastical cognizance.

ARCHERY, the art of shooting with the bow and arrow. Since the introduction of gunpowder, the arrow has ceased to be employed as an offensive weapon: but in former times it was reckoned of the utmost importance to the military strength of this kingdom. The practice of archery was followed both as a recreation and a service, and Edward III. prohibited all useless games that interfered with the practice of it on holidays and other intervals of leisure. By an act of Edward IV. every man was to have a bow of his own height, to be made of yew, hazel, or ash, &c.; and mounds of earth were to be made

[ARC]

The Scientific and Literary Treasury ;

[ARC]

in every township, for the use of the inhabitants. Indeed, it appears from the use made of the bow by the English at the battles of Cressy, Agincourt, and Poitiers, that their claim to be considered the best of modern archers can scarcely be disputed. If we look to archery as a pastime, or a healthful exercise, it has the sanction of Galen, as being sufficiently active, and not too violent, and if we consider that, in addition to its giving a salutary and moderate exertion to the muscles, it is extremely interesting to the mind when attended with competition, we cannot but be pleased to see that it has become as fashionable as it is healthful.

ARCHIES, or COURT OF ARCHES, the supreme court belonging to the archbishop of Canterbury, to which appeals lie from all the inferior courts within his province.

ARCHETYPAL, the first model of a work, which is copied after to make another like it. Among masons it is used for the standard weight by which the others are adjusted—The *archetypal world*, among Platonists, means the world as it existed in the idea of God, before the visible creation.

ARCHIL, a violet red paste used in dyeing, prepared, by the aid of murate of ammonia, from the *lichen roccella*.

ARCHITECT, one who is skilled in architecture. The architect forms plans and designs for edifices, conducts the work, and directs the artificers employed in it.

ARCHITECTURE, the art of inventing and drawing designs for buildings, or the science which teaches the method of constructing any edifice for use or ornament. It is divided into *civil*, *military*, and *naval*, according as the erections are for civil, military, or naval purposes, and for the sake of convenience, other divisions are sometimes introduced. Architecture appears to have been among the earliest inventions and its works have been commonly regulated by some principle of hereditary imitation. Whatever rude structure the climate and materials of any country have obliged its early inhabitants to adopt for their temporary shelter, the same structure, with all its prominent features, has been afterwards in some measure kept up by their refined and opulent posterity. To Greece we are indebted for the three principal orders of architecture, the *Doric*, the *Ionic*, and the *Corinthian*, Rome added two others, both formed out of the former, the *Tuscan* and the *Composite*. Each of these has a particular expression, so that a building, or different parts of a building, may be rude, solid, neat, delicate, or gay, accordingly as the Tuscan, the Doric, the Ionic, the Corinthian, or the Composite are employed. The columns of these several orders are easily distinguishable to common observers, by reason of the ornaments that are peculiar to their capitals, but the scientific difference consists in their proportions. The Tuscan order is characterized by its simplicity and strength. It is devoid of all ornament. The Doric is enlivened with ornaments in the frieze and

capital. The Ionic is ornamented with the volute scroll, or spiral horn its ornaments are in a style of composition between the plainness of the Doric, and the richness of the Corinthian. The Corinthian order is known by its capital being adorned with two sorts of leaves, between these rise little stalks, of which the volutes that support the highest part of the capital, are formed. The Composite is nearly the same as the Corinthian, with an addition of the Ionic volute. In their private buildings the Roman architects followed the Greeks; but in their public edifices they far surpassed them in grandeur. During the dark ages which followed the destruction of the Roman empire, the classic architecture of Greece and Rome was lost sight of, but was again revived by the Italians at the time of the restoration of letters. The *Gothic style* was so called because it was first used by the Visigoths, but at first it was vastly inferior to that which we now call Gothic, and which exhibits grandeur and splendour, with the most accurate execution. The *Saxon* and *Norman styles* were so called because they were respectively used by the Saxons before the Conquest, and by the Normans after, in the building of churches. The Saxon style was distinguished by the semicircular arch, which they seem to have taken partly from the Romans, and partly from their ancestors on the continent. The Norman was distinguished by the following particulars: the walls were very thick, generally without buttresses, the arches, both within and without, semicircular, and supported by very plain and solid columns. These two styles continued to be the prevailing modes of building in England until the reign of Henry II, when a new mode was introduced, which was called *modern Gothic*. Whether this was purely a deviation from the other two modes, or whether it was derived from any foreign source, is not known. It is, however, supposed to be of Saracenic extraction, and to have been introduced by the crusaders. The style is distinguished by its numerous buttresses, lofty spires and pinnacles, large and ruined windows, with a profusion of ornaments throughout. In the fifteenth and sixteenth centuries the taste for Greek and Roman architecture revived, and brought the five orders again into use, although for sacred edifices the Saxon and Gothic styles still maintain the pre-eminence.

ARCHITRAVE, in architecture, that part of a column, or order of columns, which lies immediately upon the capital, being the lowest member of the entablature. Over a chimney, this member is called the mantle piece, and over doors or windows, the hyperthyron.

ARCHIVALT, in architecture, the inner contour of an arch, or a frame set off with mouldings, running over the faces of the arch stones, and bearing upon the impost.

ARCHIVES, ancient records, or charters which contain titles, pretensions, pri-

ARCHES-COURT WAS ANCIENTLY HELD IN ST. MARY LE BOW CHURCH, BUT NOW, LIKE THE OTHER SPIRITUAL COLLEGE, AT DOCTOR'S COMMONS.

THE WORD "ARCHITECTONICS" IS SOMETIMES USED FOR THE SCIENCE OF ARCHITECTURE, BUT IT SOUNDS PEDANTIC, AND IS UNNECESSARY.

[ARG]

A New Dictionary of the Belles Lettres.

[ARG]

vilages, and prerogatives of a community, family, city, or kingdom.

AR'CHON, the chief magistrate of the city and commonwealth of Athens.

ARCTIC, Northern; lying under the arctic, or north pole, is that which is raised above our horizon, and is nearly pointed out by the last star in the tail of *Ursa minor*. The *arctic circle* is a lesser circle of the sphere parallel to the equator, and distant $23^{\circ} 28'$ from the north pole. This and the *antarctic* are often called polar circles, and may be conceived to be described by the motion of the poles of the ecliptic round those of the equator.

ARCTOS, or ARCTUS, in astronomy, the Greek name for the *Ursa major* and *minor*, or the great and little Bear.

ARCTURA, in medicine, inflammation of the finger or toe, from the curvature of the nail.

ARCTURUS, a fixed star of the first magnitude, in the constellation of *Arctophylax* or *Boötes*.

ARCUATION, in horticulture, the raising of trees by layers.—*ARCUTION*, in surgery, a distortion or incurvature of the bones.

ARCUBALISTA, a cross-bow; a term which has been contracted both into *Balista* and *Arbalist*.

ARIDASINES, a very fine sort of Persian silk; the finest used in the looms of France.

ARIE'SIA, in mineralogy, a genus of argillaceous earths, consisting of alumina, silica, &c.

AREA, the site or space of ground on which any building is erected; but more generally applied to the open space at the bottom of a house.—*AREA*, in geometry, the superficial contents of any figure, as a triangle, quadrangle, &c.—*AREA*, in mineralogy, the mass dug from the mines, or the place where it is dug.

ARECA, an Indian nut, the fruit of a kind of palm-tree, which the natives chew, and roll up in a betel leaf to help digestion.

AREN'A, in Roman antiquity, that part of the amphitheatre where the gladiators fought: so called from its being always strewed with sand, to conceal from the view of the people, the blood spilt in the combat.—*ARENA*, in mineralogy, a genus of earths of the siliceous order.

AREOLA, the coloured circle surrounding the nipple of the breast.

ARENATIO, a kind of dry bath, wherein the patient sat with his bare feet on hot sand.

AREOPAGUS, a sovereign tribunal at Athens, famous for the justice and impartiality of its decrees. It was in the town, on a rock or hill opposite to the citadel. There are some remains of the areopagus still existing in the middle of the temple of *Theseus*, which was heretofore in the middle of the city, but is now without the walls.

ARGAL, or ARGOL, crude tartar, in the state in which it is taken out of empty wine-vessels.

AR'GENT, in heraldry, the white colour in the coats of arms of baronets, knights, and gentlemen.

AR'GENTINE, in mineralogy, a subspecies of carbonate of lime, of a shining pearly lustre.

AR'GIL, in mineralogy, white clay; an unctuous kind of earth, of which earthenware is made.

ARGILLA'CEOUS EARTH, the earth of clay, called in chemistry *alumina*, because it is obtained in the greatest purity from alum. Argillaceous earths are the basis of earthenware.

ARGO NA'VIS, in astronomy, a constellation, called after the ship of Jason and his companions.

ARGONAUTS, in Grecian antiquity, a company of illustrious Greeks, who embarked along with Jason in the ship *Argo*, on an expedition to *Colchis* with a design to obtain the golden fleece. Some writers imagine, and foremost among them is Sir Isaac Newton, that this expedition was really an embassy sent by the Greeks, during the intestine divisions of Egypt, in the reign of Amenophis, to persuade the nations upon the coasts of the *Euxine* and *Mediterranean* seas to take that opportunity of shaking off the yoke of Egypt, which Sesostris had laid upon them: and that fetching the golden fleece was only a pretence to cover their true design.

AR'GUMENT, in rhetoric and logic, an inference drawn from premises, the truth of which is indisputable, or at least highly probable. In reasoning, Mr. Locke observes that men ordinarily use four sorts of arguments. The first is to allege the opinions of men, whose parts and learning, eminency, power, or some other cause, has gained a name, and settled their reputation in the common esteem, with some kind of authority; this may be called *argumentum ad reverentiam*. Secondly, another way is to require the adversaries to admit what they allege as a proof, or to assign a better; this he calls *argumentum ad ignorantiam*. A third way is, to press a man with consequences, drawn from his own principles or concessions; this is known by the name of *argumentum ad hominem*. Fourthly, the using proofs drawn from any of the foundations of knowledge or probability; this he calls *argumentum ad judicium*; and observes, that it is the only one of all the four, that brings true instruction with it, and advances us in our way to knowledge.

Argument, in literature, denotes also the abridgment, or heads of a book, history, chapter, &c.—*ARGUMENT*, in astronomy, any quantity or equation on which depends another quantity relating to the motion of the planets; or it may be defined, an arc whereby another arc is to be sought, bearing a certain proportion to the first arc.—*Ex.*: *Argument of Inclination*, an arch of a planet's orbit intercepted between the ascending node, and the place of the planet from the sun, numbered according to the succession of the signs.

ARGUMENTATION, in logic, an op-

IN THE ARCTIC REGIONS THE COMING OF SPRING IS WONDERFULLY RAPID; IN A FEW DAYS THE FOLIAGE APPEARS, FLOWERS BLOOM, AND INSECTS SWARM.

BY A LAW OF SOLOX, NO PERSON COULD BE A MEMBER OF THE ARROPAGUS, UNTIL HE HAD SERVED THE OFFICE OF ANCHON.

[ARI]

The Scientific and Literary Treasury;

[ARM]

ration of the intellect, by which any proposition is proved by the help of other propositions.

ALGEBROPOEIA, in alchemy, the art of making silver out of inferior metals, by the aid of the philosopher's stone.

ARIANS, the followers of Arius, a bishop of Alexandria, about A.D. 318, who denied the three persons in the Holy Trinity to be of the same essence, and affirmed Christ to be a creature; that he was inferior to the Father as to his deity; that he was neither co-eternal, nor co-equal with him; and that the Holy Ghost was not God, but a creature of the Son.

ARIES, in astronomy, a constellation of fixed stars, drawn on the globe in the figure of a ram. It is the first of the twelve signs of the zodiac, from which a twelfth part of the ecliptic takes its denomination, and consists of sixty-six stars. It is usually called the vernal sign.—**ARIES** was also the original name for the battering ram of the ancients.

ARIO SO, in musical composition, the Italian word for the tune of a common air.

ARIS'EA, in botany, a long needle like beard, which stands out from the husk of a grain of corn, *crass*, &c.

ARISTOC RACY, an hereditary government, composed of the nobles, or superior citizens of a country: such was the government of Venice. Aristocracy is also often used for the nobility of a country, under a monarchy, or any form of government.

ARISTOLO CHIA, in botany, *Buthort*—a genus of the hexandria order, and gynandria class of plants. The species are all either shrubs or perennials.

ARISTOTELIAN, something relating to Aristotle, thus we read of the Aristotelian philosophy, school, &c. The Aristotelians were also designated Peripatetics, and their philosophy long prevailed in the schools, till it gave place to the Newtonian.

ARITHMETIC, the art or science of numbering, or computing by certain rules, of which the four first and simplest are addition, subtraction, multiplication, and division. Vulgar Arithmetic is the computation of numbers in the ordinary concerns of life. Integral Arithmetic treats of whole numbers; Fractional Arithmetic, of fractional numbers; Decimal Arithmetic, of decimal numbers. The method of notation that we now use is said to be taken from the Arabians, and the characters by which all the operations of common arithmetic are performed are these, 1, 2, 3, 4, 5, 6, 7, 8, 9, 0. The first nine are called significant figures, which when placed singly denote the simple numbers subjoined to the characters; but when several significant numbers are placed together, the first or right hand figure only is to be taken for its simple value: the second signifies so many tens, the third so many hundreds, and so on. Although this notation consists of only nine digits, with the cipher 0, yet, by giving a local power to these figures, namely, that of units, tens, hundreds, thousands, &c. they may be made to express numbers

to an indefinite extent. The Greeks made use of the letters of their alphabet to represent their numbers. The Romans followed the same method, and besides characters for each rank of classes, they introduced others for five, fifty, five hundred, &c.; as, I, for One; V, Five; X, Ten; L, Fifty; C, One Hundred; D, Five Hundred; and M, a Thousand. Now it is evident that with these seven letters any number may be represented, by repetition and combination, thus XXX stand for three tens or thirty; CCX for two hundred and ten, and so on. The general rule with regard to the addition and subtraction of these letters is this: when a numeral letter is placed *after*, or on the right hand of one of greater value, their values are to be added, thus XVI stand for sixteen, and MDCCXXXIX for the date of the year 1839. If when a numeral letter is placed *before*, or on the left hand of one of greater value, the value of the less is taken from that of the greater, thus IV stand for five less one, or four, IX or ten less one, or nine; XC one hundred less ten, or ninety, &c.

ARK, the floating vessel in which Noah and his family were saved from the flood. It was 500 feet long, 90 broad, and 50 high.

ARK OF THE COVENANT, the chest in which the stone tables of the ten commandments, written by the divine hand, were laid up. The lid of the ark was called the mercy-seat, before which the high-priest appeared once every year on the great day of expiation, and the Jews, wherever they worshipped, turned their faces towards the place where the ark stood.

ARMA DA, a Spanish term, signifying a fleet of men-of-war. The armada to which the Spaniards, in confidence of success, gave the name of *invincible*, consisting of 130 large ships, furnished with an immense quantity of military stores and a large army, was intended to destroy the liberties of this country during the reign of the illustrious Elizabeth, but it was scattered by the elements and almost annihilated by the English fleet, on the 30th July, 1588. On which occasion a medal was struck with the motto, "Aslavit Deus, et dissipavit," in grateful memory of the interposition of Heaven in our favour.

ARMADIL'LA, called also *GUARDA COSTAS*, a squadron of men-of-war formerly maintained on the coasts of Spanish America, to prevent foreigners from trading with the colonists and natives.

ARMADIL LO, in natural history, a quadruped, a native of Brazil and the West Indies, with the snout of a pig, the tail of a lizard, and the feet of a hedgehog. He is armed with a coat of impenetrable scales, under which he retires like a tortoise.

ARMA'RIUM, in antiquity, a storehouse for all sorts of arms or utensils.

ARMATURA, in antiquity, the military exercise in use among the Romans, which consisted either in throwing the spear or javelin, shooting with the bow, &c.

ARME'NIANS, a sect or division amongst the eastern Christians; thus called from

THE WORD "ARISTOCRACY" IS USED TO DENOTE A BODY OF GOOD MEN IN POWER, "OLIGARCHY," A CORRUPT ARISTOCRACY.

THE WORD "ARMADIL'LO" IS SYNONYMOUS WITH ARMOUR, AND COMPREHENDS WHATEVER IS WORN FOR THE PROTECTION OF THE BODY.

Armenia, the country anciently inhabited by them, there were two kinds of Armenians, one which adhered to the catholic church, and another which rejected episcopacy. They are generally accused of being monophysites, only allowing of one nature in Jesus Christ.

ARMIL NIAN STONE, an opaque sort of stone, of a greenish blue colour, like the lapis lazuli. It is used as a purgative.

ARMH NIAN HOLE, a native bole or earth brought from Armenia, commonly called bole armeniace. It is used as an absorbent and astrigent.

ARMIGER, an acquire, or armour bearer. A title of dignity to such as bear arms, of which there are two kinds, *Armigers by courtesy*, as sons of noblemen (eldest sons of knights, &c., and *Armigers by creation*, such as the king's servants, &c.

ARMILLA MEMBRANA, in anatomy, is that circular ligament which comprehends all the tendons of the whole hand as it were a circle. — **ARMILLA**, in antiquity, a bracelet or ornament for the wrist, presented as a badge of distinction to soldiers.

ARMILLARY SPHERE, in astronomy, an artificial sphere composed of a number of circles put together in their natural order to assist the imagination in conceiving of the motions of the celestial bodies. It is a sphere revolves on its axis with a silvered horizon which is divided into degrees and moveable every way upon a brass support. The other parts are the equinoctial, zodiac meridian tropic and polar circles. — **ARMILLARY TRIANGUMETER**, an instrument consisting of five arm circles divided and graduated so as to solve many problems in astronomy.

ARMINIANS, followers of Arminius, a sect of Christians which arose in Holland about the beginning of the 17th century and separated themselves from the Calvinists. They consider the doctrine of the Trinity as unessential to salvation and the worship of the Holy Spirit as unordained by any precept of the scriptures. Their great principle is that all sects of Christians ought to be tolerated.

ARMOUR, a name for all such habiliments as serve to defend the body from wounds especially of a sword, lance, &c. A complete suit of armour anciently consisted of a casque or helm, a gorget cuirass, gauntlets, tassets, bracers, cuisses and covers for the legs, to which the arms were fastened. This they called *armour cap a pie*, and was worn by cavaliers and men at arms. The infantry had only part of it, viz a pot or head piece, a cuirass and tassets, but all of them made light. Lastly, the horses themselves had their armour wherewith to cover the head and neck. Of all this furniture of war, scarcely any thing is now retained except the cuirass.

ARMOUR BEARER the person who was formerly employed to carry the armour of another.

ARMS, in military phraseology, all kinds of weapons, whether used for offence or defence. — **ARMS**, in a legal sense, extend to

any thing that a person wears for his own defence, or takes into his hand, and uses, in anger, to strike or throw at another. — **ARMS** denote also the natural weapons of beasts, as claws, teeth, back, &c.

ARMS, Coats or, family insignia or distinctions, which had their rise from the painting of the shields used in war before the invention of gunpowder.

ARMY, in a general sense is taken for the whole armed force raised for the defence of the country by land. In a limited sense, it denotes a large body of soldiers consisting of horse and foot, completely armed, and provided with artillery, ammunition provisions &c. under a commander in chief, having lieutenant generals, major generals, brigadiers, and other officers under him. An army is generally divided into a certain number of corps, each consisting of brigades, regiments, battalions and squadrons when in the field, it is formed into lines, the first line is called the vanguard, the second the main body, the third the rear guard or body of reserve. The middle of each line is occupied by the foot, the cavalry forms the right and left wing of each line, and sometimes squadrons of horse are placed in the intervals between the battalions. — The *matériel* of an army, as the French term it, consists of the horse, stores, provisions and every thing necessary for service. Armies are moreover distinguished according to their service, into *blockading army*, *army of observation*, *army of reserve*, &c.

ARNABOS, an aromatic drug sometimes employed as a substitute for cinnamon.

AROB, in commerce, a Portuguese measure for sugar equal to 26 bushels.

AROMA the odiferous principle peculiar to plants and flowers.

AROMATIC, an appellation given to such plants and other bodies as yield a brisk fragrant smell and a warm spicy taste as cloves, cardamom seeds, cinnamon, nutmegs, &c. Their peculiar qualities reside in a volatile oil, usually called essential oil and a grosser resinous substance capable of being extracted by spirit of wine. *Aromatic* considered as medicines, warm the stomach, and by degrees the whole habit raise the pulse and quicken the circulation. Hence in cold languid cases, they increase strength, and promote the natural secretions.

AROPH, a term employed by the ancient alchemists for a distillation of santon and other chemical flowers.

ARPLING in music, is a term implying that the tones should be sung distinctly, as they are heard on the harp. — **ARREGGIO ACCOMPAGNIMINTO** consists chiefly of the notes of the several chords taken in returning successions.

ARPLINT, a French measure of 100 perches.

ARQUFBUS, a hand gun larger than a musket. He who used it was called an *Arquebuser*.

ARQULBUSA DE, a kind of medicated water, recommended in cases of gun shot

[ARS]

The Scientific and Literary Treasury ;

[ART]

wounds; whence its name. It is also called *aqua vulcanaria* and *aqua sclopetaria*.

ARRACHEE in heraldry, a representation of a plant torn up by the roots.

ARRAIGNMENT, in law, the bringing a prisoner forth, reading the indictment to him, and putting the question of guilty or not guilty.

ARRAS HANGINGS, in commerce, tapestry made at Arras, in France.

ARRAY, the drawing up of soldiers in order of battle.—In law, to *challenge an array*, is to make exceptions against all the persons arrayed or impanelled.

ARREST, the apprehending and restraining a person, in order to oblige him to be obedient to the law, which in all cases, except treason, felony, or breach of the peace, must be done by virtue of precept out of some court. Ambassadors, peers of the realm, and members of parliament, are privileged from an arrest for debt. **ARREST OF JUDGMENT**, is the assigning just reasons why judgment should not pass, as, want of notice of the trial, a material defect in the pleading, when the record differs from the deed pleaded, when persons are mis-named, where more is given by the verdict than is laid in the declaration, &c. This may be done either in criminal or civil cases.—**ARREST**, in the veterinary art, a disease seated between the ham and the pastern.

ARRIRE BAN, the phrase for a general proclamation of the French kings, by which not only their immediate feudatories, but their vassals, were summoned to take the field of war.—An *arrière vassal* was the vassal of a vassal.

ARRIS, in architecture, the intersection or line formed by the meeting of the exterior surfaces of two bodies, answering to what is called the edge.—**ARRIS LINE**, a small piece of timber, of a triangular section, used in raising the slates against a wall that cuts obliquely across the roof.

ARRONDEE, in heraldry, a cross, consisting of sections of a circle, the whole of the curves being in the same direction.

ARROW, a light shaft or rod, pointed at one end, and feathered at the other, intended as a weapon of offence. Arrows were called *flecheis* (from *fleche*, the French word for arrow). When this weapon is borne in coats of arms, it is said to be barbed and feathered.

ARROW-GRASS, a plant so called because its leaves resemble the head of an arrow.

ARROW-ROOT, the root of the *maranta arundinacea*, a plant which grows in the West Indies, and furnishes a kind of starch, more nutritive, and freer from peculiar taste or flavour, than the starch of either wheat or potatoes.

ARROW-STICK, a rod employed in surveying.

ARSENIC, a ponderous mineral body, associated with a great many metallic ores. It is yellow, white, and red. Yellow arsenic is the native arsenic dug out of the mines, otherwise called *arsenic ore*. White arsenic is drawn from the yellow by sublimating;

and is reduced to powder by the mixture of oxygen, or exposure to the air. This is sometimes used in medicine in small quantities, but is otherwise a deadly poison. Red arsenic is the yellow arsenic rubified by fire, when it is called *realgar*. The following recipe has been given, as likely to be effectual where arsenic has been received into the stomach. If a quantity is swallowed large enough to endanger life, let an emetic be instantly given, and then large quantities of hepatic sulphur dissolved in water be taken. This, a scruple at a time, given with emetics, milk, castor oil, &c. may prevent the dire effects that would otherwise follow the dose of poison.

ARSENICAL, an epithet for whatever contains or belongs to arsenic, as *arsenical pyrites*, &c.—**ARSENICAL MAGNET**, a preparation of antimony with sulphur and white arsenic.—**ARSENICAL SOLUTION**, a solution of arsenic with sub-carbonate of potash in distilled water.

ARSENATE, a sort of salts formed by the combination of arsenic acid with different bases, as the arsenate of ammonia, &c.

ARSON, the act of wilfully setting houses on fire, which is felony at common law, and likewise by statute.

ART, a system of rules, serving to facilitate the performance of certain actions, in which sense it stands opposed to science, or a system of merely speculative principles.—*Terms of Art*, are such words as are used in regard to any particular art, profession, or science.

ART AND PART, a phrase used in Scotland, when any one is charged with a crime, they say, he is *art and part* in committing the same, that is, he was concerned both in the contrivance and execution of it.

ARTERY, a blood vessel, which proceeds from the heart, and gradually becomes less in diameter the farther it goes, but it gives out numberless ramifications in its course. Arteries carry the blood from the heart to every part of the body, for the preservation of life, for nutrition, generation of heat, and the secretion of the different fluids. The action of the arteries, called the pulse, corresponds with that of the heart.

ARTEMISIA, in antiquity, a festival celebrated in honour of Diana. In the Linnæan system of botany, a genus of plants, in which southernwood, wormwood, &c. are contained.

ARTESIAN WELLS, a subterranean fountain of pure water, which is obtained by boring vertically down through one or more of the geological strata of the earth, till the perforation reaches a porous gravel bed containing water, placed under such incumbent pressure as to cause it to ascend to the surface, or to a height convenient for the operation of a pump. It is said that they derive their name from the ancient French province of Artois, where for many centuries they have been used, although their adoption in this country is very recent. The operations employed for penetrating the soil are entirely similar to those practised by the miner, in boring to find

NO PERSON CAN BE ARRESTED IN A FAIR, EXCEPT FOR DEBTS CONTRACTED THERE, OR PROVIDED THERE TO BE PAID.

IN SCRIPTURE, THE "ARROWS OF GOD" ARE THE APPREHENSIONS OF HIS WRATH, OR THE REPRESENTATIONS OF HIS JUDGMENTS.

[ART]

A New Dictionary of the Belles Lettres.

[ARV]

SEE JERUSALEM ARTICHOKE IS SO CALLED FROM A CORRUPTION OF THE ITALIAN "GIARSOLE ARTICOCOCO," BURY-FLOWER ARTICHOKE.

metallic veins; but the excavator of Artesian wells must resort to peculiar expedients to prevent the purer water, which comes from deep strata, mingling with the cruder waters of the alluvial beds near the surface of the ground, &c. In London and its vicinity there are now a great many of these wells, which have been perforated through the immensely thick bed of London clay, and even through some portions of the sub-jacent chalk. If we admit that the numerous springs which issue from the ground proceed from the infiltration of the waters progressively condensed in rain, dew, &c. the theory of these interior streamlets is sufficiently obvious, for as soon as the upper stratum is perforated, the waters may rise, in consequence of the hydrostatic pressure upon the lower strata, and even overflow the surface in a constant stream, provided the level from which they proceed be proportionally higher. In the progress of the boring, frequent veins of water are passed through, but as these are small streams, and perhaps impregnated with mineral substances, the operation is carried on until an aperture is made into a main spring, which will flow up to the surface of the earth. If this has its source in a neighbouring hill, the water will frequently rise up, and produce a continued fountain, but if the spring happens to be below the level of the surface of the ground where the boring is effected, it may be necessary to dig a well of considerable size down to that level, in order to form a reservoir into which the water may flow, and whence it must be raised by a pump.

ARTHRITIS, the Gout, in medicine [see the article Gout].

ARTHRITICA, in botany, a name used for the primrose.

ARTHRODIA, in natural history, a genus of imperfect crystals, found always in complex masses, and forming long, single pyramids, with very short and slender columns. — In anatomy, a species of articulation, wherein a flat head of one bone is received into a shallow socket of another.

ARTIC'HOOKE, a plant very like the thistle, with scaly heads similar to the cone of the pine tree. At the bottom of each scale, as also at the bottom of each floret, is the well known fleshy edible substance. The *Jerusalem Artichoke* is a plant, the root of which resembles a potato, having the taste of the artichoke.

ARTICLE, in grammar, a particle in most languages, that serves to express the several cases and genders of nouns, when the languages have not different terminations to denote the different states and circumstances of nouns. — **ARTICLE**, in law, the clause or condition in a covenant.

ARTICULAFION, in anatomy, the junction of two bones intended for motion. There are two kinds, the diarthrosis, which has a manifest motion, and synarthrosis, which has only an obscure motion. — Also, the distinct utterance of every letter, syllable, or word, so as to make one's-self intelligible.

ARTIFICER, one who works with the hands, and manufactures any kind of commodity in metal, wood, &c. a mechanic.

ARTIFICIAL DAY, in astronomy, that space of time which intervenes between the rising and setting of the sun.

ARTIFICIAL LINES, in geometry, lines so contrived on a sector as to represent logarithmal lines and tangents.

ARTILLERY, a collective name denoting engines of war, but particularly cannon, mortars, and other large pieces, for the discharge of shot and shells. It is also employed to denote the science which teaches all things relating to the artillery, as the construction of all engines of war, the arrangement, movement, and management of cannon and all sorts of ordnance, used either in the field, or the camp, or at sieges, &c. The same name is also given to the troops by whom these arms are served, the men being, in fact, subsidiary to the instruments. — *Park of artillery*, a place set apart in a camp for the artillery and large fire arms. — *Train of artillery*, a set or number of pieces of ordnance mounted on carriages. — *Flying artillery*, a sort of artillery, so called from the celerity with which it can be moved. Scats are contrived for the men who work it, and a sufficient force of horses is applied to enable them to proceed at a gallop, each horse being rode by a separate driver.

ARTIMOURANTICO, in metallurgy, a recently discovered compound of tin, bismuth, sulphur, and copper, having greatly the appearance of gold.

ARTIST, a proficient in the liberal arts, in distinction from *Artisan*, or one who follows one of the mechanic arts.

ARTS, in the most general sense of the word, means any acquired skill. They are usually divided into *free* and *useful*, comprising under the former, all those, the direct object of which is not absolute utility, as painting, sculpture, music, poetry, &c. in distinction to the arts called *useful*, or such as are essential to trade and commerce.

ARVALES FRATRES, in Roman antiquity, a college of twelve priests, instituted by Romulus, who himself made one of the body. They assisted in the sacrifices of the Ambervalia, offered annually to Ceres and Bacchus, for the prosperity of the principal fruits of the earth.

ARUNDELIAN MARBLES, called also the Parian Chronicle, are ancient stones, on which is inscribed a chronicle of the city of Athens, supposed to have been engraven in capital letters, in the island of Paros, 264 years before Christ. They take their name from the earl of Arundel, who procured them from the East, or from his grandson, who presented them to the University of Oxford.

ARSPICES, or **HARUSPICES**, an order of priesthood among the Romans, who pretended to foretell future events by inspecting the entrails of victims killed in sacrifice. They were introduced by Romulus, and abolished by Constantine, A.D. 337.

ARVIL, or **ARVAL**, in archaeology, fu-

IN THE ATTAINMENT OF ALL EXCELLENCE IN THE ARTS, PATROVAGE AND GENIUS SHOULD EVER GO HAND IN HAND.

ASCARIDS OF DIFFERENT KINDS LIVE IN THE SKINS OF ANIMALS, AND ATTACH THEMSELVES TO THE BODIES OF BEETLES AND OTHER INSECTS.

neral rites.—ARVIL BREAD, bread given to the poor at a funeral.

ARYTHMUS, in music, the modulation of time.

AS, a weight used by the ancients, consisting of 12 ounces: it was also used as a coin, and as an integer divided into 12 parts.

ASAFOETIDA, a resinous gum of a very fetid smell, obtained from the *ferula amygdaloides*, a perennial plant, which is a native of Persia. It comes into this country in small grains of different colours, hard and brittle, and is considered an excellent remedy in hysterical disorders.

ASAPHATUM, in medicine, a sort of serpigo, supposed to be generated in the pores like worms.

A SAPHES, defective utterance.

ASAROTA, in antiquity, a pavement or floor laid in dining rooms, and composed of very small tiles inlaid in different colours.

ASASI, a tree growing on the coast of Guinea, the infusion of whose leaves cures the tooth ache.

ASBESTUS, or ASBESTUS, an inflammable mineral substance, of which *amianthus* is one of its principal species. This consists of elastic fibre, somewhat unctuous to the touch, and slightly translucent. The ancients manufactured cloth from the fibres of the asbestos for the purpose, as is said, of wrapping up the bodies of the dead when exposed on the funeral pile, it being incombustible in its nature.

ASCARIDES, worms that infest the intestines *rectum*, and cause a violent itching, also a kind of worms which infest the intestines of all animals.

ASCENDANT, in Law, such relation as are nearer the root of the family, as the father, grandfather, great uncle, &c. Marriage is always forbidden between the ascendants and descendants in a right line.

—ASCENDANT, in astrology, that degree of the ecliptic that rises at a person's nativity, or the planet supposed to preside over the fate of an individual at his birth.

—ASCENDANT, in architecture, an ornament in masonry or joiner's work, which borders the three sides of doors, windows, and chimneys.

ASCENDING, in astronomy, an epithet applied to any star, deklin, or point in the heavens, which is rising above the horizon.

—ASCENDING LATITUDE, the latitude of a planet when going toward the north pole.—ASCENDING NODE, that point of a planet's orbit, wherein it passes the ecliptic to proceed northward.—ASCENDING SIGNS, those which are upon the ascent, or rising, from the nadir to the zenith.

ASCENSION, in astronomy, that degree of the equator reckoned from the first of Aries eastward, which rises with the sun or a star. This is either right or oblique, according as it rises in a right or an oblique sphere.—ASCENSIONAL DIFFERENCE, the difference between the right and the oblique ascension in any part of the heavens.

ASCENSION DAY, a festival observed in the Christian church, ten days before

Whitsuntide, in memory of our Saviour ascending into Heaven. It is otherwise called Holy Thursday.

ASCENSUS MORBI, in medicine, the ascent or increase of a disease.

ASCENT, in a general sense, the motion of a body upwards. The ascent of light bodies is owing to the preponderancy of heavier ones, whereby they are impelled upwards.—ASCENT OF FLUIDS, the rising of fluids in a glass tube or any vessel above the surface of their own level.—ASCENT, in logic, a sort of reasoning by which one ascends from particulars to universals.

ASCETICS, in ecclesiastical history, such Christians in the primitive church as insured themselves to great degrees of abstinence and fasting, in order to subdue their passions. In short, every kind of uncommon piety laid claim to the name *ascetic*.

ASCIA, in geography, inhabitants of the globe having no shadow, such as those in the torrid zone, who twice a year have their sun at noon in the zenith.—ASCIA, in surgery, a bandage in the form of an axe.

ASCIDIA, in entomology, a genus of animals of the *mollusca* species, found principally in the sea, adhering to rocks, shells, and other submarine substances.

ASCITES, in medicine, dropsy in the region of the abdomen.

ASCLEPIA, a Grecian festival, held in honour of *Æsculapius*. It was also called the sacred contest, because poets and musicians contended for victory there.

ASCLEPIADIAN VERSE, a kind of poetic measure, so called from *Æsclepius*, the inventor of it.

ASCLEPIAS, in botany, a genus of plants, of which the species are mostly perennials and shrubs. Class 5, *Pentandria*, Order 2, *Digynia*.

ASCOLIA, in Grecian antiquity, a festival celebrated by the Athenian husbandmen, in honour of *Bacchus*, to whom they sacrificed a he-goat, because that animal destroys the vines.

ASCYRUM, in botany, a genus of plants with a roseaceous flower, and an oblong capsular fruit, formed of two valves, and containing a number of small, roundish seeds. It belongs to the *polyadelphia polyandra* class of *Linneus*.

ASL, in medicine, a term formerly used to denote a loathing of food arising from a diseased stomach.

ASH, a well known English tree, whose wood is much used by wheelwrights, turners, &c. There are several kinds, the common, flowering, mountain ash, &c.

ASHES, the remains of any vegetable, animal, or mineral substance that has been burned, and when of metals, called dross, calces, or oxides.

ASCRIPITIL, in ancient history, supernumerary soldiers, who served to supply the losses in the legions. Also, in later times, foreigners or aliens newly admitted to the freedom of a city.

ASH LAB, free-stone as it comes from the quarry.

"ASCENDING VESSELS" IN ANATOMY, ARE THOSE WHICH CARRY THE BLOOD TOWARD THE UPPER OR SUPERIOR PARTS OF THE BODY.

[ASP]

A New Dictionary of the Belles Lettres.

[ASS

THE DEAD SEA IS FREQUENTLY TERMED THE ASPHALTIC LAKE, FROM THE LIQUID ASPHALTUM WHICH FLOATS ON ITS SURFACE.

ASHORE, a term for on the shore or land, as opposed to aboard; but a ship is said to be *ashore* when she has run aground.

ASH-WEDNESDAY, the first day in Lent, so called from the ancient custom of fasting in sackcloth and ashes.

ASIRARCH, in Grecian antiquity, a governor of the provinces, who used to preside over the public games.

ASIDE, a term in plays for what is to be said on the stage without being heard by the other performers.

ASILUS, in entomology, a genus of insects in the Linnean system, of the order *diptera*.

ASINARIA, a festival anciently held in Sicily, in commemoration of the victory obtained over the Athenians, when Demosthenes and Nicias were taken prisoners; and was so called from the river Asinarus, near which it was fought.

ASP, in zoology, a very small kind of serpent, (the *Coluber aspis* of Linneus), peculiar to Lybia and Egypt. Its bite is so fatal, and its effects so quick, that death ensues without the possibility of applying a remedy.

ASPARAGUS, a valuable esculent plant, which requires three years at least to bring it to maturity from the time of sowing the seed, and will not yield vigorously without a continual supply of manure.

ASPEN-TREE, a kind of white poplar, the leaves of which are perpetually in a tremulous motion.

ASPERIFOLIATE, or **ASPERIFOLI- OUS**, among botanists, such plants as are rough leaved, having their leaves placed alternately on their stalks, and a monopetalous flower divided into five parts.

ASPERIFOLLE, the 41st Linnean natural order of plants, with rough leaves.

ASPHALTUM, a bituminous or indam- mable substance, found in abundance in different countries, especially near the Dead Sea, and in Albania; but nowhere in such quantities as in the island of Trinidad, where there is a large plain of it, called the Tar Lake, which is three miles in circum- ference and of an unknown depth. It is also found in France, Switzerland, and some other parts of Europe. It appears in detached masses of no regular structure, breaking easily in any direction, very light, fusible, and after burning some time with a greenish white flame, leaving a residuum of white ashes. The ancients employed asphaltum in the construction of their build- ings; and at the present day it is used par- tially in lieu of stone, in paving the streets of London. In short, several "asphalt companies" have been formed with a view of prosecuting it as a commercial specula- tion; and, judging by the specimens we have seen, we are induced to think it will eventually be very generally introduced.

ASPER, a Turkish coin, equal to three farthings of our money.

ASPHODEL, in botany, a genus of the *hexandria monogynia* class of plants, the flower of which is lilaceous. We are told that the ancients used to put asphodel into

the tombs, that there might be food in the regions below for the departed spirits.

ASPIRYXIA, in medicine, the state of a living body in which no pulsation can be perceived.

ASPIRATE, in grammar, a character in the Greek (marked thus, '^{h}) to denote that the vowel must be sounded with a breath- ing. In English, the letter *h* is called as- picate, when it is sounded, in distinction to *h* mute.

ASS, (*equus asinus*) a patient and useful quadruped, remarkable for its hardihood and length of life. Notwithstanding the dull and dogged disposition of this animal in our climate, it is a descendant of the wild ass, inhabiting the mountainous de- serts of Tartary, &c.; celebrated in sacred and profane history, for the fiery activity of its disposition, and the fleetness of its course; but in consequence of ill usage and bad fare, the ass has long since become proverbial for stolid indifference to suf- fering, as well as for obstinacy and stu- pidity. Its characteristics are a long head, long ears, a round body covered with a short and coarse fur, of a pale dun colour, with a streak of black running down its back and across the shoulders, and a tail not hairy all the way, as in a horse, but only at the end. The best breed of asses is that originally derived from the hot and dry regions of Asia; but the best to be met with in Europe are the Spanish.

ASSASSIN, one who kills another, not in open combat, but privately, or suddenly. The name is generally restrained to mur- derers of princes or other political charac- ters; or, to speak perhaps more explicitly, to where the murder is committed from some sentiment of hatred, but in a private and dastardly manner.

ASSAI, a musical term, which indicates that the time must be accelerated or re- tardated; as *allegro*, quick; *allegro assai*, still quicker; *adagio assai*, still slower.

ASSANE'GIL, in mineralogy, the powder that falls off from the walls of salt in the salt mines.

AS'SANTS, an ancient weight amounting to two drams.

ASSAULT, in law, an attempt or offer, with force and violence, to do a bodily injury to another; as by striking at him either with or without a weapon.—**AS- SAULT**, in the military art, a furious effort made to carry a fortified post, camp, or fortress, wherein the assailants do not screen themselves by any works.

ASSAYING, in metallurgy, is used to express those chemical operations which are made in small to ascertain the quantity of metal contained in ores, or to discover the value or purity of any mass of gold, silver, or any other metal. This mode of examination differs from analysis, in being principally concerned about only one of the ingredients in the ore or alloy, whereas the object of the latter is to ascertain the quantity and proportion of every sub- stance in the mass to which it is applied.

ASSAY-MASTER, an officer, under cer-

A COMPOSITION OF ASPHALT, LAMP-GLASS, AND OIL IS USED FOR DRAWING BLACK FIGURES ON DIAL-PLATES.

[ASS]

The Scientific and Literary Treasury ;

THE TERM "ASSETS" WAS SOMETIMES APPLIED TO THE GENERAL COUNCIL, OR ANCIENT WITTEVAMOTE, OF ENGLAND.

tain corporations, entrusted with the care of making true touch, or assay, of the gold and silver brought to him, and giving a just report of the goodness or badness thereof.

ABSENT (THE ROYAL), is the approbation given by the king (or reigning monarch) in parliament to a bill which has passed both houses; after which it becomes a law.

ASSETS, in law or trade, signifies goods or property enough to answer all demands made upon them.—**REAL ASSETS** are lands in fee simple whereof a man dies possessed.—**PERSONAL ASSETS**, any personal estate.

ASSIDENT SIGNS, in medicine, symptoms which occasionally attend any disease incident to the human frame.

ASSIGNABLE MAGNITUDE, in mathematics, any finite magnitude that can be expressed or specified.

ASSIGNAT, the name of the national paper currency in France during the Revolution. Four hundred millions of this paper money were first struck off by the constituent assembly, with the approbation of the king, April 19, 1790, to be redeemed with the proceeds of the sale of the consecrated goods of the church. They at length increased, by degrees, to forty thousand millions, and after a while they became of no value whatever.

ASSIGNEE, in law, a person appointed by another to do an act, transact some business, or enjoy a particular privilege. The person to whom is committed the management of a bankrupt's estate.

ASSIGNMENT, in law, the act of assigning or transferring the interest or property a man has in a thing, or of appointing and settling over a right to another.

ASSIMILATION, that process in the animal economy by which the different ingredients of the blood are made parts of the various organs of the body.

ASSIZES, a meeting of the king's judges, the sheriff, and jurors, for the purpose of making good-delivers, and trying causes between individuals, generally held twice in the year. The assizes are *general* when the justices go their circuits, with commission to take all assizes, that is, to hear all causes, and they are *special* when special commissions are granted to hear particular causes.

ASSOCIATION OF IDEAS. By this phrase is understood that connexion between certain ideas which causes them to succeed each other involuntarily in the mind. To the wrong association of ideas made in our minds by custom, Mr. Locke attributes most of the sympathies and antipathies observable in men, which work us strongly, and produce as regular effects, as if they were natural, though they at first had no other origin than the accidental connexion of two ideas, which (either by the strength of the first impression, or future indulgence, are so united, that they ever after keep company together in that man's mind as if they were but one idea.

ASSODES, in medicine, a fever with excessive inward heat, though not so great externally.

ASSOILE, in our ancient law-books, to absolve, free, or deliver one from excommunication.

ASSONANCE, in rhetoric or poetry, is where the words of a phrase or verse have nearly the same sound, or termination, but make no proper rhyme.

ASSUMPSIT, in law, a voluntary promise by which a man binds himself to pay any thing to another, or to do any work.

ASSUMPTION, a festival in the Romish church, in honour of the miraculous ascent of the Virgin Mary into heaven.—**ASSUMPTION**, in logic, is the minor or second proposition in a categorical syllogism. It is also used for a consequence drawn from the propositions whereof an argument is composed.

ASSUMPTIVE ARMS, in heraldry, are such arms as a person has a right to assume to himself by virtue of some action, provided his right be confirmed by the approbation of his sovereign and the heralds.

ASSURANCE, or **INSURANCE**, an engagement by which a person is indemnified from the loss he would sustain by the happening of a particular event, as by the capture or wreck of a ship at sea, the destruction of property by fire, or by the death of the party.—**ASSURANCE**, in theology, is the firm persuasion of possessing a personal or actual interest in the divine favour.

ASTER (Stewart), in botany, a genus of the *syngenesia polygamia* class of plants, with a radiated flower, the disk of which is composed of florets, and its border of semifloretules, the receptacle is plane and naked, and the seeds are of an oblong figure, oval at top, and winged with down.

ASTEBIAS, in ichthyology, the Star fish or Sea star, a genus of animals, class *terres*, order *mollusca*. They feed on oysters, to whose beds they are very destructive. The species are distinguished into the *lunate*, *stellate*, &c.

ASTERISK, a little mark in the form of a star (*) used in printing as a mark of reference.

ASTERISMUS, in astronomy, an asterism or constellation of fixed stars.

ASTERN, a maritime term for behind a ship.

ASTEROIDES, or **ASTEROIDS**, the four small planets, Ceres, Juno, Pallas, and Vesta.

ASTHMA, a disease of the lungs, causing painful, difficult, and laborious breathing, with a hissing cough.

ASTRAGAL, in architecture, a little round moulding, in form of a ring, serving as an ornament at the tops and bottoms of columns.—**ASTRAGAL**, in gunnery, the corner ring of a piece of ordnance.

ASTRAGALUS, in anatomy, the ankle-bone.—**ASTRAGALUS**, in botany, Liqueur-Vetch, the seed of which resembles in shape the ankle bone. It is also the name of a genus of plants, of the *diadelphia-decandria* class.

AN ASSIGNEE DIFFERS FROM AN ASSIZE IN THIS, THAT THE LATTER COVERS ONE'S INTEREST IN PROPERTY FOR A LIMITED TIME ONLY.

[AST]

[AST]

ASTRICTA, in medicine, an epithet applied to the belly, in opposition to *soluta*, or relaxed.

ASTRICTION, the operation of astrin-gent medicines.

ASTRINGENTS, medicines of the cor-roborative class, which, acting as a stimu-lus, crisp and corrugate the fibres into a more compact tone, corroborate the solids, which are weakened, and consolidate such as are corroded and wounded. Such are the mineral acids and solutions of iron, zinc, &c. Peruvian bark is also highly astringent.

ASTROLABE, in geometry, an instru-ment for the accurate measurement of angles. It generally consists of a horizon-tal circular plate of metal, having the de-grees, minutes, and seconds marked on its outer edge. The astrolabe was formerly used by navigators to discover the situation of a vessel at sea without the aid of the compass, but it is now superseded by Had-ley's quadrant.

ASTROITES, or **STAR STONE**, a stone so called on account of its resemblance to a star. It has often been questioned among naturalists, whether they are parts of a pe-trified marine animal, or, as is more proba-ble, a species of corals buried in the earth. The corals forming these stars are some-times round, at other times angular, and their columns are sometimes se-parated, and sometimes the striae run into each other.

ASTROLOGY, is an art which may truly be said to be among the oldest superstitions in the world, and which consisted in judg-ing or predicting human events from the situation and different aspects of the hea-venly bodies. We read of it in the Mosaeic history; and we know that those who pro-fessed the astrological art gave so much trouble at Rome, that they were at length banished by Tiberius. During the middle ages astrology and astronomy were culti-vated in connexion by the Arabs, and their works on the subject are still extant. Nay, even so late as the 17th century astrology had its defenders among the learned men of Europe, but the Copernican system shook the foundations of the ancient science, and there are now but artful plunderers and ignorant dupes who, at the present day, give it the slightest counte-nance.

ASTRONOMY is that science which treats of the heavenly bodies, explaining the motions, times, and causes of the motions, distances, magnitudes, gravities, light, &c. of the sun, moon, and stars, the nature and causes of the eclipses of the sun and moon, the conjunction and opposition of the plan-ets, and any other of their mutual aspects, with the time when any of them did or will happen. As the heavens may be considered either as they appear to the naked eye, or as they are discovered by the understand-ing, astronomy may be divided into *spheri-cal* and *theoretical*. Spherical astronomy is the consideration of the universe as it offers itself to our sight, under which head come all the appearances of the heavens, such as we perceive them, without any inquiry into

the reason, the theory, or the truth of these appearances. Theoretical astronomy is the consideration of the true structure of the universe, accounting for the various phe-nomena of the heavenly bodies. This sub-lime science is founded in observation, but it receives its last perfection from calcula-tion. Outrunning the cautious advances of observation, it descends from causes to phe-nomena, and on geometrical principles ex-plains all the motions, magnitudes, and pe-riods of revolution, of the heavenly bodies. This part has been called *descriptive astron-omy*, and that which explains the causes of their motions, and demonstrates the laws by which those causes operate, *physical as-tronomy*. It is not within the scope of this work, however, to enter into the details of this science, but we shall briefly notice the most striking portions of its history. The generality of writers agree in assigning the origin of astronomy to the Chaldeans soon after the deluge, when, for the purpose of making their astrological predictions, to which they were much addicted, as also for that of advancing the science of astronomy, they devoted themselves to the study of the heavenly bodies. They discovered their mo-tions and peculiar characters, and, from their supposed influences on human affairs, pretended to predict what was to come.

The planets they called their interpreters, ascribing to Saturn the highest rank, the next in eminence was Sol, the sun, then Mars, Venus, Mercury, and Jupiter. By the motions and aspects of all these they fore-told storms of wind and of rain, or excessive droughts, as also the appearance of comets, eclipses of the sun and moon, and other phenomena. The Egyptians also cultivated the science of astronomy about the same time, and there are some who ascribe to them the honour of being its real authors. The most ancient astronomical observations known to us are Chinese. (One, mentioned by Montucla, viz. a conjunction of Saturn, Jupiter, Mars, Mercury, and the Moon, oc-curs almost 2500 years before the Christian era.) That the Indian Brahmins also made considerable advances in the science of as-tronomy, among the earliest people of an-tiquity, appears no less certain. But in the obscurity of ancient history it is no easy task to determine to what nation the merit is actually due. Descending, however, to classic times, we find, that astronomy made great progress in Greece, and that Thales calculated a solar eclipse about 600 years a. c. Pythagoras also seems to have been possessed of astronomical knowledge. Af-ter him, the Athenian Meton (a. c. 433) in-troduced the famous lunar cycle of 19 years, at the end of which time the new moon ap-pears on the same day of the year as at the beginning of it, since 19 solar years consti-tute very nearly 235 lunations, a discovery which was then regarded as so important, that the calculation was engraved in letters of gold, whence the number which marks the year of the cycle is still called *golden*. Eratosthenes, a Cyrenian, who was born 271 a. c. measured the circumference of the

earth; and, being invited to the court of Ptolemy Evergetes at Alexandria, he was made keeper of the royal library, and set up there the armillary spheres which Hipparchus and Ptolemy afterwards used so effectually. He also determined the distance between the tropics to be 11-83 of the whole meridian circle, which makes the obliquity of the ecliptic in his time to be 23 degrees, 51 minutes and one-third. Archimedes is said to have constructed a planetarium to represent the phenomena and motions of the heavenly bodies, and many others added to the stock of astronomical knowledge, but none so much as Hipparchus, who flourished about 140 years A.C. and surpassed all that had gone before him in the extent of his researches. He showed that the orbits of the planets were eccentric, and that the moon moved slower in her apogee than in her perigee. He constructed tables of the motions of the sun and moon, collected accounts of eclipses that had been computed by the Chaldeans and Egyptians, and calculated such as would happen for six hundred years to come, besides correcting the errors of Eratosthenes in his measurement of the earth's circumference, and computing the sun's distance more accurately. He is, however, most distinguished by his catalogue of the fixed stars to the number of a thousand and twenty-two, with their latitudes and longitudes, and apparent magnitudes. These and most other of his observations are preserved by his illustrious successor Ptolemy. From the time of Hipparchus, a chasm exists in the history of astronomy, till the commencement of the 2d century after Christ, when Ptolemy compiled a complete system of astronomy, in 13 books, which is known under the name of *Almagest*, given it by the Arabians, who translated it into their language in 427, and which, as the Ptolemaean system, notwithstanding its many errors, has maintained its value down to the latest times. The Arabians continued for many ages to direct their attention to astronomical science, and though they confounded it with the dreams of astrologers, they, nevertheless, deserve the regard of all who came after them, by their valuable observations. Among the Christian nations, at this period, a profound ignorance generally prevailed, but in the 13th century, astronomy, as well as other arts and sciences, began to revive in Europe, particularly under the auspices of the emperor Frederic II., who, besides restoring some decayed universities, founded a new one, and in 1230 caused the works of Aristotle, and the *Almagest* of Ptolemy, to be translated into Latin. King Alfonso of Castile, about the same time, invited to his court several astronomers, and commissioned them to prepare a set of new astronomical tables, which, under the name of *Alphonine Tables*, have acquired much celebrity, but, in the 17th century, differed a whole degree from the true situation of the celestial bodies. We now approach the era of reviving science. Many astronomers of inferior note paved the way, by various

insulated observations, for the great restorer of astronomy, Copernicus, who, at the beginning of the 16th century, gave the science an entirely different aspect, exploded the Ptolemaean hypothesis, and, in its stead, substituted the Copernican system of the world, which, with a few modifications, is still prevalent, and universally acknowledged to be correct. He it was that gave the sun its place in the centre of the planetary system, and who first conceived the bold idea that the earth is a planet, like Mercury, Venus, and the rest, and moves, in common with them, in a circle round the sun. His system did not, however, immediately meet with a general reception, and among other opponents was Tycho Brahe, a Dane, who asserted that the earth is immovable, in the centre of the universe, and that the whole heavens turned round it in 24 hours, an opinion which he supported, principally, by the literal sense of various passages in the Bible, where a total absence of motion is ascribed to the earth. His pupil and assistant Kepler, however, found that all the planets revolved in elliptical orbits, in one of the foci of which the sun was placed, and he moreover demonstrated that, in each elliptical revolution of the planets round the sun, an imaginary straight line, drawn from the latter to the former, always describes equal areas; and lastly, that, in the revolutions of the planets and satellites, the squares of the times of revolution are as the cubes of the mean distances from the larger body. These great discoveries paved the way for views still more comprehensive. Kepler had been indulged with a faint glimpse of the mutual tendency of all bodies to one another, and Dr Hook went so far as to show that the motions of the planets were produced by the attractive agency of the sun combined with the force which had originally projected them, but it was reserved for Newton to establish the law of universal gravitation in its entire generality, and to apply it with demonstrative evidence to all the movements within the solar system. His doctrine was, that all material bodies attract each other with a force directly proportional to the number of their particles, and inversely proportional to the squares of their distances. Descartes had sought the cause of the motion of the planets around the sun, and of the satellites around the planets, in the rotatory motion of a subtle matter. But Newton and Kepler have rescued the laws of the material universe from the thraldom of a false philosophy, and left to later times merely the development of the truths which they established. By the application of their principles, as well as by new discoveries, several succeeding astronomers have gained a high reputation, namely, Halley, by his theory of comets, Bouguer and Maupertius, by their exertions to determine the form of the earth, Mayer, by his lunar tables, Bradley, by the discovery of the aberration of light, also Euler, d'Alembert, Lalande, Lagrange, Laplace, Sir W. Herschel, Olbers, Piazzi, Encke, &c., besides many who are now in-

THE CHALDEANS HAD MADE ASTRONOMICAL OBSERVATIONS 1900 YEARS BEFORE THE TAKING OF BABYLON BY ALEXANDER, OR 330 B.C.

"TEXT, VIDI, VICI" IS AN EXAMPLE OF THE ASTRODETON; IT IS OPPOSED TO POINTSTRODETON, WHICH IS A MULTIPLICATION OF CONNECTIVES.

ing, among whom Sir John Herschel and Sir William South deserve especial mention. In conclusion, it may be observed, that this science unites the strictness of mathematical reasoning with an exalted feeling for the sublime and beautiful, and fills the mind both with confidence in itself, from its ability to calculate with certainty the career of distant worlds, and with becoming humility in reflecting how small a part of the universe is our earth, and how brief its known duration, compared with the immense periods which enter into the calculations of astronomy.

ANTROSCOPE, an astronomical instrument, composed of two cones, on whose surface the constellations are delineated, by means of which the situation of the stars may easily be known.

ASTROSCOPIA, in astronomy, the art of examining the stars by telescopes.

ASTRUM, in astronomy, a constellation or assemblage of stars.—In alchemy, ASTRUM denotes the power imparted by chemical mixture.

ASYLUM, in antiquity, a place of refuge for offenders, where they were screened from the hands of justice. The asyls of altars and temples were very ancient. The Jews had their asyls; the most remarkable of which were, the temple, the altar of burnt offerings, and the six cities of refuge. A similar custom prevailed both among the Greeks and Romans, where temples, altars, and statues, were places of refuge for criminals of every description. They had an idea, that a criminal who fled to the temple or altar, submitted his crime to the punishment of the gods, and that it would be impious in man to take vengeance out of their hands. In former times the like immunities were granted by the pope to churches, convents, &c.; and so well did the ecclesiastics improve their privileges, that convents in a little time became a kind of fortresses, where the most notorious offenders were in safety; nor could they be removed without a legal assurance of life, and an entire remission of the crime.

A'SYMPTOTE, in mathematics, a line which approaches nearer to another continually, and never meets it. It is properly applied to straight lines approaching a curve.

ANYN'DETON, in rhetoric or composition, the omission of conjunctions, or other connecting particles of speech, in order to render the sentence more lively and impressive.

ATABAL, a kind of tabor used among the Moors.

ATARAX'IA, or ATARAXY, a term used to denote that calmness of mind which secures us from all emotions arising from vanity or self-conceit. In this consisted the *summum bonum*, or sovereign good, of the Stoics.

AT'AXY, in a general sense, the want of order; by physicians it signifies the irregularity of crises and paroxysms of fevers.

AT'CHIEVEMENT, or ACHIEVEMENT, in heraldry, means the arms of any

family, with all the ornaments appendant thereto, painted on canvas, and fixed to the dwelling house of a person deceased, to denote his death.—HATCHMENT is the usual, though not the correct word.

A-TEM'PO, in music, Italian for 'in time,' employed when the regular measure has been interrupted.

ATHANA'SIA, in ancient medicine, an epithet given to a kind of antidote, supposed to have the power of prolonging life, even to immortality.

ATHANA'SIAN CREED, a formula of faith ascribed to St. Athanasius, which has been adopted into the liturgy of the Church of England.

A'THEIST, one who denies the existence of God or Providence. Some distinguish speculative atheists, or those who are so from principle and theory; from practical atheists, whose wicked lives incline them to believe, or rather to wish, that there were no God. Perhaps it is not to be wondered at, that among the smatterers in that philosophy which describes matter as acting upon matter by necessary laws, and thus producing necessary effects, some should be tempted to reject the existence of a primitive and preserving cause: especially, as in the pursuit of that philosophy the mind is accustomed to find every thing explained upon mechanical and comprehensible principles, while a distinct conception of a God exceeds the intellectual capacity of man. Lord Bacon observes, that though a smattering of philosophy may lead a man into atheism, a deep draught will certainly bring him back again to the belief of a God and Providence. We may have analyzed the component parts of matter, and reduced those parts into atoms; but, after all, what have we found that will supply the place of a Creator? It were more rational to believe that the majestic oak produces, of its own power and intelligence, its foliage and its fruit, than that atoms, of their power and intelligence, produced the majestic oak. Matter, then, must have had a Creator; and it is of little consequence to the fact, whether it acts upon instinctive endowments, or is senseless, and obeys controlling laws: in either case, a superior power and intelligence are indispensable. This power and intelligence must have existed from all eternity; since, if it ever began to be, it must have had a cause capable of producing it; and thus, to whatever distance we push the perspective, a deity closes up the scene: it must exist eternally, unless that which produced all matter, can itself be annihilated, and the source of life expire.

ATH'ELING, the title given to the king's eldest son among the Saxons, as the Prince of Wales is in our time.

ATHENÆUM, in antiquity, a public school wherein the professors of the liberal arts held their assemblies, the rhetoricians declaimed, and the poets rehearsed their performances. These places, of which there were a great number at Athens, were built in the manner of amphitheatres, encompassed with seats called *cunei*. The three

BY "ASTRO-THEOLOGY" IS MEANT, THAT SYSTEM OF THEOLOGY WHICH IS FOUNDED ON THE OBSERVATION OF THE CEREAL BODIES.

The Scientific and Literary Treasury ;

[ATM]

most celebrated Athenæa were those at Athens, at Rome, and at Lyons, the second of which was built by the emperor Adrian.

ATHENIP PUM, in medicine, an affusion for the eyes.

AHER, the prickly part or beard of barley.

ATHERA, in medicine, a kind of pap for children, also a kind of liniment.

ATHROMA, in surgery, a soft uninfamed tumour, generally contained within a cyst or bag, and often found under the arm pits, the finger-joints, &c.

ATHLETÆ, in antiquity, men of remarkable strength and agility, disciplined to perform in the public games. This was a general term, under which were comprehended wrestlers, boxers, runners, leapers, throwers of the disk, and those who practised in other exercises exhibited in the Olympic, Pythian, and other solemn sports, wherein there were prizes allotted for the conquerors.

ATHLOTHETÆ, in antiquity, the judges who presided at the athletic games.

ATHWART, a sea term, signifying across the line of a ship's course.

ATHYMIA, in medicine, defection of spirits attendant upon some diseases.

ATIBALL, in commerce, gold dust on the coast of Africa.

ATLAN TES, in architecture, images of men, as pillars, supporting the buildings like the Caryatides.

ATLAN TIDES, in astronomy, another name for the Pleiades.

ATLAS, in geography, a collection of maps, more properly, a book containing maps of the whole world, so called from Atlas, who was said to have borne the world on his shoulders. It is also the name of a chain of high mountains in Africa, extending from the coast of the Atlantic to the border of Egypt — Atlas, a rich kind of satin, manufactured in the East Indies, plain, striped, or flowered, and inter-worked with gold. The art is manufactured with an excellence beyond the reach of European art, and was formerly in great repute, though but little used now.

ATMOSPHERIC, is that invisible elastic fluid, or vast collection of air, which surrounds the earth to an unknown height, and encloses it on all sides, a fluid essential to the existence of a human and vegetable life, and even to the constitution of all kinds of matter whatever. This aerial fluid, or atmosphere, is not only admirably fitted for the respiration and nourishment of animals, for the growth of vegetables, the production and propagation of sounds, &c. but greatly contributes also to make our habitable earth that beautiful scene of variety which it now is. The numberless small particles of various kinds, which float in the air, receive the light from the sun, and like so many small specula or looking glasses, reflect and scatter it through the air, and this occasions that light which we see in the daytime, by which our eyes are affected so strongly, as to render the fainter light of the stars insensible. By this means the

stars are illuminated all round us by the sun, not only whilst he is above our horizon, but also for some time before his rising, and after his setting, so long as any of his rays can either directly, or by refraction, reach any part of the atmosphere within our visible horizon; for the air, as well as all other mediums which transmit light, refracts or bends the rays of it, if they come into it from a different medium.

—*Height, Weight, and Pressure of the Atmosphere.* Though it is impossible to ascertain the real height of the atmosphere, it nevertheless appears certain from experiments, that 45 or 50 miles is the utmost height where the density is sufficient to reflect a ray of light, and, therefore, that may be accounted the altitude of the atmosphere, to the least sensible degree of density. If the air were of an equal density throughout, the height of the atmosphere might be determined for it appears from experiments, that a column of air 72 feet high is equal in weight to one inch of water of the same base, so that the density of air is to that of water as 1 to 864. It has also been found by experiment, that the weight of a column of air, reaching to the height of the atmosphere, will be equal to the weight of a column of water of the same base, and 32 feet, or 344 inches high. Hence 864×344 gives 297776 inches, or somewhat more than five miles for the height of the atmosphere, were the density of the air every where the same as at the earth. But since its density decreases with the pressure, it will be more rarified and expanded the higher we go, by which means the height of the atmosphere becomes indefinite, and terminates in pure ether. The pressure of the atmosphere on the whole surface of the earth is said to be equivalent to that of a globe of lead of sixty miles in diameter. Admitting therefore the surface of a man's body to be about 15 square feet, and the pressure about 15lb on a square inch, it is computed that a man must sustain 32,400lb., or nearly 11 tons, and a half weight, but the difference in the weight sustained in different states of the atmosphere may be as much as a ton and a half. Taking this calculation as a philosophical fact, and that every animal supports so many fifteen pounds as the surface of the body contains square inches, it may naturally be asked, why men and beasts are not crushed to pieces by such a prodigious weight of air? To this we reply that the repeated experiments which have been made, by means of the air pump, fully demonstrate that it is owing to the equilibrium of the internal air, or the air included in all bodies, which, though it be small, can, by its reaction, counterpoise and resist the pressure of the external air, how great soever it be. But there are many other atmospheric phenomena, equally extraordinary, and still more difficult to explain, than those which have been here noticed. Among the principal ones are heat and electricity. The first raises and suspends the evaporated waters invisibly in the air, until some more

BOAR PROOF AND SNOW PRESENT TO THE EYE, WHEN SEEN THROUGH A MICROSCOPE, AN ENDLESS VARIETY OF CRYSTALS.

powerful attraction dissolves the union, and the moisture again revisits the earth in the various forms of clouds, mist, rain, dew, snow, hail, sleet, or hoar frost, while to electricity may be principally attributed the lightning, the aurora-borealis, and other igneous meteors. The constituent parts of the earth's atmosphere are nitrogen and oxygen, which are found every where, and at all times, nearly in the proportion of 79 to 21. Besides these, there is a small portion of carbonic acid, a variable portion of aqueous vapour, and a very small quantity of hydrogen. It also contains, in the form of vapour, a multitude of adventitious substances, in those injurious mixtures known under the name of *miasmata*, the nature of which can hardly be investigated. By means, however, of the currents of air, which we term *winds*, the whole of the ingredients of the atmosphere are continually amalgamated together, for we find that though the atmosphere may diminish in lightness as we ascend, there is precisely the same general character pervading it throughout. By gradual, but almost insensible expansions, the equipoised currents of the atmosphere are disturbed, the stormy winds arise, and the waves of the sea are lifted up, and that stagnation of air and water is prevented which would be fatal to animal existence.

We will conclude this article by quoting a few of Professor Leslie's plain and simple facts on this interesting subject. 1 The mean height of the barometer (that is, the mean weight or pressure of the atmosphere) at the level of the sea, is the same at every part of the globe. 2 The mean temperature of the earth's surface increases gradually from the poles to the equator. 3 The mean temperature of the atmosphere decreases from below upwards in a regular gradation. 4 The heating and cooling of the atmosphere, by the changes of day and night, take place equally throughout its mass. 5 A wind generally acts from the sea to the land during the day, and from the land to the sea during the night, especially in hot climates. 6 As we advance towards the polar regions, we find the irregularities of the wind increased, and storms and calms repeatedly alternate, without warning or progression. 7 More than two currents may often be traced in the atmosphere at one time, by the motion of clouds, &c. 8 The force of the winds does not always decrease as the elevation increases, but, on the contrary, is often found to augment rapidly. 9 Northerly winds almost invariably raise the barometer, while southerly winds constantly depress it. The same authority also states, that the British islands are situated in such a manner as to be subject to all the circumstances which can possibly be supposed to render a climate irregular and variable. Placed nearly in the centre of the temperate zone, where the range of temperature is very great, their atmosphere is subject, on the one side, to the impressions of the largest continent in

the world, and, on the other, to the vast Atlantic Ocean. Upon their coasts the great stream of aqueous vapour perpetually arising from the western waters, first receives the influence of the land, whence emanate those condensations and expansions which deflect and reverse the grand system of equipoised currents. They are also within the terrific effects of the immense barriers and fields of ice, which, when the shifting position of the sun advances the tropical climate towards the northern pole, counteract its energy, and present a condensing surface of enormous extent to the increasing elasticity of the aqueous atmosphere.

ATMOSPHERIC TIDES, are certain periodical changes in the atmosphere, similar to those of the ocean, and produced from nearly the same causes, of this description are the equinoctial winds.

ATOM, in philosophy, a particle of matter, so minute as to admit of no division. Atoms are the *minima nature*, and are conceived as the first principal or component parts of all physical magnitude. From the earliest times of antiquity, down to the present day, two opinions directly opposed to each other, have divided the world on this subject, the one, that matter is composed of an assemblage of minute particles, or atoms, incapable of farther division, the other, that there is no limit to its divisibility, the smallest conceivable portion still consisting of an infinity of parts. The first of these theories, which is commonly distinguished by the name of the Atomic Philosophy, was originated in Greece by Leucippus, it was supported by Democritus, and subsequently improved by Epicurus and his disciples. The Epicureans professed to account for the origin and formation of all things by supposing that these atoms were endued with gravity and motion, and thus came together into the different organized bodies we now see.

ATOMIC THEORY, a phrase expressive of a species of philosophy recently introduced into chemistry, and grounded on the axiom that "chemical union consists in the combination of the atoms of bodies with each other," so that when two bodies chemically unite and form a third body, the two substances united are dispersed every where through the new compound.

ATONY, a defect of tone or tension, or a relaxation of the solids of the body.

ATRA BILIS, a disposition to a dark bilious secretion, usually visible throughout the whole frame.

ATRACTYLIS, a plant called distaff-thistle, the leaves of which are aperitive and sudorific.

ATRIEN SLS, in Roman antiquity, servants entrusted with the care of the most valuable description of property.

ATRIP, in nautical language, is applied either to the anchor or sails. The anchor is *atrip* when it is just drawn out of the ground in a perpendicular direction. The top sails are *atrip* when they are just started from the cap.

THE BRILLIANT TINTS SEEN AT THE RISING AND SETTING OF THE SUN, ARE CAUSED BY THE REFRACTIBILITY OF THE INTERCEPTING VAPOURS.

[ATT]

The Scientific and Literary Treasury ;

[ATT

ATROPA, or **DEADLY NIGHTSHADE**, a genus of plants, one species of which, namely the *Atropa Belladonna*, is remarkable for bearing berries of a fine black colour, which are highly poisonous. The flowers are bell-shaped, dusky on the outside and purplish within. The fruit has a nauseous sweet taste, and is full of small kidney-shaped seeds.

ATROPHY, a disease wherein the body, or some of its parts, not receiving necessary nutriment, insensibly waste away and decay.

ATTACHMENT, in law, the taking or apprehending a person, by virtue of a writ or precept. It differs from an arrest, inasmuch as it lays hold of the goods, as well as the person, and also from a distress, which seizes on lands, tenements, and goods, but an attachment on the goods and body.—**ATTACHMENT OF PRIVILEGE**, is by virtue of a man's privilege to call another to that court whereto he himself belongs, and in respect whereof he is privileged to answer some action.—**FOREIGN ATTACHMENT**, is an attachment of money or goods, found within a liberty or city, to satisfy some creditor within such liberty or city. By the custom of London, and several other places, a man can attach money or goods in the hands of a stranger, to satisfy himself.

ATTACK, in the military art, a general assault, or onset, made to gain a post, or any particular point. Every combat consists of attack and defence the first is generally the most advantageous, and an experienced general chooses it, if possible, even in a defensive war. Those attacks are considered the best, where all the forces can be directed in concert towards that point of the enemy on which his position depends.

ATTAIN'DER, the name of a law by which the estate and life of a traitor is forfeited. A Bill of Attainder is a bill brought into parliament for attainting persons convicted of high treason. A person attainted of high treason forfeits all his lands, tenements, and hereditaments, his blood is corrupted, and he and his posterity rendered base, and this corruption of blood cannot be taken off but by act of parliament.—**ATTAIN'DERS** may be reversed or falsified (i. e. proven to be false) by writ of error, or by plea. If by writ of error, it must be by the king's leave, &c. and when by plea, it may be by denying the treason, pleading a pardon by act of parliament, &c.

ATTAINT, in law, a writ that lies after judgment against a jury of twelve men that are charged with having given a false verdict.—**ATTAINT**, in the veterinary art, is a diseased limb proceeding from a blow.

ATTELABUS, in entomology, a genus of insects of the beetle kind, the species of which are distinguished into those which have the jaws bidd, those which have the jaw one-toothed, and those which have the feelers clavate.—The *ATTELABUS CORYLI*, found chiefly on hazel-trees, &c. is of the first kind.

ATTENTION, the applying the ear or the mind assiduously to any thing said or done.—**ATTENTION**! the word of command given in the British army preparatory to any particular exercise or direction.

ATTENUANTS, medicines which promote the circulation as well as the discharge of all noxious and excrementitious matter. Of the vegetable kingdom, the whole tribe of acrid and bitter plants, are attenuants, of the animal kingdom, the volatile salts, as sal ammoniac, and saltpetre; and of the mineral kingdom, the mineral acid salts.

ATTIC, in architecture, a sort of building, in which there is no roof or covering to be seen, as was usual in the houses of the Athenians.—The **ATTIC**, or **ATTIC STORY**, is the upper story of a house.

The **ATTIC BAL** is a peculiar kind of column, or support, employed both in the Doric and Ionic orders.

ATTIRE, in botany, a name formerly used to denote the third part or division of the flower of a plant, the other two being the calyculament and the lobation.—In heraldry, the term **ATTIRE** designates the horns of stags and similar animals in blazoning coats of arms.

ATTITUDE, in painting and sculpture, the position and gesture of a figure or statue, or such a disposition of their parts, as shall best display some grace or beauty, or serve to express the action and sentiments of the person represented.

ATTOL'LENS, in anatomy, an epithet applied to some muscles, otherwise called *levatorum* and *elevatorum*.

ATTORNEY, one who is appointed by another to do a thing in his absence. A *public attorney* is one who acts in the courts of law, and is a lawyer by profession. No attorney can practise in any court, unless he has been admitted and sworn an attorney of that particular court. As an officer of the court in which he is admitted, an attorney enjoys several privileges, and is liable, on the other hand, to the censure and correction of the judges.

A *private attorney* acts upon particular occasions, and is authorized by a *letter of attorney*, which gives one full power to act for another.

ATTORNEY-GENERAL, a great law officer, appointed by the king to manage all affairs of the crown, either in criminal prosecutions or otherwise.

ATTRACTION, the power or principle by which bodies mutually tend towards each other, which varies according to the nature of the bodies attracted, and the circumstances under which this attraction takes place. Hence attraction is scientifically distinguished into the Attraction of Cohesion, Attraction of Gravitation, Attraction of Electricity, Attraction of Magnetism, and Chemical Attraction.—**Attraction of Cohesion** is peculiar to the component particles of bodies, by virtue of which they are firmly connected and held together.—As the attraction of cohesion is the cause of the solidity of small bodies,

A VEGETABLE ALCAL, NAMED "ATROPIA," HAS BEEN EXTRACTED FROM THE ATROPA BELLADONNA, OR DEADLY NIGHTSHADE.

WHEN THE MUTUAL ATTRACTION OF CERTAIN PARTICLES IS REVISED, AS WHEN GUNPOWDER EXPLODES, IT IS CALLED REPELUSION.

[AUG]

A New Dictionary of the Belles Lettres.

[AUG

so is the **ATTRACTION OF GRAVITATION** that chain which, being diffused over the solar system, preserves the planets in their orbits, and makes them revolve about the centre of the system. That which in common language is called weight, is by philosophers explained to be *gravitation*; that is, a tendency to the centre of gravity. By gravitation a stone and all heavy bodies, if let fall from a height, are supposed to drop to the earth. All celestial bodies are supposed to have not only an attraction or gravitation towards their proper centres, but that they mutually attract each other within their sphere. The planets tend towards the sun and towards each other, as the sun does towards them. The earth and moon tend likewise reciprocally towards each. By this same principle of gravity heavenly bodies are kept in their orbits, and terrestrial bodies tend, as is supposed, towards the centre of the earth. And it is from this attraction that all the motion, and consequently all the changes in the universe, are supposed to arise.—**ATTRACTION OF MAGNETISM** is the particular tendency of certain bodies to each other, as that of the magnet, which attracts iron, of which we shall speak more particularly in its proper place; as well also of the **ATTRACTION OF ELECTRICITY**.

ATTRACTIVES, in medicine, a peculiar species of remedies which act by promoting external discharge.

ATTRIBUTES, in theology, the several qualities or perfections of the divine nature, or such as we conceive to constitute the proper essence of God; as his wisdom, power, justice, goodness, &c.—**ATTRIBUTES**, in logic, are the predicates of any subject, or what may be affirmed or denied of any thing.—**ATTRIBUTES**, in painting and sculpture, are symbols added to a figure or group, which are characteristic of the principal subject. Thus the eagle is an attribute of Jupiter; a peacock, of Juno; a caduceus, of Mercury; a club, of Hercules, &c.

ATTRITION, the rubbing or striking of bodies one against another, so as to throw off some of their superficial particles.

ATTRITION is also often used for the friction of such simple bodies as do not wear from rubbing one against another, but whose fluids are, by that motion, subjected to some particular determination; as the various sensations of hunger, pain, and pleasure, are said to be occasioned by the attrition of the organs formed for such impressions.

AUCUPATION, fowling, or the art of bird-catching.

AUCTION, a public sale of goods to the highest bidder. It is not generally known that a bidder at an auction under the usual conditions, may retract his bidding any time before the hammer is down. A mock auction is that which is conducted by unlicensed persons for fraudulent purposes.

AUDIENCE, the persons assembled at a theatre, or other public place to see and hear the performances.—**AUDIENCE**, a ceremony used in courts at the admission of ambassadors or other public ministers to

a hearing. In England audience is given to ambassadors in the presence chamber; and to envoys and residents in a gallery, closet, or any place where the king happens to be.—**AUDIENCE** is also the name of an ecclesiastical court, held by the archbishop of Canterbury, wherein differences upon elections, consecrations, institutions, marriages, &c., are heard.

AU'DIT, a regular examination of accounts by officers appointed for that purpose.

AU'DITOR, an officer of the king, or any corporate body, appointed annually to examine accounts.

AUDITORIUS MEATUS, the passage or entrance into the ear, that conveys the air to the auditory nerve.

AUDITORY NERVES, a pair of nerves arising from the *medulla oblongata*, with two trunks, one of which is called the *portia dura*; the other, *portia mollis*.

AUGMENTATION, in heraldry, a particular mark of honour generally borne either on the escutcheon or a canton, as *argent*, a hand, *gules*, borne by every baronet who cannot claim higher honour.

AU'GES, two points in a planet's orbit; the one denominated the apogee, the other the perigee.

AUGETTE, in fortification, the wooden pipe which contains the powder by which a mine is fired.

AU'GITE, a species of mineral, of which many varieties are found differing both in form and colour. Different names have been applied to some of its most remarkable varieties; as *diopside*, to greenish-white transparent crystals; *sahlite*, when it is in imperfectly prismatic and foliated masses; and *corcolite*, when in small, slightly-cohering grains. It is one of those few mineral substances, the composition of which may be imitated by the artificial mixture of its constituents, and subjecting them to fusion. Its component parts are silic, lime, magnesia, and oxyde of iron.

AU'GUR, an officer among the Romans appointed to foretell future events, by the chattering and feeding of birds. The augurs bore an augural staff or wand, as the ensign of their authority, and their dignity was so much respected, that they were never deposed, nor any substituted in their place, though convicted of the most enormous crimes.

AU'GURY, a species of divination, or the art of foretelling future events, practised by the ancients. It was distinguished into five sorts, viz., augury from appearances in the heavens; from birds; from chickens; from quadrupeds; and from portentous events. This, like other human errors, appears to have arisen from ideas tolerably rational at first. The regular appearance and disappearance of the birds, and the precision that is observable in almost their whole proceedings, might naturally impress an ignorant race of men with a belief that they either inherently possessed, or from time to time received, supernatural information. Accustomed to regulate by these mo-

"CONTIGUOUS ATTRACTION" IS THAT WHICH IS EXERCISED BETWEEN MINUTE PARTICLES OR ATOMS, AT INSENSIBLE DISTANCES.

IN ANCIENT ROME THERE WAS A COLLEGE OR CONGREGATION OF "AUGURES," CONSISTING OF FOUR PATRICIANS AND FIVE PLEBEIANS.

AUN]

The Scientific and Literary Treasury ;

[AUN

nitors their rural occupations, the shepherd and the husbandman were led, by the most excusable association of ideas, to consult the same advisers in the few other concerns of life that fell to their lot and on the foundation laid by superstition, imposture subsequently raised a fantastic structure.

AUGUST, the eighth month of our year, containing 31 days August was dedicated to the honour of Augustus Cæsar, because in the same month (before called Sextilis, or the sixth from March) he was created consul, thrice triumphed in Rome, subjugated Egypt to the Roman sway, and put an end to the civil wars.

AUGUSTA LÆS, in Roman antiquity, an epithet given to the flames or priests appointed to sacrifice to Augustus, after his dedication, and also to the games celebrated in honour of him on the fourth of the ides of October.

AGUSTATIA, a festival instituted by the Romans in honour of Augustus.

AUGUSTALIS PRÆFLATIO, a title peculiar to a Roman magistrate who governed Egypt, with a power much like that of a provincial in other provinces.

AGUSTAN denotes something relating to the emperor Augustus, as *Augustan age*, *Augustan era*, &c.

AGUSTINES, a religious order, so called from St. Augustine, their founder, and vulgarly called Austin friars or Christian hermits. Before the Reformation they had 42 houses in England. Among other things, this rule enjoins to have all things in common, to receive nothing without the leave of the superior, and several other precepts relating to charity, modesty, and chastity. There are likewise nuns of this order. The Augustines are clothed in black, and at Paris are known under the name of the religious of St. Genesius, that abbey being the chief of the order.

AGUSTINIANS, a religious sect of the 16th century, who maintained that the gates of heaven were not opened till the general resurrection.

AIK, a bird of the Arctic seas, known as the Penguin or Razor bill, but called by Linnaeus *Itea*. This bird is observed by seamen never to wander beyond soundings, and accordingly they conclude, on its appearance, that land is not far off.

AI'LI, an epithet given to certain oficers in the *desert* of the Roman empire, who composed a court which decided, without appeal, in all judicial processes entered in it. This court, which was provided for the slow administration of justice, had not only concurrent jurisdiction with the court of the imperial chamber, but, in many cases, exclusive jurisdiction. The right of appeal, possessed by the estates, existed also in regard to the judicial decisions of the aulic court.

AULOS, a Grecian measure of length equal to the stadium.

AUME, a measure of capacity, employed on the continent, equal to thirty-five English gallons.

AUNCEL-WEIGHT, an ancient kind

of hand-weighting. The auncel was a balance, with several scale-pans, and as it was supposed to give an advantage to the seller, its use was prohibited by statute.

AUNE, a measure of length employed on the continent, but varying considerably in different parts of Europe. It is generally about the length of an English ell.

AURA, an exhalation or vapour. Ancient chemists defined it to be a certain fine and pure spirit, found in every animal or vegetable body, but so subtle, as only to be perceptible by its smell.

AURK'LIA, that intermediate state in which many insects remain for some time, between the caterpillar form and the period in which they are furnished with wings, antennæ, and other organs appertaining to the perfect insect.

AUREOLA, in its original signification, denotes a jewel, which is proposed as a reward of victory in some public dispute. Hence, the Roman schoolmen applied it to the reward bestowed on martyrs, virgins, &c., on account of their works of supererogation, and painters use it to signify the crown of glory with which they adorn the heads of saints, confessors, &c.

AURES MARINÆ, EAR SUFFIS, in natural history, a name given to different species of the *halotis*, which is an univalve shell fish of a flattened shape, somewhat resembling the human ear.

AUREUS, a Roman gold coin, equal in value to twenty five denarii.

AURIC'LE, in anatomy, that part of the ear which is prominent from the head, called by many authors *auris externa*. There are also AURICULÆ CORDIS, or auricles of the heart, which are appendage at the base of the heart, and are distinguished into right and left, the former of which is placed in the anterior, the latter in the hinder part. These are muscular bags, which move regularly with the heart, but in an inverted order.

AURICULA, in botany, that species of primrose, called from the form of its leaves, *bear's ear*.

AURICULAR CONFESSION, a mode of confession among Roman Catholics, by whispering in the ears of their fathers, confessors, or priests.

AURIGA, or the WAGGONER, in astronomy, a constellation of the northern hemisphere, containing about 46 stars of the first six magnitudes.

AURIS, the term by which anatomists express the ear.

AURICULUM, a surgical instrument employed to operate on the ear.

AURO'RA, the morning twilight, or that faint light which appears in the morning when the sun is within 18 degrees of the horizon.

AURO'RA BOREALIS, or NORTHERN LIGHTS, a kind of meteor appearing in the northern part of the heavens, most frequent and most brilliant during the winter solstice. We often see in the north, near the horizon, usually a short time after sunset, a dark segment of a circle, surrounded by a

THE EPITHET "AUGUSTUS" WAS FIRST CONFERRED BY THE ROMAN SENATE UPON OCTAVIUS, AFTER CONFIRMING HIM IN THE SOVEREIGN POWER.

THE PRINCIPLES OF THE PROTESTANT FAITH, DRAWN UP BY LUTHER AND MELANCTHON AT AUGSBURG, IS CALLED THE "AUGUSTAN CONFESSION."

AUR]

A New Dictionary of the Belles Lettres.

[AUT

IF THE NORTH EASTERN PARTS OF SIBERIA, THE "ACROIA" REMEMBERED A YAST EXTENDED TRYST, GLITTERING WITH GOLD, RUBIES, AND SAPPHIRES

brilliant arch of white or fiery light, and this arch is often separated into several concentric arches, leaving the dark segment visible between them. From these arches, and from the dark segment itself in high latitudes columns of light of the most variegated and beautiful colours, shoot up to wards the zenith, and sometimes, masses like sheaves of light are scattered in all directions. In the Shetland islands, the *nerry dancers* as they are there called, are the constant attendants of clear evenings, and cheerers of the long winter nights. In still more northern countries as Norway, Lapland, and Siberia, they greatly enliven the snowy landscapes. They commonly appear at twilight, near the horizon of a dun colour, approaching to yellow sometimes continuing in that state for several hours, without any sensible motion after which they break out into streams of stronger light, spreading into columns, and altering slowly into a thousand different shapes, varying their colours from all the tints of yellow to the obscurest russet. They often cover the whole hemisphere and then make the most splendid appearance. Their motions, at all these times are amazingly quick and they astonish the spectator with the rapid change of their form. They break out in places where none were seen before skimming briskly along the heavens and are suddenly extinguished leaving behind them a uniform dusky track. This is again illumined in the same manner and as suddenly left a dull blank. In certain nights they assume the appearance of vast columns on one side of the deepest yellow on the other declining away till it becomes undistinguished from the sky. They have generally a strong tremulous motion from the end, which continues till the whole vanishes. During the winters of 187 and 1818 the aurora borealis was several times witnessed in England but we who only see the extremities of this northern phenomenon, have but a faint idea of its grandeur or its motions. Various theories have existed respecting the cause of this phenomenon but little doubt is now entertained of its being occasioned by the passage of electricity through the upper regions of the atmosphere its appearance in fact exactly resembling the effects of artificial electricity when passing through rarified air. There is the same variety of colour and intensity, the same undulating motion and corroborations of the streams exhibit the same diversity of character at one moment minutely divided in ramifications and at another beaming forth in one body of light or passing in distinct broad flashes and when the rarefaction is considerable various parts of the stream assume that peculiar glowing colour which occasionally appears in the atmosphere, and is regarded by the unimformed observer with astonishment and fear.

AURUM MOSAICUM, a combination of tin and sulphur, used by statuary and painters, for giving a gold colour to their figures.

AURUM POTABILE, tincture of gold a cordial liquor with leaf gold in it.

AURUM PULMINANS, a precipitate of gold, so called, because of the explosion which it makes by a gentle attrition.

AUSPICIS a kind of soothsaying among the Romans, by the flight or singing of birds.

AUSTRAL, relating to the south thus the six signs on the south side of the equinoctial are called austral signs.

AUSTER the south wind.

AUSFRA LIO PIN CLS, a constellation of the southern hemisphere, consisting of 4 stars, according to the Struvcian catalogue.

AUTOGRAPHI, an epithet applied to whatever is written in a person's own hand writing as an autograph letter a letter of one's own writing.

AUTOMATON (see ANDROIDS) Every mechanical construction which, by virtue of a latent intrinsic force not obvious to the sight can carry on for a certain length of time such movements as resemble the results of human execution, is an automaton. But the term is generally applied to the figure of an animal, to which motion is given by wheels, springs and weights internally placed and causing apparent animation, as the mechanical chess player and flute player. The practice of making these automata is much less frequent at present than formerly ingenious mechanicians nowadays finding themselves better rewarded by directing their talents to the self acting machinery of modern manufactures. As Dr Ure observes it is in our modern cotton and flax mills that automatic operations are displayed to most advantage for there the elemental powers have been made to animate millions of complex organs infusing into forms of wood iron, and brass an intelligent agency. And pursuing the subject with his characteristic zeal while comparing the commercial greatness of Britain with the baseness of Asiatic and Roman despotism, he says "such is the automatic system of it with prodigies in mechanics and political economy which promises in its future growth to become the great minister of civilization to the terraqueous globe enabling this country as its heart to diffuse, along with its commerce the life blood of knowledge and religion to myriads of people still lying in the region and shadow of death."

AUTUMN the third season in the year, which begins in the northern hemisphere, on the day when the sun enters Libra that is on the 22d of September. It terminates about the same day in December, when the winter commences. Autumn is represented, in painting by a man of mature age clothed and girt with a starry skirt holding in one hand a pair of scales equally poised, with a globe in each and in the other a bunch of grapes and other fruit. His age denotes the perfection of this season and the balance that sign of the zodiac which the sun enters when our autumn begins.

LOUIS XIV WAS FANATICALLY FOND OF "AUTOMATA," AND DEVOTED THE EARLY YEARS OF HIS LIFE TO THEIR CONSTRUCTION.

[AXI]

The Scientific and Literary Treasury ;

[AZA]

AUTUMNAL SIGNS, the three signs, Libra, Scorpio, and Sagittarius, through which the sun passes during the season of autumn.

AUXILIARY VERBS, in grammar, are such verbs as help to form or conjugate others; as, in English, the verbs "to have," and "to be."

AVATAR, a term used by the Hindoos to express an incarnation or descent of Vishnu, their deity; nine of which are believed to be passed, and the tenth yet to come.

AVE MARIA, the name given to the angel Gabriel's salutation to the Virgin Mary. Also, the chaplets and rosaries of the Romish church, which are divided into ave-marias and pater-nosters.

AVENUE, in ornamental gardening, a walk planted on each side with trees, and leading to a house, garden-gate, wood, &c., and generally terminated by some distant object.—**AVENUE**, in fortification, an opening or inlet into a fort, bastion, or the like.—In architecture, it means an approach to a palace or mansion, by a long walk of columns, arcades, statues, &c.

AVERAGE, the results from equal division of several sums added together. It is also a term used in commerce, among merchants and ship-owners, to denote the quota or proportion which each merchant or proprietor in the ship or lading is adjudged, upon a reasonable estimate, to contribute towards the expenses of the voyage, &c.

AVIARY, a place set apart for feeding and propagating birds.

AVOIRDUPOIS, a weight used in England, the pound being 16 ounces.

AWARD, in law, the judgment of an arbitrator, or of one who is not appointed by the law a judge, but chosen by the parties themselves for terminating their difference.

AWLWORT, the popular name of the *subularia aquatica*; so called from its awl-shaped leaves, which grow in clusters round the root.

AWEIGH, a sea term, denoting that the anchor is just drawn out of the ground, and hangs perpendicular.

AWN, a slender sharp process issuing from the glume or chaff in corn and grasses: the beard.

AWN'ING, a canopy, usually a piece of tarpaulin or a sail, extended over the decks or any other part of the ship, to afford shelter from the sun, rain, &c.

AXAYA'CAT, a Mexican fly, whose eggs, deposited on rushes and flags, in large quantities, are sold and used as a sort of caviare.

AX'ESTONE, a mineral, a sub-species of nephrite, of an olive or grass-green colour. It is found chiefly in New Zealand and the South Sea Isles, where it is used by the natives for axes and other instruments.

AXILLA, in anatomy, the arm-pit, or the cavity under the upper part of the arm.—**AXILLA**, in botany, the space or angle formed by a branch with the stem, or by a leaf with a branch.

AXINITE, a mineral which sometimes

occurs in lamellar masses, but commonly in crystals. Its edges are thin and sharp, like an axe, whence its name.

AXINOM'ANCY, a species of divination, among the ancients, performed by laying an agate stone on a red-hot hatchet, or by fixing a hatchet on a round stake so as to be poised; then the names of those suspected were repeated, and he at whose name the hatchet moved, was declared guilty.

AX'IOM, in philosophy, is such a plain, self-evident proposition, that it cannot be made more plain and evident by demonstration; because it is itself better known than anything that can be brought to prove it. By axioms, called also maxims, are understood all common notions of the mind, whose evidence is so clear and forcible, that a man cannot deny them without renouncing common sense and natural reason.

AX'IS, in astronomy, an imaginary right line supposed to pass through the earth, sun, planets, satellites, &c., and about which they perform their respective diurnal rotations. The earth and planets, in their progress through the annual orbit, move in such a manner that the axis of each always keeps parallel to itself, or points to the same part of the heavens. The axis of the earth is inclined to the ecliptic, in an angle of nearly sixty-six and a half degrees, a position which is well adapted for promoting the fertility of the earth and rendering it habitable.—**AXIS**, in geometry, a right line conceived to be drawn from the vertex of a figure to the middle of the base. It is so called because the figure, by revolving round this line, is conceived to generate a solid. The axis of the circle is the same as the diameter.—**AXIS**, in mechanics, a certain line about which a body may move, as the axis of a balance, &c.—**AXIS**, in optics, is that ray, among all others that are sent to the eye, which falls perpendicularly upon it, and which consequently passes through the centre of the eye.—**AXIS**, in anatomy, the second vertebra of the neck, so called from the head's turning on it like an axis.—**AXIS**, in botany, is a taper column in the centre of some flowers, about which the other parts are disposed.—**Axis** in *Peritrochio*, or *WHEEL AND AXLE*; one of the five mechanical powers or simple machines, which is principally used in the raising of water. The power is applied at the circumference of the wheel, and the weight is raised by a rope that is gathered up on the axis while the wheel turns round.—**Axis of Oscillation**, is a line parallel to the horizon, passing through the centre, about which a pendulum vibrates, and perpendicular to the plane in which it oscillates.—**Axis of a Vessel**, is an imaginary line passing through the middle of it, perpendicular to its base, and equally distant from its sides.

AX'OLATE, a black water lizard found in Mexico.

AZA'LEA, in botany, a genus of plants, the chief species of which are flowering shrubs.

THE PROPORTION WHICH A POUND WEIGHT "AVOIRDUPOIS" BEARS TO A POUND "TROY," IS AS SEVENTEEN TO FOURTEEN.

SELF-EVIDENT TRUTHS, NOT LIMITED TO TIME AND PLACE, BUT WHICH ARE TRUE AT ALL TIMES AND ALL PLACES, ARE "AXIOMS."

[BAB]

A New Dictionary of the Belles Lettres.

[BAC]

AZEN'SALL, in botany, a sort of moss that grows on rocks; also a kind of black stone found among gold.

AZIMUTH, in astronomy, an arc of the horizon, intercepted between the meridian of the place, and the vertical circle passing through the centre of an object.

MAGNETICAL AZIMUTH, is an arc of the horizon contained between the sun's azimuth circle and the magnetical meridian.

AZIMUTH CIRCLES, OR VERTICAL CIRCLES, imaginary great circles passing through the zenith and nadir, and cutting the horizon at right angles. The altitudes of the heavenly bodies are measured on these circles, which circles may be represented by screwing the quadrant of altitude on the zenith of any place, and making the other end move along the wooden horizon of the globe. **AZIMUTH COMPASS**, an instrument for finding in a more accurate manner than by the common sea compass, the magnetical amplitude of the sun or stars.

AZO'ITE, OR NITROGEN, the radical principle of atmospheric air; a species of gas of which the atmosphere contains nearly 4-5ths in bulk, and 3-4ths in weight; the other fifth and fourth being oxygen, without which the air will support neither life nor combustion. In its nature it is invulnerable and elastic, and capable of condensation and expansion. It immediately extinguishes animal life, and the flame of a candle. It has no taste; some plants live and flourish in it. It is not absorbed by water,

but is capable of combining with oxygen; and with different proportions of this substance it forms atmospheric air, gaseous oxide of azote, or nitrous oxide, nitrous gas, nitrous acid, and nitric acid. Combined with hydrogen, it forms volatile alkali; and it enters into the composition of most animal substances.

AZO'TITE, a kind of salt formed from the combination of the protoxyde of azote, or nitrous oxide, with alkalis.

AZ'URE, the blue colour of the sky. Among painters, this word originally signified *lapis-lazuli*, and the blue colour prepared from it. At present it is called *ultramarine*; and the blue glass made from the earth of cobalt and other vitrifiable matters, which, when in masses, is called *smalt*, is, in the state of fine powder, known by the name of *azure*. *Azure* being employed to colour starch, is also called *starch-blue*.

AZURE, in heraldry, the blue colour in the arms of any person below the rank of a baron. In the escutcheon of a nobleman it is called *sapphire*; and in that of a sovereign prince, *Jupiter*. In engraving, this colour is expressed by lines or strokes drawn horizontally.

AZYMA, in theology, the feast of unleavened bread among the Jews.

AZYMITES, in church history, Christians who administer the eucharist with unleavened bread. This appellation was given to the Latin by the Greek church, and also to the Armenians and Maronites.

B.

B, the second letter, and first consonant, in the alphabet, is formed in the voice by a strong and quick expression of the breath, and a sudden opening of the lips; it is therefore called a *labial*, and its pronunciation differs but slightly from *p* and *v*. It is often used as an abbreviation for *Bachelor*, as *B. A.* Bachelor of Arts, *B. D.* Bachelor of Divinity, &c., and for *before*, as *B. C.*, Before Christ. *B*, as a numeral among the Romans, stood for 300, and with a dash over it for 3000. *B*, in chronology, stands for one of the dominical letters, and in music for the seventh note in the gamut.

BA'AL, an idol among the ancient Chaldeans and Syrians; supposed to represent the sun, and to be the same as the *Bel* or *Belus* of the Greeks. The word signifies also lord or commander; and the character of the idol was varied by different nations, at different times. Of the manner in which *Baal* was worshipped, we have but imperfect and contradictory statements; but we are informed in Scripture that human victims were among the sacrifices offered to him.

BABOON', a large kind of ape with a short tail, which forms one division of the

genus *Simia* in the Linnæan system. They are the most disgustingly lascivious of all the monkey tribe; and such is their natural ferocity, that they can never be said to be properly tamed into obedience; they ought not therefore to be admitted into zoological exhibitions for the public.

BABYLON'ICS, in literary history, a fragment of the ancient history of the world, ending at 267 years before Christ; and composed by Berosus, a priest of Babylon, about the time of Alexander.

BABYLON'ICA, in antiquity, a species of rich weaving so called from the city of Babylon, where the art of weaving hangings with a variety of colours was first invented.

BABYRIOUS SA, in zoology, the Indian hog. This quadruped belongs to the genus *sus*, in the class *mammalia*; and its most distinguishing characteristic is, that from the outside of the upper jaw spring two teeth twelve inches long, bending like horns, and almost touching the forehead.

BAC'CHÆ, the priestesses of Bacchus, who, crowned with vine and ivy leaves, and clad in the skins of wild beasts, celebrated the orgies of their god with frantic cries and gestures. They were also called *Maenades*, *Bassarides*, and *Thyades*.

AN "AZIMUTH DIAL" IS A DIAL WHOSE STYLE OR Gnomon IS AT RIGHT ANGLES, OR PERPENDICULAR, TO THE PLANE OF THE HORIZON.

NO ANIMAL THAT BREATHES CAN LIVE IN "AZOTE," AND FROM THIS CIRCUMSTANCE IT TAKES ITS NAME, WHICH SIGNIFIES LIFE-DEPRIVER.

[BAL]

A New Dictionary of the Belles Lettres.

[BAL]

the value of the cause.—To *admit to bail*, is to release upon security given by bondsmen.—To *swear by bail*, is to prove by the oath of the person that he is worth the sum for which he is surety beyond his debts.

BAILLEE, in law, the person to whom the goods of the one that is bailed are delivered. The party who delivers the goods is termed the **BAILLOR**.

BAILIFF, a subordinate magistrate or officer appointed within a particular province or district, as bailiffs of hundreds, liberties, courts, barons, &c. Sheriffs' bailiffs are officers appointed by the sheriff to execute writs. These, being bound in bond to the sheriff for the due execution of their office, are called bound bailiffs, vulgarly *bum-bailiffs*.—**WATER BAILIFF**, an officer who searches ships, gathers toll for anchorage, and arrests persons for debt upon the water.

BAILTICK, a liberty exempt from the power of the sheriff, in which district the lord exercises the office of sheriff, and appoints his own bailiff. A *bailwick* is also the hundred, or district, through which the authority of a bailiff extends.

BAIO'CO, a small coin in the papal states, one hundred of which make a Roman crown.

BA'IRAM, a festival among the Turks, celebrated after the fast of Ramazan, when it is customary to send presents from one to another, and otherwise to express the joy they feel on the occasion.

BALZE, a coarse, woollen stuff, with a long nap, sometimes frized on one side, without sale, being manufactured on a loom, with two treddles, like flannel.

BALÆNA, or the *W hale* species, a genus of animals in the Linnæan system, class *Mammalia*, order *Cete*. There are several kinds, the generic character being *horney lamina* in the upper jaw in place of teeth, and a *spiracle* with a double external orifice on the top of the head.

BALANCE, an instrument for weighing commodities, consisting of a beam or lever suspended exactly in the middle, with a scale hung to each extremity, of precisely equal weight. Hence the term *balance*, in mechanics, is defined as a peculiar application of that simple mechanical power called the lever, by which it is rendered useful in determining the difference or equality of weights in heavy bodies, and consequently their masses or quantities of matter. The characteristic difference between a *balance* and a *lever* is, that the former is suspended from something which is above it, the latter supported by a prop or fulcrum below it. The difference between the use of the *scales* and the *steelyard*, consists in this, that as in the former you make use of a larger power, or more weight, to estimate the weight of a heavier body, in the latter you use the same power, but give it a greater velocity with respect to that of the weight, by applying it further from the fixed point, which produces the same effect.—The *hydrostatic balance* is an instrument to determine the specific gravity of fluid and solid bodies.—The

assay balance is used to ascertain the exact weight of the different metallic bodies of which the ore is composed.—In accounts, *balance* is the difference of two sums; hence, to pay a balance, is to pay the difference, and make the two accounts equal.—In astronomy, *Libra*, or the *balance*, is a sign in the zodiac, which the sun enters at the autumnal equinox.

BALANCE OF TRADE, in commerce, the equality between the value of the commodities bought of foreigners, and the value of the native productions exported. When a nation imports to a greater extent than it exports, the balance of trade is said to be against it; that is, it loses by its trade, and *vice versa*. The native commodities of a nation are its income, its property, and it is apparent that wherever purchases exceed the income, there is a tendency to bankruptcy.

BALANCE OF POWER, in politics, that just equipoise or equal state of power between nations, which may be consistent with their general security and prosperity.

BAL ASS RUBY, in mineralogy, a species of ruby, with crystals of a regular octahedral form.

BALBITODES, in anatomy, the cavity at the extremity of the *humerus* to which the *ulna* is articulated.

BALBU TIES, in medicine, a stammering and precipitate speech.

BAL'CONY, in architecture, a projection from the front of a house, surrounded by a balustrade or open gallery. In large buildings they are susceptible of considerable elegance of decoration, and may be made highly ornamental to the edifices to which they are attached.

BALDACHIN, in architecture, a kind of canopy erected over an altar.

BALE GOODS, in commerce, such goods as are exported or imported in bales.

BALISTES, or *PIE-PEN*, a genus of animals, so called from the resemblance of their back bone to a pile—they are remarkable for the brilliancy of their colours.

BALL, in military affairs, comprehends all sorts of bullets for fire arms, from the cannon to the pistol, those for pistols and small arms are made of lead, but cannon-balls are formed of cast iron.—In surgery, any medicine given to a horse in the shape of a ball.—**FIRE BALL**, a meteor, or luminous globe darting through the atmosphere. Also, a bag of canvas filled with gunpowder, sulphur, pitch, &c., to be thrown by the hand, or from mortars.

BALLAD, a short lyric composition, or tale in verse, of a simple and popular character, set to music, and generally in most esteem by the lower classes. It originally meant a solemn song of praise.

BALLAST, heavy matter, as stone, gravel, iron, &c. thrown into the hold of a ship, to sink her to a proper depth in the water, that she may be capable of carrying a sufficient quantity of sail without over-setting.

BALLATOON, a heavy luggage boat employed on the rivers about the Caspian lake.

BALLET, a dramatic entertainment,

A TWENTY FOUR POUND BALL, MOVING AT THE RATE OF 2000 FEET PER SECOND, MEETS WITH A RESISTANCE OF 200 POUNDS.

THE VELOCITY OF A MUSKET-BALL IS, ON AN AVERAGE, SIXTEEN HUNDRED FEET PER SECOND, AND ITS RANGE HALF A MILE.

[BAL]

The Scientific and Literary Treasury ;

[BAN]

consisting of action and dancing only, invented by the Italians.

BALLISTICS, the art of using projectiles.—The *ballistic pendulum* is a machine for ascertaining the velocity of military projectiles.

BALLISTA, or **BALISTÆ**, a military engine used by the ancients, in battle, to throw stones, darts, and javelins.

BALLOON, in a general sense, means any spherical hollow body; but it more particularly designates a globe made of silk, and rendered air-tight by gum, which, when filled with hydrogen gas, from ten to thirteen times lighter than atmospherical air, ascends into the atmosphere, and will convey heavy bodies suspended to it. [See the article **AEROSTATION**.]—In fireworks, a *balloon* is a ball of pasteboard, or kind of bomb, filled with combustibles, which, bursting in the air, exhibits sparks of fire like stars.—In chemistry, it means a round vessel with a short neck; or, a glass receiver of a spherical form.

BAL'LOT, the method of determining an election by means of small balls, black or white, put privately into a box.

BALLOTA, in botany, the plant called stinking or black horshound. In the Linnean system, a genus of plants, class 14 *Didymia*, order 1 *Gymnospermia*; the species of which are mostly perennials, but the sweet-smelling horshound is an annual.

BALLOTA'DE, in horsemanship, the leap of a horse between two pillars, or upon a straight line, so that when his fore feet are in the air, he shows nothing but the shoes of his hind feet, without jerking out; differing in that respect from the *capriole*.

BALLS, in electricity, are two pieces of cork, or pith of elder, nicely turned in a lathe to the size of a small pea, and suspended by linen or silken thread, intended as electrometers, to discover small quantities of electricity.—**BALLS**, in meteorology, luminous bodies, generally appearing at a great height above the earth, with much splendour. Their tract is usually from north to south, and their velocity is very great.

BALM, in botany, the name of several aromatic plants.—The **BALM OF GILEAD**, or balm of Mecca, is the dried juice of a small tree or shrub growing in Syria: it has a warm aromatic taste, and an exquisitely fragrant smell. It is highly esteemed by the Turks as an odoriferous unguent and cosmetic; but its scarcity is such, that the genuine balm is seldom exported as an article of commerce. We are informed by Josephus, the Jewish historian, that the balm of Gilead was one of the trees given by the queen of Sheba to Solomon; and it appears from the Scriptures that it was in high repute among the nations of the East.

BAL'NETUM, in antiquity, a private bath or bathing place, in distinction from the *balnea*, which were public baths.—In chemistry, a contrivance to modify and regulate the heat in various chemical processes, particularly distillations, by the use of different intermedia. When the degree of heat required is below that of boiling water,

a vessel containing that fluid is interposed between the fire and the substance to be acted upon; and when a superior degree of heat is necessary, sand, or some other matter of a similar nature is employed.

BAL'SAM, an oily aromatic, resinous, or liquid substance, flowing either spontaneously, or by means of incision from certain plants, and used in the cure of several kinds of wounds, diseases, &c. Thus we have the balm of Copaiva; the balm of Tolu; the balm of Peru.—*Partitions or artificial balsams*, are certain compositions chiefly of balsamic and healing ingredients, made by apothecaries in imitation of the native balsams.

BALSAMICS, in pharmacy, softening, restoring, healing and cleansing medicines; of gentle attenuating principles; warm, stimulating, and demulcent.

BAL'ISTER, (often improperly written *baluster*), in architecture, a small turned column usually introduced between piers, on the upper parts of large buildings under windows, and on balconies, &c.

BALUSTRA'DE, a series or row of balusters, joined by a rail: serving as well for rest to the elbows, as for a fence or inclosure to balconies, altars, staircases, &c.

BAMBOO, a very large species of the *arundo*, or cane; it grows about the tropical regions, and was a native of Asia, but it has long since been introduced into the West-Indian Islands. It is used in building, in making bridges, vessels, boxes, caps, baskets, mats, and other utensils and furniture. Paper is likewise manufactured from it: it is the common fence for gardens and fields, and is used for pipes to convey water wherever it is wanted. The leaves are generally put round the chests of tea which are sent to Europe from China, to form a kind of mat.

BAN'ANA, the tree and fruit of the plantain, a species of palm. Dampier compares it when stripped of its integuments, to a large sausage, in size and shape; and to fresh butter in winter, as to substance and colour. Its taste resembles that of a ripe and luscious pear.

BAND, in architecture, any flat, low member or moulding, which is broad but not deep.—The word *band* is applied to denote a company of persons engaged in one common design; as, a *band of music*, viz., the collective body of instrumental performers in a regiment, popularly termed *the band*.—A *band of soldiers* designates a troop or company, who fight under the same standard.—The *band of pensioners*, in England, is a company of 120 gentlemen, who receive a yearly allowance of £120, for attending on the sovereign on certain solemn occasions.

BAND'AGE, in surgery, a fillet, roller, or swathe, used in dressing and binding up wounds, restraining dangerous hæmorrhages, and in joining fractured or dislocated bones.

BANDAN'NA, a kind of calico-printing, practised in India from time immemorial, on which white or brightly-coloured spots

MONTGOLFIER'S FIRST BALLOON ASCENDED AT PARIS IN 1783; LOMARDI MADE HIS FIRST ASCENT IN ENGLAND IN 1784.

MESSRS. GREEN, HOLLAND, AND MASON MADE THEIR AERIAL VOYAGE IN 1836, FROM LONDON TO NASSAU, IN GERMANY, 480 MILES, IN 18 HOURS.

[BAN]

A New Dictionary of the Belles Lettres.

[BAN]

are produced on a red or dark ground; but by the joint resources of mechanical and chemical science, the European imitations have now far surpassed, in beauty and precision, the oriental patterns.

BANDO LEEB, a large leathern belt, thrown over the right shoulder, and hanging under the left arm, worn by ancient musketeers, for sustaining their fire-arms and musket-charges.

BANGUE, the name of an opiate used in the East, made from the leaf of wild hemp. It is used, by the Mahometans, for the same purpose as wine and spirits are by the Christians.

BANDITTI, a term peculiarly denoting companies of armed robbers, formerly common in Italy and France; but sometimes also used, in a more general sense, for robbers, pirates, outlaws, or others, united for nefarious purposes.

BAN'IAN, a caste of the Hindoos, whose profession is trade and merchandise; and, in India and Asia, they are the great factors and bankers, as the Jews are in the West. They believe in the transmigration of souls, and not only abstain from eating the flesh of animals, but endeavour to release even the most noxious from the cruelty of others. They are mild in temper, and honest in their dealings; and are so cautious of having communication with any but their own caste, that if any of another nation or tribe has drunk out of or touched their cup, they break it.

BAN'IAN-DAYS, a proverbial expression, imported from the Asiatic colonies, used for a short or indifferent dinner, or days on which no animal food is eaten: in allusion to the Bunians above described.

BAN'IAN-TREE, one of the greatest wonders of the vegetable kingdom. It never dies, and continually extends itself; for every branch shoots downward, and, striking into the ground, becomes itself a parent tree, whose branches, in like manner, spread. One of them, the Cubbeer Burr, has 350 stems, equal to large oaks, and more than 3000 smaller ones, covering space sufficient to shelter 7000 persons. Its branches are crowded with families of monkeys, and with birds of every description; and also with enormous bats, all of which find luxurious subsistence upon the rich scarlet figs that grow upon it.

BANK, in commerce, an establishment for the receiving of monies and letting them out on interest.* It may likewise be defined, a place used as a common repository of the money of individuals or of companies. Also, a company of persons concerned in a private bank; or the directors of an incorporated one. The basis of all banking is the profitable use to which the banker or company can apply the capital which is deposited. The first bank was established at Venice about 1157, and the name of Banco was given to it in Italian, from the bench which the money-changers or bankers used to sit upon in their houses or exchanges.

BANK-NOTE, or **BANK-BILL**, a promissory note, issued by a banking com-

pany, properly signed and countersigned, payable to the bearer in the current coin of the realm, on demand.

BANK OF ENGLAND. In the fifth and sixth years of William and Mary, (A. D. 1694, 1695) in consideration of a loan to government of £1,200,000, at an interest of almost eight per cent, a company was incorporated by the name of the "Governors and Company of the Bank of England," with a restriction by which they were prevented from dealing in any other than money concerns. The profits of the company arise from the interest received from government on the permanent debt; on their annual advances on exchequer bills, &c., from their allowance for receiving the contributions to loans, and for paying the dividends on the public funds; from dealing in bullion, and from their large discounts with a mere paper currency. It is said, on good authority, that for conducting the various pecuniary transactions of the exchequer, for receiving the taxes, paying the interest of the public debt, &c. the Bank of England receives a per centage, or commission, which amounts annually to about 260,000*l*. to which must be added the profit derived from the use of a floating balance due to the public, never less in amount than four millions sterling. This balance, employed in discounting mercantile bills at the rate of four per cent. yields a revenue of 180,000*l*. per annum, which being added to the commission of 260,000*l*. gives a total of 420,000*l*. as the profit which the proprietors of bank-stock derive every year from the connection subsisting between that establishment and the Treasury. The affairs of this company are in the hands of a governor, deputy-governor, and twenty-four directors, who are annually elected by the general court.

BANKER, a person who trafficks in money, by receiving the current cash of individuals free of interest, and negotiating with it, either in the discount of bills, or the advance of money on sufficient securities. The monied goldsmiths, in the reign of king Charles II. first acquired this name.—The Romans had two sorts of bankers, whose office was much more extensive than that of the bankers among us; their's being that of public affairs, in whom were united the functions of a broker, agent, banker, and notary, managing the exchange, taking in money, assisting in buying and selling, and drawing the writings necessary on all these occasions.

BANKRUPT, in a general sense, is a trader who fails or breaks, so as to be unable to carry on his business or pay his debts. In all cases, some act of bankruptcy must be committed, before a creditor can render his debtor a bankrupt; and an act of bankruptcy is an act of such a nature as evinces an intention on the part of a debtor to deprive his creditors of the security which they might have in the possession of his person or his property. The following are among the chief acts of bankruptcy. 1. Departing from the realm, whereby a man withdraws himself from the

THE FIRST REGULAR BANKER IN LONDON IS SAID, BY PENNANT, TO HAVE BEEN MR. FRANCIS CHILD, IN THE REIGN OF CHARLES II.

THE PRESENT BANK OF "CHILD AND CO.," NEAR TEMPLE-BAR, STANDS ON THE SPOT WHERE THEIR ANCESTOR'S BANK WAS FIRST ESTABLISHED.

jurisdiction and coercion of the laws. 2. Departing from his own house, and thus secreting himself. 3. Keeping in his own house, except for just and necessary cause, so as not to be seen or spoken with by his creditors. 4. Procuring, or suffering himself willingly to be arrested, or outlawed, or imprisoned, without just and lawful cause. 5. Procuring his money, goods and chattels, and effects, to be attached or sequestrated. 6. Making any fraudulent conveyance of his property to a friend, or secret trustee.

BAN (*banum*), in the feudal law, a solemn proclamation or publication of any thing. Hence the custom of asking, or publishing the bans, before marriage.

BAN, in military affairs, a proclamation made in the army, by beat of drum, sound of trumpet, &c., requiring the strict observance of discipline, either for the declaring a new officer, or punishing an offender.—The word BAN also means an edict of interdiction or proscription. Thus, to put a prince under the *ban* of the empire, is to divest him of his dignities, and to interdict all intercourse and all offices of humanity with the offender.

BANNER, a square flag, or the principal standard belonging to a prince or state.

—In botany, the upper petal of a papilionaceous corolla.

BANNERET, an ancient order of knights or feudal lords, who, possessing several large fiefs, led their own flag or banner. As the spirit of the feudal system declined, persons came to be created bannerets, and hence the institution must have become merely titular. The last knight of this description was Sir John Smith, on whom the honour was bestowed after Edgehill fight, for rescuing the standard of Charles I. On the day of battle, the candidate presented his flag to the king or general, who cutting off the train or skirt, and making it a square, returned it again. Hence, bannerets are sometimes called knights of the square flag.

BANNOCK, a kind of oat-cake, baked in the embers, or on a stone placed before the fire; it is common in Scotland and the northern parts of England.

BANQUETTE, in fortification, the elevation of earth behind a parapet, on which the garrison of a fortress may stand, on the approach of an enemy, in order to fire upon them.

BAOBAB, a cooling acid fruit, of the gourd kind, a native of Africa.

BAPTISM, a rite of the Christian religion, by which the members of its church are received into the communion. Almost all sects of Christians style baptism a sacrament, and consider it as important; but the manner in which it ought to be performed, and the effects to be derived from it, have been subjects of much controversy.

BAPTISTS (a contraction of ANABAPTISTS), a Christian sect who practise the baptism of adults instead of that of children.

BAPTISTERY, in ecclesiastical writers, a place in which the ceremony of baptism is performed. In the ancient church, it was one of the *exedre* or buildings distinct from the church itself, and consisted of a porch or ante-room, where the persons to be baptised made their confession of faith, and an inner room where the ceremony of baptism was performed. Thus it continued till the sixth century, when the baptisteries began to be taken into the church-porch; and afterwards into the church itself.

BAR, the partition which separates the members of a court of justice from those who have to report or hear. It is also applied to the benches, where the lawyers are seated, because anciently there was a bar to separate the pleaders from the attorneys and others. Hence those who are called to the bar, or licensed to plead, are termed *barristers*, an appellation equivalent to *licentiate* in other countries.—BAR, in law, a plea of a defendant, which is said to be sufficient to destroy the plaintiff's action.

—BAR, in music, a stroke drawn perpendicularly across the lines of a piece of music, including between each two a certain quantity or measure of time.—BAR, in heraldry, an ordinary in form of the fesse, but much less.—A bar of gold or silver is an ingot, or wedge, from the mines, run in a mould and unwrought. A bar of iron is a long piece wrought in the forge.—The word BAR is also used figuratively for any tribunal; as, the bar of public opinion.

BARALYPTON, in logic, an indirect mode of syllogism, consisting of two universals and one particular affirmative proposition: as, "Every animal is endued with sense; every man is an animal; therefore, something endued with sense is man."

BARANGI, certain officers in the Greek empire, who had the keys of the city in charge where the emperor resided.

BARATHRUM, in antiquity, a deep pit, with sharp spikes at the top and bottom, into which condemned persons were cast headlong, at Athens.

BARATRY, or BARRATRY, in commerce, a term used when the master of a vessel or the mariners cheat the owners by embezzling their goods, or running away with the ship.

BARB, the points that stand back in the head of an arrow or fishing-hook, to prevent them from being drawn out easily.—The name of a horse of the Barbary breed, remarkable for its swiftness.—Any roughness that grows and resembles a beard; as the down with which the surface of some plants are covered; the tuft of hairs at the point of leaves.

BARBACAN, or BARBICAN, an outer defence to a city or castle, used especially as a defender to a city or walls; also an aperture made in the wall of a fortress through which to fire upon an enemy.

BARBARA, in logic, an arbitrary term for the first mode of the first figure of syllogisms, consisting of three universal propositions: as, "All animals are endued with

AT THE PASCHAL SEASON, THE JEWS BAPTISED THEIR PROSELITES, IN ORDER THAT THEY MIGHT EAT THE PASSOVER.

THE STING OF AN INSECT USUALLY REMAINS IN THE WOUND IT INFLECTS, ON ACCOUNT OF THE SIDES OF ITS POINT BEING "BARBED."

[BAR]

BARLEY IS FREED FROM ITS BEAN, AS IN PEARL BARLEY, BECAUSE THE BEAN CONTAINS A BEAN OF AN ACERIMONIOUS NATURE.

sense: all men are animals; therefore, all men are endued with sense."

BARBARIAN, a name given by the ancient Greeks and Romans, to all who were not of their own country, or were not initiated in their language, manners, and customs. In this sense the word signified with them no more than foreigner, not signifying, as with us, a wild, rude, or uncivilized person.

BARBARISM, in a general sense, a rudeness of language or behaviour.—In grammar, an offence against the purity of style or language; or a mode of speaking or writing contrary to the true idiom of any particular language.

BARBEL, a fish of the genus *Cyprinus*, which lies in holes near the banks, and feeds on testaceous animals, worms, &c.

BARILES, or **BARBS**, in farriery, the knots or superfluous flesh that grow up in the channels of a horse's mouth; that is, in the intervals that separate the bars, and lie under the tongue.

BARD, the name given to those individuals of semi-barbarous tribes, whose genius or imagination enabled them to describe events in elevated or measured language. Homer was one of these bards among the early Greeks; Ossian another among the ancient Irish; and their rhapsodies were the foundations of the art of poetry, which has been cultivated with success by all civilized nations. In the first stages of society, in all countries, bards have made a conspicuous figure; and the "light of the song" has been the morning-beam that first broke upon the darkness of ignorance: but no where does it appear, did ever verse and its professors receive so much public regard as under the druidical establishment; a regard with which they continued to be honoured long after that system had perished. In battle the bards of the Celtic tribes raised the war-cry, and in peace they sung the exploits of their heroes, celebrated the attributes of their gods, and chronicled the history of their nation. Originally spread over the greater part of western Europe, they seem to have been the heralds, the priests, and the law-givers of the free barbarians who first occupied its ancient forests, until, by the gradual progress of southern civilization and despotism, they were driven back into the fastnesses of Wales, Scotland, and Ireland, where the last echoes of their harps have long since died away.

BARGE, in naval affairs, a boat of state and pleasure, adorned with various ornaments, having hales and tilts, and seats covered with cushions, and carpets, and benches for many oars; as a company's barge, an admiral's barge, &c. It is also the name of a flat-bottomed vessel employed for carrying goods in a navigable river, as those upon the river Thames, called west country barges.

BARILLA, the name of a crude soda obtained by the incineration of the *salsola soda*, a plant cultivated in Spain and Sicily, the ashes of which are used in making

glass, bleaching linen, and in the finishing process of the hard soap manufacture.

BARTUM, a metal so called by Sir Humphrey Davy, the discoverer, which is obtained by the chemical decomposition of barytes.

BARK, the exterior part of trees, corresponding with the skin of animals. The bark may be divided into the outward skin or cuticle, and the inner substance or cortex. The outward skin, or cuticle, seems to derive its origin from the inner or cortical substance, and to be nothing more than the old bark dried and shrivelled up, being supplanted yearly by a new one, after the same manner as a snake casts its skin. It is composed of little bladders or vesicles horizontally placed, so as to form a ring; among which are also intermixed, more or less, several parallel woody fibres or sap vessels. The inner substance consists, 1: of several enfoldments of woody fibres, interwoven in the manner of a net, and wrapping over each other like the coats of an onion. 2: of a number of small bladders or vesicles, sometimes of an oval, and sometimes of an angular figure, which fill up the spaces between the said fibres, and are placed in lines horizontally towards the wood. And 3: of its own peculiar vessels, which contain the proper and specific juice of the plant. It is observed that trees stripped of their bark in the time of the sap, and suffered to die, afford heavier timber, more uniformly dense, stronger, and fitter for service, than if the trees had been cut down in their healthy state.

BARK, (**PERUVIAN**), a most valuable medicine, is the produce of various species of the *Cinchona*, which is the spontaneous growth of many parts of South America, but more particularly of Peru. The tree somewhat resembles a cherry-tree in appearance, and bears clusters of red flowers. It was formerly called *Jesuit's bark*, from its having been introduced into Europe by the members of that fraternity who resided in South America, and who for many years derived from it a source of great profit. Its medicinal uses have long been well known; but it was not till lately that its medicinal properties were discovered to depend upon the presence of a substance called *quinine*, which exists, more or less, in all kinds of Peruvian bark. This discovery was made by Messrs. Pelletier and Cavatou, who also ascertained that the most useful and permanent form of the substance was that of a neutral salt, in which it was combined with sulphuric acid, constituting the celebrated *sulphate of quinine*.

BARLEY, a valuable kind of grain principally used in England in the state of malt for brewing.—**PEARL BARLEY** and **FRENCH BARLEY**, the grain freed from the husk by a mill; the distinction between the two being, that the pearl barley is reduced to the size of small shot, all but the very heart of the barley being ground away.—**BARLEY-CORN**, the least of our long measures, being the third part of an inch.

BARM, or **YEAST**, the head, or working

THE INNER BARK OF TREES, CALLED "LIBER," WAS BY THE ANCIENTS USED AS PAPER, WHENCE A BOOK HAD THE NAME OF LIBER.

[BAR]

The Scientific and Literary Treasury;

[BAR]

out of beer, which is used as a ferment to lighten bread.

BARNACLES, a species of shell-fish which sticks to the bottom of ships, rocks, &c.—In farriery, an instrument composed of two branches joined at one end with a hinge, to put upon a horse's nose, to confine him for shoeing, bleeding, or dressing.

BARNACLE-GOOSE, a large water-fowl with a broad flat bill.

BAROLITE, a stone of the ponderous order, called also the carbonate of barytes. It usually occurs in small masses, which have a fibrous structure; and it is generally of a light yellowish gray colour.

BAROMETER, an instrument for measuring the weight of the atmosphere, and of use in ascertaining and anticipating the changes of the weather. For this purpose, the tube is fixed to a graduated scale, so that the smallest variation in the column is visible. In dry weather, the air being free from vapours, is consequently heavy, and presses up the quicksilver; but in moist rainy weather, the atmosphere being charged with clouds and fogs, the air is lighter, and presses with less force on the quicksilver.

From the best observations that have been made on the barometer, it appears, however, that it is not so much the height of the mercury in the tube that indicates the weather, as the motion of it up and down; therefore, in order to know whether the mercury is actually rising or falling, the following rules are of use: 1, If the surface of the mercury is convex, it is a sign that the mercury is then rising; 2, If the surface is concave, it is sinking; 3, If the surface is plain, or rather a little convex, the mercury is stationary; 4, If the glass is small, shake the tube, and if the air is grown heavier, the mercury will rise about half the tenth of an inch; if it is growing lighter, it will sink as much.

BARON, a degree of nobility next below a viscount, and above a baronet. Originally, the barons being the feudatories of princes, were the proprietors of land held by honourable service; hence, in ancient records, the word *barones* comprehends all the nobility. It is probable that formerly all those were barons who had lordships with courts-baron, and soon after the Conquest, all such sat in the house of peers; but they being very numerous, it was ordered that none should sit but such as the king thought fit to call up by writ, which ran *pro hac vice tantum*. This state of nobility being very precarious, they at length obtained of the king letters patent, and these were called barons by patent, or creation.—**BARONS OF THE EXCHEQUER**, the four judges to whom the administration of justice is committed, in causes between the king and his subjects, relating to matters concerning the revenue. They were formerly barons of the realm, but of late are generally persons learned in the laws.

BARON AND FEMME, a term in law for husband and wife, who are deemed but one person; so that a wife cannot be witness for or against her husband; nor he

for or against his wife, except in cases of high treason.

BARONET, the lowest degree of honour that is hereditary, being the next below a baron, and above a knight. The order was founded by King James I. at the suggestion of Sir Robert Cotton, when 200 baronets were created at once: to which number it was intended that they should be always restrained; but it is now enlarged at the king's pleasure, without limitation. On their institution, they were allowed to charge their coat with the arms of Ulster, in Ireland, which province they were to defend against the rebels, who then harassed it extremely: to which end they were each to raise and keep up 30 soldiers at their own expense for three years together, or to pay into the exchequer a sum sufficient to do it; which, at 8d. per day per head, was £1095: so that including fees, the expense of this dignity may be about £1200 sterling. The baronetcies of Scotland, or of Nova Scotia in America, and of Ireland, were instituted with similar views to the advantage of the state.

BARBACAN, a kind of thick, strong stuff, something like camel, but of a coarser grain. It is used to make cloaks, surtouts, and other outer garments.

BARBACKS, large buildings erected for the security and accommodation of soldiers, whether infantry or cavalry.

BARRACUDA, a species of fish of the pike kind, found in the West Indian seas. It is about ten feet long, and very voracious.

BARRATOR, in law, a common mover, or maintainer of suits and quarrels, either in courts or elsewhere; an encourager of litigation.

BARRICADE, or **BARRICADO**, a fortification made in haste, of trees, earth, palisades, wagons, or any thing that will obstruct the progress of an enemy, or serve for defence or security against his attack.

BARRISTER, a counsellor learned in the law, admitted to plead at the bar, and there to take upon him the protection and defence of clients. They are termed *juris consulti*; in some countries *licentiate jure*; and anciently, barristers were called *apprentices of the law*: in Latin, *apprenticius juris nobilioris*. In Scotland, they are called *advocates*. An inner barrister is one who is a serjeant, or king's counsel, and is admitted to plead within the bar: an outer barrister is one who pleads without the bar; but at the Rolls, and other inferior courts, all barristers are admitted within the bar.

BARROW, a large hillock or mound of earth. They are met with in many parts of the world, and on being opened, are found to be repositories of the dead. When these mounds are composed of stones, they are usually distinguished by the name of *cairns*. By the Romans they were called *tumuli*, and are still to be seen in many parts of Great Britain and Ireland, as well as in several other countries.

BARRY, in heraldry, is when an escutcheon is divided bar-wise, that is, across from side to side, into an even number of

BY THE "PORTABLE BAROMETER" THE PROFILE OF A CHAIN OF MOUNTAINS MAY EASILY BE TAKEN, WITH A GREAT DEGREE OF CORRECTNESS.

THE DUTIES OF A COUNSEL ARE HONORARY, AND HE CAN MAINTAIN NO ACTION FOR HIS FEES, WHICH ARE CONSIDERED AS A GRATUITY.

[BAS]

FEW COUNTRIES IN THE WORLD PRESENT SUCH MAGNIFICENT "BASALTIC ROCKS" AS THE NORTH OF IRELAND, AND SOME OF THE HEBRIDES.

partitions, consisting of two or more tinures interchangeably disposed.

BAR-SHOT, double-headed shot, consisting of a bar with a half ball or round head at each end; used for destroying the masts and rigging in naval combat.

BARTER, the exchanging of one commodity for another, the trucking of wares for wares, among merchants. Barter was the original and natural way of commerce, there being no buying till money was invented.—Also the rule in Arithmetic by which the proportionate value of commodities is found.

BARYTA, or **BARYTES**, in mineralogy, a very ponderous kind of earth, very brittle, and perfectly soluble in boiling sulphuric acid. It is compounded of oxygen and barium.

BARYSTONTIANITE, a mineral called also *Stromessite*, from Stromness, in Orkney. It is of a yellowish white colour externally, but of a greyish white within.

BARYTO-CALCITE, in mineralogy, a mixture of carbonate of lime with sulphate of barytes, of various forms and of a grey colour.

BARYTONE, in music, a male voice, the compass of which partakes of the common base and the tenor, being lower than the one and higher than the other.

BASALTES, or **BASALT**, a stone supposed to be of volcanic origin, black or green in colour, and found in pillars in the prismatic form. Columns of basalt form the Giant's Causeway, the Isle of Staffa, and Fingal's Cave, and are always found near great volcanoes, as Hecla, &c. It is remarkably hard and heavy, will not strike fire with steel, and is a fine touch-stone.

BASALTINE, in mineralogy, a variety of common hornblende, often found in basalt and volcanic scoriae.

BASANITE, in mineralogy, Lydian stone, or black jasper; a variety of siliceous or flinty slate; of a bluish black colour, interspersed with veins of quartz. It is employed to test the purity of gold.

BASE, in geometry, the lowest side of the perimeter of a figure: thus, the base of a triangle may be said of any of its sides, but more properly of the lowest, or that which is parallel to the horizon.—**BASE**, in architecture, is used for any body which bears another, but particularly for the lower part of a column and pedestal. The base of columns is differently formed in different orders; thus, the Tuscan base consists only of a single torus, besides the plinth; the Doric has an astragal more than the Tuscan: the Ionic has a large torus over two slender scotias, separated by two astragals: the Corinthian has two toruses, two scotias, and two astragals: the Composite has an astragal less than the Corinthian: the Attic base has two toruses and a scotia, and is proper for either the Ionic or Composite columns.—**BASE**, in fortification, the exterior side of the polygon, or that imaginary line which is drawn from the flanked angle of a bastion, to the angle opposite to it.—**BASE**, in chemistry, a term used to de-

note the earth, the alkali, or the metal of which a salt is formed in union with oxygen: thus, in the oxyde of iron or copper, the iron or copper is the base.—**BASE**, in botany, that part on which the whole flower stands, and the fruit too when the flower has faded.—**BASE LINE**, in perspective, the common section of a picture, and the geometrical plane.—**BASE TENURE**, in law, the holding by villeinage or other customary services, as distinguished from the higher tenures in *capite*, or by military service.—**BASE FEE** is to hold in fee at the will of the lord, as distinguished from socage tenure.—**BASE COURT**, any court not of record.

BASHAW, **PASHA**, or **PACHA**, a dignity under the Turkish government. *Bashaw*, used absolutely, denotes the prime vizier; other bashaws, which are generally governors of provinces or cities, being distinguished by the name of the place under their command. The appellation is given by way of courtesy to almost every person of any figure at the Grand Signior's court. Their degrees of dignity were marked by their bearing one, two, or three horses' tails.

BASIL, in botany, an aromatic plant of the genus *Ocymum*, of which there are many species, all natives of warm climates. The sweet basil is much used by the French in cookery.—*Basil*, in carpentry, the slope or angle of a chisel, plane, or other tool.

BASILICA, anciently, public halls or courts of judicature, where princes and magistrates sat to administer justice. They were at first the palaces of princes, but were finally converted into churches. Hence *basilic* now means a church, chapel, cathedral, or royal palace.

BASILICA, or **BASTLIC**, in anatomy, the interior branch of the axillary vein, running the whole length of the arm.

BASILICI, a denomination given in the Greek empire to those who carried the emperor's orders and commands.

BASILICON, in medicine, an ointment consisting of resin, oil, wax, &c.; a sovereign kind of plaster. The word is also used as an epithet for many compositions.

BASIS, in medicine, the principal ingredient in a composition.—**BASIS CORDIS**, in anatomy, the superior part of the heart, to distinguish it from its apex or small point.—**BASIS CEREBRI**, the lower and posterior part of the brain.

BASILICUS, in astronomy, *Cor Leonis*, a fixed star of the first magnitude in the constellation Leo.

BASILID'IAN, in church history, a branch of gnostics, who maintained that Christ's body was only a phantom, and that Simon the Cyrenean suffered in his stead.

BASILISK, a fabulous kind of serpent, called a cockatrice, said to be produced from a cock's egg, hatched by a serpent, and supposed to kill by its breath or sight only.—A harmless species of lizard, with piercing eyes, and a white spot on its head, of remarkable brilliancy.—A large piece of ordnance.

BASIN, a hollow vessel for holding li-

[BAT]

DURING THE DAY-TIME, "BATHS" REMAIN SUSPENDED BY THEIR HOOKED HINDER CLAWS, IN THE LOFTS OF BATHS, OR IN TREES.

quids.—In hydraulics, any reservoir of water.—*Basin of a dock*, a place where the water is confined by double flood-gates. The *basin of a haven* is that part which opens from a narrow passage into a spacious receptacle.—In Jewish antiquities, the laver of the tabernacle.

BASSO, in music, the Italian for *bass*. Thus, *Basso concertante*, is the bass of the little chorus : *basso respinto*, the bass of the grand chorus ; and *basso continuo*, that part of a composition which is set for the organ, &c.

BASKING-SHARK, a species of *squalus* or shark, from three to twelve yards in length. It is also called the *sun-fish*, from its lying on the surface of the water, and basking in the sun. It produces a great quantity of oil.

BASKET FISH, a species of sea-star, or star-fish, of the genus *asterias*, having five rays issuing from an angular body, and dividing into innumerable branches.

BASS (sometimes written *bass*, which is the correct English word for *basso*, low) : the lowest or fundamental part in music, and important as the foundation of harmony.—*Thorough bass* is that which includes the fundamental rules of composition. *Ground bass* is that which commences with some subject of its own, that is continually repeated throughout the movement, whilst the upper parts pursue a separate air. *Counter bass* is a second or double bass, where there are several in the same concert.—*Bass*, among gardeners, a soft kind of sedge or rush used in binding plants, &c.

BASS VIOL, a stringed musical instrument of the same shape as a violin, but much larger.

BASSETTING, the rising of a vein of coal or other stratum, towards the surface of the earth.

BASSOON, a musical wind instrument, consisting of a very long tube, with a reed for the mouthpiece.

BASSO RELIEVO, or BASS RELIEF, sculpture in which the figures are represented as projecting not far above the plane on which they are formed. Figures cut are said to be done in *relief*, and when the work is low or flat it is called *bass relief*, or *basso rilievo*, in distinction from *alto rilievo* and *mezzo rilievo*.

BASTILE, a noted fortress in Paris, which was used as a state prison, and in which many persons who had incurred the resentment of the French monarchs, or their ministers, had been immured for life. It was built at the latter part of the 14th century ; and was demolished by the enraged populace at the commencement of the revolution in 1789.

BASTINADO, a mode of punishment used among the Turks, of beating the offender on the soles of the feet.

BASTION, in modern fortification, a huge mass of earth, usually faced with sods, but sometimes with brick, and, in a few instances, with stone, standing out from a rampart, whereof it is a principal part, and

what in ancient fortification, was called a *bulwark*. The bastion consists of two *faces*, and an opening towards the centre called the *gorge*. Bastions are solid or hollow. A *flat* bastion is made in the middle of the curtain, when it is too long to be defended by the bastions in its extremes. A *demi* bastion is composed of one face only, with one flank and a demi-gorge. A *double* bastion is one raised on the plane of another.

BAT, in zoology, the *l'espertilio* of Linnaeus, an animal resembling both a bird and a mouse. It has wings, not of feathers but of a skin distended, and flies only by night, and has an unknown power of distinguishing distant objects without light. It lays no eggs, but brings forth its young alive, and suckles them. They feed upon moths, flies, flesh, and oily substances, and are torpid during the winter. The species are numerous, and among them is the *vampire* or *Ternate bat* of Africa and the Oriental isles : their wings when extended measure five or six feet ; they live on fruits, but they are said to suck the blood of persons when asleep.

BATH, a sufficient quantity of water collected in some convenient receptacle, for persons to plunge or wash their bodies in, either for health or pleasure. They are distinguished into *natural* and *artificial*, and natural again into *warm* and *cold*. Natural warm baths are formed of the water of hot springs, of which there are many in different parts of the world ; especially in countries where there are, or evidently have been, volcanoes. The artificial warm baths consist of either water or some other fluid heated by art. The cold bath consists of water, either fresh or salt, in its natural degree of heat ; or it may be made colder by art, as by a mixture of nitre, sal-ammoniac, &c. The chief natural warm baths in Great Britain are those of Bath and Bristol, in Somersetshire ; and those of Buxton and Matlock in Derbyshire ; which latter are merely *tepid*. Some are impregnated with iron, and called *chalybeate* ; others with sulphur, carbonic acid, and other mineral qualities. They are often very efficacious in scorbutic, bilious, and dyspeptic complaints, as well as for the removal of various chronic diseases. The word *bath* also signifies any artificial contrivance which is to supply the place of a bath, as a *shower bath*, or an apparatus for applying water to the body in the form of a shower ; a *vapour bath*, or a mode of conveying moisture to the body by means of steam. Among the ancients, the most magnificent edifices were erected for bathing in ; such were the baths of Titus, Paulus Emilius, and Dioclesian, whose ruins are still remaining. At the present day, baths are in general use in the East.

BATH, (KNIGHTS OF THE), a military order of knighthood in England, supposed to have been instituted by Richard II., who limited the number of knights to four : but his successor, Henry IV., on the day of his coronation increased them to forty-six. This order received its denomi-

IF IT IS CUSTOMARY FOR RUSSIANS, AFTER ENJOYING A "STEAM BATH," TO PLUNGE INTO A RIVER, OR ROLL THEMSELVES IN THE SNOW.

EACH BATTALION IN THE BRITISH ARMY CONSISTS OF FOUR DIVISIONS, WHICH ARE SUBDIVIDED, AND FORMED INTO SECTIONS.

nation from a custom of bathing before the knights received the golden spur. The badge or symbol of the order is a sceptre, rose, thistle, and three imperial crowns conjoined within a circle, upon which is the motto, "Tria juncta in uno," alluding to the three cardinal virtues—faith, hope, and charity. The order of the bath, after remaining many years extinct, was revived under George I., by a solemn creation of a great number of knights.

BATON, the staff or truncheon given as a symbol of authority to field-marshal.

BATOON, in architecture, a moulding in the base of a column.

BATRACHIUS, in ichthyology, the sea-devil, a froglike fish.—In medicine, an inflammatory tumour under the tongue.

BATRA'CIAN, an epithet designating an order of animals, including frogs, toads, &c.

BATTA, allowances made to troops in India. *Dry batta* is money given in lieu of rations; *wet batta* what is given in kind.

BATTA'LIA, an army drawn up in order of battle.

BATTALION, a body of foot soldiers, consisting of from 600 to 1000 men.

BATTEL, an ancient mode of trial by single combat, which was introduced into England by William the Conqueror. The contest was had before the judges, on a piece of ground enclosed, and the combatants were bound to fight until the stars appeared, unless the death of one party or victory sooner decided the contest. It is but of late years that this barbarous law has been abolished.—An account of the expenses, for provisions and liquor, of a student at Oxford.

BATTEN, a scantling or piece of wooden stuff, from two to four inches broad, and one inch thick.

BATTERING-RAM, a military machine, with which the ancients effected breaches in fortifications. These engines were variously constructed and of different sizes; but in general the battering-ram consisted of a vast beam suspended to a frame, and armed at one end with a head of iron, resembling that of a ram; from the butting of which animal the idea was doubtless derived. This being equally balanced, and furnished with a number of ropes, at the extremity opposite to the ram's head, a great number of men threw it forward with violence, and thus, by a repetition of the strokes, demolished the wall against which it was directed.

BATTERY, in the military art, a parapet thrown up to cover the gunners and men employed about the guns from the enemy's shot. This parapet is cut into embrasures for the cannon to fire through. A *battery of mortars* is sunk in the ground, and has no embrasures. *Cross-batteries* are two batteries which play athwart one another upon the same object, thus forming an angle, and beating with great effect, because, what one ball shakes, the other beats down. *Battery d'ensfilade*, is one that scours or sweeps the whole length of a straight line. *Battery en echappe*, is that

which plays obliquely. *Battery de reserve*, that which plays on the enemy's back. *Camerade battery*, is when several guns play at the same time upon one place.—*BATTERY*, in electricity, is a combination of coated surfaces of glass, commonly jars, so connected together that they may be charged at once, and discharged by a common conductor.—*GALVANIC BATTERY*, or *PILE*, an apparatus employed for accumulating the electricity of galvanism, which is produced by the mutual agencies of certain metallic and carbonaceous substances, and peculiar fluids. It was invented by the celebrated Volta, and is often called the *Voltaic battery*.—*BATTERY*, in law, the striking, beating, or offering any violence to another person, for which damages may be recovered. It is distinguished from an *assault*, inasmuch as the latter does not necessarily imply a hitting or blow. There may be an assault without battery, but battery always implies an assault.

BATTLE-AXE, a kind of halberd, first introduced into England by the Danes, and much used in the early part of the middle ages.

BATTEMENTS, in architecture, are indentures or notches in the top of a wall, or other building, in the form of embrasures.

BATTOLOGY, in grammar, a superfluous repetition of some words or things.

BAY, in geography, an arm of the sea, extending into the land, and terminating in a nook. It is larger than a creek, and less than a gulf. It is also often applied to large tracts of water, as the *bay of Biscay*.—*BAY*, one of the colours of a horse, of which there are various shades.—*BAY*, or *BAY TREE*, the female laurel tree, an evergreen which grows wild in Italy and France.

—*BAYS*, in the plural, an honorary garland or crown, bestowed as a prize for victory or excellence, anciently made of laurel branches.

BAY-SALT, a salt which crystallizes or receives its consistence from the heat of the sun or action of the air.

BAYONET, a short pointed instrument or triangular dagger, made to fix on the muzzle of a firelock or musket.

BAZAR, or BAZAAR, a kind of exchange or market-place among the Turks and Persians. Some of these buildings are remarkable, not only for their extent, but for their magnificence.—This name has of late years been in use with us to denote certain large buildings containing a collection of shops or stalls, let to different persons, and in which a great variety of "fancy goods" are exposed for sale.

BDEL'LIUM, a gummy resinous juice, produced by a tree in the East Indies, of which we have no satisfactory account. It is brought into Europe from the East Indies, and from Arabia. As a medicine, in which quality it is brought to market, it is better in its simple state, than when formed into any preparation. It is one of the weakest of the deobstruent gums, has a fragrant odour, and a pungent flavour.

EACH REGIMENT IN NAPOLEON'S ARMY HAD A BATTALION OF "VOLONTAIRES," THE PRUSSIANS HAVE ONE ALSO, CALLED "FUSILIERS."

[BEA]

The Scientific and Literary Treasury ;

[BEA]

BEA'CON, a signal erected on a long pole, upon an eminence, consisting of a pitch-barrel or other combustible matter, to be fired at night, to notify the approach of an enemy. Also, any object serving as an occasional signal, or as a constant sea-mark, by means of which ships may be warned of danger, or assured of their port.

BEAD, in architecture, a round moulding, commonly made upon the edge of a piece of stuff, in the Corinthian and Roman orders, cut or carved in short embossments, like beads in necklaces.—**BEAD**, in metallurgy, the small ball or mass of pure metal separated from the scoria, and seen distinct while in the fire.—**BEAD-PROOF**, a term among distillers for that proof of the strength of spirituous liquors denoted by the bubbles called *beads*, which rise and remain on the surface of the liquid for some time after it has been shaken.

BEADY-TREE, in botany, a shrub growing in Spain and Portugal; so called, because the nut which it bears is bored through, and strung as beads by the Roman catholics of those countries. It is the *Melia* of Linnæus.—A *beadman* is one who recites beads or prayers for his patron, &c.

BEAK, in a general sense, the upper end or point, as the upper part of the bill of a bird.—**BEAK-HEAD**, in a ship, a small platform at the fore-part of the upper deck.—**BEAKED**, in heraldry, an epithet in blazoning for birds whose beaks are of a different tincture from the bodies. And in botany, an epithet for the fruit when it is terminated by a process in the shape of a bird's beak.

BEAKER, a drinking cup; so called from its having a spout like a bird's beak.

BEADLE, a messenger, or apparitor of a court, who cites persons to appear, and answer in the court what is alleged against them.—A **BEADLE** is also an officer at an university, whose chief business it is to walk before the masters with a mace, at all public processions, &c.

BEAGLE, the name of a particular kind of bound or hunting-dog, of which there are several sorts.

BEAM, the largest piece of timber in a building, laid across the walls, and which serves to support the principal rafters. In ships, beams are the large main timbers that stretch across a ship to support a deck.—The part of a balance, from the ends of which the scales are suspended.

—**BEAM**, among hunters, the main stem of a deer's head, or that part which bears the antlers, royals, and tops.—**BEAM-HEADS**. A vessel is said to be on her beam ends, when she inclines so much on one side that her beams approach a vertical position.—**BEAM-COMPASS**, an instrument consisting of a square wooden or brass beam, having sliding sockets, used for describing large circles.—**BEFORE THE BEAM**, is an arch of the horizon between a line that crosses the ship at right angles, and that point of the compass which she steers.

BEAM-TREE, a species of wild service.

This tree grows to the height of thirty or forty feet, and is particularly fitted for making axle-trees and the like.

BEAR, a wild quadruped, of the genus *ursus*. Its limbs are large and heavy, the head large, terminating in a prolonged snout, the body covered with shaggy hair, and having hooked claws for climbing trees. It feeds on honey, insects, and carcases, and lies torpid during the winter. There are ten species, three of which are well known. 1. The Brown bear, which subsists chiefly on fruit, vegetables, and honey. 2. The American bear, which is smaller than the other, and feeds in like manner. 3. The Polar or maritime bear, which is only found in high northern latitudes: it is from eight to twelve feet long; of great strength and ferocity, devouring fish, seals, and whales at sea; and on land, any animals which it can seize.—**BEAR**, in astronomy, a name given to two constellations called the greater and the lesser bear, or *ursa major* and *ursa minor*.

BEARDED, (*barbatus*) in botany, having parallel hairs or tufts; in opposition to **BEARDLESS** (*imberbis*) without parallel hairs or tufts; epithets applied to the corollas of certain plants.

BEARER, in architecture, a post or brick wall between the ends of a piece of timber, to support it.—In heraldry, a figure in an achievement, placed by the side of the shield, and seeming to support it.

BEARING, in navigation and geography, the situation of one place from another, with regard to the points of the compass, or the angle which a line, drawn through two places, makes with the meridian of each.—Also a sea term in several phrases; thus, when a ship sails towards the shore, before the wind, she is said to *bear in with the land* or harbour. To let the ship sail more before the wind, is to *bear up*. To put her right before the wind, is to *bear round*. A ship that keeps off from the land, is said to *bear off*. When a ship that was to windward comes under another ship's stern, and so gives her the wind, she is said to *bear under her lee*, &c.—In heraldry, bearings are the coats of arms or figures of armour, by which the nobility and gentry are distinguished from common persons.

BEAT. In military phraseology, "to *beat*" has various significations, expressive of giving a signal by *beat of drum*. "To *beat an alarm*," to give notice of danger. "To *beat a charge*," a signal for charging the enemy. "To *beat the general*," to give notice to the troops to march. "To *beat the reveille*," to give notice for leaving quarters. "To *beat the tat too*," to give notice for retiring to quarters, as at bedtime. "To *beat the troop*," a signal for repairing to their colours. "To *beat to arms*," to give a signal for the troops to arm themselves. "To *beat a parley*," a signal for a cessation of hostilities, to hold a conference with the enemy.

BEATIFICATION, an act of the Pope, by which he declares a person beatified or

THE ASIATIC, OR LONG-LIPPED BEAR, IS A NATIVE OF INDIA, AND FEEDS ON ANTS, RICE, HONEY, AND THE FRUIT OF THE PALM-TREE.

THE POLAR BEAR WALKS FIRMLY ON ICE, BECAUSE THE SOLES OF HIS FEET ARE ALMOST ENTIRELY COVERED WITH LONG HAIR.

blessed after death, and is the first step towards canonization, or the raising of one to the dignity of a saint; but no person can be beatified till fifty years after his death.

BEATINGS, in music, the regular pulsative swellings of sound, produced in an organ by pipes of the same key, when not in unison, and their vibrations not simultaneous or coincident.

BEATING TIME, in music, that motion of the hand or foot by which some person marks and regulates the movements of the performers.

BEAUTY, a general term for whatever excites in us pleasing sensations or causes our admiration. Or it may be defined to be an assemblage of graces or properties which please the eye and interest the mind. The proportion and symmetry of parts, the regularity and symmetry of features, the expression of the eye, and the complexion, are among the principal properties which constitute *personal* beauty. This kind is said to be *intrinsic*, and immediately perceptible; but when reflection is requisite to comprehend the utility of an object, it is said to be *relative*: for instance, the beauty of a machine is not perceived till we understand its uses and adaptation to its purpose. Thus, an object may please the understanding without interesting the sense; and on the other hand, we perceive agreeable sensations, excited by some objects, whose ideas are not related to anything that is praiseworthy.—**BEAUTY**, in architecture, painting, and other arts, is the harmony and justness of the whole composition taken together.

BEAVER, an amphibious quadruped that lives on the banks of rivers and unfrequented lakes, and is remarkable for its ingenuity in building its habitation. It has short ears, a blunt nose, small forefeet, large hind feet, and a flat ovate tail. It walks slowly, swims dexterously, cats sitting on its haunches, and conveys its food to its mouth with its fore paws. This animal is valued both for its fur and for the oil which it yields, called castor oil.—**BEVVIS**, that part of the helmet which defends the sight, and opens in front.

BEAU MONDE, a French term, implying the gay fashionable world.

BED, an article of furniture for stretching and composing the body on, for rest, or sleep, consisting generally of feathers inclosed in a case of tick. The ancient Romans had various sorts of beds, for various purposes; they had their chamber-bed, whereon they slept; their table-bed, whereon they eat, in a recumbent posture; there being usually three persons to one bed, whereof the middle place, as well as the middle bed, was accounted the most honourable: they had also the bed whereon they studied, and that whereon the dead were carried to the funeral pile.—**BED**, a plat or level piece of ground in a garden, raised a little above the level of the adjoining ground.—A hollow place in which any thing rests: as, the *bed* of a mortar.—A stratum, or extended mass of any

thing, whether upon the earth or within it; as, a *bed* of sulphur, a *bed* of sand, &c.—

The *bed* of a river is the bottom of a channel in which the stream or current usually flows.—*From bed and board*, in law, a separation of man and wife without being divorced, the wife having a suitable maintenance allotted to her out of the husband's estate, called alimony.

BEE, an insect of the genus *apis*, of which there are numerous species, but the most interesting and useful to man is the honey-bee: it is justly celebrated for its singular instincts, and highly prized for the valuable products of its industry. The honey-bees live in swarms or societies of from 10,000 to 40,000, and contain three sorts of individuals: the female, or, as she is commonly called, the *queen* bee; the males, or drones; and the *neuters*, or working bees; though by some naturalists these latter are called imperfect females. A hive usually consists of one mother, or queen, from six to eight hundred males, and from 15 to 20,000 working bees. The office of the queen bee is to propagate the species; that of the neuters to collect the honey, form the cells, and feed the young. They are furnished with a proboscis by which they suck the honey from flowers; this they swallow, and when it has undergone a peculiar process in the stomach, they disgorge it into the cells. The pollen of flowers settles on the hairs with which their body is covered, whence it is collected into pellets, by a brush on their second pair of legs, and deposited in a hollow in the third pair. It is called *bee-bread*, and is the food of the larvæ or young. The females and neuters have a barbed sting, attached to a bag of poison, which flows into the wound inflicted by the sting. The season of fructification occurs about the beginning of summer. It is said that the female, in the spring, lays as many as 12,000 eggs in the lapse of twenty-four days. When a hive is overstocked, a new colony is sent out under the direction of a queen bee; this is called *swarming*; and three or four swarms sometimes leave a hive in one season.

BEER, a drink made of malt and hops by the process of brewing; it is of three kinds, namely, strong beer, ale, and table beer, or small beer.

BEETLE, or *SCARABÆUS*, a genus of insects furnished with shelly wing-cases, and of which there are several species, all perfectly harmless, but differing greatly in size. The largest sort is the elephant beetle, found in South America, which is four inches long.

BEHEMOTH, an animal mentioned in the book of Job, which some naturalists suppose to be the same as the river-horse.

BEL-LIS, in botany, the *DAISY*, a genus of plants, class 19 *Syngenesia*, order 2 *Polygamia superflua*.

BEI'ZA, in Hebrew antiquity, a word signifying an egg, was a certain measure in use among the Jews. The beiza was likewise a gold coin of the Persians, who asserted that Philip of Macedon owed their

[BEL]

The Scientific and Literary Treasury ;

[BEN]

king Darius a thousand bezas or golden eggs for tribute money; but Alexander the Great refused to pay them, saying that the bird which laid these eggs had flown into the other world.

BELMONTITE, in mineralogy, a kind of stone resembling an arrow in shape, and vulgarly called thunder-stone: a genus of fossil shells, common in chalk and limestone.

BELL, a hollow body of metal, ranked by musicians among the musical instruments of percussion. The constituent parts of a bell are the body or barrel, the clapper on the inside, and the ear or cannon by which it hangs to a large beam of wood. The matter of which it is usually made is a composition called bell-metal, which consists of three parts of copper and one of tin. The sound of a bell consists in a vibratory motion of its parts, much like that of a musical chord; and as the external surface of the bell undergoes alternate changes of figure, it gives that tremulous motion to the air, in which the sound consists.

Bells are of high antiquity. The blue tunic of the Jewish high priest was adorned with golden bells; and the kings of Persia are said to have the hem of their robe adorned with them. They were introduced into English churches about the year 700, and used to be baptised before they were hung. The number of changes may be found by multiplying the digits in the number into one another; thus four bells will give 24 changes, and six bells 720, and ten changes may be rung in a minute.—To *bear the bell*, is to be the first, or leader, in allusion to the bell-wether of a flock, or the leading horse of a team that wears bells on his collar. Or may it not be synonymous with *to bear away the bell*? which is thus explained: Race-courses were formerly called bell-courses, the prize given being a silver bell; therefore, to win the race was “to bear away the bell.”—In naval language the word *bells* is used to denote half hours of the watch, which are marked by striking the bell at the end of each.

BELLOCULUS, in mineralogy, a precious stone resembling the eye, and formerly on that account supposed to be useful in diseases of that organ.

BELLONATI, in Roman antiquity, the priests of Bellona, who, in honour of that goddess, used to make incisions in their body; and after having gathered the blood in the palm of their hand, give it to those who were partakers of their mysteries.

BELLES-LETTRES, or **POLITE LITERATURE**, in its most obvious sense, is that description of literature which has a peculiar reference to matters of taste: but according to many writers, the term has a much more extensive signification, and is made to comprehend not merely every elegant acquirement, but nearly every branch of knowledge.

BELLONIA, in botany, a genus of the *pentandria monogynia* class of plants, whose flower, consisting of a single petal, is of

the rotated kind; the fruit is a capsule of a turbinato-oval figure, surrounded by the cup, and containing only one cell, in which are numerous very small roundish seeds.

BELLOWS, an instrument or machine for blowing fire, so contrived as to exhale and inhale air by turns, by enlarging and contracting its capacity. It serves also for organs and other pneumatic instruments, to give them a proper supply of air. The air which enters the bellows is compressed when they are closed, and flows with a velocity proportioned to the force by which it is compressed.—Bellows of very great power are generally called *blowing machines*. One of the largest known is erected at the smithy in the royal dockyard at Woolwich: it is adequate to the supply of air for forty forge fires, amongst which are several for the forging of anchors, &c.

BEL-METALO DI VOCE, in music, an Italian expression for a clear and brilliant toned *soprano* voice.

BEL'OMANCY, a kind of divination practised by the ancient Scythians, Arabians, &c. A number of arrows, being marked, were put into a bag or quiver, and drawn out at random; and the marks or words on the arrows drawn, determined what was to happen.

BELTS, or **FASCIE**, in astronomy, two zones or girdles round the planet Jupiter, more lucid than the other parts of his body, and terminated by parallel straight lines, sometimes broader, and sometimes narrower, varying both in magnitude and position.

BELL'EVUE (*French*), a name given in France to small country-seats, or to arched bowers at the end of a garden or park, intended for the enjoyment of fresh air in the shade.

BEL'LU'E, the sixth order of the animals of the class *mammalia*, with cutting teeth in both jaws, feet hoofed, and living on vegetables; including the genera of the horse, hippopotamus, and swine.

BELUGA, a large fish of the cetaceous order, found in the arctic seas, and measuring from twelve to eighteen feet in length. In swimming, this fish bends its tail under its body like a lobster, and thrusts itself along with the rapidity of an arrow.

BEL'VEDERE, (*Ital.*) a name given in Italy to the cupolas on palaces or large houses, which are ascended for the enjoyment of a fine prospect and the advantage of a pure air. This is the name also of a part of the Vatican, where the famous statue of Apollo is placed, and which, on this account, is called the *Apollo Belvedere*.

BENCH, in law, a seat of justice, as the Queen's Bench at Westminster. Also, the persons sitting on a bench, as a bench of magistrates.

BENCH'ER, a lawyer of the oldest standing in the Inns of Court.

BEND, in heraldry, one of the ten honourable ordinaries, drawn from the dexter or right corner, at the top of the escutcheon.

THE GREAT BELL OF MOSCOW, CAST IN 1633, IS SAID BY MR. CLARKE, TO BE CAPABLE TO WEIGH 443,772 POUNDS.

THE GREAT BELL OF ST. PAUL'S, LONDON, WEIGHS 8400 POUNDS; GRAY TOM OF CHURCH'S-CHURCH, OXFORD, WEIGHS 17,000 POUNDS.

[HEN]

A New Dictionary of the Belles Lettres.

[BES]

to the sinister base, or left corner, at the bottom. It is supposed to represent a shoulder belt, or scarf, and to show the bearer to be valiant in war. It is sometimes called a *bend-dexter*, to distinguish it from the *bend-sinister*, which is drawn from the left side of the shield to the right.

BURNS of a ship are the strongest and thickest planks in her sides, and are reckoned from the water, first, second, or third bend. They have the beams, knees, and foot-hooks bolted to them, and are the chief strength of the ship's sides.

BENDING, in seamanship, the tying of two ropes or cables together: thus they say bend the *cable*, that is, make it fast to the ring of the anchor; bend the *sail*, make it fast to the yard.

BEND'LET, in heraldry, a little bend which occupies a sixth part of a shield.

BENEDICTINES, a celebrated order of monks, who profess to follow the rules of St. Benedict. They wear a loose black gown with large white sleeves, and a cowl on the head, ending in a point. They are the same as are called *Black-friars*.

BENE PLACITO, in music, an Italian term, denoting that the performer is to exercise his own taste.

BENEFICE, an ecclesiastical living, particularly a rectory and a vicarage. Bishops, deans, and prebendaries are usually styled *dignities*.

BENEFIT OF CLERGY, a privilege, originating in a superstitious regard for the church, whereby the clergy were either partially or wholly exempted from the jurisdiction of the lay tribunals. It extended in England only to the case of felony; and though it was intended to apply only to clerical felons or clerks, yet as every one who could read was, by the laws of England, considered to be a clerk, when the rudiments of learning came to be diffused almost every person became entitled to this privilege. A variety of provisions and exceptions were from time to time enacted; till at length by the statute of 7 and 8 Geo. IV., c. 28, it was decreed that "benefit of clergy, with respect to persons convicted of felony, shall be abolished."

BENZOIN, or **BENJAMIN**, a dry solid vegetable substance, or resin, of a fragrant smell, produced by an incision from the *styrax*, an Indian tree. It is brought to us from the East Indies, particularly from Siam and the islands of Java and Sumatra, in masses of various sizes, composed of small granules of a whitish or yellowish colour, with a purple cast on the surface. It is very inflammable, and diffuses a fragrant smell while burning, or when rubbed in the hand. When the benzoïn tree is six years old, the natives cut it in several places in an oblique direction, and the benzoïn flows out in the form of a balsamic juice, having a pungent taste and an agreeable odour. Benzoïn was formerly very much esteemed as an expectorant; and is still often employed in medicine. A cosmetic is also prepared from it, which is much used in France, under the name of *lait virginal*;

and the gum is a principal ingredient of court plaster.

BEN-BERIS, or **BARBARY-TREE**, in botany, is a shrub rising to eight or ten feet high, well known as an ornamental shrub in our gardens. The leaves have a grateful acid taste, the flowers at a distance yield a pleasant smell, but very near they are rather offensive. The berries are so very acid that the birds seldom touch them; they are used in this country as pickles and preserves. The roots of the shrub boiled in lye give a fine yellow, which is used in Poland for dyeing leather; the bark, with the aid of alum, is used for the same purpose.

BERGAMOT, or **BERGAMOTTE**, in chemistry, a fragrant essence, extracted from a fruit which is produced by grafting a branch of a citron tree upon the stock of a bergamot pear. This essence is obtained by cutting the external rind of the fruit into small pieces, and squeezing them into a glass vessel, in the same manner as the juice of a lemon is squeezed out, by which means an ethereal oil is produced of a very fragrant smell.

BERLIN, a kind of chariot, supposed to have its name from the Prussian capital, where it was first made.

BERME, in fortification, a space of ground left between the rampart and the moat or foss, designed to receive the ruins of the rampart, and prevent the earth from filling the foss.

BERNARDINES, an order of monks, founded by Robert, abbot of Moleme, and reformed by St. Bernard. They wear a white robe with a black scapulary, and when they officiate they are clad in a large white gown, with great sleeves, and a hood of the same colour.

BERRE, the popular term for a succulent pulpy fruit, containing several seeds or granules, as the gooseberry, &c.

BERTH, any situation or place where a vessel lies, either at anchor or in a wharf.—An apartment in a ship where a number of officers or men mess or reside.—Also, the box or place for sleeping at the sides of a cabin; or the place for a hammock.

BERYL, in mineralogy, a pellucid gem of a light green colour, found in the East Indies, Brazil, Peru, Siberia, &c. Beryl is considered by Cleaveland as a subspecies of emerald. It is crystallized in six-sided prisms, which are perfect or truncated on the edges and angles. It is nearly as hard as the topaz, and can scarcely be melted without the addition of some other substance. With borax, it melts easily. It becomes electrical by rubbing, and is found in primitive rocks, accompanied with quartz, felspar, garnet, mica, and topaz.—A beautiful sea-green colour for the use of artists, is also prepared under this name.

BERYL-CRYSTAL, a species of imperfect crystal, of a very pure, clear, and equal texture. Its colour is a fine transparent pale brown.

BESTIARI, an appellation given by the Romans to such as engaged with wild beasts

THE ORANGE AND LEMON ARE BERRIES, AS MUCH AS GOOSEBERRIES AND CURRANTS ARE, THEIR SEEDS LYING WARED IN THE PULP.

[BEL]

The Scientific and Literary Treasury ;

[BIG]

at their public games whether they fought by compulsion as criminals, or, as gladiators, made a trade of it.

BETA, the second letter in the Greek alphabet.

BETEL or **BETEL NUT** a species of pepper plant the leaf of which is universally chewed by the southern Asiatics, to sweeten the breath and strengthen the stomach. It is a slender stemmed climbing plant. In India there is an almost incredible consumption of the betel nut. It is taken by the natives after meals during a visit it is offered to friends when they meet and when they part and in short nothing appears to be done without betel. To correct the bitterness of the leaves a little *areca* is wrapped in them with the *chinnam* which is a kind of burnt lime made of shells.

BETONY or **HELONICA** in botany a genus of the *didyma gymnosperma* class of plants whose flower consisting of a single labiated petal is of a bright red colour and disposed in short spikes. It is reckoned vulnerary aperient and diuretic.

BETULA the **BIRCH TREE**. The trees of this genus most commonly known, are the *birch* and the *alder*. The birch is applied to an infinity of uses. A wine is drawn by tapping from the trunk by the natives of Canada and in Europe wine is made from the fruit of the alder. The birch though the worst of timber is manufactured into vessels of various domestic uses. Broom makers are constant customers for the twigs and hoop makers for the larger branches and for the trunks the turners and manufacturers of instruments of husbandry have a constant demand. It is also used in certain processes of dying and for tanning leather.

BEVEL an instrument to mark particular angles on wood or stone much used by joiners and masons.—In architecture any angle that is not a right angle or square is more or less than 90 degrees is termed a bevel but if it has an angle of 45 degrees it is called a *miter*.

BEY among the Turks signifies a governor of a country or town. The Turks write it *begh* or *beg* but pronounce it *bey*. The word is particularly applied to a lord of a banner whom they call *sangjak beg* or *bey*. Every province in Turkey is divided into several *sangjaks* or banners each of which qualifies a bey and these are all commanded by the governor of the province whom they also call *begler beg* that is lord of all the bays of the province.

BETUNT a round flat piece of pure gold without any impression supposed to have been the current coin of Byzantium.

BEZOAR a medicinal stone brought from the East and West Indies which was formerly reckoned a sovereign antidote against poisons. It is found to be a calculus or inorbid concretion contained in the stomachs of certain animals and consists for the most part of bile and resin. The great value of the bezoar at one time gave birth to many imitations of it, nor can it be wondered at, when we read of its being

eagerly bought for ten times its weight in gold. Hence other medicines, supposed to possess similar virtues obtained the name of *beoards*.—**BEZOAR** is also the name of some medicinal preparations as the **BEZOAR ANIMALS**, made of calcined haithorn and vitriol and **BEZOAR MINERAL** a preparation of antimony made by adding nitrous acid to antimony.—**BEZOARDIC ACID**, a name given to the acid extracted from the urinary calculi formed in the kidneys or gall bladder.—The word *bezoartie* is also used in various medical compositions.

BIBLE (THE BOOK) a name given by way of eminence to the Sacred Writings. The Old Testament consists of the five books called the Pentateuch the Historical Poetical, and Prophetic books the New Testament of the four Gospels the Acts and the Epistles. The earliest version of the Bible is a Greek translation called the Septuagint, and from this other translations have been made. It was first printed in English in 1535. The present authorized version of the Holy Scriptures was completed in the reign of James the First, about the year 1603.

BIBLIOGRAPHY the knowledge of books as to their several editions time of being printed and other information tending to illustrate the history of literature.

BIBLIOMANCY a kind of divination, performed by means of the Bible by selecting passages of Scripture at hazard and drawing from them indications concerning future events.

BIBLIOTHECA in its original and proper sense denotes a library or place for depositing books. In matters of literature it means a treatise giving an account of all the writers on a certain subject thus we have *bibliotheca* of the doge law philosophy &c. There are likewise universal *bibliothecae* which treat indifferently of books of all kinds.

BICAPSTUAR in botany having two carpels containing seeds to each flower.

BICE a blue colour perceived in the *Lapis lazuli*. Bec bears the best body of all the bright blues used in common work as house painting &c but it is the palest in colour. It works tolerably well but inclines a little to sandy and therefore requires good grinding. Next to ultra marine which is too dear for general use it is the best of all the blues.

BICIPITATE or **BICIPITIS** *manatoma* denotes that a muscle has two heads or origins and such muscle is denominated *biceps*.

BICUNIAIS in botany plants that flourish two years and then perish thereby so that leaves being formed the first year and their fruit the second.

BILARKOS in botany denotes that the leaves grow only on opposite sides of a branch.

BIFIDATT in botany, an epithet for opening with a cleft.

BIGAMY double marriage or the marrying of two wives or two husbands while

CHewing THE "BETEL NUT" REDDENS THE SALIVA AND TURNS THE TEETH BLACK, BUT IT CREATES AN APPETITE

"FOSSEL BEZOAR" IS A FIGURED STONE OF A PURPLE COLOUR, ABOUT THE SIZE OF A WALNUT IT IS CALLED SICILIAN BARTHE

[BIL]

A New Dictionary of the Belles Lettres.

[BIO]

FOURCOSE SUPPOSES THAT THE "BIL," AS SHOWN BY THE CONTENTS OF THE INFESTED CANAL, BECOMES DECOMPOSED.

the first is alive, which is felony by statute.

BIGARIUS, in antiquity, the charioteer of a *biga*, or two-wheeled chariot. Money or medals stamped with this emblem were called *bigati*.

BIGEMINATE, in botany, twin-forked; used of a decompound leaf having a forked petiole, with several leaflets at the end of each division.

BIGOT, a person who is obstinately and unreasonably wedded to a particular religious creed, practice, or opinion; or one who is illiberally attached to any opinion or system of belief.

BILANDER, a small merchant vessel with two masts, rigged in a peculiar manner, but now rarely used.

BILATERAL, in a general sense, denotes something with two sides. Hence, bilateral cognation is kinship both by the father's and mother's side.

BILBOES, a punishment at sea answering to the stocks on land. The offender is laid in irons, or stocks, which are more or less ponderous, according to the quality of the offence of which he is guilty.

BILE, a yellowish green fluid secreted by the liver, accumulated in the gall-bladder, and thence conveyed through a canal into the duodenum, where it converts the chyme into chyle and excrement. The bile is properly of two kinds, and is distinguished under them by the names of *cystic* and *hepatic*. The hepatic bile is thin, almost insipid, and scarcely coloured, the cystic bile is thicker, more coloured, and very bitter. The use of the bile is to attenuate the chyle, to mix the oleaginous parts of the blood with the aqueous, to stimulate the intestines, and in part to change the acid of the chyle. All these effects the cystic bile produces in a greater, and the hepatic in a less degree.

BILUGOUS, in botany, yoked or coupled side by side, an epithet for a leaf.

BILABIAL, in botany, two lipped, an epithet for the corolla and perianth.

BILIARY DUCTS, in anatomy, small canals which convey the bile out of the liver into the hepatic duct, which is formed of these canals, into one trunk.

BILL, in trade, both wholesale and retail, as also among workmen, signifies an account of merchandise or goods delivered to a person, or of work done for one.

BILL, in law and commerce, an obligation or security given for money under the hand of the debtor, without a condition or forfeiture for non-payment. This is also called a note of hand.—A *bill of exchange* is an order drawn on a person, in a distant place, requesting or directing him to pay money to some person assigned by the drawer, or to his order, in consideration of value received. The person who draws the bill is called the *drawer*; the person to whom the request or demand is made, is called the *drawee*; and the person to whom the money is directed to be paid, is called the *payee*. Such a bill is frequently called a *draught*, but *bill of exchange* is the more legal, as

well as more mercantile, expression.—A *bill of entry* is a written account of goods entered at the custom house, whether imported or intended for exportation.—A *bill of lading* is a written account of goods shipped by any person, on board of a vessel, signed by the master of the vessel, who acknowledges the receipt of the goods, and promises to deliver them safe at the place directed.—A *bill of parcels* is an account given by the seller to the buyer, of the several articles purchased, with the price of each.—A *bill of sale* is when a person borrows money and delivers goods to the lender as security, and at the same time gives him a bill, empowering him to sell the goods if the money is not repaid at the appointed time with interest.—A *bill in parliament*, is an instrument drawn up by any member, and presented to parliament for its approbation or rejection. Should it be passed into a law, it then becomes an act of parliament.

BILLIARDS, an interesting game, affording a very healthful exercise and an agreeable recreation. It is played on an oblong table, covered with green cloth, with ivory balls, which are struck or driven with sticks, called the mace and cue, so as to drive the antagonist's ball into holes, called *hazard-nets* or pockets, at the corners or by the sides of the table. The art of the game lies in pocketing your antagonist's ball without putting in your own.

BILLS OF MORTALITY, annual registers of the deaths and burials which take place in and near London. These bills were first commenced in 1542, during the period of a great pestilence, when they included 109 parishes. The number has since been greatly increased.

BINARY ARITHMETIC, that in which two figures or characters, viz 1 and 0, only, are used the cipher multiplying every thing by 2, as in the common arithmetic by ten, thus, 1 is one, 10 is 2, 11 is 3, 100 is 4, 101 is 5, 110 is 6, 111 is 7, 1000 is 8, 1001 is 9, 1010 is 10, being founded on the same principles as common arithmetic. This sort of arithmetic was invented by Leibnitz, who asserts that it is more expeditious than common arithmetic in discovering the properties of numbers, and in extensive tabular calculations.

BINACLE, a wooden case, containing the compasses, log glasses, watch glasses, &c on board a ship.

BINOCLE, or **BINOCULAR TELESCOPE**, a kind of dioptric telescope fitted with two tubes joined in such a manner, that one may see a distant object with both eyes, at the same time.

BINOMIAL, a term in algebra for any quantity consisting of two names, or terms, connected together by the sign +, or —. Thus $a + b$ and $a - b$ are binomials, consisting of the sums and differences of these quantities.

BIOGRAPHY, the life of one or more in dividuals whose actions are deemed worthy of record. No species of history can be more entertaining or instructive than the

BE A "BIL OF RIGHTS" IS MEANT, A CONSTITUTIONAL CHARTER, GUARANTEEING CERTAIN RIGHTS AND PRIVILEGES TO THE PEOPLE.

[BIS]

The Scientific and Literary Treasury;

[BIT]

lives of eminent men, who by their private virtues or public deeds, by the efforts of genius or the impulses of philanthropy, excite our admiration, and afford examples for posterity to emulate.

BIOTA, in zoology, a genus of sea-insects, of a cylindric, but variable figure, with the tentacula arranged in a single series round the aperture of the mouth, at the extremity of the body. Among the several other species of this genus is the polype.

BIPARTITE, in botany, an epithet for the corolla, the leaf, and the perianth, when they are divided into two parts at the base.

BIPENNIS, in Roman antiquity, an axe with a double edge, one of which was used in stabbing, and the other in cutting.

BICUADRATE, in algebra, an obsolete term for the square of the square, as, 16 is the biquadratic power of 2, for $2 + 2$ is 4, and 4×4 is equal to 16—**BICUADRATIC** root of a number, is the square root of its square root thus the biquadratic root of 41 is 3, for the square root of 41 is 9, and the square root of 9 is 3—**BICUADRATIC** EQUATION, an equation where the unknown quantity of one of the terms has four dimensions.—**BICUADRATIC PARABOLA**, in geometry, is a curve line of the third order, having two infinite legs tending the same way.

BICQUINTILE, in astronomy, an aspect of the planets, when they are distant from each other by twice the fifth part of a great circle, that is, 144 degrees.

BIRD BOLT, a small arrow with three heads, which was discharged at birds from a cross-bow. The bird bolt is still used as a bearing in coat armour.

BIRD-CATCHING, the art of taking birds or wild fowl by birdlime, nets, and decoys, which, as respects the more artful modes of catching birds, is called fowling.

BIRDLIME, a glutinous substance, made of the bark of holly, which is spread on the twigs of trees to catch birds.

BIRDS' NESTS, in cookery, the nest of the *Hirundo caelestis* or Indian swallow, very delicately tasted, and frequently mixed among soups. On the sea coasts of China, at certain seasons of the year, there are seen vast numbers of these birds they leave the inland country at their breeding time, and come to build in the rocks, and fashion their nests out of a matter which they find on the shore, washed thither by the waves. The nests are of an hemispheric figure, of the size of a goose's egg, and in substance much resemble the ichthyocolla or isinglass. They are esteemed a great luxury, and sell at a high price.

BISHOP, a prelate, or person consecrated for the spiritual government of a diocese. In Great Britain, bishops are nominated by the sovereign, who, upon request of the dean and chapter for leave to elect a bishop, sends a *compte d'elire*, or license to elect, with a letter missive, nominating the person whom he would have chosen. The election by the chapter must

be made within twelve days, or the king has a right to appoint whom he pleases. The jurisdiction of a bishop of the church of England consists in collating benefices, granting institutions, commanding inductions, taking care of the profits of vacant benefices for the use of the successors, consecrating churches and chapels, ordaining priests and deacons, confirming after baptism, granting administrations, and taking probates of wills; these parts of his function depend upon the ecclesiastical law. A bishop is also a peer of the realm.

BISHOP'S COURT, an ecclesiastical court, held in the cathedral of each diocese, the judge whereof is the bishop's chancellor, who judges by the civil and canon law, and if the diocese be large, he has his commissaries in distant parts, who hold what they call consistory courts, for matters limited to them by their commission.

BISULCI OUS, in botany, an epithet for plants contained in two distinct pods.

BISMUTH, one of the brittle metals, of a reddish or yellowish white colour and a lamellated texture, and moderately hard and brittle so that it not only breaks into pieces under the strokes of the hammer, but may even be beat into powder. Bismuth is more commonly found in a native state than any other semimetal. Most metallic substances unite with bismuth, and are thereby rendered more fusible than before, hence it is used in making solder, printer's types, pewter, &c.

BISON, or Wild Ox, a quadruped of the bovine genus. It has short, black horns, very wide at the base, and on the shoulders is a large bunch, consisting of a fleshy substance, which, with the head, is covered with a long undulated fleece, divided into locks. In winter, the whole body is covered in this manner, but in summer, the hind part of the body is naked. The tail is about a foot long, with a tuft of hairs at the end. The fore parts of the body are very thick and strong, but the hind parts are slender and weak. These animals inhabit the interior of North America, and some of the mountainous parts of Europe and Asia.

BISSEXTILE, or LEAP YEAR, a year consisting of 366 days, and happening every fourth year, by the addition of a day in the month of February, which that year consists of 29 days. And this is done to recover the six hours which the sun takes up nearly in his course, more than the 365 days commonly allowed for it in other years.

BISTRE, or BISTRE, the burnt oil extracted from the root of beech wood, which is used as a brown pigment by painters.

BISTORT, or SNaky weed, a species of Polygonum, the roots of which, when medicinally applied, are powerfully astrigent and antiseptic.

BISTOURY, a small surgical knife, of various forms, according to the purpose for which it is intended.

BISULPHURET, in chemistry, a sulphuret with a double proportion of sulphur.

BIT, in carpentry, a boring instrument

BIRDS WHICH REGULARLY PAIR ARE CALLED "MONOGAMOUS," (MARRIED TO ONE); THOSE WHICH DO NOT, ARE CALLED "POLYGAMOUS."

IT IS SAID THAT HERDS OF TEN THOUSAND WILD "BISOES" ARE OFTEN SEEN ON THE MISSISSIPPI, EACH WITH ITS ARRANGED BENVENUE.

[BLA]

A New Dictionary of the Belles Lettres.

[BIA]

WORDS WRITTEN WITH A COLOURED SOLUTION OF NITRATE OF SILVER BECOME QUITE BLACK IF EXPOSED FOR A FEW MINUTES TO THE LIGHT

so constructed as to be taken out of the handle

BLIT A sea term for the two pieces of timber to which the anchor cables are attached — The iron attached to the bridle which is put into the horse's mouth

BITTER An epithet given to ill bodies of a sharp acid biting taste Bitters are accounted stomachic and cleansing and are said to resist putrefaction correct acidities and assist digestion — *Ist fecal bitter* is any bitter formed by the action of nitric acid on vegetable and other substances

BITTERN in ornithology the English name of the *arde isabellina* it is about the size of the common heron — **BITTERN** in the salt works the brine remaining after the salt is converted It is used in the preparation of 1 pound salt the sulphate of magnesia and of Glaubers salt the sulphate of soda

BITUMEN a combustible mineral which is gross to the touch and when ignited emits a strong odour When moist fluid it is called *asphaltum* when viscid *petroleum* and when hard *asphalt* Cals are supposed to be of vegetable origin and bitumen a compound of vegetable and animal substances

BIVALVE one of the three general classes of shell fish comprehending all those the shells of which are composed of two pieces joined together by a hinge — **BIVALVE** is also an appellation given to such joda or capsulae as consist of two valves enclosing the seeds

BIVOUAC in military affairs a night guard performed by the whole army when there is any apprehension of danger from the enemy or an encampment in the open air

BIXA in botany a genus of plants class 13 *Polyandria* order 1 *Monogynia* from the red pulp which covers the seeds of the *BIXA ORBICULARIS* *arnotto* is made

BLACK A well known colour supposed to be owing to the absence of light in most of the rays falling upon black substances being not reflected but absorbed — There are several species of blacks used in painting as *Frankfort black* of which there are two sorts one a natural earth inclining to blue and the other made from the lees of wine burnt washed and ground with ivory bones &c *lamp black* the smoke of resin prepared by melting it in iron vessels *ivory black* made of burnt ivory and used in miniatures *Spanish black* made of burnt cork and first used by the Spaniards

BLACK BOOK a book kept in the exchequer of England containing a description of that court its officers ranks privileges, perquisites and jurisdiction with the revenues of the crown in money grain and cattle It is said to have been composed in 1170, by Gervase of Tilbury

BLACK CAP in ornithology the *Motacilla atricapilla* or meek nightingale so called from its black crown

BLACK LEAD otherwise called *lithum bago* and *Graphite* is a mineral substance

used in the making of pencils in forming a composition for crucibles and in covering the surface of iron utensils to preserve them from rust and give them a good appearance It has a dark iron black colour a metallic lustre and a thin slaty fracture it is found in separate loose pieces of a fine grain which are very soft and leave as is well known strongly coloured traces on paper by friction It is found chiefly in Cumberland and forms a very valuable article of commerce

BLACK MAIL A certain rate of money corn or cattle anciently paid in the north of England to certain persons connected with the moss troopers or robbers to be by them protected from pillage

BLACK THORN a species of *prunus* called also *aloe* It is much used for hedges its branches being armed with sharp strong spines

BLADDER A thin membranous bag in animals serving as a receptacle of some juice or of some liquid excrement as the urinary bladder gall bladder &c

BLANCHING the art of making any thing white as (in cookery) the blanching or peeling of almonds or as (in horticulture) the method of whitening salads — *Blanching money* is the annealing boiling and cleansing it when it is coined Blanching copper is done in various ways so as to make it resemble silver Blanching is also the operation of covering iron plates with a thin coat or crust of tin

BLANCHMETER an instrument for measuring the bleaching power of chloride of lime and potash

BLANCHMANGER (Fr pron *blo monge*) a preparation of dissolved singlass milk sugar &c boiled into a thick consistence, and garnished with blanch'd almonds

BLANK a void space in any writing or printing The word is applied to various objects usually in the sense of destitution, or emptiness

BLANK VERSE in poetry that which is composed of a certain number of syllables without the assistance of rhyme

BLANKET a warm woollen stuff light and loose woven chiefly used in bedding — **BLANKETS** a sea term for combustibles made of coarse brown paper steeped in nitre dried and then steeped again in tallow resin and sulphur they are used in fire ships

BLAST in its literal sense signifies to wither by some pernicious influence to prevent coming to maturity or to affect with some sudden calamity The figurative senses of the word are taken from the blasting of plants and all express the idea of preventing maturity destroying or disappointing of the intended effect as to blast credit or reputation, to blast some cherished design &c

BLASTING among miners the splitting and tearing up of rocks by the force of gun powder

BLAST FURNACE a large conical or quadrangular building, used at iron works for smelting iron stones and ores

SLAVES AND FEATHERS ARE NON CONDUCTORS OF ELECTRICITY NEITHER A RED IS A PLACE OF COMPARATIVE SAFETY IN A STORM

BLASTING BELLOWS, instruments used when greater heat is wanted than could be obtained by the common accession of the air. Sometimes they have a wheel turned by water or steam and the shaft, being provided with projecting pieces raised and lowered the upper sides of these enormous bellows which discharge their volumes of air into the furnace.

BLAZONRY or **BLAZONING**, that branch of heraldry which consists in expressing in proper terms all that belongs to coats of arms. The word is from the German *blasen* to blow because the herald blew a trumpet and called out the arms of a knight when he entered the lists at a tournament.

BLEACHING the process of whitening linen by exposure to the sun and air or as is now more commonly in use by the application of chemical preparations such for instance as oxymuriatic acid or sulphuric acid combined with chloride of lime.

BLEIME in the veterinary art an inflammation arising from bruised blood between the horse's sole and the bone of the foot towards the heels.

BLENDE the ore of zinc.

BLIGHT a general name for various distempers incident to plants corn fruit trees &c the whole plant sometimes perishing by it and sometimes only the leaves and blossoms which will be scorched and shrivelled up the rest remaining green and flourishing. The chief cause of blights seems to be a continued dry easterly wind for several days together without the intervention of showers or any morning dew by which the circulation of the vegetable juices is stopped. Another cause of blights in the spring is sharp hoar frosts which are often succeeded by hot sun shine in the day time this is the most sudden and certain destroyer of fruits that is known. A third kind originates in *fungus* which attack the leaves or stems of herbaceous and woody plants and more particularly the most useful kinds of grain. These are variously known to farmers by the name of *red rust* *red gum* &c.

BLINDS in the military art a sort of defence made of boards or branches interwoven and laid a row two rows of stakes about the height of a man and four or five feet asunder used particularly at the heads of trenches when they are extended in front towards the glacis serving to shelter the workmen and prevent their being over looked by the enemy. The word *blinds* is in fact used to denote all preparations which are intended to intercept the view of the enemy and they are of course variously constructed according to the situation or means of position, them.

BLINDNESS a total privation of sight arising from an obstruction of the functions of the organs of sight or from an entire deprivation of them. The causes of blindness are various proceeding from cataracts gutta serena &c. There are also kinds of periodical blindness as a defect of sight in some towards night in others only in the

day the former of which is termed *nyctalopia* the latter *hemeralopia*.

BLINDWORM a small reptile, called also a *slow worm* from the smallness of its eyes and the slowness of its motion.

BISTERR a pustule in the skin filled with serum in general any swelling caused by the separation of the outer integument of any substance from that which is under neath.—In medicine the plaster or application that raises a blister mostly made of the cantharides or Spanish flies.

BLOCK, a sea term for a pulley or series of pulleys mounted in a frame, or shell which serves to facilitate the passage of the ropes. The *blocks* now used in the navy are made in Portsmouth by means of circular saws and other machinery of most ingenious construction by which the several operations from the rough timber to the perfect *block* are performed in the completest manner possible the whole being worked by means of a steam engine. We have lately seen it asserted with an air of authoritative veracity that the machinery for supplying the royal navy with blocks (which is characterised as 'one of the wonders of the world') is the invention of Mr Brunel. We have no wish to detract from the real inventions of this gentleman whose scientific acquirements are too numerous and too important for him to require the aid of borrowed plumage. But we feel ourselves bound to contradict the statement in express terms. Great and even wonderful as Mr Brunel's improvements may have been the merit of inventing the block machinery is due to the late Mr Walter Taylor of Woodmill in the parish of South Stoneham Hants where his original manufactory of blocks and pumps for the navy for many years existed. And we observe that in an able local work, entitled 'Sketches of Hampshire' lately published the circumstance is thus noticed:—

'To the ingenuity of that gentleman (Mr Taylor) this country is justly indebted for when the government took into their own hands the manufacture of blocks and erected the celebrated machine in Portsmouth dock yard for that purpose they availed themselves most advantageously of Mr Taylor's prior inventions. As the sole credit of the conception as well as of the perfection of that machinery is very generally though erroneously attributed to the fertile genius of Mr Brunel it is but just in this place to assert the claim of a late inhabitant of South Stoneham to his fair share of that merit of applause which is too often exclusively offered to the successful engineer who had the good fortune to perfect the design which Mr Taylor commenced.' The block making machine as it now exists at Portsmouth dock yard unites the action of sixteen different machines in one steam engine—seven for the shiel and nine for the sheave. Ten men do the work of 110. It makes about 200 sorts and sizes of blocks viz 72 sizes of thick blocks 48 of thin blocks 10 of clue line ditto, 20 sister blocks 20 topsail ditto, 24

DURING THE LAST CENTURY IT WAS CUSTOMARY TO SEND WOVEN GOODS FROM ENGLAND TO HOLLAND TO BE "BLEACHED"

CLOTH IS PREPARED FOR "BLEACHING" BY KEEPING IT SOME HOURS IN WARM WATER, AND AFTERWARDS BOILING IN AN ALKALINE LYE

[BLO]

[BOA]

MR. BRUNEL RECEIVED, AS A FINAL REWARD FOR HIS BLOCK MACHINERY, THE PROFITS OF ONE YEAR'S OPERATION, AMOUNTING TO ABOUT 20,000!

iddle ditto, 20 jack ditto, and of these various kinds the machines make 1120 blocks per day! Yet when we add that every 74 gun ship requires about 1300 blocks and there are 200 different sizes varying from 4 to 34 inches in length no one need be surprised at the importance which is attached to this beautiful machinery.

BLOCKADE, in military affairs, the blocking up a place by posting troops at all the avenues leading to it to keep supplies of men and provisions from getting into it and by this means proposing to starve it out without making any regular attacks.—To *raise a blockade* is to force the troops that blockade to retire.

BLOOD a red fluid circulating through the arteries veins and other vessels of animal bodies serving for the support of life and the nourishment of all their parts. It is found in the mammalia in birds in reptiles and in fishes but in the last two classes of animals the temperature of the blood is much lower than in the former for which reason they are cold blooded. In the human body the formation of blood depends principally upon the efficacy of the circulation by which the vessels act upon their contained fluids. Hence in the most robust persons the blood is of a deep red colour, and is concreted almost the very moment it is left in a state of rest. But in weak persons in whom the circulation is far less vigorous all the parts are pale and languid whilst the blood is thin and hardly capable of coagulation. Yet even in such persons when with due exercise and proper remedies the circulation is augmented the red colour and due cohesion of the blood return. All the blood takes its origin from the chyle and deposits by degrees the nourishing particles requisite to the preservation and growth of the body. Its due circulation is as it were the principle and first condition of life and such is the rapidity of the circulation that if it flowed at an equal rate in a straight line it would run through one hundred and fifty feet in the space of a minute.

BLOOD in law is regarded in descent of lands for a person must be next and most worthy of blood in order to inherit his ancestor's estate.—A kinsman of the *whole blood* is one who descends from the same couple of ancestors of the *half blood* is one who descends from either of them singly by a second marriage.

BLOOD HORSE a breed of horses originally from the Arabian stock the excellence of which consists in the compactness of his fibre of fat adds to his strength with out increasing his bulk.

BLOOD HOUND a hunting dog of such exquisite scent that he will follow the track of men as well as of animals. It is the *canis sagax* of Linnaeus.

BLOOM a mass of iron after having undergone the first hammering called *blomery*.

BLOW PIPE in chemistry and mineralogy, a wind instrument or apparatus

for the purpose of increasing the heat of a candle or lamp in the same manner as a pair of bellows is employed for raising the temperature of a common fire or furnace. It is made of brass or white iron and its most simple form is that of a tapering tube about eight inches in length, and curved nearly at right angles, within two inches of its smaller extremity which is as fine as a wire. The use of the blow pipe, both to the artist for the purpose of enamelling and of softening and soldering small pieces of metal to the glass blower in making thermometers and other glass instruments to the chemist and mineralogist in the examination of substances and indeed wherever it is required to subject a small body to a strong heat, is very important.

BLUBBER, the fat of whales and other large sea animals, of which is made train oil.—**SEA BLUBBER**, a name used for the *urtica marina*.

BLUE one of the seven primitive colours into which they are divided when refracted through a glass prism. Blue, as a colour in painting is distinguished into *ultra marine* from the azure stone, called *lapis lazuli* *Prussian blue* a colour next to ultramarine for beauty *blue ashes* used in liming fresco and miniature *blue verditer* a blue somewhat inclining to a green and *blue* which is the palest of all the bright blues. In dying the principal ingredients for giving a blue colour are *indigo* and *wood*.

BOA CONSTRUCTOR, the largest of the genus of serpents twenty five or thirty feet long very ferocious and so strong that by twisting itself round the bodies of oxen and other animals it breaks their bones and swallows them whole.

BOA CANINA a snake of South America of a beautiful make about four feet long the head is large and resembles that of a dog and the colour of the animal is an elegant green with white stripes.—There are many other of the *boa* genus the greater part of which are also natives of South America.

BOARD in politics an office under the control of the executive government it thus we say the Board of Trade the Board of Works the Board of Admiralty the Board of Ordnance &c. the business of those departments being there conducted by officers specially appointed for the purpose.—The word *board* has also numerous significations in nautical language.

BOAT a small open vessel usually moved by oars or rowing. The forms and even the names of boats are different according to the various uses they are designed for and the places where they are to be used.

BOATSWAIN the officer who has the boats sails rigging colours anchors and cables committed to his charge. It is particularly the duty of the boatswain to direct whatever relates to the rigging of a ship, after she is equipped from a royal dockyard. It is likewise his office to summon

THE 'BLOWPIPE' CAN PRODUCE THE SAME EFFECT ON SMALL SUBSTANCES BY THE FLAME OF A CANDLE, AS FURNACES CAN ON LARGE ONES

the crew to their duty; to assist with his mates in the necessary business of the ship, and to relieve the watch when it expires.

BODY, in physics, an extended solid substance, of itself utterly passive and inactive, indifferent either to motion or rest; but capable of any sort of motion, and of all figures and forms. It is a *hard* body when its parts do not easily yield to any stroke or percussion, a *soft* body when it yields to every stroke, and thereby undergoes a change, and an *elastic* body, that changes its form with every stroke, but recovers it again when the impelling force is removed.—**Body**, with regard to animals, is used in opposition to soul, in which sense it makes the subject of anatomy, and is that part of the animal composed of bones, muscles, canals, juices, nerves, &c., which, if considered with regard to the various voluntary motions it is capable of performing, is an assemblage of an infinite number of levers, drawn by cords. It considered with regard to the motions of the fluids it contains, it is another assemblage of an infinity of tubes and hydraulic machines, and if considered with regard to the generation of those fluids, it is another infinite assemblage of chemical instruments and vessels, the principal apparatus whereof, in the whole body, is the brain.—In hydrostatics, **body** is distinguished into solid, fluid, dense, rare, specifically heavy, and light. A *solid* body is that whose particles are kept by a certain continuity which preserves them in the same form. A *fluid* body is that in which the particles are not so bound together as to preserve a constant cohesion. A *dense* body is that which within the same space contains a greater mass than another. A *rare* body is that which contains a less mass within the space than others. A *body specifically heavier* is that which with the same volume of matter contains a greater weight. A *body specifically lighter* is that which with the same volume of matter contains a less weight.—In optics, a *luminous body* is that which diffuses a borrowed light. A *pellucid* or *diaphanous* body is that through which the rays of light easily pass. An *opaque* body intercepts the passage of the rays.—**Body** in matters of literature, denotes much the same with system, being a collection of every thing belonging to a particular science or art, disposed in proper order. Thus we say, a body of divinity, law, physics, &c.—**Body**, in the art of war, a number of forces, horse and foot, united under one commander. The *main body* is that part of an army which occupies the centre between the two wings. The *vanguard* is a select body of troops posted by a general out of the first line of action, to answer some especial purpose.

BODIES, *geometric*, the name of five solids, as the tetrahedron, or pyramid, with four triangular faces, the hexahedron, or cube, with six square faces, the octahedron, with eight faces, the dodecahedron, with twelve, and the icosahedron, with twenty faces.

BOILING, or **EBULLITION**, the bubbling up of any fluid. The term is most commonly applied to that bubbling which happens by the application of caloric, though that which ensues on the mixture of an acid and alkali is sometimes also distinguished by the same name. Boiling, in general, is occasioned by the discharge of an elastic fluid through that which is said to boil, and the appearance is the same, whether it is common air, fixed air, or steam, that makes its way through the fluid. The boiling of water is occasioned by the lowermost particles being rarefied into vapour by reason of the vicinity of the bottom of the containing vessel to fire. In consequence of this, being greatly inferior in specific gravity to the surrounding fluid, they ascend with great velocity, and, agitating the body of water in their ascent, give it the tumultuous motion called boiling. Every liquid has a fixed point at which boiling commences, and this is called the *boiling point*. Thus water begins to boil at the temperature of 212°. After a liquid has begun to boil, it will not become hotter, for although a stronger heat makes all liquids boil more rapidly, yet it does not increase their temperature.

BOG, a quagmire covered with grass, but not solid enough to support the weight of the body, in which case it differs only from marshes or fens, as a part from the whole.

BOLES, are viscid earths, less coherent and more friable than clay, more readily uniting with water, and more freely subsiding from it. They are soft and unctuous to the touch, adhere to the tongue, and by degrees melt in the mouth, impressing a slight sense of astringency. There are a great variety of these earths, and they are sometimes used medicinally.

BOLEIUS, in botany, a genus of the *cryptogamia fungi* class of plants, growing horizontally, and porous underneath.—**BOLÉTIC ACID** is an acid made from mush rooms.

BOL/LARDS, large posts set in the ground, on each side of a dock. On docking or undocking ships, large blocks are lashed to them, and through these blocks are reeved the transporting hawsers to be brought to the captains.

BOLO (ONA) STONE is a phosphoric stone, first found at Bologna in Italy. It is a gray soft sulphureous stone, about the size of a large walnut, which shines in the dark after calcination. It is the native sulphate of barytes.

BOLSTER, a soft pillow for a broken limb.—In farriery, it is the name of those parts of a saddle which are raised upon the bows to receive the rider's thighs.—*Bolster* is also a sea term, for a piece of timber cut and placed for the easement of the cable.

BOLT, among builders, a strong cylindrical iron or other metal pin, used as a fastening for doors and windows. They are generally distinguished into three kinds, viz., plate, round, and spring bolts.—In

[BON]

A New Dictionary of the Belles Lettres.

[BOO

ELPHANT'S BONES HAVE BEEN FOUND IN DILUVIAL STRATA, IN NEARLY EVERY COUNTY OF ENGLAND AND WALES.

gunnery, there are prise-bolts, transom-bolts, traverse bolts, and bracket-bolts.—In ships, bolts are used in the sides and decks, and have different names, as eye-bolts, ring-bolts, chain-bolts, &c.

BOLT-HEAD, in chemistry, a long straight-necked glass vessel for distillations, which being fitted to the alembic or still, is called a *receiver*.

BO'LUS, a soft mass of any thing medicinal, made a little thicker than honey, and smaller in quantity, so that it may be swallowed like a pill.

BOMB, a large shell or ball of cast iron, round and hollow, with a vent to receive a fusee, which is made of wood, and filled with combustible materials of all kinds. This being done, and the fusee driven into the vent, the fusee is set on fire, and the bomb is thrown from a mortar, in such a direction as to fall into a fort, city, or enemy's camp, when it bursts with great violence, and often with terrible effect, blowing into pieces whatever may be in its way.—

BOMB CHEST, a chest filled with bombs, or gunpowder only, and placed under ground, in order to effect great destruction when it bursts.—

BOMB-KETCH, a small vessel, constructed for throwing bombs into a fortress from the sea.

BOMBASIN', a name given to two sorts of stuff; the one of silk, and the other crossed with fine worsted.

BOMBAST', in literary composition, an inflated style, by which, in attempting to raise a low or familiar subject beyond its rank, the writer seldom fails to be ridiculous.

BOM'BIC ACID, in chemistry, an acid liquor contained in a reservoir near the anus of the silkworm.

BOMBYLJUS, an ancient drinking-cup, with a long narrow neck; and which derived its name from the bubbling noise it made in drinking.—

In entomology, *bombylus* is the name of the humble-bee.

BOMBYX, in entomology, the silk worm.

BONA'SUS, or **BONAS'SUS**, the wild ox, with a long mane; a native of Asia and Africa. It much resembles the bison, which see.

BOND, a legal obligation to perform a certain condition under forfeiture.—

BOND, in carpentry, the binding of any two pieces together by tenancing, morticing, &c. In masonry, it is the disposition of stones or bricks in a building, so that they most aptly fit together.—

Bond-timbers are the horizontal timbers bedded in stone or brick walls for strengthening the masonry.

BONDS'MAN, one bound or giving security for another.

BONE, a hard substance, of a dull whitish colour, composing some part of the frame of an animal body, and serving as a prop or support to it. The bones are covered with a thin, strong membrane, called the periosteum, which has very little sensibility in a sound state, but when inflamed is extremely sensible. Their cells and cavities are occupied by a fatty substance, called

the marrow, or medulla. From the analysis of bones we learn that, although the proportion of ingredients varies in different animals, the general constituents of bone are as follows: 1. Gelatin, soluble by boiling rasped or bruised bones in water, and giving a fine clear jelly; 2. Oil or fat separable during the boiling, by rising to the top of the water, and when cold concreting into a suet; 3. Phosphate of lime, soluble in dilute nitrous, muriatic, or acetic acid, and precipitable thence by pure ammonia; 4. Some sulphate of lime; 5. A little carbonate of lime; and, 6. A membranous or cartilaginous substance, retaining the form of the bone after every thing else has been extracted by water and an acid. Of these ingredients the phosphate of lime exists in far the greatest abundance, and it is this which gives them their solidity. Man has 246 bones. The head and face 63, the trunk 89, the arms 64, and the lower extremities 60. That part of anatomy which treats of the bones is called *osteology*.

BONITO, a fish of the tunny kind, growing to the length of three feet, and found on the American coast, and in the tropical climates.

BON'NET, in fortification, a small work composed of two faces, usually raised before the saillant angle of the counterscarp.

BONZE, an Indian priest, who wears a chaplet of beads about his neck, and carries a staff, having a wooden bird at one end. The bonzes of China are the priests of the Fohists, or sects of Fohi; and it is one of their established tenets, that there are rewards allotted for the righteous, and punishments for the wicked, in the other world; and that there are various mansions, in which the souls of men will reside, according to their different degrees of merit. The number of bonzes in China is estimated at fifty thousand, and they are represented as idle, dissolute men.

BOO'BY, a fowl of the pelican genus.

BOOK, a literary composition, designed to communicate something which the author has invented, experienced, or collected, to the public, and thence to posterity; being printed, bound in a volume, and published for that purpose.—The five books of Moses are doubtless the oldest books now extant; and there are none in profane history extant anterior to Homer's poems. A great variety of materials were formerly used in making books: plates of lead and copper, the bark of trees, bricks, stone, and wood, were among the first materials employed to engrave such things upon, as men were desirous to transmit to posterity. Josephus speaks of two columns, the one of stone, the other of brick, on which the children of Seth wrote their inventions and astronomical discoveries: Porphyry makes mention of some pillars, preserved in Crete, on which the ceremonies practised by the Corybantes in their sacrifices, were recorded: Herodotus's works were originally written upon tables of lead, and deposited in the temple of the Muses, in Boeotia: the ten commandments, deliver-

SO SCARCELY AND DEAR WERE BOOKS BEFORE THE INVENTION OF PRINTING, THAT THEY WERE COMMONLY CHAINED TO THEIR PLACES IN LIBRARIES.

[BOR.]

The Scientific and Literary Treasury ;

[BOR.]

GREY FOLDING LEAF TRASH AND FRIVOLOUS TALES ARE CATERED FOR THE PUBLIC AFFECTION, USEFUL LITERATURE IS LIKELY TO DECLINE

ed to Moses, were written upon stone, and Solon's laws upon wooden planks. Tables of wood, box, and ivory, were common among the ancients. When of wood, they were frequently covered with wax, that people might write on them with more ease or blot out what they had written. The leaves of the palm tree were afterwards used instead of wooden planks, and the finest and thinnest part of the bark of such trees, as the lime, the ash, the maple, and the elm, from hence comes the word *liber*, which signifies the inner bark of the trees, and as these barks were rolled up in order to be removed with greater ease, these rolls were called *voluemes*, a volume, a name afterwards given to the like rolls of paper or parchment. With regard to the use of books it is indisputable that they make out of the chief instruments of acquiring knowledge they are the repositories of the law and vehicles of learning of every kind, our religion itself is founded on books, and without them (says Bartholin) God is silent justice dormant, physics at a stand, philosophy lame letters dumb and all things involved in Cimmerian darkness. Yet with all the well merited eulogies that have been bestowed on them we cannot overlook the fact that many are frivolous and some pernicious. It will therefore be well to bear in mind the opinion of the learned Selden who says that the characteristics of a good book are solidity, perspicuity and brevity.

BOOK BINDING a very ingenious art, by which printed sheets are folded, gathered, pressed, sewn together, shielded with millboards and covered with leather which is lettered and ornamented by the use of lead gold and gilding tools.

BOOK KEEPING the art of registering mercantile transactions for reference, statement and balance, all of which must be so clearly done that the true state of every part, and of the whole may be easily and distinctly known.

BOOM a term for a long pole to extend the bottoms of particular sails as the *job boom* and *studding sail boom*.

The *boom of a harbour* is a strong iron chain thrown across a harbour, to prevent the entrance of an enemy, and a *fire boom* is a strong pole thrown out from a ship to prevent the approach of fire ships &c.

BOOR a term applied to the uncivilized peasants of Russia and other countries.

BOOTES a northern constellation containing Arcturus and 50 other stars. It is also known as Charles's Wain.

BORACIC ACID in its native state exists in several small lakes in Italy and in certain hot springs, from whose waters it is deposited by natural evaporation. It is also obtained from the mineral called *borax* which consists of this acid in conjunction with soda. The acid, when separated appears in the form of a white, scaly, glittering salt, with hexahedral scales, soft and unctuous to the touch. Its taste is bitterish with a slight degree of acidity. It is soluble in alcohol, which it causes to burn,

when set on fire, with a green flame surrounded with a white one. Boracic acid was discovered by Sir Humphry Davy to be a compound of a peculiar base, which he called *boron*, and oxygen, in the proportion of 8 parts of the former to 16 of the latter. The most important combinations formed by boracic acid is that with soda, commonly called *borax*.

BO RAX, a native salt found in a fluid form, suspended in certain waters, and discovered in them by its brackish and bitter taste readily separable from them by evaporation, and appearing on a nice solution and evaporation, in transparent crystals. It is chiefly found in Thibet, and is imported into England from India. Borax makes no effervescence either with acids or alkalies, and yields nothing by distillation but an insipid phlegm. Its use in soldering gold and other metals, is well known also in metallurgy, as a flux, in the remelting the small masses of gold and silver that are the products of assays, for by rubbing it over the vessels these are to be melted in, it fills up all their little cavities and leaves not the least roughness on the surface, to detain any of the melted metal. It is used by the dyers to give a gloss to silks, and it is also in request both as a cosmetic and a medicine.

BO RACITE, or **BORATE** of **MAGNESIA**, in chemistry magnesian earth combined with boracic acid. It is generally of a cubic form and remarkable for its electrical properties when heated.

BORDURE in heraldry a cutting off from within the escutcheon all round it about 1/10th of the field, serving as a difference in a coat of arms to distinguish families of the same name, or persons bearing the same coat.

BORING in mineralogy a kind of mineral cutting or a method of piercing the earth with scooping irons which when drawn out bring with them samples of the different strata through which they have passed. By this means the veins of ore or coal may be discovered without opening a mine. Boring for water has of late been very successfully practised. [See *Artesian Wells*.]

BORING MACHINE in mechanics an engine used for boring or piercing the bores of cannon cylinders for steam engines, &c. It is a machine of great power and complexity.

BOROUGH This word originally denoted a fortified city or town but at present it is given to such town or village as sends burgesses or representatives to parliament. Boroughs are equally such whether they be incorporated or not there being several boroughs that are not incorporated, and on the contrary several corporations that are not boroughs. — **BOROUGH ENGLISH** is a customary dialect of lands or tenements, in certain parts of England by which they descend to the youngest instead of the eldest son, or if the owner leaves no son to the youngest brother. The custom goes with the land, although there be a

AT THE BURNING OF CONSTANTINOPLE BY THE TURKS IN 1452, ONE HUNDRED AND TWENTY THOUSAND GREEK MANUSCRIPTS WERE BURNED

devise at the common law to the contrary. The reason of this custom is, because the youngest is presumed in law to be the least able to provide for himself.

BOS, in zoology, the generic name in the Linnæan system for all animals of the ox tribe, as the bison, buffalo, common ox, musk ox &c. The characters of this genus are, that the horns are hollow and turned forward, bent like crescents, and smooth on the surface. The fore teeth are eight in number and there are no canine teeth.

BORSELIA, in mechanics, an instrument with which glass makers contract or extend their glasses at pleasure.

BORRELISTS, in church history a sect of Christians in Holland, (so called from Borrel, their founder) who reject the use of the sacraments, public prayer, and all external worship, yet they lead a very austere life.

BORSHOLDER, among the Anglo-Saxons, one of the lowest magistrates, whose authority extended only over one tithing consisting of ten families. Each tithing formed a little state of itself and chose one of its most respectable members for its head who was called a borsholder a term derived from two words signifying a "surety" and a "head."

BOSAGL in architecture a term used for any stone that has a prostructure and is laid rough in a building, to be afterwards carved into mouldings, capitals, coats of arms &c.—*Bossage* is also the name for what is otherwise called *rustic work* consisting of stones that seem to project beyond the level of the building by reason of indentures or channels left in the joinings. These are chiefly in the corners of edifices, and are there called *rustic quoins*.

BOTANOMANCY an ancient species of divination by means of plants especially sage and hylæ leaves. Questions were written on leaves which were then exposed to the wind and as many of the letters as remained in their places were taken up and being joined together, contained an answer to the question.

BOTANY that branch of natural history, which treats of plants their classes and divisions, genera and species. Various systems or plans of arrangement have been from time to time proposed but the actual system of Linnaeus is at present generally received. This naturalist has drawn a continued analogy between the vegetable economy and that of the animal and has derived all his classes, orders and genera from the number, situation and proportion of the parts of fructification.—We shall, however first speak of the NATURAL orders into which plants are distinguished viz into *trees*, the stems of which send forth branches from the middle and top *shrubs*, the stems of which send forth branches from the bottom and *herbs*, which bear flowers and seeds and then die. If they die at the end of one year they are called *annuals* if at the end of two years *biennials*, if they last three or more years they are *perennials*. The parts of plants are distinguished ge-

nerally into the root, the stem, the bud, the leaf, the inflorescence, and the fructification. The *root* is the part through which the plant derives nourishment from the earth. The *stem* is the prolongation of the plant above the soil proceeding from the root. The *bud* is that part of the plant which contains the embryo of the leaves, flowers, &c. and serves as their hybernaculum, or winter receptacle. The *leaf* is the herbaceous production from the ascending stem, when the stalk and leaf are so intimately connected that they cannot be distinguished, this is called a *frond* as in the palms and the alga. The *inflorescence* is the mode of flowering, which differs very much in different plants. The various parts of a flower are arranged under distinct heads, consisting of the calyx or calicament, the blossom or corolla, stamens or chives, pistils or pointals, seed vessel or pericarp, the seeds, the nectary, and receptacle. The *calyx* is formed of one or more green or yellowish green leaves placed at a small distance from, or close to the blossom. There are different kinds of calyxes, as the perianthium or cup near the flower, in the rose—the involucre, remote from the flower in umbelliferous plants as is seen in the hemlock and carrot—the catkin, or amentum as in the willow or hazel—the sheath or spathe in the snow drop—the husk or gluma in wheat, oats and different kinds of grasses—the veil, or calyptra, covering the fructification of some of the mosses and resembling an extinguisher—the curtain or volva surrounding the stems and attached to the pilus or cap, that spreading part which forms the top of several fungi and covers the fructification, and which in the common mushroom covers the gills. The *blossom* is that beautifully coloured part of a flower, which principally attracts the attention. It is composed of one or more petals or blossom leaves. When it is united in one as in the *polyanthus* or auricle it is termed a blossom of one petal but if it be composed of many parts it is then said to be a blossom of one two three or many petals. The *stamens* are slender thread like substances generally placed within the blossom and surrounding the *pistils*. They are composed of two parts the filament or thread and the anther or tip but the latter is the essential part. A *pistil* consists of three divisions, the germ or seed bud the style or shaft, and the summit or stigma but the second is often wanting. Some flowers have only one pistil others have two three four &c. or more than can easily be counted. The seed vessel in the newly opening flower, is called the *germen* but when it enlarges it is termed the seed vessel. Some plants have no appendage of the kind and then the seeds are uncovered, as in the dead nettle the cup however, generally melows and retains the seeds till they ripen and in the tribe of grasses, this friendly office is generally performed by what was previously called the blossom. The part to which the seeds are affixed

[BOT]

The Scientific and Literary Treasury ;

[BOT]

within the seed-vessel, is termed the receptacle of the seeds. Nectaries are those parts in a flower which are designed to prepare a sweet nectarous liquor. The tube of the blossom, as in the honey suckle, frequently answers the purpose, but in many other flowers, there is a peculiar organization for the purpose. The *receptacle* is the seat or base to which the various divisions of a flower are affixed. Thus, if you pull off the calyx, the blossoms, the stamens, the pistils, and the seeds or seed-vessels, the substance remaining on the top of the stalk is the receptacle.

It will be our business now to describe the ARTIFICIAL classification of plants, or *sexual system* of *Linnaeus*, and difficult as it may be to give a clear view of it in such a summary as the limits of our work afford, it is our intention not to lose sight of its scientific character, while we attempt to render it more intelligible to those who have never made its study an object of their attention. *Linnaeus* has laid it down as a fundamental law of botany, that the sexual parts of plants are most intimately related to the growth of the fruit, and that they are therefore of the greatest importance, in short, that no other system of classification could possibly introduce order into a branch of natural history, treating, as this does, with almost endless diversities. He accordingly divided all known plants into twenty four classes, distinguishing them according to the number or situation of the stamens, filaments, anthers, or male and female flowers in each plant, as follows —

- 1 *Monandria*, plants having one stamen
- 2 *Diandria* two stamens
- 3 *Triandria* three stamens
- 4 *Tetrandria* four stamens
- 5 *Pentandria* five stamens
- 6 *Hexandria* six stamens
- 7 *Heptandria* seven stamens
- 8 *Octandria* eight stamens
- 9 *Enneandria* nine stamens
- 10 *Decandria* ten stamens
- 11 *Dodecandria*, from eleven to seventeen stamens
- 12 *Icosandria*, many stamens inserted in the calyx [wards]
- 13 *Polyandria* twenty stamens and up
- 14 *Didynamia*, four stamens in one flower, two longer than the rest
- 15 *Tetradynamia*, six stamens, two shorter than the rest
- 16 *Monodelphia*, the filaments connected in the form of a tube [tubes]
- 17 *Diodelphia*, the filaments forming two
- 18 *Polyadelphia*, the filaments forming several parcels [tube]
- 19 *Syngenesia*, the anthers formed into a
- 20 *Gynandria*, the stamens standing in the style
- 21 *Monocria*, stamens and pistils in separate flowers, but in one plant. [plants]
- 22 *Dioecia*, stamens and pistils in separate
- 23 *Polygamia*, stamens and pistils separate in some flowers, and united in others
- 24 *Cryptogamia*, flowers inconspicuous, or invisible to the naked eye

In this last class are comprehended the

ferns (*filices*); mosses (*muscæ*); sea-weeds (*algæ*), and the different kinds of *Fungi*.

The *Orders*, or subdivisions of the classes, from class 1 to 13 inclusive, are marked by the number of styles or pistils in each plant, as *monogynia*, where there is but one pistil, and *digynia*, *trigynia*, *tetragynia*, &c for two, three, four, or more pistils. When the seeds are naked, the term *gymnospermia* denotes the order, when contained in a pericarp, *angiospermia*, when the seeds are contained in a silique of different sizes, they are termed *siliculosæ* and *siliquosæ*. In most of the other classes the orders are marked by the number of stamens in each plant, except *syngenesia*, in which the orders *polygamia equalis*, *polygamia superflua*, *polygamia frustanea*, *polygamia necessaria*, and *polygamia segregata* mark the connexion of the flower. The next division is into *Genera* or families, each genus uniting together all those plants which bear so strong an affinity as to be considered members of the same family. The name given to the genus is the name by which all the plants of that family are known thus, the genus *rosa* includes all the different kinds of roses, *salix* (which is the scientific name for willow), every kind of willow, *compositus*, every kind of bindweed, and *cicuta*, all the henchmans. The distinctive or characteristic marks upon which the genera are founded, are always taken from the shape, position, number, or some other property of the different parts of the flower, as the calyx, petals, aecia, seed-vessels, &c, whether they be round or heart shaped, whole or divided, rough or smooth, single or many, and the like. There is only one more division, viz the *Species*. Each genus is divided into species, the characteristic marks of which are formed upon the leaves, stems, roots, or any other parts of the plant except the flower, and some name, called the *specific* or *trivial* name, is given to each species, thus characterized, which, added to the name of the genus, sufficiently distinguishes each particular plant. To elucidate this we will quote the words of a botanical essayist—"Suppose that you have found, and brought home from your walk, a delicate, blue, bell shaped flower, called by some bell flower, by others Canterbury bell, and by others again blue-bell. You naturally wish to know by what name this plant is distinguished by the botanist, what name all scientific men in every country have agreed to give it, that you may be at no loss under what name to look for a description of it, or how to communicate to others any observations you may have made upon this plant yourself. In the first place, then, examine how many stamens, or how many of those small bodies called its anthers, are to be found in the bell shaped corolla, or blossom, you discover five, now run over the classes of *Linnaeus*, till you come to that, which is distinguished by its five stamens this is called *pentandria*, and you therefore know your flower to be in this class. Next look for the pistillum or

WHEN A TREE BEGINS TO DECAY IN THE CENTRAL PART OF THE WOOD, THE TOP BRANCHES ARE OBSERVED TO WITHER.

THE AGE OF A TREE IS KNOWN BY THE CIRCULAR LAYERS OR RINGS IN THE WOOD, ONE RING BEING FORMED EVERY YEAR.

[BOW]

THESE ARE COLLECTING VESSELS AND RETAINING VESSELS FOR THE SAP IN PLANTS, ANSWERING TO THE VEINS AND ARTERIES OF ANIMALS

pastilla, of which, in this plant, you will find only one, this characterises the first order, called *monogynia*, and therefore your plant is in the class *pentandria*, and order *monogynia*. You have now done with the stamina and pistilla, and must attend to the other parts of the flower comparing them, as you go on, with the characters of all the genera in this first order of the fifth class. The calyx you find to have five divisions sharp and not quite upright, the corolla of one petal, bell shaped with five clefts, close at the base, shrivelling, segments broad sharp, ten seed vessels roundish, of three or four cells all which tallies exactly with the generic character of *campanula* this therefore is the genus, and you have now only to find out to what species your's belongs. The leaves nearest to the roots and which are generally so close to the ground as to require care not to leave them behind in gathering the plant, you will find to be round or rather heart shaped, or sometimes kidney shaped, whilst the leaves on the stem are narrow and strap shaped this determines the species, and in this your flower agrees with the character of that called *rotundifolia*. You have therefore now determined your plant to be the *campanula rotundifolia* and you may read all the descriptions of this plant without a doubt as to its being the same and may describe to others where you found it when you found it and what else you know of it without any fear of confounding it with any other blue bell-shaped flower of which there are many both of this and other genera.

BOJAR GO a kind of sausage made of the ribs of the mullet much used on the Mediterranean coast as an incentive to drink.

BOIRYOLITE in mineralogy is a variety of silicious borate of lime and occurs in botryoidal concretions in a bed of magnetic iron in gneiss near Arundel in Norway. Its colours are gray reddish white, and pale rose red and form concentric stripes.

BOTRYOIDAL, having the form of a bunch of grapes, as a mineral, presenting an aggregation of small globes.

BOTS a species of small worms found in the intestines of horses and are the larvae of a kind of gad fly which deposits its eggs on the tips of the hairs, generally of the fore legs and mane whence they are taken into the mouth and swallowed.

BOTTOM in navigation is used to denote as well the channel of rivers and harbours as the body or hull of a ship thus, in the former sense we say a gravelly bottom clayey bottom sandy bottom &c. and in the latter a British bottom a Dutch bottom &c. Goods imported in foreign bottoms pay a higher duty than those imported in our own. Hence, a state of hazard chance or risk thus we say do not venture too much in one bottom meaning, do not hazard too much at a single risk.

BOTTOMRY in commerce the act of borrowing money upon the keel or bottom

of a ship, that is, the ship itself is pledged as security for the repayment of the money. If the ship is lost, the lender loses the money but if the ship arrives safe, he is to receive the money lent, with the interest or premium stipulated, although it may exceed the legal rate of interest.

BOUL FINE, in architecture a convex moulding placed next below the plinth in the Tuscan and Doric capital.

BOUND a sea term, expressive of being confined to a particular spot or direction, as wind bound, see *bound* &c, conbnd by the wind or ice to a place from which you were sailing.

BOURGEOIS, a small kind of printing type between longprimer and brevier the type used in this work is four sixes smaller than *bourgeois*.

BOUFS RIMES (Fr, pron *boo re ma*), a term for certain rhymes disposed in order, and given to a poet together with a subject, to be filled up with verses ending in the same word and same order.

BOW an instrument of war and hunting, made of wood or other elastic material, which, after being bent by means of a string fastened to its two ends, throws out an arrow with great force and velocity. The bow is still used as a weapon of offence by many of the inhabitants of Asia Africa and America and in Europe, before the invention of fire arms, a part of the infantry was armed with bows which were made of the yew tree or ash and were of the height of the archer. For several centuries the long bow was the favourite national weapon in England and many laws were made to encourage the use of it the parliament under Henry VIII complained of the disuse of long bows "heretofore the safeguard and defence of this kingdom and the dread and terror of its enemies." The cross bow, a ballist was a common weapon with the Italians and was introduced into England in the 14th century the arrows shot from it were called *quarrels*. Of the power of the bow and the distance to which it will carry many remarkable anecdotes are related Lord Bacon speaks of a Turkish bow which has been known to pierce a steel target or a piece of brass two inches thick, while other authorities declare they have seen an arrow shot from a bow to the distance of 600 yards. [For further remarks see *Archer*]. —Bow in mechanics is the name of several things so called from their curved figure as the *turner's bow* a pole fixed to the ceiling to which the cord is fastened that wheels round the piece to be turned the *bow of a saddle* the piece of wood on each side laid arclwise to receive the upper part of a horse's back — A *bow* is also the name of an instrument formerly used at sea for taking the sun's altitude consisting of a large arch of ninety degrees graduated, a shank or staff a shade vane a sight vane and an horizon vane — And in music *bow* is the name of that well known implement (consisting of a round stick furnished with hair) by the means of which the tone is produced from violins, &c

PLANTS RESIST THE COLD IN WINTER, IN CONSEQUENCE OF THEIR TEMPERATURE BEING SOME DEGREES WARMER THAN THE AIR

BO W I D E R or **BO W L D E R S T O N E**, a smooth stone found on the sea shore, or in the channels of rivers, &c worn smooth by the action of water.—In geology, the term *boulder* is used for rounded masses of any rock transported from their original bed by water. Large boulders of granite are very common on the surface of the most recent formations.

BO W L D E R W A L L, a wall, generally on the sea coast, constructed of large pebbles or boulders of flint, which have been rounded by the action of water.

BOWLS a game played upon a fine smooth grassy surface used solely for the purpose and denominated a bowling green.

BOX E R S a kind of athletes, who combat or contend for victory with their fists. Among the Romans they were called *pugiles* hence the appellation of *pugilists* to the boxers of the present day.

BRACE in architecture a piece of timber framed in with bevel joints to keep the building from swerving either way. When the brace is framed into the principal rafters it is sometimes called a *strut*—

BRACE in marine language are ropes belonging to all the yards of a ship except the main two to each yard reeved through blocks that are fastened to pennants at the end to the yard arms.—*To brace about*, is to turn the yards round for the contrary tack.—*To brace to* is to check or ease off the lee brace and round in the weather ones to assist in tacking.

BRACHIAL in a general sense denotes something belonging to the arm as the *brachial artery*—**BRACHIALIS** is particularly used for a thick and broad muscle of the arm lying between the shoulder bone and the elbow.

BRACHIALE an epithet for having branches in pairs all nearly horizontal and each pair at right angles with the next.

BRACHIOGRAPHY stenography or the art of writing in short hand.

BRACHYLOGY in rhetoric the method of expressing anything in the most concise manner.

BRACHYPSYCHIA in medicine short respiration at small intervals.

BRACTEA or **BRACTEA** in botany a floral leaf one of the accessory or prophylls of plants. It differs from the leaf in its shape and colour and is generally situated on the peduncle so near the corolla, as easily to be mistaken for the calyx.

BRACTEOLAE in botany an epithet for plants which are furnished with bracteoles or little bracteas.

BRAMINS or **BRAMINS** the caste or hereditary division of Hindus peculiarly devoted to religion and religious science in the same manner as among the Jews the priesthood was ordained to continue in the tribe of Levi. The families of this caste claim peculiar veneration from the rest and seem in their name of *bramins* to claim the merit of being the more immediate followers of Brahma, their incarnate deity. Some of them, however are described as very corrupt in their morals, while others

live sequestered from the world, devoted to superstition and indolence. To the bramins we are indebted for whatever we know of the Sanscrit, or ancient language of the country, in which their sacred books are written.

BRAIN, in anatomy, that soft white mass enclosed in the cranium or skull, in which all the organs of sense terminate, and the intelligent principle of man is supposed to reside. It consists of two principal parts connected by delicate veins and fibres, and is divided above into a right and left hemisphere, and below into six lobes. The external portion of the brain is soft and vascular, and is called the *cortical substance* the internal is called the *medullary*. Between the skull and the brain there are three membranes, the outer one called the *dura mater*, which is strong dense, and elastic, the next is the *tunica arachnoidea*, which is thin and nearly transparent and an inner one, called the *pia mater*, which is very vascular and covers the whole surface of the brain. It is worthy of observation that every part of the brain is exactly symmetrical with the part opposite, and that irregularities in its structure are far more uncommon than in the other parts of the human body.

BRAN the skins or husks of grain especially wheat ground, separated from the flour by a sieve or boulder.

BRANCH a shoot from the main bough of a tree. Also several things similar in figure as the antlers or shoots of a stag's horn the branches of veins, branches of a river &c.

BRANCHIÆ in ichthyology, are the gills or organs of respiration answering to the lungs in other animals with which all fishes are provided except the cutaneous tribe and the lamprey. They are eight in number and serve the fish to take in and throw out water with the air.

BRANCHIOSTOME an epithet for an order of fishes in the Linnæan system, including such as have gills without bony rays as the pipe fish sucker frog fish &c.

BRANDY, a spirituous and inflammable liquor extracted from wine and other liquors of distillation. The wine brandy, made in France is esteemed the best in Europe. It is made wherever wine is made, and prickled wine is used for this purpose, rather than good wine. The chief brands for foreign trade and those accounted best, are the brandies of Bourdeaux, Rochelle, Cognac, Blagnac, Poitiers, Juraime, Anjou, Nantes, Burgundy, and Champagne. As we hear so much of the good qualities of *British* brandy and have never been so fortunate as to discover them perhaps it may not be amiss to give a recipe from Dr. Ure. He says 'the following formula may be proposed for converting a silent or flavourless corn spirit into a factitious brandy. Dilute the pure alcohol to the proof pitch add to every hundred pounds weight of it from half a pound to a pound of argol (crude whinstone) dissolved in water a little acetic ether, and French wine vinegar,

BRANDY WILL PREVENT INTERIOR WINE FROM 'POILING' BUT IT TENDS TO DESTROY WHAT VIGOROUS FLAVOUR IT BEFORE POSSESSSED

[BRA]

A New Dictionary of the Belles Lettres.

[BRE

THE SCARCITY OF BREAD HAS BEEN THE FREQUENT CAUSE OF PUBLIC COMMOCTIONS, ESPECIALLY IN ANCIENT ROME AND IN FRANCE.

some bruised French plums, and flavour-stuff from Cognac; then distil the mixture with a gentle fire, in an alembic furnished with an agitator. The spirit which comes over may be coloured with nicely burnt sugar (caramel) to the desired tint, and roughened in taste with a few drops of tincture of catechu or oak-bark. The above recipe, he observes, will afford a spirit free from the deleterious drugs too often used to disguise and increase the intoxicating power of British brandies; one which may be reckoned as wholesome as alcohol, in any shape, can ever be!"

BRASS, in metallurgy, a factitious compound metal, of a yellow colour, consisting of copper and about one third of its weight of zinc. It is more fusible than copper, and not so apt to tarnish: it is malleable when cold, but not when heated. In order to combine copper most intimately with zinc, and yet to preserve its malleability, the ingenious process of cementation has been resorted to in the manufacture of brass, which is performed by heating in a covered pot alternate layers of copper in small pieces, with zinc and charcoal, and continuing the fire till the copper is thoroughly impregnated with the zinc. The mode has been thus described:—"Melt the mixture in a crucible till the blue flame is seen no longer on the lid of the crucible, and when cold a fine button of brass is found beneath the scoria, weighing rather more than the copper alone, obtainable from its oxide without the calamine. Brass is so ductile that sieves of extreme fineness are wove with the wire, after the manner of cambric weaving.—**CORINTHIAN BRASS** has been famous in antiquity, and is a mixture of gold, silver, and copper. L. Mummius having sacked and burnt the city of Corinth, A.C. 146, it is said this metal was formed from the immense quantities of gold, silver, and copper, with which that city abounded, and which by the violence of the conflagration were thus melted and run together.

BRAS'SICA, CABBAGE, in botany, a genus of the *tetradymia-siliquosa* class of plants. This well-known vegetable was as much used by the ancients as it is by the moderns. The principal species are the *brassica oleracea*, or common cabbage; *brassica napus*, wild cabbage or rape; *rapa rotunda*, or turnip, &c.

BRAURONIA, an Athenian festival celebrated every five years in honour of Diana, who was surnamed Brauronia.

BRAVURA, in music, an air so composed as to enable the performer to show his skill in the execution of difficult passages. It is also sometimes used for the style of execution.

BRAZING, the soldering or joining two pieces of iron together by means of thin plates of brass, melted between the pieces that are to be joined. If the work be very fine, as when two leaves of a broken saw are to be brazed together, they cover it with pulverized borax, melted with water, that it may incorporate with the brass powder,

which is added to it. The piece is then exposed to the fire without touching the coals, and heated till the brass is seen to run.

BRAZING, the soldering together of edges of iron, copper, brass, &c. with an alloy consisting of brass and zinc, sometimes with a little tin or silver.

BRAZIL-WOOD, the Linnæan name of which is *caesalpinia crista*, is found in the greatest abundance in the province of Pernambuco, in Brazil; but it is also met with in many other parts of the western hemisphere, and in the East Indies. The tree is large, crooked, and knotty; it is very hard, and susceptible of a fine polish; is pale when newly cut, but on exposure to the air is of a red colour. The juice of the Brazil-wood is made use of for dyeing silk of a crimson colour, but it is inferior and less permanent than the crimson obtained from cochineal. It is also used, in combination with certain mordants and alkalies, for various shades of red, purple, and violet, in cotton and woollen cloths.

BRAZIL-WOOD, a sort of wood so denominated because, as is supposed, it was first brought from Brazil. It is red and heavy, so as to sink in water, takes a good polish, and yields beautiful orange and red colours, which are used by dyers.

BREACH, in fortification, a gap or opening made in any part of the works of a town by the besiegers, in order to facilitate an attack upon the place. The breach is called *practicable*, if it is large enough to afford a reasonable hope of success, in case of an assault.—To *repair a breach*, is to stop or fill up the gap with gabions, fascines, &c., so as to prevent an assault.—In law, a *breach* is the violation of a contract.—*Breach of pound*, is the breaking any place where cattle are distrained.—*Breach of prison*, an escape by breaking out of prison.

BREAD, a preparation of flour mixed with water, fermented with yeast, and baked in an oven; water gives flour consistency, but yeast separates the parts, and renders it light and wholesome. In the earliest antiquity, we find the flour or meal of grain used as food; and by degrees the artificial preparation of bread by proper fermentation was discovered; but, from all we read, it would appear, that for many ages the meal derived from the bruised grain was merely mixed with milk and water, and a tough paste was made into balls. The superiority of wheat to all other farinaceous plants in the manufacture of bread is so very great, that wherever it is successfully cultivated, wheaten bread is now used to the nearly total exclusion of most others. But in the sixteenth century, rye bread and oatmeal formed the chief part of the diet of servants even in great families; and in the reign of Charles I. barley bread was the usual food of the middle classes; nay, so lately as a century ago, not more than half the people of England fed on wheaten bread. Thanks to the improved state of agriculture, the produce

IN SOME PARTS OF SWEDEN THE BREAD IS COMPOSED, IN PART, OF THE BARK OF TREES, DURING THE WINTER.

[BKE]

The Scientific and Literary Treasury ;

[BKE]

THE BONES OF FIRMS, BEING GROUND, ARE MIXED UP WITH FARINACEOUS SUBSTANCES, AND USED AS BREAD BY MANY NORTHERN NATIONS.

of the wheat crops in England has since that time been more than trebled, barley is no longer used, except in the distilleries and in brewing, the use of oats as bread is limited even in Scotland and Ireland, and the consumption of rye bread is very considerable. The process of making bread is nearly the same throughout Europe, though the materials of which it is composed vary with the farinaceous productions of different climates and soils. The French, who particularly excel in the art of baking, have a great many different kinds of bread, from the *pain bis*, which is the coarsest of all, to the *pain mollet*, or soft bread, made of the purest flour, without any admixture. In this country we have fewer varieties of bread, and these differ chiefly in their degrees of purity. Our white or fine bread is made of the purest flour, our wheaten bread of flour, with a mixture of the finest bran, and our household bread, of the whole substance of the grain, without the separation either of the fine flour or coarse bran. Like the French, we have also many sorts of small bread, in which butter, milk, and eggs are incorporated; but our Gallic neighbours have a greater variety. "The object of baking is to combine the gluten and starch of the flour into one homogeneous substance, and to excite such a viscus fermentative action, by means of its saccharine matter, as shall disengage abundance of carbonic acid gas in it for making an agreeable, soft, succulent, spongy, and easily digestible bread. The two evils to be avoided in baking are, hardness on the one hand, and pastiness on the other."—The *Adulteration of Bread*, by means of alum, has long been a prolific source of evil, inasmuch as the health of the public, and of children especially, is often seriously injured by it. It is, however, fortunate, that to discover this pernicious practice no chemical skill is required on detecting a small piece of the crumb of new baked bread in cold water, sufficient to dissolve it, the taste of the latter, if alum has been used by the baker, will acquire a sweetish astringency. Another method of detecting this adulteration consists in thrusting a heated knife into a loaf before it has grown cold, and if it be free from that ingredient, scarce any alteration will be visible on the blade; but, in the contrary case, its surface, after being allowed to cool, will appear slightly covered with an aluminous incrustation. Dr Ure's directions for discovering the presence of alum in bread are given in the following words:—"When alum is present in bread it may be detected by treating the bread with distilled water, filtering the water first through calico, and next through filtering paper, till it becomes clear, then dividing it into two portions, and into the one pouring a few drops of nitrate or murate of barites, and into the other a few drops of water of ammonia. In the former a heavy white precipitate indicating sulphuric acid will appear, and in the latter a light precipitate of alumina, redissoluble by a few drops of solution of caustic potash."

He further says, "When chalk or Paris plaster is used to sophisticate flour, they may be best detected by incinerating the bread made of it, and examining the ashes with nitric acid, which will dissolve the chalk with effervescence, and the Paris plaster without. In both cases the calcareous matter may be demonstrated in the solution, by oxalic acid, or better by oxalate of ammonium." That there has been much reason to complain of the adulteration of bread, particularly in times of scarcity, or whenever the high price of this grand necessary of life has stimulated the cupidity of fraudulent dealers, there can be no doubt, but we are inclined to believe that the practice, to any injurious extent, is much less prevalent than the public suspect. The subject, however, is too important to be overlooked, and the foregoing tests are at least worthy of insertion.

BREAD-FRUIT-TREE (*Artocarpus incisa*). It appears to have been first discovered to Europeans by the great navigator Dampier, and is indigenous in Otaheite and other islands of the South Sea. The tree is said to be of the size of a large apple tree, the leaves broad, and of a dark green. The fruit is appended to the boughs in the manner of apples, and of about the size of a pound of bread, inclosed with a tough rind, which, when ripe, turns of a yellow colour. The internal part is yellow, soft, and sweet. The natives bake it in an oven till the rind is black, and thus being scraped off, they eat the inside, which is then white, resembling new-baked bread, having neither seed nor stone. Some of the trees have been planted in Jamaica, and other West India islands, where it is used as a delicacy, and whether employed as bread, or in the form of pudding, it is considered highly palatable. But in Otaheite the bread-fruit tree not only supplies food, but clothing, and numerous other conveniences of life. The inner bark, consisting of a white fibrous substance, is formed into a kind of cloth, and the wood is used for the building of boats and houses.

BREAK'ERS, billows which break violently over rocks lying under the surface of the sea, exhibiting a white foam, and being distinguished by a peculiar hoarse roaring, very different from that of waves in deep water.

BREAKING GROUND, a military term, for opening the trenches and beginning the works for a siege.

BREAKWATER, the hull of a vessel sunk at the entrance of a harbour, or any erection of wood or stone placed there to break the force of the water, such as the Breakwater erected in Plymouth Sound.

BREAST-PLATE, a piece of defensive armour worn on the breast, which formerly was deemed of great importance, but in modern warfare has fallen much into disuse.—In horsemanship, a leather strap running from one side of the saddle, across the horse's breast, to the other, to keep it in its place.

BREAST-POUGH, a sort of plough

WHATEVER GRAIN IS USED FOR BREAD, WHETHER WHEAT, BARLEY, OATS, RYE, OR MAIZE, HAS THE NAME OF "BREAD-CORN."

[BRE]

A New Dictionary of the Belles Lettres.

[BRE]

which is driven forward by the breast, and is used in paring off turf from the land.

BREAST-WHEEL, a water-wheel, which receives the water at about half its height, or at the level of its axis.

BREAST-WORK, a military term, for works thrown up as high as the breast of the besieged. Also a sea term, for the balustrade of the quarter deck.

BREATH, the air inhaled and expelled in the respiration of animals. A bad breath is often caused by local affections in the mouth or windpipe, but more frequently by carious teeth, and by many kinds of food, as onions, &c. The disagreeableness of a bad breath is too evident to require comment, but we have not yet arrived at that refinement in moral legislation which they have reached in Prussia, where a bad breath furnishes ground for a divorce!

BRECCIA, or PUD'ING-STONE, a sort of aggregate earth, consisting of fragments of stones united by some common cement.

BREECH or BRITCH, the hinder part of a gun, from the cascabel to the bore. Also a sea term, for the angle of knee timber in a ship.

BREECH'ING, or BRITCH'ING, a rope used to secure the anchor of ships of war, and prevent them from recoiling too much in the time of battle.

BREED'ING, in a moral sense, denotes a person's deportment or behaviour in the external offices and decorums of social life. In this sense, we say, well bred, ill-bred, a man of breeding, &c. Lord Shaftsbury compares the well bred man with the real philosopher the conduct and manners of the one is formed according to the most perfect ease and good entertainment of company, of the other, according to the strictest interest of mankind, the one according to his rank and quality in his private station, the other, according to his rank and dignity in nature. In short, *good breeding* is politeness, or the union of those qualifications which constitute genteel deportment — In husbandry, *breeding* is that part which consists in the rearing of cattle or live stock of different kinds, particularly by crossing or mingling one species or variety with another, so as to improve the breed.

BREEZE, a shifting wind, that blows from sea or land to some certain house in the day or night, common in Africa, and some parts of the East and West Indies. The sea breeze is only sensible near the coasts, it commonly rises in the morning, about nine, proceeding slowly in a fine small black curl on the water, towards the shore, it increases gradually till twelve, and dies, about five. Upon its ceasing, the land-breeze commences, which increases till twelve at night, and is succeeded in the morning by the sea breeze again.

BRE'VE, in brick-making, small ashes and cinders, sometimes made use of instead of coals, for the burning of bricks.

BREVE, in music, a note of the third degree of length. It is equal to two semi-breves, or when dotted, to three. the former

is called an *imperfect*, the latter, a *perfect* breve.

BREVET, a military term, expressive of nominal promotion without additional pay. thus, a brevet major serves a captain, and draws pay as such. The word is borrowed from the French, signifying a royal act granting some favour or privilege, as *brevet d'invention*.

BRE'VIA VA'SA, in anatomy, small venous vessels passing from the stomach to the splenic veins.

BREVIARY, the book containing the daily service of the church of Rome. Originally every body was obliged to read the breviary, but by degrees the obligation was reduced to the beneficiary clergy only, who are enjoined under penalty of mortal sin and ecclesiastical censures, to recite it at home, when they cannot attend in public. In the 14th century there was a particular reserve granted in favour of bishops, who were allowed, on extraordinary occasions, to pass three days without rehearsing the breviary.

BREVIARIUM, in Roman antiquity, a book first introduced by Augustus, containing an account of the application of the public money.

BREVIATOR, an officer under the eastern empire, whose business it was to write and translate briefs.

BREVIER, in printing, a small kind of type, or letter, between nonpareil and bourgeois.

BREV'IS, in anatomy, an appellation given to several muscles, on account of their shortness.

BRE'VIAN TES, a small kind of frog, to the blood of which was falsely ascribed, according to Galen, the virtue of restoring the lost hair.

BRI'BERY, the act of prevailing upon any individual to do a legal or illegal act for the sake of reward.

BRICK, a composition of argillaceous earth, first moistened and made fine by treading and grinding, then formed into long squares, four inches and a half broad and nine long, and baked or burnt in a kiln, or in a *clamp*, to serve as stones in building. The different kinds of bricks made in England are principally *place* bricks, grey and red *stocks*, *mail* facing bricks, and *cutting* bricks. The *place* bricks and *stocks* are used in common walling, the *marls*, which are of a blue yellow colour, hard, and well burnt, are used in the outside of buildings, and the finest kind of *mail* and red bricks, called *cutting* bricks, are used in the arches over windows and doors, being rubbed to a centre, and gauged to a height. An able workman will make, by hand, 5000 common bricks in a day. The use of unburnt bricks is of great antiquity, they are found in the Roman and Grecian monuments, and even in the ruins of Egypt and Babylon. They were dried in the sun, instead of being burned, and mixed with chopped straw to give them tenacity, and owing to the extreme heat and dryness of the climate they acquired such hardness

SINGERS PRODUCE THEIR HIGH NOTES BY LESSENING THE APERTURE AND INCREASING THE VELOCITY OF THE "BREATH."

IN SOME PARTS OF AMERICA BRICKS ARE MADE OF AGASSIC MINERAL, AND BEING BLOTTED IN WATER, ARE CALLED "FLOATING BRICKS."

[BRI]

The Scientific and Literary Treasury ;

[BRI]

as to have lasted for several thousand years.

BRI'DEGROOM, and **BRIDE**, the names given to a newly married man and woman. But these terms are applied to them at the marriage festival, before they are married, as well as after the ceremony; and the true meaning is, a man and woman espoused or contracted to be married. The word *bridegroom* was formerly written *bridegoom*, the last syllable being derived from the Saxon *guma*, a man. *Groom* is a Persian word, signifying one who has the care of horses, hence it appears, that by an error of pronunciation we have been led into this ridiculous corruption of the original word. Among the Greeks it was customary for the bride to be conducted from her father's house to her husband's in a chariot, the evening being chosen for that purpose, to conceal her blushes: she was placed in the middle, her husband sitting on one side, and one of her most intimate friends on the other: torches were carried before her, and she was entertained in the passage with a song suitable to the occasion. When they arrived at their journey's end, the axle-tree of the chariot they rode in was burnt, to signify that the bride was never to return to her father's house. Among the Romans, when a bride was carried home to her husband's house, she was not to touch the threshold at her first entrance, but was to leap over it.

BRIDGE, any structure of wood, stone, brick, or iron, raised over a river, or canal, its strength depending on its own form, its unyielding materials, and the permanence of the abutments. Among the bridges of antiquity, that built by Trajan over the Danube is allowed to be the most magnificent, it was composed of twenty arches, of a hundred and fifty feet in height, and their opening from one pier to another was a hundred and sixty feet: the piers of this fine bridge are still to be seen on the Danube, being erected between Servia and Moldavia, a little above Nicopolis. In Great Britain, the art of building bridges appears to have been diligently studied from early times. The most ancient bridge in England is the Gothic triangular bridge at Croyland in Lincolnshire, said to have been built in 840, but the ascent is so steep that none but foot-passengers can go over it. The longest bridge in England is that over the Trent, at Burton in Staffordshire, built in the 12th century. It consists of thirty four arches, and is 1645 feet long. Old London Bridge was commenced in 1176, and was encumbered with houses for a long period. They were, however, removed in 1759. Among the great architectural works of our own times are Waterloo and New London bridges. The former consists of nine elliptical arches of 120 feet span each, is 1280 feet long, and has a flat surface in its whole course. The latter, which was commenced in 1824, and finished in 1831, consists of five elliptical arches, the centre one being 162 feet span, and the least of them being larger than any stone

arch of this description ever before erected. This magnificent structure, which was built after a design of the late John Rennie, contains about 120,000 tons of granite, measures 982 feet from the extremities of the abutments, with 53 feet of roadway between the parapets, and cost about two millions sterling. There are several cast-iron bridges in England, the chief of which is Southwark-bridge, over the Thames. It consists of three arches, and is the finest iron bridge in the world.—*Suspension Bridges*. Although pendent or hanging bridges has by some persons been deemed a modern invention, we find that the use of them is of great antiquity in mountainous countries; though the scientific principles which distinguish those of recent construction may perhaps be sought in vain among them. The most remarkable bridge of suspension in existence is allowed to be that built by Mr. Telford over the Menai strait, between the isle of Anglesea and Caernarvonshire in Wales, which was finished in 1825. Others also, most elegant in their design, and fully answering all that can possibly be expected from them, have been recently erected; viz over the Thames at Hammersmith, at Shoreham, and at various other places. In these the flooring or main body of the bridge is supported on strong iron chains or rods, hanging in the form of an inverted arch, from one point of support to another. The points of support are the tops of strong pillars or small towers, erected for the purpose. Over these pillars the chain passes, and is attached, at each extremity of the bridge, to rocks or massive frames of iron, firmly secured under ground. The great advantage of suspension bridges consists in their stability of equilibrium, in consequence of which a smaller amount of materials is necessary for their construction than for any other bridge. If a suspension bridge be shaken, or thrown out of equilibrium, it returns by its weight to its proper place, whereas the reverse happens in bridges which are built above the level of their supporters.—A *draw-bridge*, is one that is fastened with hinges at one end only, so that the other may be drawn up, in which case, the bridge stands upright, to prevent an enemy from passing the moat.—A *bridge of communication* is that made over a river, by which two armies, or forts, which are separated by that river, have a free communication with one another.—A *floating bridge* is a sort of redoubt, consisting of two boats, covered with planks, which are solidly framed, so as to bear either horse or cannon.—A *bridge of boats* consists of a number of common boats joined parallel to each other at the distance of six feet, till they reach across a river. They are then covered with planks, so as to serve as a passage for men and horses. We may here observe, in conclusion, that in military operations, temporary bridges are often formed in this and various other ways, by laying planks upon boats, pontoons, or such other buoyant supporters as readily present themselves.

THE EARLIEST WOODEN BRIDGE THERE IS ON RECORD, IS THAT THROWN BY JULIUS CÆSAR OVER THE RHINE, AND DESCRIBED IN HIS COMMENTARIES.

THE MENAI BRIDGE IS 560 FEET BETWEEN THE POINTS OF SUSPENSION, WEIGHS 480 TONS, AND THE ROADWAY IS 100 FEET ABOVE HIGH WATER.

[BRO]

A New Dictionary of the Belles Lettres.

[BRO]

BRIDON, the snaffle and rein of a military bridle, which acts independently of the bit and curb at the pleasure of the rider.

BRIEF, in law, an abridgment of the client's case, made out for the instruction of counsel on a trial at law; wherein the case of the plaintiff, &c. is to be briefly, but completely, stated.—*Brief*, in music, a measure of quantity, which contains two strokes down in beating time, and two up.—*Briefs*, apostolical, letters or written messages of the pope, addressed to princes or magistrates, respecting matters of public concern.

BRIGADE, a party or division of soldiers, either horse or foot. An army is divided into brigades of horse and brigades of foot: a brigade of horse is a body of eight or ten squadrons; a brigade of foot consists of four, five, or six battalions.

BRIGANTINE, a kind of ancient defensive armour, consisting of thin jointed scales of plate, so arranged as to be pliant and easy to the body.

BRIGANTINE, a small light vessel, which can both row and sail well, being adapted either for fighting or for chase.

BRIMSTONE, the vulgar name for SULPHUR, [which see.]

BRINE, is either native, as sea-water, or the water flowing from salt springs; or artificial, being formed by the dissolution of salt in water.

BRISTLE, the hair of swine, which is much used by brushmakers, particularly that imported from Russia.—*Bristle-shaped*, in botany, an epithet for a leaf in the shape of a bristle; that is, shorter than a capillary leaf.

BRISTOL-WATERS, mineral waters of the lowest temperature of any in England, being the fourth in degree amongst the waters which are esteemed warm. The waters of Bath are the first, Buxton the second, and Matlock the third. The constituent parts of Bristol water are carbonic acid gas, lime, and magnesia, besides the muriatic and vitriolic acids.

BRITANNIA, the name given by the Romans to the island of Britain, which is represented on their medals under the figure of a female resting her left arm on a shield.

BRITANNIANS, a body of Augustine monks who received their name from Britanni, in Aconia. They were distinguished by their austerities in living.

BRIZA, or QUAKING-GRASS, in botany, a genus of plants, class *triandria*. There are several species, some of which are annuals.

BRIZE, in agriculture, a term for ground that has lain long untillied.

BRIZEVENT, in horticulture, shelters on the north side of melon-beds where walls are wanting.

BROADSIDE, a sea term, for a discharge of all the guns on one side of a ship.—In printing, one full page printed on one side of a whole sheet of paper; of which a posting-bill is an example.

BROADSWORD, a sword with a broad blade, chiefly designed for cutting.

BROCADE, a stuff of gold, silver, or silk, raised and enriched with flowers, foliages, and other ornaments, according to the fancy of the merchants or manufacturers.

BROCHETTE, in cookery, a particular mode of frying chickens.

BRODIUM, in medicine, the liquor in which some solid medicine is preserved.

BROGUE, a defective pronunciation of a language, particularly applied to the Irish manner of speaking English.

BROKER, a name applied to persons of several and very different professions, the chief of which are exchange-brokers, stock-brokers, pawn-brokers, and brokers who sell household furniture.

BROME, in chemistry, a peculiar substance obtained from the bitterness of seawater, or the washings of the ashes of seaweed. It possesses the bleaching powers of chlorine, and, like that substance, is eminently hostile to life; a single drop of it placed upon the bill of a bird being sufficient to kill it.

BROME GRASS, a sort of grass much resembling oats in the stalk, leaf, &c.; whence it has also been called oat grass.

BRONCHIA, in anatomy, the ramifications of the trachea, or windpipe, which convey the air to the lungs.—*Bronchial Glands*, absorbent glands situated at the root of the lungs.—*Bronchial Arteries* and *Veins*, those which accompany the bronchus into the lungs.

BRONCHOCELE, in surgery, a tumour arising in the anterior part of the neck, arising from some violence, as straining in labour, lifting of weights, &c.

BRONCHOTOMY, in surgery, an incision made in the *aspera arteria*, or windpipe, which is necessary in many cases, and especially in a violent quinsy, to prevent suffocation from the great inflammation or tumour of the parts. It is also sometimes called *laryngotomy* and *tracheotomy*.

BRONTIUM, in Grecian antiquity, a place underneath the floor of the theatres, in which were kept brazen vessels full of stones and other materials, with which they imitated the noise of thunder.

BRONTOLOGY, the doctrine of thunder, or an explanation of its causes, phenomena, &c. together with the presages drawn from it.

BRONZE, a mixed metal, composed principally of copper, with a small portion of tin and other metals. The ancients used bronze for a great variety of purposes; hence, arms and other instruments, medals and statues of this metal, are to be found in all cabinets of antiquities. The moderns have also made much use of bronze, particularly for statues exposed to accidents, or the influence of the atmosphere, and for casts of celebrated antiques. Bronze of a good quality acquires, by oxydation, a fine green tint, called *patina antiqua*, or *arugo*; which appearance is imitated by an artificial process, called *bronzing*.

BROOM, a shrub of which there are several kinds, having a papilionaceous flower,

THE WARM SPRING AT BRISTOL RISES NEAR THE BOTTOM OF THE CLIFF, AND BUZZES THROUGH THE ROCK, DISCHARGING SIXTY GALLONS PER MINUTE.

A COMPOSITION MADE BY GRINDING GOLD-LEAF WITH HONEY, AND THEN WASHING OFF THE HONEY, IS OFTEN USED FOR "BRONZING."

[BRU]

The Scientific and Literary Treasury ;

[BUC]

which becomes a short roundish swelling pod, containing a kidney-shaped seed in each. It is used by dyers to give a yellow colour.

BROWNISTS, in church history, a religious sect, which sprang up in England towards the end of the 16th century, and long known under the denomination of *Independents*. Their leader was one Robert Brown, born at Northampton, yet his name was not adopted by them, but rather given to them by their adversaries as a nickname. They equally disliked episcopacy and presbyterianism. They condemned the solemn celebration of marriages in churches, maintaining, that matrimony being a political contract, the confirmation of it ought to proceed from the civil magistrate, an opinion in which they are by no means singular, as may be adduced from the late enactments of our legislature on this subject. They also rejected all forms of prayer, and held, that the Lord's prayer was not to be recited as a prayer, being given only as a model upon which to found our supplications. Any lay brother was allowed the liberty of giving a word of exhortation to the people, and after the sermon to reason upon the doctrines that had been preached. In a word, every church on their model is a body corporate, being accountable to no class, synod, convocation, or other jurisdiction whatever. During Elizabeth's reign the laws were enforced against them with great severity, and accordingly many retired and settled at Amsterdam, where their church flourished nearly a century.

BRUMEL, the winter quarter of the year, beginning at the shortest day.

BRUTÆ, the second order of animals of the *Mammalia* class, who have no foveæ teeth in either jaw, consisting of nine genera, the principal of which are the sloth, rhinoceros, elephant, &c.

BRUMALIA, in antiquity, a festival celebrated by the Romans in honour of Bacchus twice a year, viz. on the twelfth of the calends of March, and the eighth of the calends of December.

BRUSSELLIA, in botany, a genus of shrubby plants, natives of the East Indies, named by Plumier after Bruuselsius, a German monk and physician, class 11 *Didyma* mas, order 2 *Angiospermia*.

BRUNIA, in botany, a genus of plants named after Cornelius Bruun, a traveller, class 3 *Pentandria*, order 1 *Monogynia*. There are various species which are all shrubs, and natives of Ethiopia.

BRUNELLIA, a Malabar tree, the bark of which is diuretic.

BRUTE, an animal without the use of reason, or that acts by mere instinct, in which sense it denotes much the same with beast, and comprehends all animals excepting mankind. Philosophers, however, are far from being agreed on this subject, some making brutes mere machines, whilst others allow them not only reason, but immortality. Others take a middle course, and allow brutes to have imagination, memory, and passion, but deny that they have un-

derstanding or reason, at least, in any degree comparable to that of mankind. The sagacity of man, brutes is indeed admirable, yet what a prodigious difference is there between that sagacity and the reason of mankind!

BRYONY, in botany, a genus of the *monocotyledonous* class of plants, the flower of which consists of a single petal, divided into five deep segments, and the fruit is a roundish berry, containing a few seeds. The root of the rough or white bryony is a strong irritating cathartic.

BUBBLE, a bladder in water, or a vesicle filled with air. — **BUBBLES**, in commerce, a term given to any delusive scheme or project for raising money on imaginary or false pretences, as the famous "South Sea Bubble," [which see] and hundreds since.

BUBO, in medicine, the name of any tumour in the lymphatic glands, particularly in the groin or axilla.

BUBONICLE, in medicine, the inguinal hernia, or rupture of the groin, formed by a prolapsus of the intestines or omentum.

BUCANIER, or **BUCCANEER**, a name given to those piratical adventurers, chiefly English and French, who, in the seventeenth century, committed the most excessive depredations on the Spaniards in America. The name had been given to the first French settlers on the island of St Domingo, whose sole employment consisted in hunting bulls or wild boars, in order to sell their hides and flesh, and as they smoked and dried the fish of the animals according to the manner of the Indians, which was called *bucanering*, they thus obtained the name of bucaniers.

BUCCO, in ornithology, a species of owl, in the Philippine isles, of a beautiful plumage, and size of a peacock, but remarkable for its hideous scream.

BUCARDIA, in mineralogy, a stone shaped like the heart of an ox.

BUCCANAL GLANDS, in anatomy, the small glands of the mouth under the cheek, which assist in secreting the saliva.

BUCCELTION, in medicine, a method of stopping an hæmorrhage, by applying pieces of lint to the vein or artery.

BUCCELLARIA, an order of soldiery under the Greek emperors, appointed to guard and distribute the rations of bread.

BUCINA, an ancient musical and military instrument, somewhat similar to the modern trumpet. Hence *Buccinators*, or trumpeters.

BUCINITE, fossil remains or petrifications of the shells called *buccina*.

BUCINATOR, in anatomy, a muscle of the cheek, so called from its office of forcing out the breath.

BUCULA, in antiquity, that part of the helmet which protected the cheeks.

BUCENTAU, the name of the large vessel which the Venetians formerly used in the ceremony of espousing the sea.

BUCEROR, the hornbill or Indian raven; a genus of birds of the order *Picæ*, of which there are several species.

THE WEALTH WHICH THE BUCANERS ACQUIRED WAS SPENT IN GAMBLING, OR IN THE INDULGENCE OF OTHER CRIMINAL PLEASURES.

RELIGION WAS STRANGELY BLENDED WITH THE VICES OF THE BUCANERS, AND THEY ALWAYS BEGAN THEIR ENTERPRISES WITH A PRAYER.

[BUD]

A New Dictionary of the Belles Lettres.

[BUL]

THE BULBS OF PLANTS ARE THE RESERVOIRS OF THEIR VITAL POWERS DURING THE SEASON WHEN THOSE POWERS ARE BECOME FORGOTTEN

BUCK, the male of the fallow deer In his first year a buck is called a fawn the second a pricket, the third a sord the fourth a sore the fifth, a buck of the first head and the sixth a great buck The word is also used to denote the male of the hare and rabbit tribes

BUCKHOLITE, a recently discovered mineral marked with black and white spots

BUCKLER, a piece of defensive armour used by the ancients commonly composed of hides fortified with plates of metal—*Bucklers* *totius* were those consecrated to the gods and hung up in their temples in commemoration of some hero or as a thanksgiving for a victory obtained over an enemy whose bucklers taken in war were offered as a trophy—*Buckler* in naval language are two pieces of wood fitted together to stop the hawser holes so as to prevent the ship taking in too much water in a heavy sea

BUCKRAM a sort of coarse cloth made of hemp gummed calcined and dyed of several colours It is used in diaphery garments &c, required to be kept stiff to their form

BUCCOLIC in ancient poetry a poem relating to shepherds and rural affairs The most celebrated of the ancient buccolics are those of Virgil

BUD that part of a plant which contains the embryo of the leaves flower &c It is called by botanists the *hyle sac* or winter receptacle of the leaves or flowers of plants and is an epitome of a flower or of a shoot which is to be unfolded the succeeding summer

BUDDING a method of propagating fruit trees The stocks are rustic in seed and in these buds of other trees are inserted which invariably produce the same kind of tree fruit and flower as those from which the buds are taken

BUDDHISTS the followers or worshippers of Buddha the founder of a very ancient religion in India which afterwards spread to Japan Tibet and China where it exists at the present day According to an article in the *Journal des Savans* of 1821 which cites the *Japin Encyclopedia* in Buddha whose historical name was *Siddhartha* was born under the reign of Ashoka wang of the dynasty of *Sakya* 10,000 years ago and died under the reign of *Mouwang* 900 years ago His disciple *Mahakasya* succeeded him and was the first saint or patriarch of Buddhism but a regular dynasty of successors held this important station till 1671 Their history is mixed with the grossest fables but it is clear that they devoted themselves to religious exercises and constant contemplation and condemned them selves to the severest abstinence Besides many other monuments of the ancient worship of Buddha there are two particularly remarkable—the ruins of the gigantic temple *Boro Budor* in Java and the five large subterranean halls, called *Panth Paidu* on the way from *Gururat* to *Maleva* Tradition ascribes these astonishing works of ancient Indian architecture and sculp

ture which far surpasses the skill of the modern Hindoos, to the *Pandus*, the heroes of Indian mythology

BUDGE the name given to the annual statement made to the House of Commons, of the public finances

BUFF, in commerce a sort of leather prepared from the skin of the buffalo which when dressed with oil after the manner of chamois makes what we call buff skin This is a very considerable article in the French English and Dutch commerce at Constantinople Smyrna and along the coast of Africa The skins of oxen and some other animals when prepared after the same manner as that of the buffalo are likewise called *buffs*

BUFFALO in zoology the *Bubalus bubalus* of Linnaeus an animal of the ox kind with very large crooked and reaspinated horns It came originally from India but is now found in most of the warmer countries of the eastern hemisphere It is larger and less docile than the common ox and is fond of marshy places and rivers The name is also applied to the bison of North America and to wild oxen in general

BUFFO the Italian for a singer or actor when he takes the humorous part in comic operas &c

BUFFONIA in botany a genus of plants of the *titan* *id gymna* class called after the naturalist Buffon

BUFFET was anciently a little apartment separated from the rest of the room by slender wooden columns for the disposing of china glass &c

BULONNIS or *BULONNIS* *PARIS* in numerology a sort of stone said to have been found in the head of a toad and hence vulgarly called *toad stone*

BUL a troublesome and disgusting insect that infests beds &c It is the *imex lect larva* of Linnaeus The destruction of bugs may be effected by a solution of corrosive sublimate in water or in water and alcohol This solution should be applied with a brush to every crevice where it is possible the insects can lodge

BULGOS in botany a name given to several very distinct genera of plants, as the anchusa *hyssopus* and *asparagus*

BULSTON or *BULSTON* a sub species of silica or quartz occurring in amorphous masses partly compact but containing many irregular cavities It is used for millstones

BUL in the ancient Hebrew chronology the eighth month of the ecclesiastical and the second of the civil year it has since been called *Musulman* and answers to our October

BULB or *BULBOUS* *ROOT* in the anatomy of plants expresses a root of a round or roundish figure and usually furnished with fibres at its base The bulb under ground is what the bud is upon the stem or branches a hybernacle or winter receptacle of a future plant containing the plant in embryo protected by a rind of scales &c Bulbous roots are said to be solid when composed of one uniform lump of matter

BULBOUS ROOTS IN GLASSES PLACED IN A WINDOW HAVE GENERALLY TOO MUCH HEAD, AND IN CONSEQUENCE BECOME WEARILY

[BUL.]

The Scientific and Literary Treasury ;

[BUR]

BULL-DOGS ARE MORE VICIOUS AND FEROCIOUS THAN ANY OF THE CANINE SPECIES, AND BITE ON THE SLIGHTEST PROVOCATION.

as in the tulip; *tunicated*, when formed of multitudes of coats, surrounding one another, as in the onion; *squamose*, or *scaly*, when composed of lesser flakes, as in the lily; *duplicate*, when there are only two to each plant; and *aggregate*, when there is a congeries of such roots to each plant.

BULIMIA, or **BULIMY**, a disease in which the patient is affected with an insatiable and perpetual appetite for food.

BULK HEADS, partitions made athwart a ship, by which one part is divided from another; as the great cabin, gun-room, bread-room, &c.

BULL, in zoology, the male of the bovine genus of quadrupeds, of which cow is the female.—In astronomy, the constellation Taurus.—Also, an edict or mandate issued by the Pope, and sealed with the bulla, a leaden or gold seal.

BULLA, in antiquity, a small round ornament of gold or silver, worn about the neck or breast of the children of the nobility till the age of fourteen.—In conchology, a genus of testaceous animals, class *vermes*, order *testacea*.

BULLATE, in botany, an epithet for a leaf; *folium bullatum*, a leaf having protuberances on its surface resembling blisters.

BULL-DOG, a dog of English breed, so called from his propensity of attacking the bull, whence he was formerly used in the cruel sport of bull-baiting.

BULLET, a leaden ball with which small fire arms are loaded.

BULLETIN, an official account of public transactions or matters of general interest.

BULL-FIGHT, an entertainment formerly frequent in Spain and Portugal, at which wild bulls are encountered by men on horseback, armed with lances.

BULL-FROG, a remarkable species of the frog in North America, so called because its voice resembles the distant lowing of an ox.

BULLITE, in conchology, a petrified shell, or the fossil remains of shells, of the genus *bulia*.

BULLION, uncoined gold or silver in the mass. Those metals are called so, either when smelted from the native ore, and not perfectly refined; or when they are perfectly refined, but melted down in bars or ingots, or in any unwrought body, of any degree of fineness.

BULL'S EYE, a mark in the centre of a target, in the shape of a bull's eye, at which archers shoot by way of exercise.—In astronomy, *Aldebaran*, a star of the first magnitude in the constellation Taurus.—Among seamen, a small obscure cloud, ruddy in the middle, generally the immediate forerunner of a great storm at sea.—It is also the name given to the patent reflectors set into the posts or derks.

BULWARK, in fortification, a mound of earth capable of resisting cannon shot, and formed with bastions, curtains, &c.—The word is also used figuratively, as "the British navy is the nation's bulwark."

BUM-BOAT, a sort of wherry used about

harbours, to carry provisions, &c., for sale to ships lying at a distance.

BUNGALOW, an Indian name for a house with a thatched roof such as is peculiar to the country.

BUNT, a sea term, the middle part of a sail formed into a sort of bag, or hollow, that the sail may gather more wind.

BUNTINE, or **BUNTING**, the thin woollen stuff of which the colours, or flags and signals, of ships are made.

BUNTING, in ornithology, a bird of the genus *emberiza*, remarkable for the shape of its bill, the sides of the upper mandible forming a sharp angle bending inwards towards the lower.

BUNT LINES, small ropes fastened to cringles, which serve to force up the bunt of the sail for the better furling it up.

BUOY, a short piece of wood or close hooped barrel fastened by a rope to the anchor, to point out its situation. It is also a piece of wood or cork fastened by a chain, serving to point out dangerous places.

—A *Life-buoy* is intended to keep a person afloat till he can be taken from the water. It should be suspended from the stern of the ship, and let go as soon as anybody falls overboard, and a light may be attached to it if the accident happens by night. It consists of two hollow copper vessels connected together, each about as large as an ordinary sized pillow, and of buoyancy and capacity sufficient to support one man standing upon them.

BUPHAGA, or **BEEP-EATER**, in ornithology, a bird of the order *piee*, found in Africa. It is so called, because it alights on the backs of cattle, and picks holes in them to get at the larvae of the gad-fly, on which it lives.

BUPHTHALMUM, or **OX-EYE**, in botany, a genus of plants, class 19 *Syngenesia*, order 2 *Polygamia superflua*. There are many species, and are all either annuals or shrubs. It takes its name from the resemblance which its flowers have to the eye of an ox.

BUPHTHALMUS, in medicine, a diseased enlargement of the eye.

BUPRESTIS, in entomology, an insect of the coleopterous order, remarkable for the brilliancy of its colours, which emulate the polish of the finest metals; but it bites severely and has a nauseous scent.

BURDEN, the contents of a ship; or the number of tons which a vessel will carry.—*The burden of a song* is that part which is repeated at every verse or stanza.

BUREAU, in its primary sense is a cloth covering a table; next a writing-table; and afterwards used to signify the chamber of an officer of government, and the body of subordinate officers who labour under the direction of a chief. According to the parliamentary usage of France, the chamber of deputies is divided into nine bureaux, composed of an equal number of deputies designated by lot; and each bureau discusses all matters referred to it by the chamber separately.

BURGAGE, an ancient tenure in bo-

THE TERM "BUREAUCRY" IS OFTEN APPLIED TO THOSE GOVERNMENTS IN WHICH THE BUSINESS OF ADMINISTRATION IS CONDUCTED BY "BUREAUS."

BUR]

A New Dictionary of the Belles Lettres.

[BUT

BY THE ACTION OF POWERFUL BURNING MIRRORS, WATER WILL IMMEDIATELY BOIL AND WOOD BURST INTO A FLAME IN A MOMENT.

roughs, whereby the inhabitants, by custom, hold their lands, &c. of the king, or other superior lord of the borough, at a certain yearly rent. A dwelling house in a borough, was also formerly called a bur-gage.

BURGESS, an inhabitant of a borough, or one who possesses a tenement therein. In other countries, burges and citizen are used synonymously, but with us they are distinguished, burges being ordinarily used for the representative of a borough-town in parliament.

BURGLARY, in law, the breaking and entering the dwelling of another in the night, with the intent to commit some felony, whether the felonious intent be put in execution or not. The like offence committed by day, is called house breaking.

BURGOMASTER, the chief magistrate of the great towns in Flanders, Holland, and Germany. The authority of a burgo-master resembles that of the Lord Mayor in London.

BURLETTA, a light, comic species of musical drama, which derives its name from the Italian *burlesco*, to jest.

BURNING, the action of fire on some pabulum, or fuel, by which the minute parts thereof are put into a violent motion, and some of them assuming the nature of fire themselves, fly off in *orbem*, while the rest are dissipated in form of vapour, or reduced to ashes.

BURNING-GLASS, a lens which unites the rays of light that fall upon it, in so narrow a space as to cause them to kindle any combustible matter coming in their way. The lenses used for this purpose are generally convex on both sides, by which the rays are brought upon a point with the greatest force, in consequence of the shortness of their focal distance.—*Burning Mirrors*, or *Specula*, are concave reflecting surfaces, which carry the rays of light by reflection to the common centre. Among the ancients, the burning mirrors of Archimedes and Proclus are famous. By the former, the Roman navy was set on fire and consumed, at the distance of a bow-shot, and by the latter, according to Zonares, the navy of Vitellius, while besieging Byzantium, was burnt to ashes. By means of a mirror made by Vilette, a French artist of Lyons, a waxen pipe was melted in seven in nuts and a half and a halfpenny in sixteen minutes. This mirror was 47 inches wide, and ground to a sphere of 76 inches radius, so that its focus was about 34 inches from the vertex. Its substance was a composition of tin, copper, and glass.

BURIN, an instrument used for engraving on copper or steel plates.

BURREL SHOT, small shot, nails, pieces of old iron, &c. put into cases, to be discharged out of ordnance.

BURSÆ MUCOSÆ, in anatomy, bags which secrete a mucous fat that serves to lubricate tendons, muscles, and bones, in order to render their motion easy.

BURSA'RII, in archæology, stipendiary

scholars who lived upon the burse, or joint-stock of the college.

BURSE, **BURSA**, or **BASILICA**, an exchange, or place of meeting for merchants to consult on matters of trade, and to negotiate bills of exchange.

BUSH-HARROW, an implement of husbandry for harrowing grass lands, and covering grass or clover seeds. It consists of a frame with three or more bars, in which bushes are interwoven.

BUSH MEN, a name given by the Dutch to the wild and ferocious inhabitants of Africa, near the Cape of Good Hope.

BUS'KIN, a kind of high shoe, anciently worn by tragedians; also a sort of leather stocking serving the purpose of a boot.

BUST, or **BUSTO**, in sculpture, denotes the figure or portrait of a person in relieve, showing only the head, shoulders, and stomach, the arms being lopped off. The stomach and shoulders are, strictly speaking, the bust. The term is also used by the Italians, for the torso or trunk of the body, from the neck to the hips.

BUSTARD, a large species of fowl of the Grallæ order. It runs fast, and takes flight with difficulty. It inhabits England, but the breed is nearly extirpated.

BUSTUM, in antiquity, a funeral pile on which the dead bodies of the Romans used to be burnt. Hence *BUSTUARI* were gladiators who fought about the bustum of any person in the celebration of his obsequies.

BUTCH'ER-BIRD, a species of the *shrike*, remarkable for its ferocity towards the little birds which it kills.

BUTTER, a fat unctuous substance, procured from the cream of milk by churning. This kind of oil, in its natural state, is distributed through all the substance of the milk in very small particles, which are interposed between the caseous and serous parts, among which it is suspended by a slight adherence, but without being dissolved. It is in the same state as that of oil in emulsions, hence the same whiteness in milk and in emulsions, and hence, by rest, the oily parts separate from both these liquors to the surface, and form a cream. It was late before the Greeks appear to have had any notion of butter, their poets make no mention of it, and yet are frequently speaking of milk and cheese. The Romans used butter no otherwise than as a medicine, never as a food.—Butter is a name given in old books of chemistry to several metallic muriates, on account of their texture when newly prepared. Hence there are the butters of antimony, arsenic, bismuth, and tin. Thus, butter of antimony is a compound of antimony and oxygenized muriatic acid, and is a muriate of antimony, and so of the rest.

BUTTERBUR, a plant with a fluscular flower, consisting of many florets.

BUTTERFLY, or **PAPILIO**, a genus of insects, of which there are many hundred species. Curious and elegant as they are, this is the last state of the varied existence of the same creature, first in the grub, or

A GLASS LENS, THREE FEET IN DIAMETER, AND ITS OTHER PARTS IN PROPORTION, BURNED PURE GOLD, PLATINA, AND CAST-IRON IN THREE SECONDS.

CAA]

The Scientific and Literary Treasury;

[CAA

caterpillar form, in which it emerges from the eggs laid by a former generation the grub then passes into an insensible state, called the chrysalis or aurelia, in which it continues some weeks or months, having neither legs, wings, nor motion at length the case is burst and moths and butterflies emerge, which pass a short and fluttering existence, during which they lay eggs for future successions of the same kind.

BUFLER MILK, a kind of serum that remains behind, after the butter is made.

BUTLER WORT in botany, the English name of a distinct genus of plants, called *pinguicula*.

BUTLERY, a room in the houses of noblemen and gentlemen, belonging to the butler, where he keeps the utensils belonging to his office.

BUTTOCK of a ship, is that part of her, which is her breadth right a stern, from the tack upwards, and a ship is said to have a broad or a narrow buttock, according as she is built, broad or narrow at the transom.

BUTTONS The manufacture of buttons is an art which gives employment to numerous persons and constitutes many distinct trades. The most durable and ornamental buttons are made of various metals generally polished, or covered with an exceedingly thin wash of some more valuable metal as gold, silver or tin. Horn, leather, bone and wood are also used for buttons which are sometimes plain but more frequently covered with silk, mohair, thread or other ornamental materials. It is impossible consistent with our limits to describe the processes by which the various kinds of buttons are made and it must suffice to state that there is no kind of manufacture whatever in which greater ingenuity is exercised nor in which the labours of the artisan have been crowned with more complete success.

BUXUS, the box tree, of which there are three species 1 the *arborescens*, with oval leaves, 2 the *angustifolia*, with narrow leaves, 3 the *sufruticosa*, commonly used for bordering of flower beds. The two first sorts, when suffered to grow in a natural manner, are deciduous shrubs of a very elegant figure. There were formerly large trees of these kinds upon Boxhill, near Dorchester in Surry. Boxwood is extremely hard and smooth, and therefore capable of being wrought with great neatness by the turner. It is used for the same reasons by engravers on wood.

BUZE, a wooden or leaden pipe to convey the air into mines.

BY LAWS, or **BYE LAWS**, private and peculiar laws for the good government of a city, court, or other community, made by the general consent of the members. All by laws are to be reasonable, and for the common benefit, not private advantage of any particular persons and must be agreeable to the public laws in being.

BUZZARD, a rapacious, but sluggish bird, as the hawk kind.

BYSSOLITE, a scarce mineral, occurring in very delicate filaments, short, flexible, and elastic. The colour is olive green, and their lustre rather silky.

BYSSUS, in botany a genus of mosses, consisting of plain simple, capillary filaments. The byssus are nearly allied to the confervæ from which, however, they differ, as consisting of finer, shorter and more tender filaments, and not growing in water, as the confervæ do—*Byssus*, a fine linen among the ancients procured from India. Also that fine Egyptian linen, whereof the tunics of the Jewish priests were made.

BYZANTINE, a gold coin of the value of 15*l* so called from being coined at Byzantium. Also an epithet for any thing pertaining to Byzantium an ancient city of Thrace, situated on the Bosphorus.

C.

C, the third letter and second consonant of the alphabet, is pronounced like *k* before the vowels *a*, *o*, and *i* and like *s* before *e* and *y*. Before *h* it has a peculiar sound as in chance, chalk, in chord and some other words it is hard like *k* but in many French words it is soft before *h* like *s* as in chance, chagrin &c. As a numeral *C* stands for 100 and *CC* for 200 &c. as an abbreviation it stands for *Christ* as *A C* Anno (*Christi*) or Ante (*Christum*) also for *Companion* as *C B* Companion of the Bath. And in music *C* after the clef, is the mark of common time.

CAABA, or **CAABAH**, properly signifies a square building but is particularly applied by the Mahometans to the temple of Mecca, built, as they pretend, by Abraham,

and Ishmael his son. It is towards this temple they always turn their faces when they pray in whatever part of the world they happen to be. This temple enjoys the privilege of an asylum for all sorts of criminals, but it is most remarkable for the pilgrimages made to it by the devout Mussulmen who pay so great a veneration to it that they have a single sight of its sacred walls without any particular act of devotion is as meritorious in the sight of God as the most careful discharge of one's duty for the space of a whole year, in any other temple.

CAAPIA, in botany the Indian name for the *Dorstenia Brasilensis* of Linnaeus, with which the natives cure the wounds inflicted by poisoned arrows.

BUTTON SHAVES ARE MADE BY HAND FROM A BRASS OR IRON WIRE, WHICH IS LAPPED SPIRALLY AROUND A PIECE OF SILK YARN

THE SHAVES OF PLATED BUTTONS ARE SOLDIERED ON WITH SILVER SOLDER, AND SEPARATELY HEATED BY MEANS OF A BLOWPIPE

[CÆ]

A New Dictionary of the Welles Letters.

[CÆ]

A PATENT WAS OBTAINED IN 1826 BY MR. SEATON, A SURGEON IN THE NAVY, TO SUBSTITUTE "IRON CABLES" FOR CORDAGE IN THE SEA-SERVICE.

CAA-O'PIA, in botany, the *Hypericum bacciferum*, a Brazilian tree, the bark of which emits a juice which when dried resembles gamboge.

CAB, an original dry measure, equal to nearly three English pints corn measure.

CABAL, denotes a number of persons united in some close design, and is sometimes used synonymously with *faction*. This term was applied to the ministry of Charles II., from the initial letters of their respective names, viz. Clifford, Ashley, Buckingham, Arlington, and Lauderdale.

CAB'ALA, a mysterious kind of science pretended to have been delivered by revelation to the ancient Jews, and transmitted by oral tradition to those of our times; serving for the interpretation of the books both of nature and scripture.

CABALLINE, (from *caballus*) pertaining to a horse; as, *caballine* aloe, so called from its being a medicine given to horses.

CAB'AGE-TREE, the cabbage-palm, a species of *Areca*, which grows with a straight stem to the height of 180 or 200 feet. Its branches grow in a circular manner, and on the top grows a snow-white substance, called cabbage, which is eaten with meat, like other vegetables. The fibres of the leaves are used for making nets and cordage.

CABIN, the apartment in a vessel for the officers and superior passengers.—*Cabin passengers* are those who pay for accommodations in the cabin, in distinction from deck or steerage passengers.

CABINET, a select apartment set apart for writing, studying, or preserving any thing that is precious. Hence we say, a cabinet of paintings, curiosities, &c.—Also, the closet or private room in the royal palace, where councils are held, likewise the ministers of state who are summoned to attend such councils.

CAB'IRI, certain deities greatly venerated by the ancient Pagans in Greece and Phœnicia, who were supposed to have a particular influence over maritime affairs.

CABLE, a large strong rope or chain, used to retain a vessel at anchor. In the use of the cable there are many sea phrases.

CABO'CHIED, or **CABO'SSE**, in heraldry, having the head cut close, so as to have no neck left.

CABO'SSE, the cook-room or kitchen of a ship. It also signifies the box that covers the chimney of a ship.

CAB'URE, a Brazilian bird of the owl kind, of a beautiful brown colour spotted with white.

CACADE, a French military term for an unlucky enterprise in war, which has been ill-concerted and ill-conducted.

CACALIA, a genus of plants in the Linnæan system, class 19 *Syngenesia*, order 1 *Polygamia equalis*.

CACH'ALOT, in ichthyology, the Physeter or sperm whale.

CACH'OLONG, in mineralogy, a sub-species of quartz, which often envelopes common chalcocite, the two minerals being united by insensible shades.

CACOC'HYLIA, in medicine, a bad chylification; when the humour called chyle is not duly made.

CACOC'HYMY, a vicious state of the vital humours, especially of the blood, arising from a disorder of the secretions or excretions, or from contagion.

CACOE'THES, an ill habit or propensity; as the *cacoethes scribendi*, an itch for authorship.

CACOPH'ONG, in rhetoric, an unsmooth, bad tone of the voice, proceeding from the ill disposition of the organs.

CACOSYN'THETON, in grammar, an improper selection and arrangement of words in a sentence.

CACOTROPHY, in medicine, any sort of vicious nutrition.

CACTUS, in botany, a genus of succulent plants, permanent in duration and singular in structure, which are all natives of South America. Most of this genus are now to be met with in the choice collections of exotics reared in this country.

CAD'DIS, a kind of worm or grub found in its case of straw.

CAD'ENCE, in grammar, the fall of the voice; also the flow of verses or periods.

—In music, it is a pause or suspension at the end of an air, or at the termination of a proper chord.—In dancing, cadence is used when the steps follow the notes and measures of the music.—In horsemanship, the cadence is the measure or proportion observed by a horse in all his motions.

CAD'ENT, in astrology, an epithet for a planet when it is in a sign opposite to its exaltation.

CADEN'ZA, in music, the fall or modulation of the voice in singing; or the close of an air.

CADET, one who is trained up for the army by a course of military discipline; such as the cadets at the military colleges of Woolwich, Addiscombe, &c.—**CADETSHIP**, the commission given to a cadet to enter the East India Company's service.

CAD'I, a civil judge or magistrate in the Turkish empire.

CAD'MIA, an oxide of zinc which collects on the sides of furnaces where zinc is sublimed.

CADMITES, in mineralogy, a precious stone having blue specks in it.

CAD'MIUM, a ductile and malleable metal, chiefly found in Silesia, in ores of zinc. It has the colour and lustre of tin, and is susceptible of a fine polish.

CADU'CEUS, the wand or sceptre of Mercury, being a rod entwisted by two serpents, and tipped with wings; borne by that deity as the ensign of his office. When used on medals, &c. it is an emblem of peace, and was carried by the Roman heralds when they went to proclaim peace. The rod signified power; the serpents, wisdom; and the wings, diligence and activity.

CADU'COUS, in botany, denotes falling early; as, *caducous* leaves, which fall before the end of summer.

CÆ'CIAS, a northerly wind, which is

SOME FLOWERS, LIKE THE "CACTUS GRANDIFLORUS" OR NIGHT-BLOWING CEREUS, HAVE NO SCENT IN DAY, BUT IN THE EVENING EMIT THEIR ODOR.

[CAL]

The Scientific and Literary Treasury;

[CAL]

said to be distinguished from the other winds by its drawing the clouds to itself.

CÆCILIA, in zoology, a genus of animals, class *Amphibia*, order *Serpentes*.

CÆRITES TABULÆ, in antiquity, tables or registers in which the censors entered the names of those citizens, who for any misdemeanour were deprived of their right of voting at an election.

CÆSAR, in Roman antiquity, the family name of the first five Roman emperors, and afterwards adopted as a title by their successors. It was also used, by way of distinction, for the intended or presumptive heir of the empire.

CÆSARIANS, in Roman antiquity, officers or ministers of the Roman emperors, who kept an account of their revenues, and took possession in their name of such things as devolved or were consecrated to them.

CESURA, a figure in prosody, by which a division or separation takes place in a foot that is composed of syllables belonging to different words.

CETERIS PARIBUS, a term often used by mathematical and physical writers, the words literally signifying *the rest, or other things, being alike or equal*. Thus of a bullet, it may be said, *ceteris paribus*, the heavier it is the greater the range, supposing the length and diameter of the piece and the quantity and strength of the powder be the same.

CAGUTI, a Brazilian monkey, the smallest species of which is not more than six inches long.

CAIRNS, heaps of stones in a conical form, which are frequently to be met with in Scotland and Wales.

CATSKON, or **CATSKOON**, a wooden chest filled with bombs or powder, and laid in the way of an enemy, or buried under some work to blow it up. Also, the frame used in laying the foundations of a bridge.

CAJUPUT OIL, in medicine, an aromatic oil extracted from an Indian tree, the *Maleuca Leucodendron* of Linnaus, which grows in the Molucca islands.

CALABASH TREE, in botany, the *Coccoloba Linnaea*, the fruit of which is enclosed in a rill that serves the natives of the Caribbee islands for a drinking cup, a pot for boiling, and for various other domestic purposes.

CALAMINCO, a fine sort of woollen stuff of a blue gloss, and chequered in the warp, so that the checks are seen only upon one side.

CALAMYRIÆ, the third natural order of plants in the Linnaan system, containing the reeds, reedmingle grasses.

CALAMAR, a name of the cuttle fish.

CALAMBAC, aloes wood, a drug, the produce of a tree growing in China and some of the Indian isles.

CALAMBOUR, a species of the aloes wood, used by cabinet makers and inlayers.

CALAMIFEROUS, a botanic term for plants having a long, hollow, knotted stem.

CALAMINE, or **LA FIS CALAMINARIA**, the calamine stone, or oxyde of zinc,

a kind of bituminous fossil earth, which, when mixed with copper, produces brass.

CALAMUS, a rush or reed used anciently as a pen to write on parchments or papyrus.

The generic name of an Indian cane, otherwise called *rotang*.—Also, a kind of reed, or sweet-scented cane, used by the Jews as a perfume.

CALANDRA, in ornithology, a species of lark of a reddish brown colour.

CALASH, a light open chariot.

CALATHUS, in antiquity, a basket or hamper, made of osiers or reeds, used to put needle-work in, or to hold flowers. Calathus was also a pan for cheese-curd and milk, also the name of a cup for wine used in sacrifices.

CALATOR, in antiquity, was a public servant and a freeman, such as a bailiff or crier, to summon courts, synods, and other public assemblies. He also attended on the priests in the sacrifices.

CALCAR, a kind of furnace, used in glass works for the calcination of sand and salt of potash.

CALCAREOUS EARTH, or **Lime**, as marble, limestone, and gypsum, forming ranges of mountains, and containing marine shells and bones of animals, of which it is supposed to be the concentrated ruins.

CALCAREOUS SPAR, crystallized native carbonate of lime.

CALCAVELLA, a sweet kind of Portuguese wine.

CALCEUS, in antiquity, a shoe, or whatever served as a covering for the foot. There were two sorts, the *calcei lunati*, which were worn by the patricians, so called from an ivory crescent with which they were ornamented, and the *calcei mulii*, or red shoes. They came up to the middle of the leg, but only covered the sole of the foot. They at first graced the feet of royalty, but on the abolition of the monarchy they were appropriated to those who had borne a curule office.

CALCIEROS, producing calx or lime.

CALCINATION, the chemical process for the reduction of bodies to a pulverizable state, by the action of fire, or the solution of a mixed body by the means of heat or any corroding substance, as mercury, aquafortis, &c., when by it is reduced to powder.

CALCIUM, the metallic basis of lime.

CALCOGRAPHY, an engraving after the manner of a drawing in chalk.

CALCINTER, the incrustations of carbonate of lime upon the ground, also, the stalactites attached to the roofs of caverns.

CALC TUFF, an alluvial formation of carbonate of lime.

CALCULARY, a congeries of stony accretions found in the pulp of a pear and other fruits.

CALCULATION, the act of computing several sums by means of addition, subtraction, multiplication, division, &c., or an estimate formed in the mind by comparing the various circumstances which influence its determination.

CALCULATOIRES, accountants among

FROM THE DEATH OF JULIUS CÆSAR, 44 B.C. TILL 476 A.D. THERE WERE SIXTY-FOUR ROMAN EMPERORS, THE LAST BEING AUGUSTULUS.

THE ROMANS HAD NO TITLES, PROPERLY SO CALLED, BUT WERE DISTINGUISHED BY PRÆTORS, CONSOLES, AND COGNOMENS.

the Romans, who used to reckon by means of little stones or pebbles.

CALCULUS, (*a stone*), a name generally given to all hard concretions, not bony, which are formed in the bodies of animals. Calculi may be divided into two classes, according as they are found in the gall-bladder or in the urinary bladder: the first are called *biliary calculi*; the second, *urinary calculi*. The calculus in the bladder is called *lithiasis*; in the kidneys, *nephritis*.

—In mathematics, the *differential calculus* is the finding an infinitely small quantity, which, being taken infinite times, shall be equal to a given quantity.

CALDA'RUM, in antiquity, a bath heated by means of steam.

CALEFA'CIENTS, in medicine, such preparations as have a tendency to stimulate the action of the blood.

CALEFACTION, a way of preparing simple or compound medicines by a moderate heat of the sun.

CAL'ENDAR, a register of time divided into months, weeks, and days throughout the year; together with an account of the festivals and other such matters as serve for the daily purposes of life. The Roman and Julian Calendars were used by the Romans; the Gregorian and Reformed Calendars among the moderns. It received its name from the Roman *calenda*, which the first day of each month was called.

CAL'ENDER, a machine used in manufactories, to press stuffs, silks, linens, &c., to give them a fine gloss and wavy appearance. It consists of two thick rollers or cylinders, revolving so nearly in contact with each other that cloth passed through between them is not only smoothed, but glazed by their powerful pressure, and waved or watered, according to the pattern engraved on the revolving cylinders.

CAL'ENDULA, the *MARIGOLD*, a genus of plants in the Linnean system, class 19 *Syngenesia*, order 4 *Polygamia necessaria*. The species are perennials, annuals, and shrubs.

CAL'ENTURE, a violent ardent fever, incident to sailors in hot climates; the principal symptom of which is, their desire to rush into the sea, which, it is said, they imagine to be a green field.

CAL'IBER, the interior diameter of the bore of any piece of ordnance, or the diameter of a shot or shell.

CAL'IBER COMPASSES, a particular instrument used by gunners for measuring the diameters of shot, shells, &c. They resemble other compasses, except in their legs, which are arched, so that the points may touch the extremities of the arch.

CAL'ICO, cloth made of cotton. It is called *calico*, because originally brought from *Calicut*, a kingdom of India on this side of the Ganges, on the coast of Malabar. These cloths, whether plain, printed, dyed, stained, or painted, chintz, or muslins, are all included under one general denomination.

CAL'ICO-PRINTING, is the art of impressing cotton cloth with topical dyes.

It has been for many centuries practised by the oriental methods in Asia and the Levant, but it was unknown in this country till the end of the 17th century. In speaking of the superiority of our present improved cylindrical machinery for calico-printing, Dr. Ure says, "the economy of labour introduced by these machines is truly marvellous; one of them, under the guidance of a man to regulate the rollers, and the service of a boy, to supply the colour troughs, being capable of printing as many pieces as nearly 200 men and boys could do with blocks. The perfection of the engraving is most honourable to our artisans. The French, with all their ingenuity and neat-handedness, can produce nothing approaching in excellence to the engraved cylinders of Manchester,—a painful admission, universally made to me by every eminent manufacturer in Alsace, whom I visited in my late tour."

CAL'IDUCT, in antiquity, a pipe or canal disposed along the walls of a house for conveying heat from a furnace to the various apartments.

CAL'IGA, in antiquity, a sort of sandal worn by the Roman soldiers, whence *Caligula* derived his name. These *caliga* were sometimes adorned with gold and silver nails.

CALIGATION, dimness of sight, caused by an opacity of the anterior surface of the crystalline lens; or incipient cataract.

CAL'IN, a compound metal of lead and tin, of which the Chinese make tea-cannisters, &c.

CAL'IPHI, the chief sacerdotal dignity among the Saracens or Mahometans, vested with absolute authority in all matters relating both to religion and policy. It is at this day one of the Grand Signior's titles, as successor of the Prophet; and of the Sophi of Persia, as successor of Ali. The government of the original Caliphs continued from the death of Mahomet till the 655th year of the hegra.

CALK'ING, or **CAULK'ING**, the driving oakum or old ropes untwisted into the seams of a ship, to prevent their leaking or admitting water: after which they are covered with hot melted pitch or resin.—In painting, the covering of the back side of a design with red chalk, and tracing lines through on a waxed plate or wall, so as to leave an impression of the colour there.

CALK'INS, in farriery, the prominent parts at the extremities of a horse-shoe, bent downwards and forged to a sort of point.

CALL OF THE HOUSE, a parliamentary term implying an imperative call or summons, sent to every member on some particular occasion.

CALLIONYMUS, in the Linnean system of fishes, the various species of *Draconet*.

CALLISTIA, in Grecian antiquity, a Lesbian festival, at which the women presented themselves in Juno's temple, in order that the prize might be assigned to the fairest. There was a similar festival of

[CAL]

The Scientific and Literary Treasury ;

[CAM]

Ceres Eleusinia, among the Parthians, and another among the Eleans, where the most beautiful man was presented with a complete suit of armour, which he consecrated to Minerva, to whose temple he walked in procession, being accompanied by his friends, who adorned him with ribbons, and crowned him with a garland of myrtle.

CALLOSUM CORPUS, in anatomy, a medullary prominence in the brain, seen when separating the two lateral parts of the cerebrum.

CALUS, the new growth of osseous matter between the extremities of fractured bones, or any dense, insensible knob or horny substance on the skin.

CALODEN DRUM, a tree shrub, native of the Cape of Good Hope.

CALOMEL, in medicine, the submuriate of mercury, a preparation of mercury by sublimation or precipitation.

CALORIC, the principle or cause of heat, as distinguished from the sensation.

CALORIMETER, an instrument for measuring the heat given out by a body in cooling.

CALORIMOTOR, a galvanic instrument, in which the caloric effects are attended by scarcely any electrical power.

CALOTTE, a sort of skull cap worn by the French cavalry under their caps, as a guard against the blows of the sabre.

CALVINISM, the theological tenets of John Calvin, who, in the 16th century, flourished at Geneva, where his doctrines still subsist. The doctrinal parts of this system differ from that of other reformers of Calvin's period, chiefly in what regards the absolute decrees of God, by which, according to this teacher, the future and eternal condition of the human race was predetermined; in other words, Calvin denied the free agency of man, and maintained predestination.

CALUMNET, a symbolical instrument of great importance among the Indians of America. It is a smoking pipe, the bowl of which is generally made of a soft red marble, and the tube of a very long reed, ornamented with feathers. This instrument, the use of which bears a great resemblance to the caduceus of the Greeks, is a pledge of peace and good faith. The calumet of war, differently made, is used to proclaim war.

CALA, a kind of fine friable powder which remains of metals, minerals, &c., after they have undergone the violence of fire, and have lost all their humid parts. Iron being combined with oxygen, metallic calxes are heavier than the metal from which they are produced.

CALYCANTHEMA, the 17th practical Linnean order of plants, the corolla and stamina inserted in the calyx.

CALYCFLORE, the 16th Linnean natural order of plants, the stamina inserted in the calyx, as the wild olive, &c.

CALYCFORM, in botany, an epithet for the involucre when it has the appearance of a calyx.

CALYCISTÆ, an appellation given by Linneus to those botanists who have classed plants according to the different structure of the calyx or flower cup.

CALYCLE, in botany, a diminutive of calyx, a row of small leaflets placed at the base of the calyx on the outside.

CALYPTRA, in botany, a thin membranaceous involucre, or cowl, usually of a conic figure, which covers the parts of fructification. The capsules of most of the mosses have calyptrae.

CALYPTRANTHES, a genus of plants, class 12 *Icosandria*, order 1 *Monogynia*. The species are shrubs, natives of the East and West Indies.

CALYX, in botany, a term for the em-palement or flower-cup, or that part of a plant which surrounds and supports the other parts of the flower.

CAMBRIC, a species of fine white linen, made of flax, said to be named from Cambray, in Flanders, where it was first manufactured.

CAMBER-BEAM, in architecture, a beam cut hollow or archwise in the middle, commonly used in platforms.

CAMBERED, an epithet for the deck of a ship, the flooring of which is highest in the middle. also when it is defectively so, or what is sometimes called broken backed.

CAMEL, in zoology, a genus of quadrupeds, of the order of *pecora*, distinguished from the rest by having no horns. The dromedary or Arabian camel has one hump on the back, four callous protuberances on the fore legs, and two on the hind legs. The Bactrian camel has two humps on the back. By the camel's power of sustaining abstinence from drink for many days, and of subsisting on a few coarse shrubs, he is peculiarly fitted for the parched and barren lands of Asia and Africa. The Arabians chiefly subsist on the milk of their camels, and without them they could neither carry on trade, nor travel over their sandy deserts.

CAMELILIA, in botany, a genus of the *monadelphia-polyandria* class of plants. The flower consists of five ovated petals, connected vertically at the base, the fruit is a turbinate, lignose, and furrowed capsule, the seeds are numerous and small.

CAMELOPARD, or **GIRAFFE**. This animal, whose existence was at one time disputed, is a native of several parts of Africa, living in forests, and feeding on the leaves. This animal has two straight horns, without branches, six inches long, covered with hair, truncated at the end and tufted. The shoulders are of such a vast length, as to render the fore part of the animal much higher than the hind part. The neck is very long, the head slender and elegant, and the colour of the body a dusky white, with large rusty spots. It is mild and inoffensive, and, in cases of danger, has recourse to flight for safety, but when obliged to stand on self-defence, it kicks its adversary.

CAMELOPARDALIS, in astronomy, a constellation, consisting of 32 stars, situ-

THE SENSATION OF HEAT BEING OFTEN MISTAKEN FOR THE CAUSE, THE WORD "CALORIC" IS NOW USED TO DENOTE THE LATTER.

A CAMEL'S FOOTWEAR IS PERFECTLY NOBLELESS, ITS FEET BEING COMPOSED OF A SOFT ELASTIC SUBSTANCE, AND COVERED WITH HAIR.

[CAN]

ated between Cepheus, Perseus, Cassiopeia, Ursa Major and Minor, and Draco.

CAM'EO, or CAMA'IEU, a peculiar sort of onyx; also, a stone on which are formed various figures and representations of landscapes. The word is also applied to any gem on which figures may be engraved.

—The name of *camæen* is likewise given to such paintings as have but one colour, where the lights and shades are made on a ground of gold or azure.

CAME'RALISTICS, the science of finance or public revenue, comprehending the means of raising and disposing of it.

CAM'ERA LU'CIDA, an optical instrument, for the purpose of making the image of any object appear on the wall in a light room, either by day or night—Also, an instrument for drawing objects in true perspective.

CAM'ERA-OBSCU'RA, or dark chamber, an optical machine or apparatus, in which the light being collected, and thrown through a single aperture, external objects are exhibited distinctly, and in their native colours, on any white surface placed within the machine.

CAMISA'DE, a French term for attacking or surprising an enemy by night. It obtained the name from the soldiers wearing their shirts over their other clothes, that they might be known to each other.

CAM'LET, a sort of stuff originally made of camel's hair and silk mixed, but now of wool and silk.

CAMP, the residence of an army resting in tents; or, the place and order of tents for soldiers in the field. On the continent of Europe tents are abolished, and the armies bivouac in the open air, or, if the time will allow it, lodge in huts built of branches, &c. In short, in the progress of the military art, camps have become more slight and simple, even with those who still continue to make use of them.

CAMPA'IGN, the space of time during which an army is kept in the field. A campaign is usually from spring to autumn; but sometimes armies make a winter campaign.

CAMPANA'CEE, one of Linneus's natural order of flowers, including those that are bell-shaped, as the campanula, convolvulus, &c.

CAMPANOLO'GY, the art of casting bells, or of ringing them.

CAMPAN'ULA, or BELL FLOWER, a genus of plants, mostly perennials, and bearing a bell shaped flower. Several sorts of the campanula are natives of Britain.

CAMPAN'ULATE, or CAMPAN'IFORM, in botany, an epithet for the corolla, calyx, &c., when either are bell-shaped.

CAMP'HOR, a white concrete crystalline substance, of an acrid bitter taste and a penetrating smell. It is extracted from the *laurus camphora*, a large tree growing wild in Borneo, Sumatra, &c. To obtain camphor, the tree is cut down, and divided into pieces, and the camphor is taken out; it being found in small whitish flakes in and near the centre of the tree. It is then

repeatedly soaked, washed, and separated from all extraneous matter. Camphor is altogether volatile and inflammable, soluble in vinous spirits, oils, and mineral acids, but not in water, alkalies, or vegetable acids.—OIL OF CAMPHOR, an oil which is procured by the solution of camphor in nitric acid.

CAMP'HORATED, an epithet for any liquid mixed or impregnated with camphor. CAMP'HOROS'MA, a genus of plants, class 4 *Tetandria*, order 1 *Monogynia*; the species of which are mostly shrubs.

CAMP'TION, in botany, the *Agrostemma* of Linneus. The rose campion, or *Agrostemma Coronaria*, is a well-known garden flower.

CAMPUS MAIL, an anniversary assembly of our ancestors, held on May-day, when they confederated together for defence of the kingdom against all its enemies.

CAMPUS MARTIUS, among the Romans, a field, by the side of the Tiber, where the youth exercised themselves in warlike exercises. It was so called, on account of a temple that stood on it, consecrated to the god Mars. The consuls, Brutus and Collatinus, made it the place for holding the comitia or assemblies of people, and, in after times, it was adorned with a great quantity of fine statues.

CANADA BAL'SAM, a medicinal substance which is obtained from the *Pinus balsamea*.

CANAL, an artificial river, provided with locks and sluices, and sustained by banks and mounds.—In anatomy, a duct or passage in the body of an animal, through which any of the juices flow, or other substances pass.

CANA'RUM AUGU'RUM, in antiquity, a sacrifice among the Romans, of a red dog, for the purpose of appeasing the fury of the dog-star on the approach of harvest.

CANA'RY-BIRD, an elegant yellow singing bird much bred in England, brought originally from the Canary Islands, where it is of a white colour.

CANCELLA'RIA CU'RIA, in archæology, the court of Chancery.

CANCEL'LI, in architecture, trellis, or lattice-work, made of cross bars of wood or iron. Also, the balusters or rails encompassing the bar of a court of justice.

CANCER, in medicine, a hard ulcerous and exceedingly painful swelling, and generally seated in the glandulous parts of the body.—In astronomy, a constellation, and the fourth sign in the zodiac, which the sun enters on the twenty-first of June, thence called the summer solstice.

—CANCER, *tropic of*, a small circle of the sphere, parallel to the equator, and passing through the beginning of Cancer.

CANC'RITE, a fossil or petrified crab.

CANDELA'BRA, Numerous domestic utensils intended for the purpose of holding lights, received this name by the ancients, while every variety of form and the most costly materials were occasionally put in requisition to produce candelabra of ex-

AN OPTICAL INSTRUMENT CALLED THE "CAMERA LUCIDA" HAS BEEN INVENTED TO SUPPLY THE DEFICIENCIES OF THE "CAMERA OSCURA."

[CAN

quisite workmanship. But, with all their skill and labour, modern artists have greatly excelled them in lightness, grace, and utility.

CANDIDATE, a person who seeks or aspires to some public office. In the Roman commonwealth, the *CANDIDATI* were obliged to wear a white robe, during the two years of their soliciting for a place. This garment, according to Plutarch, they wore without any other clothes, that the people might not suspect they concealed money for purchasing votes; and also, that they might the more easily show to the people, the scars of those wounds they had received in fighting for the defence of the commonwealth.

CANDIDATI MILITES, an order of soldiers, among the Romans, who served as the emperor's body-guards, to defend him in battle. They were the tallest and strongest of the whole troops; and were called *candidati*, in consequence of being clothed in white.

CANDILL, a measure of capacity in India, by which a ship's burden is estimated as it is by tons in Europe. A candill is 500 cwt.

CANDLE-BERRY-TREE, the *Myrica Cerifera*, or wax-bearing myrtle; a shrub common in North America, from the berries of which a kind of wax or oil is produced of which candles are made.

CANDLEMAS DAY, the festival observed on the second of February, in commemoration of the purification of the Virgin Mary. It is borrowed from the practice of the ancient Christians, who on that day used an abundance of lights both in their churches and processions, in memory, as is supposed, of our Saviour's being on that day declared by Simeon "to be a light to lighten the Gentiles." In imitation of this custom, the Roman Catholics on this day consecrate all the tapers and candles which they use in their churches during the whole year.

CANDY, a preparation of sugar made by melting and crystalizing it several times.

CANDYTUFT, in botany, the *Iberis*, an annual that is cultivated in gardens, bearing a white or purple flower.

CANEPIORÆ, the noble Athenian virgins who carried the baskets at the festival of the Panathœna of Minerva.

CANEPHORIA, in Grecian antiquity, a ceremony which made part of a feast celebrated by the Athenian virgins, on the eve of their marriage day.—**CANEPHORIA** is also the name of a festival of Bacchus, celebrated particularly by the Athenians, on which the young virgins carried golden baskets full of fruit. The baskets were covered, to conceal the mystery from the uninitiated.

CANFARA, a sort of ordeal by fire, as it once existed in this kingdom. The accused carried hot irons in his hands; and if he came off unhurt, he was deemed innocent.

CANICA, a kind of wild cinnamon, resembling the clove in flavour.

CANICULAR DAYS, commonly called dog-days, a certain number of days preceding and ensuing the heliacal rising of the *canicula*, or the dog star, in the morning. The Ethiopians and Egyptians began their year at the rising of the dog star, reckoning to its rise again the next year, which is called the *annus canarius*.

CANINA'NA, in zoology, a species of serpent in America; so called because it may be treated as familiarly as a dog.

CANIS, a genus of quadrupeds, class *Mammalia*, order *Fera*. This genus comprehends animals that differ very essentially from each other in their habits, as the dog, the wolf, the fox, and the jackall. Our observations will only extend to the chief peculiarities of the dog, or *Canis familiaris*. They cultivate the society of men, and are but rarely found wild: they feed on flesh and farinaceous vegetables; they digest bones: they are extremely docile, affectionate, and vigilant in their intercourse with men: they have an aversion to strangers generally, and particularly beggars. They are capable of imitation and instruction, and in many instances seem endowed with a degree of intelligence more allied to human reason than to animal instinct.—**CANIS**, in astronomy, the name of two constellations in the southern hemisphere; namely, *Canis Major* and *Canis Minor*.

CANKER, a corroding disease which occurs frequently in fruit trees.—Also, a fungous excrescence in the feet of horses.

CANNEL-COAL, or **CANAL-COAL**, in mineralogy, the *Bitumen argillites* of Linnaeus; a hard, opaque, indammable jet-black fossil coal, which burns with a bright white flame, like a candle. It is sufficiently solid to be cut and polished, and is often, like jet, made into trinkets. In the fire it decrepitates and breaks into angular fragments, leaving a strong or sooty residuum.

CANNEQUIN, white cotton cloth brought from the East Indies, made in pieces of about eight ells long.

CANNON, a piece of ordnance, or a heavy metallic gun for a battery, mounted on a carriage. Guns of this kind are made of iron or brass, and of different sizes, carrying balls from three or four to forty-eight pounds weight. The explosion being directed by the tube, balls and missiles are carried to great distances with destructive force. In a field of battle they are often drawn by horses on light carriages, and are called field pieces, or flying artillery.

CANOE, (pron. *ca-noo'*) a small boat, made of the trunk of a tree, hollowed out by cutting or burning; and sometimes also of pieces of bark joined together. It is impelled by a paddle instead of an oar; and is used by the uncivilized nations in both hemispheres.

CANON, a law or ordinance of the church. The Canon Law consists of rules drawn from Scripture, from the writings of the ancient fathers, from the ordinances of councils, and the decrees of the pope.—Also a dignitary of the church. Originally,

CANDLES INCLUDING THREE DEGREES FROM THE FRIGIDIGUAL, REQUIRE NO SHUFFING, AND GIVE A UNIFORM LIGHT.

CANNERS IN TREES ARE CAUGHT BY A SUPERABUNDANCE OF SAP, WHICH FORCES ITS WAY THROUGH THE BARK, AND IS CHECKED BY SUDDEN COLD.

CAN]

A New Dictionary of the Belles Lettres.

[CAO

THERE ARE DIFFERENT KINDS OF CANONS; AS THE "CANONIA FIDARICA," AND THE "CANONIA PETERARCHA."

canons were only priests, or inferior ecclesiastics, who lived in community, residing near the cathedral church to assist the bishop, depending entirely on his will, supported by the revenues of his bishopric, and living in the same house as his domestics or counsellors, &c. By degrees, these communities of priests, shaking off their dependance, formed separate bodies; in time they freed themselves from their rules, and at length ceased to live in a community.—*Canon of Scripture*, is that body of books of the Holy Scripture which serves for a rule of faith and practice.—In modern music, a *canon* is a kind of perpetual fugue, in which the different parts, beginning one after another, repeat incessantly the same air.—In mathematics, it is used for a general rule for resolving all cases of a like nature in geometry, algebra, &c.

CANONICAL, in ecclesiastical polity, signifies, agreeable to the canons of the church; as, *canonical hours*, or hours prescribed by the canons for prayers.

CANONIZATION, an act of the Romish church, by which it takes upon itself to rank a deceased person among the catalogue of its saints; but the act is preceded by beatification, and by an examination into the life and "miracles" of the deceased.

CANONRY, or CANONSHIP, the benefice filled by a canon. It differs from a prebend, inasmuch as a prebend may subsist without the canonicate; whereas a canonicate is inseparable from a prebend: again, the rights of suffrages, and other privileges, are annexed to the canonicate, and not to the prebend.

CANO PUS, in astronomy, a star of the first magnitude in the rudder of Argo, a constellation of the southern hemisphere.

CANOPY, a magnificent covering raised over an altar, throne, chair of state, pulpit, &c. In figurative language the *sky* is called a canopy.

CANT, quaint or vulgar language, affected by particular persons or professions, and not authorized by established usage.

—In architecture, a term expressing the position of any piece of timber not standing square.—*Cant moulding*, a moulding with a bevelled surface applied to the capitals of columns.—*Cant-timbers*, in ship-building, those timbers which are situated at the two ends of a ship, and *canted* or raised obliquely from the keel.

CANTAB'LE, in music, a term applied to movements intended to be in a graceful and melodious style.

CANTANTE, in music, a term to denote the vocal part of the composition.

CANTATA, a song, or composition, intermixed with recitatives, airs, and different movements, chiefly intended for a single voice, with a thorough bass, though sometimes with other instruments.

CANTEEN', a public-house licensed in every barrack or fort to sell liquors. Also, a semi-cylindrical tin-case, carried over a soldier's knapsack, to carry his cooked victuals in.

CANTHARIDES, in medicine, (the *Cantharis Vesicatoria*, or Spanish fly), are insects of the scarabæus, or beetle-kind: they are usually about half an inch in length, of a fine shining gold and green colour, but of a fetid smell. When bruised, they are universally used as a vesicatory, or blistering plaster. Taken internally, they act as the most energetic acid poison; and though in some disorders this medicine is taken in small doses, as a powerful stimulant, its use requires the greatest caution on the part of the physician.

CANTHARIDIN, that peculiar substance existing in the cantharides, which causes vesication.

CANTHABUS, in antiquity, a tankard sacred to Bacchus.

CANTHI, in anatomy, cavities at the extremities of the eye-lids, commonly called the corners of the eye: the internal or greater canthus is next the nose; the external or lesser canthus near the temple.

CANTICÆ, ancient dramatic soliloquies, supposed to have been introduced as interludes.

CANTICLES, the Song of Songs, in the Bible, supposed to be a marriage song written by Solomon; to be explained by compositions of a similar nature in Eastern countries. By other writers it is supposed to be a series of sacred idylls, each distinct and independent of the other.

CANTILE'NA, in music, the treble melody, or upper part of any composition.

CANTO, a part or division of a poem, answering to what in prose is called a book. In Italian, *canto* is a song; and it signifies also the first treble, or highest vocal part.

CANTON, a small division; hence, in heraldry, a small square, separated from the rest of the coat, is called a *canton*.—In military affairs, troops billeted into different quarters or divisions, are said to go into *cantonments*.—In geography, a small district of territory, constituting a distinct state or government, as the cantons in Switzerland.

CANTONED, in architecture, is when the corner of a building is adorned with a pilaster, an angular column, rustic quoins, or anything that projects beyond the level of a wall.

CANVAS, a coarse sort of cloth, of which there are several kinds. Among others, are 1. That worked regularly in little squares as a basis for tapestry: 2. That which is called buckram: 3. The cloth used for pictures: And, 4. That employed for sails of ships, tents, &c.

CANZONE, or CANZONA, in music, a song or air in two or three parts, with passages of fugue and imitation; but it is sometimes used for a kind of lyric poem, in Italian, to which music may be composed in the style of a cantata.

CANZONET', in music, a short song, in one or two parts.

CAOPO'IBA, in botany, a Brazilian tree, growing to the height and shape of a beech.

THE FIDARIC CANONS ARE DIVIDED INTO STROPHES, ANTI-STROPHES, AND REFRENS, AND ARE CALLED "CANONIA ALLA GRECA."

[CAP]

The Scientific and Literary Treasury ;

[CAP]

BE THE INDIANS, "CAOUTCHOUC" IS MADE INTO WATER-PROOF BOOTS, WHICHE, WHEN SMOKEED, HAVE THE APPEARANCE OF SHAKERS.

CAOUCHOUC, or **CAOUTCHOUC**, (pron. *coe-chook*) improperly called *elastic gum*, and more commonly *India rubber*, is obtained from the milky juice of several plants and trees, particularly from the syringe tree of Cayenne. Its elasticity is such that it can be stretched to a great extent, and its pliancy is increased by heat. From its softness, elasticity, and impermeability to water, it is used in the manufacture of many articles; and since it is easily dissolved by the purified naphtha from coal tar, which forms a cheap and effectual solvent, and does not change its properties, the solution has been most extensively employed to give a thin covering to cloth, so as to render it impervious to moisture. It is also used for over-shoes, and when dissolved in oils forms a flexible varnish. Caouchouc is principally obtained from South America, and usually brought to Europe in the form of pear-shaped bottles, which are formed by spreading the juice over a mould of clay, then drying by exposure to the sun, or to the smoke of burning fuel: after which it is ornamented on the outside, and the clay in the inside is moistened with water, and picked out.

CAP, a part of dress made to cover the head. The use of caps and hats is referred to the year 1449, the first seen in Europe, being at the entry of Charles VII. into Rouen: from that time they began to take place of hoods or chaperons.—**CAR**, in architecture, the uppermost part of any assemblage of principal or subordinate parts.—In ship-building, **cap** is a square piece of timber, placed over the head or upper end of a mast.—In botany, the *pileus*, or top of the fungus, generally shaped like a plate or bonnet.—*Cap of maintenance*, one of the ornaments of state, carried before the kings of England at the coronation. It is of crimson velvet, faced with ermine. It is also frequently met with above the helmet, instead of wreaths, under gentlemen's crests.—*Cap-a-pie*, (French) from head to foot.

CAPA CITY, in a general sense, means the power of containing or holding.—In geometry, the solid contents of a body.—In chemistry, that state, quality, or constitution of bodies, by which they absorb and contain, or render latent, any fluid; as the *capacity* of water for caloric.

CAPE, in geography, a promontory or headland projecting into the sea farther than the rest of the coast, as the Cape of Good Hope, Cape St. Vincent, &c.

CAPER, the bud of the caper-bush, much used for pickling. It grows in many parts of the south of Europe.

CAPET, the name of the French race of kings, which has given 118 sovereigns to Europe, viz., 36 kings of France, 22 kings of Portugal, 5 of Spain, 11 of Naples and Sicily, 3 of Hungary, 3 emperors of Constantinople, 3 kings of Navarre, 17 dukes of Burgundy, 12 dukes of Brittany, 3 dukes of Lorraine, and 4 dukes of Parma.

CAP'IAS, in law, a writ of two sorts: one before judgment, to take the defendant ;

the other after, which is called the writ of execution.

CAPILLARY, in a general sense, an epithet given to things on account of their extreme fineness, or resemblance to hair.—*Capillary Ores*, in mineralogy, the same with those otherwise denominated arborescent, or striated.—*Capillary Plants* are such plants as have no main stem, but whose leaves arise from the root, upon pedicles, and produce their seeds on the back of their leaves, as the fern, maiden-hair, &c.—*Capillary Tubes*, tubes of hair-like fineness, in which fluids ascend, owing to the pressure of the atmosphere being intercepted within the tube, by its sides, and being complete and unintercepted on the outside of the tube.—*Capillary Vessels*, in anatomy, the smallest and extreme parts of the minutest ramifications of the veins and arteries.

CAPILLA'IRE, a kind of syrup, extracted from maiden-hair.

CAPIL'LAMENT, in botany, a fine filament, like a hair, that grows in the middle of a flower, with a little knob at the top.

CAPITAL, in commerce, the fund or stock, in money and goods, of a merchant, manufacturer, &c., or of a trading company.

—A *floating capital* is that which remains after payment is made for all the apparatus and implements of the business.—*Fictitious capital* generally means nothing more or less than excessive credits, which throw the management and disposition of a great deal of property into the hands of persons who are not able to answer for the risks of loss from its bad management, or other causes.—**CAPITAL**, in architecture, the uppermost part of a column or pilaster, serving as the head or crowning, and placed immediately over the shaft, and under the entablature.—**CAPITAL**, in geography, the metropolis, or chief city or town of an empire, kingdom, state, or province.

CAPITAL PUNISHMENT. No subject has been more discussed, particularly of late years, than that by which the *right* and the *expediency*, assumed by governments, to inflict the penalty of death for offences against the safety and good order of society, is questioned; nor is there any subject whatever, perhaps, more deserving of the calm and dispassionate examination of philosophers and jurists. It has been ably, and, as we think, justly argued, that when the right of society is once admitted to punish for offences, it seems difficult to assign any limits to the exercise of that right, short of what the exigencies of society require. No government has the right to punish cruelly and wantonly: but still the discretion must be vested somewhere, to say what shall be the degree of punishment to be assigned to a particular offence. That discretion must be, from its nature, justly a part of the legislative power, and to be exercised according to the actual state of society. The very frequency of a crime must often furnish a very strong ground for severe punishment, not only as it furnishes proof that the present punish-

CREDIT GIVEN TO INDUSTRY AND ENTERPRIZE PRODUCES CAPITAL, AND CAPITAL IS THE TRUE AND VALID REPRESENTATIVE OF PROPERTY.

[CAP]

A New Dictionary of the Belles Lettres.

[CAP]

ment is insufficient to deter men from committing it, but from the increased necessity of protecting society against dangerous crimes. The right of government to inflict the punishment of death has been doubted by some distinguished persons; and the doubt is often the accompaniment of a highly cultivated mind, inclined to the indulgence of a romantic sensibility, and believing in human perfectibility. It is often said, that as life is the gift of God, it cannot be justly taken away, by human laws. True; life is the gift of God; but are not our personal endowments also the gift of God? has He not given man a right to personal liberty and locomotion—a right to eat and drink and breathe at large, as well as to exist?—yet no one doubts that, by way of punishment, he may be confined in a solitary cell; that he may be perpetually imprisoned or deprived of free air, or compelled to live on bread and water. But the expediency of capital punishment offers indeed a wide field for discussion. What may be strictly just, may not always be expedient; and a wise legislature will be slow in visiting with capital punishment any crimes but such as are in a high degree atrocious and dangerous to society, and which cannot otherwise be effectually guarded against. The bloodiest codes are not those which have most effectually suppressed offences; nay, men sometimes are hardened by the frequent spectacles of capital punishments, and in some degree grow indifferent to them; besides, no society can lawfully exercise the power of punishing, beyond what the just exigencies of that society require. On the other hand, a total abolition of capital punishments would, in some cases at least, expose society to the chances of deep and vital injuries. On a deliberate consideration of the subject, and on reference to the experience of most nations, it will probably be found, that capital punishment ought not wholly to be dispensed with; but that for any offences which are not of enormous magnitude, there exists no necessity or expediency for applying so great a severity. Much, however, must still depend upon the opinion and character of the age, the prevailing habits of the people, and upon the sound exercise of legislative discretion. In former times every species of torture was occasionally resorted to; burning the criminal at the stake, quartering him alive, breaking his limbs upon the wheel, crucifixion, exposure to the fury of wild beasts, and other savage punishments, were common in offences of an atrocious character, and more especially for those of a treasonable kind; but it is now allowed in nearly every civilized country, that the simple infliction of death is sufficient for the vengeance of the law, be the crime what it may. But upon the question whether executions ought to be in public or in private, a great diversity of opinion still exists. That public spectacles of this sort have a tendency to brutalize and harden the people—and that the courage and firmness with

which the criminal often meets death, have a tendency to awaken feelings of sympathy, and to take away much of the horror of the offence, as well as of the punishment—may certainly be true. Yet, that such spectacles are the only means to bring home to the mass of the people a salutary dread and warning, may be true likewise. To which we ought to add, that if punishments were inflicted in private, it could never be known whether they were justly and properly inflicted upon the persons condemned; neither, indeed, could we be sure that innocent persons might not become the victims. Be this however as it may, we cannot but feel rejoiced that the dictates of humanity have lately triumphed over the barbarous relics of an undue severity: and that, to the credit of the age we live in, executions are far less frequent than they were; capital punishment for many kinds of felony, which a few years ago disgraced our criminal code, has at length been obliterated, and punishments of a milder nature substituted for it.

CAPITALIST, a man of large property, which either is or may be employed in trade.

CAPITATE, in botany, an epithet for a stigma which grows in the form of a hemisphere; and for a whorl, when the flowers stand so thick as to form a hemisphere.

CAPITATION, a tax or imposition raised on each person in consideration of his labour, industry, office, rank, &c. It is a very ancient kind of tribute, and answers to what the Latins called *tributum*, by which taxes on persons are distinguished from taxes on merchandise, called *vectigalia*.

CAPITE, in law, a sort of ancient tenure, whereby a man held lands of the crown, by knight's service or in socage.

CAPITO ANADROMUS, in ichthyology, a fish of the cod kind, living both in rivers and seas; so called on account of its great head.

CAPITOL, a castle, in ancient Rome, on the Mons Capitolinus, where there was a temple dedicated to Jupiter, in which the senate assembled; and on the same spot is still the city-hall or town-house, where the conservators of the Roman people hold their meetings. The foundations of the capitol were laid by Tarquin the elder, in the year of Rome 139: his successor Servius razed the walls, and Tarquin the Proud finished it in 221; but it was not consecrated till the third year after the expulsion of the kings, and establishment of the consulate. The capitol consisted of three parts, a nave, sacred to Jupiter; and two wings, the one consecrated to Juno, and the other to Minerva: it was ascended by stairs; the frontispiece and sides were surrounded with galleries, in which those who were honoured with triumphs entertained the senate at a magnificent banquet, after the sacrifices had been offered to the gods. Both the inside and outside were enriched with numerous ornaments, the most distinguished of which was the statue of Jupiter, with his golden thunder-bolt, sceptre, and crown.

THE PRESERVE CAPITOL AT ROME (CAPITOGLIO), STANDING PARTLY ON THE SITE OF THE OLD ONE, WAS BUILT FROM A DESIGN OF MICHAEL ANGEL.

THE "CAPITE CENSI" WERE THE LOWEST CLASS OF ROMAN CITIZENS, WHO, HAVING NO PROPERTY, WERE COUNTED BY THEIR HEADS.

CAP]

The Scientific and Literary Treasury ;

[CAP

In the capitol also were a temple to Jupiter the guardian, and another to Juno; with the mint; and on the descent of the hill was the temple of Concord. This beautiful edifice contained the most sacred deposits of religion, such as the ancyli, the books of the sybils, &c.

CAPITOLINE GAMES. These were annual games instituted by Camillus, in honour of Jupiter Capitolinus, and in commemoration of the preservation of the capitol from the Gauls. There was also another kind of Capitoline games, instituted by Domitian, and celebrated every five years, at which rewards and crowns were bestowed on the poets, champions, orators, historians, &c.

CAPITULA RURALIA, assemblies or chapters held by rural deans and parochial clergy within the precinct of every distinct deanery.

CAPITULARY, the body of laws or statutes of a chapter, or of an ecclesiastical council.

CAPITULATION, in military affairs, a treaty made between the garrison of a place besieged and the besiegers, for surrendering on certain conditions. The term is also applicable to troops in any situation in which they are compelled to submit to a victorious enemy.

CAPITULUM, in antiquity, a transverse beam in the military engines of the ancients, wherein were holes for the strings with which they were set in motion.—In botany, **CAPITULUM** denotes a mode of inflorescence, when several flowers form a kind of head or ball.—In anatomy, it means a small head, or protuberance of a bone inserted into the concavity of another.

CAPIVI, a tree of Brazil, the flower of which resembles a rose. It grows to a great height, and yields the *balsam of capivi*.

CAPNIA, in mineralogy, a kind of jasper, of a smoky colour.—In botany, a vine which produces part white and part black grapes.

CAPONNIERE, in fortification, a covered lodgment placed in the glacis, at the extremity of the counterscarp; and in dry moats, with embrasures or loop-holes through which the soldiers may fire.

CAPOTE, a large great coat, with a hood or cowl, which is sometimes worn by sentinels in bad weather.

CAPPARIS, the *CAPER-BUSH*, a shrub, the trunk and fruit of which, when pickled, are eaten. It is also used in medicine.

CAPRA, the *GOAT*, in zoology, constitutes a genus of quadrupeds, of the order *pecora*, distinguished from the other genera of this order, by their hollow, rough, and erect horns, which bend a little backwards. Of this genus authors enumerate a great many species, as the common goat; the *rupicapra*, or chamois-goat; the *ibex*; the *gazelle*; and several others.

CAPRE SALTANTES, in meteorology, exhalations or fiery meteors which sometimes appear in the atmosphere, assuming various irregular shapes.

CAPREOLATE, in botany, having tendrils, or filiform spiral claspers, by which plants fasten themselves to other bodies, as in vines, peas, &c.

CAPREOLUS, in anatomy, the helix of the ear.—In botany, the clasp or tendril of a vine or other plant.

CAPRICCIO, in music, the term for that irregular kind of composition in which the composer, without any restraint, follows the bent of his humour.—**CAPRICCIO** so denotes that the movement before which it is written, is to be played in a free and fantastic style.

CAPRICORN, in astronomy, a southern constellation, and one of the twelve signs of the zodiac, which the sun enters on the 21st of December. *Tropic of Capricorn*, a small circle of the sphere, parallel to the equinoctial, passing through the beginning of Capricorn or the winter solstice, which is the sun's greatest southern declination, namely 23 degrees and a half.

CAPRIFICATION, a method used in the Levant for ripening the fruit of the domestic fig tree, by means of insects bred in that of the wild fig tree. The caprification of the ancient Greeks and Romans corresponds in every circumstance with what is practised at this day in the Archipelago, and in Italy. These all agree in declaring that the wild fig tree, *capryfwa*, never ripened its fruit; but was absolutely necessary for ripening that of the garden or domestic fig tree, over which husbandmen suspend its branches.

CAPRIOLLES, in horsemanship, are those leaps which a horse makes in the same place without advancing, in such a manner that when he is at the height of the leap, he jerks out with his hind legs.

CAPRICUM, a plant, native of South America, the fruit of which is a pod, and the strongest kind of pepper, known by the name of Cayenne Pepper.

CAPSTAN, in a ship, a strong massy column of timber, of the nature of a windlass, placed behind the mainmast, used for weighing, or raising up anchors, or any other purpose in which great power is required.

CAPSULA, in chemistry, a sort of earthen pan, in which things are put that are to undergo a violent operation by fire.

CAPSULARES ARTERIÆ, in anatomy, the arteries of the renal glands; so called because they are enclosed by a capsule.

CAPSULATED, in botany, enclosed in anything, as a walnut in its green husk.

CAPSULE, the seed-vessel of a plant; it is composed of several elastic valves, which usually burst open at the points when the seeds are ripe; it differs from a pod, in being roundish and short.

CAPTAIN, in the army, the commander of a company of foot or a troop of horse; and in the naval or merchant service, the commander of a vessel.—A *Captain-lieutenant* is an officer, who, with the rank of captain and pay of lieutenant, commands a company or troop.—A *Post-captain* in the British navy, is an officer commanding any

"CAPITULARIES" WERE GENERALLY PROMULGATED IN PUBLIC ASSEMBLIES, COMPOSED OF THE SOVEREIGN AND THE CHIEF MEN OF THE NATION.

THE WORD "CAPTAIN" ORIGINALLY DENOTED A CHIEF OR GOVERNOR, BUT IN THE COURSE OF TIME IT HAS LOST MUCH OF ITS DIGNITY.

[CAR]

A New Dictionary of the Welles Letters.

[CAR

THE WATER OF SPRINGS IMPREGNATED WITH A LARGE PORTION OF "CARBONATE OF LIME" HAS A STRONG PRESTIGIOUS QUALITY.

man-of-war, from a ship of the line down to a ship-rigged sloop.—A man eminently skilled in war or military affairs is styled a "great captain," as the Duke of Wellington.

CAPTION, in law, the act of taking any person by any judicial process.

CAPUCHIN'S, an order of Franciscan friars in the Romish church, so called from their capuche or hood sewed to their habits, and hanging down their backs.

CAP'ULA, in antiquity, a wooden utensil with two handles for taking oil out of one vessel into another. The person who did this office was called the *capulator*.

CAPUT, in anatomy, the HEAD, which is divided into the skull, *cranium*, and the face, *facies*. The skull consists of the crown, or *vertex*; the posterior part, or *occiput*; the anterior part or *sinciput*; and the temples, or *tempora*.—CAPUT OBSTURUM, a dry neck, which is generally a spasmodic disorder.

CAP'UT MORTUUM, in chemistry, the inert residuum of any body, remaining after all the volatile and humid parts have been extracted.

CARABINE, or CAR'BINE, a short gun used by the cavalry.

CARACARA, in ornithology, a Brazilian species of *falco*, the back of which is of a pale brown colour, variegated with spots of white and yellow. It is one of the most beautiful of the hawk kind, and about the size of a tame pigeon.

CARACOLE, the half wheel which a horseman makes, either to the right or left. The cavalry make a caracole after each discharge, in order to pass to the rear of the squadron.

CARACOLY, a mixture of gold, silver, and copper, of which are made rings and other ornaments, for bartering with savage tribes.

CAR'AGROUGH, a Turkish silver coin, weighing nine drachms.

CARAHUATA, in botany, the *Bromelia acaua*, or aloe of Brazil, the concreted juice of which is supposed to be ambergris.

CARAITES, a sect among the Jews who adhere closely to the text and letter of the scriptures, rejecting the rabbinical interpretations and the cabala.

CARAMBOLA, in botany, *Malus Indica*, a tree growing in the East Indies which bears fruit thrice a year.

CARAMEL, sugar refined by repeated boiling. Also, ornaments made of sugar.

CARAN'NA, the gum or resin of the caranna tree, growing in South America.

CARAPACE, the shell of the turtle or tortoise.

CARAT, or CAR'ACT, the standard weight by which the fineness of gold is distinguished. If the gold be so fine that, in purifying, it loses nothing, or but very little, it is said to be gold of 24 carats; if it lose one carat, it is said to be gold of 23 carats.—CARAT, in weighing diamonds, &c., a weight of four grains.

CARAVAN, in the East, a company of travellers, and more particularly of merchants, who for their greater security, pro-

ceed in a body through the deserts of Arabia, or other region infested with robbers. Such a company often have more than a thousand camels to carry their baggage and goods; and as they walk in single file, the line is often a mile long. Proper officers are appointed to regulate every thing during their march, the chief of whom has the title of *Caravan-Bashi*.

CARAVAN'SERA, or CARAVAN'BERY, a large building or inn for the reception of travellers and the caravans. The building commonly forms a square, in the middle of which is a spacious court, and under the arches or passages that surround it, there runs a bank, raised some feet above the ground, where the merchants and travellers take up their lodgings, the beasts of burden being tied to the foot of the bank. In the upper part, there are generally private apartments, the use of which is costly. In many of them, however, the hospitality is gratuitous, it being by no means uncommon for a pious Mussulman to establish, during his life or by will, one or more of these caravanseries.

CARAWAY, a plant of the genus *Carum*, the seeds of which have an aromatic smell and a warm pungent taste. They are used in cakes, &c., and distilled with spirituous liquors.

CARBON, the pure or essential part of charcoal. Though this substance abounds throughout the vegetable kingdom, and is also contained in animal and even mineral bodies, yet it is very rarely to be met with in a state of absolute purity. It is indeed remarkable, and would be almost incredible if the results of modern chemistry did not render it indisputable, that the most valuable of all the gems, the diamond, is nothing but pure crystallized carbon. For many ages the diamond was considered as incombustible; and Newton was the first person who conjectured, from its great refractive power, that it was capable of combustion. By the union of carbon with oxygen, it produces two gaseous substances, the first of which was formerly called fixed air, now called carbonic acid; and the second, containing less oxygen, the oxide of carbon.

CARBONATE, in chemistry, a compound formed by the combination of carbonic acid with different bases, as carbonate of copper, carbonate of lime, &c.

CARBONIC ACID, in chemistry, a colourless, inodorous, elastic fluid, being a compound of carbon and oxygen in its gaseous state, called fixed air, or *carbonic acid gas*. It is one and a half times heavier than atmospheric air, and will, therefore, neither support animal life nor combustion. It is the gas which is generated by fermentative processes, and which so often proves destructive to persons who inhale it in mines, wells, or very confined apartments. All kinds of spring and well-water contain carbonic acid, which they absorb from the atmosphere, and to which they are partly indebted for their agreeable flavour; but the water which contains carbonic acid is

A CARBON OR LAMP SMOKE, IN CONSEQUENCE OF ITS NOT PRODUCING HEAT ENOUGH TO EFFECT THE TOTAL COMBUSTION OF THE "CARBON."

[CAR]

The Scientific and Literary Treasury ;

[CAR]

wholly deprived of it by boiling.—*Carbonous acid*, is carbon not fully saturated with oxygen.

CAR'HUNCLE, in surgery, an inflammatory tumour, or painful gangrenous boil, which being seated deeply, in parts provided with cellular membrane, does not soon discover its whole dimensions, nor the ill-digested matter it contains.—It is also the name of a very beautiful gem, of a deep red or scarlet colour, known to the ancients as the *anthrax*. When held up against the sun, it loses its deep tinge, and becomes exactly of the colour of burning charcoal, whence the propriety of the name they gave it. It has, however, been supposed by some modern mineralogists that the carbuncle of the ancients was garnet.

CARBUNCLE, in heraldry, a charge or bearing, consisting of eight radii, four of which make a common cross, and the other four a saltire.

CARBUNCULATION, the blasting of the young buds of trees or plants, by excessive heat or cold.

CARBURET, in chemistry, a substance formed by the combination of carbon with metals, earth, or alkali.

CARBURETTED HYDROGEN GAS, a substance formed of hydrogen and carbon, which on being duly excited, fires oxygen, and radiates light and heat, as in gas lights, and all other lights. The gas which is known by the name of the *fre-damp* among miners is pure carburetted hydrogen.

CARCANET, in archeology, a chain for the neck.

CAR'CASS, the body of a dead animal, especially a brute: that of the human species being called a *corpsae*.—**CARCASS**, in building, the shell or timber work of a house before it is lathed and plastered or the floors laid.—In gunnery, an iron case or hollow vessel, of an oval figure, filled with combustible and other substances, to be thrown from a mortar into a town, to set fire to buildings. It has two or three apertures from which the fire blazes, and the light sometimes serves as a direction in throwing shells. It is furnished with pistol barrels, loaded with powder to the muzzle, which explode as the composition burns down to them.

CARCE'RES, in the ancient Circensian games, were inclosures in the circus, where, in the horses were restrained till the signal was given for starting, when, by an ingenious contrivance they all at once flew open.

CARCINO'MA, in medicine, a cancer; also, a turpescence of the veins of the eye.

CARDAMINE, in botany, a genus of plants in the Linnean system, class 1 *Tetradynamia*, order 2 *Silicquosa*.

CARDAMOM, a perennial plant growing in the East Indies. The seeds are of an aromatic and pungent flavour, and are used as a stimulant.

CARDIALGY, sometimes called the *cardiac passion*, is the heart-burn, a violent sensation of heat and acrimony in the

left orifice of the stomach, seemingly at the heart, but rising into the œsophagus.

CARDINAL, which in a general sense signifies principal or pre-eminent, is formed of the Latin word *cardo*, a hinge, agreeably with the common expression, in which it is said of an important matter that every thing *turns* upon it: thus Justice, Prudence, Temperance, and Fortitude are called the *four cardinal virtues*.—The *cardinal signs*, in astronomy, are Aries, Libra, Cancer, and Capricorn.—The *cardinal points* of the compass, north, south, east, and west.—*Cardinal numbers*, in grammar, are the numbers, one, two, three, &c., which are indeclinable, in opposition to the ordinal numbers, first, second, third, &c.

CARDINAL, in the Roman hierarchy, an ecclesiastical prince and subordinate magistrate, who has a voice in the conclave at the election of a pope, and who may be advanced to that dignity himself. The dress of a cardinal is a red soutanne, a rocket, a short purple mantle, and a red hat; and his title of address, "His eminence."

CARDINAL-FLOWER, a plant of the genus *Lobelia*, of many species. They are fibrous-rooted perennials, from two to five or six feet high, with erect stalks, ornamented with spear-shaped leaves, and spikes of beautiful monopetalous flowers of scarlet, blue, and violet colours.

CARDING-MACHINE, an instrument of modern invention for combing, breaking, and cleansing wool and cotton. It consists of cylinders, thick set with teeth, and put in motion by the force of water, steam, &c.

CARDIOID, in mathematics, an algebraic curve, so called from its resemblance to a heart.

CARDITE, a fossil or petrified shell, of the genus *cardium*.

CARDS, pieces of pasteboard, of an oblong shape, painted or, rather, printed, of various figures, made into packs of 52 in number, and used by way of amusement in different games. They are divided into four kinds, viz. diamonds, hearts, clubs, and spades, and thirteen of each kind, so that an infinite variety of combinations may be formed with them, and games of chance thereby rendered highly interesting.

CAREENING, in sea language, the bringing a ship to lie down on one side, in order to trim and caulk the other.

CAR'GO, the goods, merchandize, and effects which are laden on board a ship, exclusive of the crew, rigging, ammunition, provisions, guns, &c. The lading within the hold is called the *inboard cargo*, in distinction from horses, cattle, &c., carried on deck.

CAR'GOOSE, a fowl belonging to the genus *Columbus*, called the Crested Diver.

CARIBOO, in zoology, a quadruped of the stag kind.

CAR'ICA, in botany, the Papau, a tree bearing a fleshy fruit of the size of a small melon.

CARICOUS, in medicine, an epithet given to tumours resembling a fig.

THE "CARBONIC ACID" IN THE ATMOSPHERE IS GREATER DURING THE DAY IN TOWN THAN IN THE COUNTRY, AND AT NIGHT THE REVERSE.

AS "CARBONIC ACID" IS ALWAYS PRODUCED BY THE RESPIRATION OF ANIMALS, CROWDED ASSEMBLIES ARE PREJUDICIAL TO HEALTH.

[CAR]

[CAR]

CARBILLONS, a species of chimes frequent in the Low Countries, particularly at Ghent and Antwerp, and played on a number of bells in a belfry, forming a complete series or scale of tones or semitones, like those of the harpsichord and organ.

CARINATED, in botany, shaped like the keel of a ship; applied to a calyx, leaf, or nectary.

CARLINE, a piece of timber in a ship, ranging fore and aft, from one deck beam to another, directly over the keel, and serving as a foundation for the body of the ship.

—*Carline knees* are timbers lying across from the sides to the hatchway, and serving to sustain the deck.

CARLOCK, a kind of isinglass obtained from Russia, made of the sturgeon's bladder, and used in clarifying wine.

CARMEITES, an order of mendicant friars, very numerous in Italy and Spain. They wear a scapulary, or small woollen habit, of a brown colour, thrown over the shoulders.

CARMEN, a Latin term, used, in a general sense, to signify a verse; but in a more peculiar sense, to signify a spell, charm, form of expiation, execration, &c., couched in few words, placed in a mystic order, on which its efficacy was supposed to depend.

CARMINATIVES, medicines which expel wind, promote perspiration, and are anti-spasmodic.

CARMINE, a pigment or powder of a deep red or crimson colour, procured from cochineal, and used for painting in miniature.

CARNATION, a beautiful sort of clove pink, having its bright colours equally marked all over the flowers.—In painting, flesh colour.

CARNELIAN, a precious stone, either red, flesh-colour, or white. The finest carnelians are those of the East Indies; there are some beautiful ones in the rivers of Silesia and Bohemia; and some of a quality not to be despised in Britain. The use to which they are most generally applied is that of seals.

CARNIVAL, the feast or season of rejoicing previous to Lent, celebrated with great spirit throughout Italy, when feasts, balls, operas, concerts, masquerades, &c., abound. The churches are filled with choirs, and the streets with masks. This festival flourishes more particularly at Venice, where it begins on the second holiday in Christmas, and where it boasts to have had at one time seven sovereign princes and thirty thousand foreigners among its votaries.

CARNIVOROUS, an epithet applied to animals that feed on flesh.

CAROT-TREE, the *Cerotonia Siliqua*, a native of Spain, Italy, and the Levant. It is an evergreen, growing in the hedges, and produces long, flat, brown-coloured pods, filled with a mealy succulent pulp, of a sweetish taste. Though not accounted very wholesome, these pods are often eaten by the poorer classes in times of scarcity.

CAROLITIC COLUMNS, in architec-

ture, columns with foliated shafts, decorated with leaves, and branches winding spirally around them, or forming crowns and festoons.

CAROLUS, a gold coin struck in the reign of Charles I. at that time valued at twenty shillings, but afterwards current at twenty-three.

CAROTID ARTERIES, in anatomy, two arteries in the neck, which convey the blood from the aorta to the brain.

CARP, in ichthyology, a species of Cyprinus, an excellent fish for ponds. These fishes breed rapidly, grow to a large size, and live to a great age.

CARPASUS, in botany, a highly poisonous herb, resembling myrrh.

CARPATICUM, in medicine, a name for the fine essential oil distilled from the fresh cones of firs, &c.

CARPENTRY, the art of cutting, framing, and joining timber, in the construction of buildings: it is subservient to architecture, and is divided into *house-carpentry* and *sh'p-carpentry*.

CARPENTER'S RULE, a tool generally used in taking dimensions, and casting up the contents of timber and the artificer's work.

CARPE'SIUM, a genus of plants in the Linnæan system, class 19 *Syngenesia*, order 2 *Polygamia superflua*; one of the species of which is the well-known chrysanthemum.

CARPET, a sort of stuff wrought either with the needle or the loom, and used as a covering for the floor. Persian and Turkish carpets are the most costly; but a variety of other kinds are used, many of which are both elegant and durable.

CARTOLITE, petrified fruits, the most remarkable of which are nuts converted into alex.

CARPUS, in anatomy, the wrist.

CARRACK, a large armed vessel employed by the Portuguese in the East India and Brazilian trade.

CARRAGO, in the military art of the ancients, a barricade, made by carts and wagons, which the Gauls and other barbarous nations put in the way to impede the progress of an enemy.

CARRARA, a hard white kind of marble, somewhat resembling the Parian; so called from the town of Carrara, where it was found.

CARRICK-BITTS, in a ship, the bitts which support the windlass.—**CARRICK-BEND**, a particular kind of knot.

CARRONA'DE, a short piece of ordnance, having a large caliber, and a chamber for the powder, like a mortar.

CARBU'CA, in antiquity, a splendid kind of chariot, or car on four wheels, which were made of brass, ivory, silver, and sometimes of gold.

CARTE-BLANCHE, a blank paper, signed at the bottom with a person's name, and given to another person with permission to fill it up as he pleases; applied generally in the sense of unlimited terms being granted.

THE "CARNIVAL" IS EVIDENTLY NOTHING BUT THE SATURNALIA OF THE CHRISTIAN ROMANS, WHO COULD NOT FORGET THEIR PAGAN FESTIVALS.

IN CARPET-WEAVING, THE WOOL PASSES THROUGH SEVENTEEN PROCESSES, OR SETS OF HANDS, TO PRODUCE THE WARE.

[CAR]

The Scientific and Literary Treasury;

[CAS]

CARTE, in fencing, a thrust with a sword at the inside of the upper part of the body.

CARTEL, an agreement between two states for the exchange of their prisoners of war.—A *cartel-ship*, a ship commissioned in time of war to exchange the prisoners of any two hostile powers, also to carry any particular request from one power to another. The officer who commands her is ordered to carry no cargo, ammunition, or implements of war, except a gun for the purpose of firing signals.

CARTESIANS, those who adhere to the opinions of Des Cartes. This philosopher has laid down two principles, the one metaphysical, the other physical. The metaphysical proposition is this, "I think, therefore I am" the physical one, "Nothing exists but substance." Substance he makes of two kinds, the one a substance that thinks, the other a substance extended, whence actual thought and actual extension are the essence of substance.

CARTHAGINIAN, a native of ancient Carthage, or something pertaining to that celebrated city, which was situated on the northern coast of Africa, about twelve miles from the modern Tunis. It was founded by the Phœnicians, and destroyed by the Romans.

CARTHAMUS, in botany, Wild or Bastard Saffron, a genus of plants, class 19 *Syngenesia*, order 1 *Polygamia equalis*.

CARTHUSIANS, a religious order, founded in the year 1080, by one Bruno. They received their name from Chartreuse, the place of their institution. They are so remarkable for their austerity, that they never leave their cells except to go to church, nor speak to any person without leave.

CARTILAGE, or in common language *gristle*, a part of the animal body, harder and drier than a ligament, and softer than a bone: its use is to render the articulation of the bones more easy. Of the cartilages that unite the bones together, some join them so firmly, as to allow no sensible motion, and others, in such a manner, as to allow of different motions, as in those by which the bodies of the vertebrae are connected. The first grow easily hard, the other appear, in some measure, viscid, and retain their flexibility.

CARTILAGINOUS FISHES, those having cartilaginous instead of bony skeletons. Many of these are viviparous, as the ray and shark, others oviparous, as the sturgeon. They are now subdivided into *Branchiostegi* and *Chondropterygii* — *Cartilaginous leaf*, in botany a leaf surrounded with a margin, thicker than the rest, but composed of the same substance.

CARTOON, a design drawn upon large sheets of paper for the purpose of being traced upon any other substance, where the subject is to be finished. The most celebrated cartoons in existence are those of Raphael, seven of which are at Hampton Court, and were originally designed for tapestry.

CARTOUCH, a case of wood holding about four hundred musket balls, besides iron balls, from six to ten, to be fired out of a howitzer. Also, a portable box for charges.—In architecture, *cartouches* are blocks or modillions used in the corners of wainscoted apartments; also ornaments representing a scroll of paper.

CARTRIDGE, a case of paper or parchment filled with gunpowder, and used in the charging of guns. The cartridges for small arms, prepared for battle, contain the powder and ball: those for cannon and mortars are made of pasteboard or tin. Cartridges without balls are called *blank-cartridges* — The *cartridge box* is a case of wood covered with leather, with cells for cartridges, and worn upon a belt thrown over the left shoulder.

CARTULARY, or **CHARTULARY**, a register book, or record, as of a monastery. **CARTUCATE**, in old deeds, as much land as one team can plough in a year.

CARUNCLE, in surgery, a small fleshy excrescence, either natural or morbid.

CARVING, the art of cutting wood into various forms and figures.

CARYATIDES, in architecture, columns or pillars shaped like the bodies of women, and in the dress of the Caryan people. They were erected as trophies, and intended to represent the Carian women who were taken captives by the Athenians. Other female figures were afterwards used in the same manner, but they were called by the same name.

CARYOPHYLLEAE, the 22nd Linnæan natural order of plants, containing the pink, carnation, &c.

CARYOPHYLLEOUS, in botany, an epithet given to such flowers as have five petals with long claws, in a tubular calyx.

CASAR CA, in ornithology, a fowl of the genus *anas*, called also Ruddygoose, met with in Russia and Siberia.

CASCADE, a small waterfall, either natural or artificial. The word is applied to such as are less than a cataract.

CASCALHO, a deposit of gravel, sand, and pebbles, in which the diamond is found.

CASCARILLA, in medicine, the word originally used to signify Peruvian bark, but which is now applied to the bark of the *croton cascarrilla*, a very excellent tonic.

CASE, the particular state, condition, or circumstances that befall a person, or in which he is placed. Also, any outside covering which serves to enclose a thing entirely, as packing *cases*, or knife-cases. In carpentry, the case of a door is the wooden frame in which it is hung. In printing, it is a frame of wood, with numerous small partitions for the letters — **CASE**, in grammar, implies the different inflections or terminations of nouns, serving to express the different relations they bear to each other and the things they represent — *Action on the case*, in law, is an action in which the whole cause of complaint is set out in the writ.

CASE HARDENING, a method of preparing iron, so as to render its outer sur-

• WHEN THE BODY HAS BEEN LONG IN AN ERECT POSITION, THE COMPRESSION OF THE "CARTILAGES" DIMINISHES A PERSON'S HEIGHT.

[CAS]

A New Dictionary of the Belles Lettres.

[CAS]

face hard, and capable of resisting any edged tool.

CAS'EIC-ACID, the acid of cheese, or a substance so called, extracted from cheese.

CAS'EMATE, in fortification, a vault of mason's work in the flank of a bastion, next to the curtain, serving as a battery to defend the opposite bastion, and the moat.

CAS'EMENT, a window that opens on hinges. Also, a hollow moulding.

CASE-SHOT, musket balls, stones, old iron, &c., put into cases and discharged from cannon.

CASII, money in hand, or ready money, distinguished from bills.

CASHEW-NUT, the *Anacardium*, a West Indian tree, bearing a kidney-shaped nut. The fruit is as large as an orange, and full of an acid juice. To the apex of this fruit grows this nut, the shell of which is hard, and the kernel sweet.

CASHIER, a person who is entrusted with the cash of some public company. In a banking establishment the cashier superintends the books, payments, and receipts of the bank; he also signs or countersigns the notes, and superintends all the transactions, under the order of the directors.

CASK'ET, the diminutive of *cask*, a small chest or box, for jewels, &c.—In seaman's language, it signifies a small rope, used to fasten the sail to the yard in furling.

CANQUE, a piece of defensive armour, to cover and protect the head and neck in battle.

CASS'ADA, or **CASS'AVA**, in botany, a plant of the genus *yatropha*, of different species. The roots of the *manihot*, or *bitter cassada*, and of the *zanyssa*, are either made into a kind of bread, or roasted and eaten like potatoes by the natives of Africa and the West Indies. They yield also a great quantity of nutritive starch, which we know as the article called *tapioca*.

CASSATION, *Cours*, or, one of the most important institutions of modern France, which gives to the whole jurisdiction of that country coherency and uniformity, without endangering the necessary independence of the courts. It was established by the first national assembly, and has been preserved, in every essential respect, under all the changes of the revolution and restoration. It properly signifies the annulling of any act or decision, if the forms prescribed by law have been neglected or justice has been perverted.

CAS'SIA, (pron. *cassia*), in botany, a genus of the *decandria monogynia* class of plants. It is divided into three species; the *cassia fistula*, the *cassia lignea*, and the *cassia caryophyllata*. The first is the cassia of the shops, the soft fresh pulp of which is an excellent mild cathartic: it is given, with success, in inflammatory fevers, and in disorders of the breast, kidneys, and bladder. The *cassia lignea*, or cassia bark, much resembles the cinnamon: it is a stomachic and cordial, but possesses these virtues in a less degree than cinnamon; it is

also used in the venice-treacle, mithridate, &c. The *cassia caryophyllata*, or clove bark, is a stomachic, carminative, and alexipharmic.

CAS'SIDA, a genus of insects, of the order of the *co coptera*.

CASSIOBURY, in botany, a plant of the genus *cassia*, of which the most remarkable species is the Yapon of South America, whose berries are of a beautiful red colour.

CASSIOPEIA, a constellation in the northern hemisphere, situated opposite the Great Bear, on the other side the pole. In the year 1672, a remarkable new star appeared in this constellation, surpassing *Syrus* or *Lyra* in brightness. It appeared larger than Jupiter, but after a few months it declined; and in a year and a half entirely disappeared.

CASSITERIA, a genus of crystals which appear to have an admixture of some particles of tin.

CAS'SOCK, the vestment worn by clergymen under their gowns.

CAS'SOWARY, in ornithology, a large bird of the genus *Strutho*, nearly the size of an ostrich, but with legs thicker and stronger. The wings are so small as not to appear, being hid under the feathers, and on the head is a kind of horny helmet. It runs with most surprising swiftness.

CAST, among artists, any statue or part of a statue, of bronze, or of plaster-of-Paris. A cast is that which owes its figure to the mould into which the matter of it has been poured or cast while in a fluid state; and thus differs from a model, which is made by repeated efforts with a ductile substance, as any adhesive earth; and from a piece of sculpture, which is the work of the chisel.

CASTANETS, instruments formed of small concave shells of ivory or hard wood, fastened to the thumb and beat with the middle finger. The Spaniards and Moors use them as an accompaniment to their saraband dances and guitars.

CASTA'NEA, in botany, the fruit of the chestnut-tree.

CASTE, the general name for the tribes of various employment, into which the Hindoos are divided in successive generations, and generations of families. The first caste is religious; the second warlike; the third commercial; and the fourth labourers. Persons of the religious caste are universally denominated *brahmins*; the soldiers or princes are styled *cuttery* or *rajahs*; the traders, *choatras* or *shuddery*; the lowest order, *parias*.

CASTELLAIN, in feudal times, the owner, lord, or governor of a castle or fortified place.

CASTELLANY, the lordship belonging to a castle; or the extent of its land and jurisdiction.

CASTING, with founders, the running of metal into a mould: among sculptors, it is the taking casts or impressions of figures, &c. Plaster-of-Paris is the most usual material employed for this purpose.—In natural history, the word *casting* is used for that process by which some animals throw

THE TRIBUNAL OF CASSATION RECEIVED FROM NAPOLEON, IN 1804, THE NAME OF "COURT OF CASSATION," WHICH IT STILL RETAINS.

THE SENTENCES OF THE "COURT OF CASSATION" ARE RECORDED IN THE JOURNALS OF THE OTHER COURTS, AND ALSO PUBLISHED IN A BULLETIN.

[CAT]

off their skins, horns, &c when the old fall off to make room for the new.

CATTLE, a fortress or place rendered defensible, either by nature or art—English castles, walled with stone, and designed for residence as well as defence, are for the most part of no higher date than the Conquest. Those previously erected had been suffered to fall into ruin, and many writers have assigned this circumstance as a reason for the facility with which William the Norman made himself master of the country. It was the policy of this able general to build a considerable number, and in process of time the martial tenants of the crown erected them for themselves, so that toward the end of Stephen's reign, we are told that there existed upwards of eleven hundred. At this period castles were an evil of the greatest magnitude to both the sovereign and the subject, considerable struggles appear to have taken place with regard to their continuance, several were demolished, and their general decline commenced.

A complete castle consisted of a ditch or moat an outwork, called a barbican, which guarded the gate and drawbridge, an artificial mount, an outer and inner ballium or inclosure, and the keep, or lofty tower, in which the owner or governor resided, and under which were the dungeons—(castle guard, a feudal tenure, or knight service, which obliged the tenant to perform service within the realm, without limitation of time—(castle ward, an imposition laid upon subjects dwelling within a certain distance of a castle, for the purpose of maintaining watch and ward in the castle.

CASTOR, in zoology, the *Beaver*. Also, a reddish brown substance, of a strong penetrating smell, taken from bags in the groin of the beaver. It is a powerful antispasmodic.

CASIORIN, or **CASIORINE**, in chemistry, an animal principle discovered in castor which boiled in alcohol.

CASIOR OIL, in medicine, the oil of the *Ricinus*, or *Palma Christi*, a West Indian plant, and which is obtained from the nuts or seeds by expression or decoction. It is a mild and salt cathartic.

CASIRATION, in botany, the cutting off of the anthers, or the tops of the stamens of flowers, before the ripening of the pollen.

CASUISTRY, the science of resolving cases of doubtful propriety, or of determining the lawfulness or unlawfulness of any act, by rules and principles drawn from the Scriptures, from the laws of society, or from reason.

CASUS FŒDERIS, the case stipulated by treaty, or which comes within the terms of compact.

CASUS OMIS SUS, in law, where any particular thing is omitted, and not provided for by the statute.

CAT, a well known domestic animal, of the feline genus, but sometimes wild in the woods, and large and ferocious—**CAT**, a

term for a ship usually employed in the coal trade—Also a sort of strong tackle for drawing up the anchor—It is also a military term for a kind of shed under which soldiers conceal themselves while filling up a ditch or running a wall.

CATABAPTIST, one who is averse to the Christian rite or ceremony of baptism.

CATACHRESIS, in rhetoric, a trope which borrows the name of one thing to express another. Thus Milton, in describing Raphael's descent from the empyreal heaven, says,

"Down thither prone in flight
He speeds, and thro' the vast ethereal sky
Sails between worlds and worlds."

So in Scripture we read of the "*blood of the grape*." A catechesis, in fact, is the abuse of a trope, or when a word is too far wrested from its original signification.

CATACOMB, a grotto or subterraneous place for the burial of the dead. It is generally applied to a vast number of subterraneous sepulchres, in the Appian Way, near Rome, supposed to be the cells in which were deposited the bodies of the primitive Christian martyrs. But there are now many other catacombs, as at Paris, &c.

CATAMOUNT, in zoology, the wild cat, or cat of the mountain, of North America.

CATACLASIS, in medicine, a breaking or distortion in general, but particularly that of the eye.

CATACOUSTICS, an appellation given to the doctrine of reflected sounds, called also *cataphonics*.

CATADROMUS, in antiquity, the stadium, or place where races were run.

CATAGMATIC, in anatomy, an epithet for that which has the quality of promoting the union of fractured bones.

CATALEPSIS, or **CATALEPSY**, a kind of apoplexy, in which the patient is speechless, senseless, and fixed in one posture, with his eyes open, though without seeing or understanding.

CATALPA, in botany, a South American tree, of the genus *bignonia*, or trumpet-flower, remarkable for its beautiful appearance when in blossom.

CATAMARAN, a sort of floating raft, originally used in China as a fishing boat.

CATAPIRACT, in the ancient military art, a piece of heavy defensive armour, formed of cloth or leather, strengthened with scales or links, and used to defend the breast, or whole body, or even the horse as well as the rider.

CATAPLASM, a poultice applied to some part of the body, to excite or repel heat, or to relax the skin, &c. When mustard is an ingredient, it is called a *sinapium*.

CATAPULTA, or **CATAPULT**, in antiquity, a military engine used for throwing arrows, darts, and stones upon the enemy. Some of these engines would throw stones of a hundred weight. Josephus takes notice of the surprising effects of these engines, and says, that the stones thrown out of them beat down the battlements, knocked off the angles of the towers, and would level

SOME OF OUR ANCIENT CASTLES WERE CONSTRUCTED BY THE ROMANS, SOME BY THE ANGLO-SAXONS, BUT MOST OF THEM BY THE NORMANS

THE CATACOMBS OF PARIS ARE EXTENSIVE SUBTERRANEAN GALLERIES, ORIGINALLY THE GRAVES FROM WHICH STONE, &c. WERE DUG.

[CAT]

A New Dictionary of the Belles Lettres.

[CAT]

ALL MODES OF TREATING "CATARACT" CONSIST IN REMOVING THE DISEASED LENS FROM ITS SITUATION OPPOSITE THE TRANSPARENT CORNEA.

a whole file of men, from one end to the other. The catapults differed from the ballista, inasmuch as the latter threw stones only, whereas the former threw chiefly darts and javelins.

CATARACT, a great fall of water over a precipice in the channel of a river, caused by rocks or other obstacles stopping the course of the stream, as that of Niagara, the Nile, the Danube, and the Rhine.—**CATARACT**, in medicine, an affection of the crystalline humour of the eye, or its capsule, which becomes so opaque as to prevent the rays of light from passing to the optic nerve. *Incipient cataract*, is only suffusion of sight when little clouds seem to float before the eye (*opaki med cataract*), is when the apple of the eye is either wholly, or in part covered, so that the rays of light cannot pass to the retina. [For further information on this dreadful affliction, see "Stevenson on Cataract" and for an effectual cure, consult the author of that work.]

CATABRUI, commonly denominated a *cold*, is an increased secretion of mucus from the nose, fauces, and bronchiae, with fever, cough, lassitude, &c. When a catarth is epidemic, it is called the *influenza*.

CATASIASIS, in poetry, the third part of the ancient drama, being that wherein the intrigue, or action, is supported and carried on, and heightened, till it be ripe for unravelling in the catastrophe.

CATASTROPHE, in dramatic poetry, the fourth and last part in the ancient drama, or that immediately succeeding the catasiasis, and which consists in the unfolding and winding up of the plot, clearing up difficulties, and closing the play.

CATCH, in music, is denoted to be "a piece for three or four voices, one of which leads, and the others follow in the same notes." But perhaps it may be more correctly described as a fugue in the unison, wherein to humour some conceit in the words, or to give them a different meaning, the melody is broken, and the sense is interrupted in one part, and *caught* and supported by another.

CATCH-FLY, a well-known plant, having grass-like leaves, and a long stalk terminated by a cluster of crimson flowers.

CATECHISM, a form of instruction in religion, conveyed in questions and answers. The catechism of the Church of England originally consisted of no more than a repetition of the baptismal vow, the creed, and the Lord's prayer, but King James I ordered the bishops to add to it a short and plain explication of the sacraments.

CATECHIST, an officer in the primitive Christian church, whose business it was to instruct the catechumens in the first principles of religion, and thereby prepare them for the reception of baptism.

CATECHU, or *THEA JAPONICA*, a juice of a very astringent quality, obtained by decoction and evaporation from a species of *Mimosa* in India. It consists chiefly of tannin.

CATECHUMENS, a name formerly given in the Christian church, to such as were

prepared to receive the ordinance of baptism. These were anciently the children of believing parents, or pagans not fully initiated in the principles of the Christian religion, and were admitted to this state by the imposition of hands and the sign of the cross.

CATEGORY, in logic, a series or order of all the predicates or attributes contained under a genus. The school philosophers distributed all the objects of our thoughts and ideas into certain genera or classes, which classes the Greeks called categories, and the Latins predicaments. Aristotle made ten categories, viz. substance, quantity, quality, relation, action, passion, time, place, situation, and habit.

CATENA, in a general sense, denotes a chain.—In anatomy, a name used by some for the muscle, more commonly called *tibialis anticus*.—**CATENA PATRUM**, in matters of literature, a book containing the sentiments of the ancient Christian fathers, with respect to their doctrines.

CATENARIA, or **CATENARY**, in geometry, the curve which an extended rope forms by its own weight.

CATERPILLAR, in entomology, the larva produced from the egg, which is transformed first into the chrysalis or nymph, and afterwards into the butterfly. Caterpillars generally feed on leaves or succulent vegetables, and are sometimes very destructive. They are furnished with several pairs of feet, and have the shape and appearance of a worm, variously coloured, and often hairy. It is well known, that all winged insects pass through a reptile state before they arrive at perfection; this great change from a worm to a butterfly was formerly esteemed a real metamorphosis of one animal to another, but later discoveries have put it beyond all doubt, that the embryo butterfly, with all the linaments of its parent, is contained within the extrnal cases or coverings of the caterpillar.

CAT-GUT, the name for the strings made of the intestines of sheep or lambs, used in musical instruments, &c. Great quantities are imported from Lyons and Italy.

CATHARTICS, medicines which cleanse the stomach and bowels by acting as purgatives.

CAT-HFAD, in marine language, a strong beam projecting horizontally over a ship's bows.—(*at harpings*, ropes serving to brace in the shrouds of the lower masts behind their respective yards.—*Cat's paw*, a light air perceived in a calm, by a rippling on the surface of the water.

CATHEADS, two strong beams of timber in a vessel, which serve to suspend the anchor clear of the bow.

CATHEDRA, in archaeology, a term used to denote the pulpit, or the professor's chair. It originally signified any chair.—Among ecclesiastical writers it denotes a bishop's see, or throne. Hence, *ex cathedra* is a phrase much used among the clergy of the Romish church, in relation to the solemn decrees of the pope.

AN INFUSION OF ELDER LEAVES POUCHED OVER PLANTS WILL PRESERVE THEM FROM THE DESTRUCTIVE RAVAGES OF CATERPILLARS.

[CAT]

The Scientific and Literary Treasury ;

[CAU]

CATH'DRAL, the episcopal church, or a church where there is a bishop's seat or see. A cathedral was originally different from what it is now, the Christians, till the time of Constantine, having no liberty to build any temple. By their churches they only meant their assemblies, and by their cathedrals, nothing more than consistories.

CATHERINE-WHEEL, a architecture, a large circular ornament in Gothic windows. Also, a sort of three-works constructed in the form of a wheel, which is made to turn round when it is let off.

CATH'ETER, in surgery, a tubular instrument, usually made of silver, to be introduced into the bladder, in order to search for the stone, or discharge the urine when suppressed, also a bougie made of silver or caoutchouc.

CATH'ETUS, in geometry, a line or radius falling perpendicularly on another line or surface, as the two sides of a right-angled triangle — *Cathetus of incidence*, in catoptrics, a right line drawn from a point of the object, perpendicular to the reflecting line — *Cathetus of reflection*, or of the eye, a right line drawn from the eye, perpendicular to the reflecting line — *Cathetus of obliquation*, a right line drawn perpendicular to the speculum, in the point of incidence or reflection. — In architecture, a *cathetus* is a perpendicular line, supposed to pass through the middle of a cylindrical body, as a baluster, column, &c.

CATH'OLIC, an epithet properly signifying universal. Originally this appellation was given to the Christian church in general, but now the Romish church assumes it exclusively to itself, whence the name of Roman Catholics has been applied, since the Reformation, to the followers of the Romish doctrine and discipline. In the strict sense of the word, there is no catholic church in being, that is, no universal Christian communion — *Catholic Majesty*, the title given to the king or queen of Spain — *Catholic Priest*, a clergyman or priest ordained to say mass and administer the sacraments, &c., according to the rites of the Romish church — *Catholic Emancipation*, is the abolition of those civil and ecclesiastical restraints to which the Catholics of Great Britain and Ireland were formerly subjected. The first step towards this took place in 1793, when an act of parliament was passed, which conferred the elective franchise on the Catholics, threw open to them all employments in the army in Ireland, and all offices in the navy. In 1801 the legislative union of Great Britain and Ireland took place, but though full emancipation had been promised, it was said, as a consequence of this union, it was not fulfilled, and many unsuccessful attempts were afterwards made to effect it. At length, in 1829 (April 10), a *relief bill*, abolishing the civil disabilities of Roman Catholics, by repealing the oaths of supremacy, &c., was carried by the Wellington administration. By this bill, Catholics are eligible to all offices of state, excepting the

lord-chancellorships of England and Ireland, the lord-lieutenancy of Ireland, the office of regent or guardian of the united kingdom, and that of high commissioner to the church of Scotland.

CATHOLICON, a remedy for all diseases, a soft purgative electuary, so called, as being supposed an universal and efficacious purge of all humours.

CAT'KIN, in botany, a species of calyx, or rather of inflorescence, consisting of a long stem thickly covered with scales, under which are the flowers and the essential parts of the fruit, so called from its resemblance to a cat's tail. Catkins are to be found on the hazel, willow, birch, oak, poplar, &c.

CATO'CHE, or **CATO'CHUS**, in medicine, a tetanus or spasmodic affection, by which the patient is rendered, in an instant, as immovable as a statue, without either sense or motion, and continues in the same posture he was in at the moment he was seized. The proximate cause of this disease is the immobility of the common sensory, from the time of the first attack, and therefore is an absolute rest of the blood in the brain, of the glands of the brain, and of all its emissaries. It seldom changes to any other disease, and sometimes it has been succeeded by an epilepsy, convulsions, madness, or an atrophy, which have ended in death.

CATO'DON, in ichthyology, a genus of cetaceous fishes, the characters of which are these: they have no teeth in the upper jaw, nor any fin on the back.

CATOP'ISM, in medicine, an acute and quick perception, particularly that acute sense of the faculties which accompanies the latter stages of a consumption.

CATOP'TRICS, that part of optics which explains the properties of reflected light, and particularly that which is reflected from mirrors.

CAT SILVER, a fossil, a species of mica. It is of three sorts, the yellow or golden, white or silvery, and the black.

CATOPTROMANCY, a species of divination among the ancients, which was performed for the sick, by letting down a mirror, fastened by a thread, into a fountain before the temple of Ceres, to look at his face in it. If it appeared distorted and ghastly, it was a sign of death, if fresh and healthy, it denoted a speedy recovery.

CAT'S EYE, in mineralogy, a stone, or sub species of quartz, very hard and transparent, of a glistening gray, with a tinge of green, yellow, or white.

CAT'S TAIL GRASS, a kind of reed, of the genus *typha*, bearing a spike, like the tail of a cat.

CATTLE, horned beasts, that feed in pasture, or generally all four footed beasts that serve for domestic purposes.

CAUDEA, in botany, the stem of a tree.

CAUK, a name given by miners to certain specimens of the compact sulphate of barytes. The same word is sometimes given to masses composed of concentric lamellar concretions.

GEORGE III. DECLARED THAT CATHOLIC EMANCIPATION WAS INCONSISTENT WITH HIS CORONATION OATH, AND FIRMLY OPPOSED IT.

THE CATHOLIC EMANCIPATION BILL WAS REJECTED BY THE LORDS IN 1825, WHEN THE DUEL OF YORK SOLEMNLY OPPOSED IT.

[CAU]

A New Dictionary of the Belles Lettres.

[CAV]

CAUDA, in astronomy, the Latin name for tail, which is prefixed to the names of several constellations, to denote certain stars in their tails, as *Cauda Capricorni*, *Cauda Leonis*, &c.

CAUL, in anatomy, a membrane in the abdomen, covering the greatest part of the lower intestines, and usually furnished with a large quantity of fat. It is more properly termed the *omentum*, or from its net-like structure, *reticulum*—The word *caul* is also used for a membrane which encompasses the head of many new-born children, to which vulgar superstition absurdly annexes the charm of preservation from drowning.

CAULESCENT, in botany, having a stem different from that which produces the flower. Linnæus applies this term to the root also, as in the turnip.

CAULIFEROUS, an epithet given to such plants as have a perfect caulis or stem.

CAULIFLOWERS, a much esteemed species of *brassica*, or cabbage.

CAULINE, in botany, growing immediately on the stem, without the intervention of branches, as a *cauline* leaf, bulb, peduncle, &c.

CAULIS, in botany, the stalk of herbaceous plants. This in trees is called *caudex*, or the trunk, and in grasses *calmus*, or the stem.

CAUSALTY, among miners, the light earthy parts of ore, carried off by washing.

CAUSALITY, or **CAUSATION**, among metaphysicians, the action or power of a cause in producing its effect.

CAUSE, that from whence anything proceeds, or by virtue of which anything is done. It stands opposed to *effect*. We get the ideas of cause and effect from our observation of the vicissitude of things, while we perceive some qualities or substances begin to exist, and that they receive their existence from the due application and operation of other beings. That which produces is the *cause*, that which is produced, the *effect*—Causes are distinguished, by the schools, into efficient, material, final, and formal. *Efficient Causes* are the agents employed in the production of anything. *Material Causes*, the subjects whereon the agents work, or the materials whereof the thing is produced. *Final Causes* are the motives inducing an agent to act, or the design and purpose for which the thing was done. Causes are again distinguished into physical and moral, universal, or particular, principal, or instrumental, total, or partial, univocal, equivocal, &c.—*Cause*, among civilians, is the same with *action*, denoting any legal process which a party institutes to obtain his demand, or by which he seeks his supposed right.

CAUSEWAY, or **CAUSEY**, a way raised above the natural level of the ground, by stones, stakes, earth, or fascines, serving either as a road in wet marshy places, or to prevent a river from overflowing the lower grounds. It is also very generally used for a raised way or path in any ordinary road.

CAUSTIC, in medicine, any substance of so hot a nature, that, being applied, corrodes and burns the texture of the parts. Caustics differ from cauteries in performing their effects slower, and with less force and pain—*Lunar Caustic*, a preparation of crystals of silver, obtained by solution in nitric acid, and afterwards fused in a crucible. It is a nitrate of silver—*Caustic Curve*, in geometry, a curve formed by a coincidence of the rays of light, reflected from some other curve.

CAUSTICITY, the quality of acting like fire on animal matter, or of combining with the principles of organized substances, and destroying their texture—a quality belonging to concentrated acids, pure alkalies, and some metallic salts.

CAUTERY, in surgery, a medicine for burning, eating, or corroding any solid part of the body. The act of burning or eating some morbid part is termed *cauterization*.

CAUTIONE ADMITTENDA, in law, a writ which lies against a bishop that holds an excommunicated person in prison for contempt, after he has offered sufficient caution or security to obey the orders of the church. On receipt of this writ, the sheriff warns the bishop to take caution.

CAVALCADE, a pompous procession of horsemen, equipages, &c. by way of parade to grace a triumph, public entry, or the like.

CAVALIER, a gallant armed horseman. It was also an appellation given to the party of Charles I. to distinguish them from the parliamentarians, who were called Round heads—In fortification, a work raised within the body of a place, above the other works.

CAVALRY, a body of soldiers on horse back, a general term for light horse, dragoons, lancers, and all other troops who are armed and mounted. Their chief use is to make frequent excursions to the disturbance of the enemy, and intercept his convoys, in battle, to support and cover the infantry, and to break through and disorder the enemy. The use of cavalry is probably nearly as ancient as war itself. At the present day the cavalry is divided into *light* and *heavy horse*, which are employed for different purposes. The heavy cavalry, with defensive armour (*cuirassiers*), is generally employed where force is requisite, the lighter troops are used in small detachments, where swiftness and continued effort are required.

CAVAVERNA, in anatomy, the largest vein in the body, descending from the heart.

CAVEAT, an entry in the spiritual courts, by which the probate of a will, letters of administration, licence of marriage, &c. may be prevented from being issued without the knowledge, and, if the reason be just, the consent of the party entering the caveat.

CAVERN, a natural cavity, or deep hollow place in the earth, arising either from arches accidentally made, or from streams of water flowing under ground. One of the grandest natural caverns known is Fingal's cave, in Staffa, one of the western islands.

THOSE CAVERNS WHICH ARE FOUND IN LIMESTONE AND GYPSUM ARE USUALLY THE RESULTS OF THE DISSOLVING POWER OF WATER.

THE EFFECT OF CAVALRY ARISES PARTICULARLY FROM THE MORAL IMPRESSION WHICH IT GENERALLY PRODUCES ON THE ENEMY.

[CRD]

The Scientific and Literary Treasury ;

[CEM]

THE AROMATIC OILS IN CEDAR AND ROSEWOOD SECURE ARTICLES MADE OF THEM FROM THE DESTRUCTIVE ATTACKS OF INSECTS.

of Scotland. The grotto of Antiparos, in the Archipelago, is celebrated for its magnificence. In some parts, immense columns descend to the floor, others present the appearance of trees and brooks turned to marble. The Peak Cavern, in Derbyshire is also a celebrated curiosity of this kind. It is nearly half a mile in length, and, at its lowest part, 600 feet below the surface. Many caves are formed by the lava of volcanoes. In the Cevennes mountains, in France, are caverns and grottoes of great extent, and which abound in objects of curiosity. But the largest we read of is the cavern of Guacharo, in South America, which is said to extend for leagues.

CAVIARE, (pron. *caw-er*) the spawn or hard roes of sturgeon, made into cakes, salted and dried in the sun, much used in Russia, and other parts of the continent.

CAVETTO, in architecture, a hollow member, or round concave moulding, containing the quadrant of a circle, and used as an ornament in cornices.

CAVEZON, a sort of nose-band, either of iron, leather, or wood, sometimes flat, and at other times hollow or twisted, which is put on the nose of a horse, to wring it, and thus to forward the suppling and breaking of him.

CAVIN, in military affairs, a natural hollow sufficiently capacious to lodge a body of troops, and facilitate their approach to a place.

CAVOLINITE, a newly-discovered mineral, occurring in the interior of calcareous balls, &c.

CAYENNE PEPPER, a pungent ingredient in soups and highly seasoned dishes, made from the fruit of different species of capsicum, which when ripe, is gathered, dried in the sun, and then pounded. It is eaten both with animal and vegetable food, and is mixed, in greater or less proportion, with almost all kinds of sauces. It is used also in medicine as a stimulant, and is said to have been found efficacious in many gouty and paralytic affections.

CEDRAT, in botany, a species of citron-tree.

CEDRIA, or CEDRUM, a resinous liquor, issuing from the great cedar tree, or cedar of Lebanon. It yields a strong smell, is transparent, and of a thick unctuous consistence. It is possessed of two opposite qualities, viz to preserve dead bodies, by its drying and consuming superfluous moisture, without damaging the solid parts, and to putrify the soft and tender parts of living bodies, without exciting pain.

CEDRUS, the CEDAR, in botany, is an evergreen tree, growing to a great size, and remarkable for its durability. Cedarwood, which is of a fragrant smell and fine grain, is almost inextinguishable by reason of its bitterness, which renders it distasteful to worms. Historians tell us, that some of this timber was found in the temple of Apollo at Utica, two thousand years old. The cedars of Lebanon are famous, as having been used by Solomon in building the temple of Jerusalem.

CEILING, in architecture, the upper part or roof of a room, being a lay or covering of plaster over laths, nailed on the bottom of the joists which bear the floor of the upper room, or on joists put up for that purpose where there is no upper room, hence called ceiling joists.

CELARENT, in logic, a mode of syllogism, wherein the major and conclusion are universal negative propositions, and the minor an universal affirmative, as "No man that is a hypocrite can be saved: Every man who with his lips only cries Lord, Lord, is a hypocrite: Therefore, no man, who with his lips only cries Lord, Lord, can be saved."

CELERES, in Roman antiquity, a regiment of body guards belonging to the Roman kings, established by Romulus, and composed of 300 young men chosen out of the most illustrious Roman families, and approved by the suffrages of the curies of the people, each of which furnished ten.

CELESTIAL, in its first and obvious sense, denotes something pertaining to, or dwelling in heaven. In mythology, the term is applied to the residence of the gods, supposed to be in the clouds or stars, and hence the space in which the stars are situated are commonly called the celestial spaces.

CELESTINE, in mineralogy, native sulphate of strontian, it receives its name from its occasionally being of a delicate blue colour.

CELESTINS, a religious order of Christians, reformed from the Bernardines by Pope Celestin V. The Celestins rise two hours after midnight to say matins, they eat no flesh at any time, except when sick, and fast often. Their habit is a white gown, a capuche, and a black scapulary.

CELEUSMA, in antiquity, a naval shout serving as a signal for the mariners to ply their oars, or to cease from rowing. It was also made use of to signify the joyful acclamation of victors, and the shouts of the conquerors over the vanquished.

CELIBACY, an unmarried or single state of life, to which, according to the doctrine, or at least the discipline of the church of Rome, the clergy are obliged to conform.

CELL, in its first and obvious sense, a small, close apartment, as in a prison, and in a less restricted sense, it denotes any small cavity or hollow place, as the *cells* of the brain, the *cells* of a honeycomb, &c. —In anatomy, a little bag or bladder, containing fluid or other matter, as the *adipose cells*, containing fat. —In botany, a hollow place in a capsule, in which seeds are lodged.

CELLULAR MEMBRANE, a net-work of fine threads, the masses of which are filled with thin plates of fat or fluid, and which membrane surrounds every muscle, artery, vein, nerve, and organ of the body.

CELTIC, pertaining to the *Celts*, or primitive inhabitants of Britain, Gaul, Spain. Thus we say *Celtic* customs, *Celtic* origin, *Celtic* remains, &c.

CEMENT, any glutinous or other sub-

LUTHER OPENLY DENOUNCED CIERICAL CYNICALTY, AND IN 1525 HE MARRIED A WIFE, NAMED CATHERINE VON BORA.

[CFM]

A New Dictionary of the Belles Lettres.

[CFN]

stance having the quality of uniting bodies in close cohesion, as mortar, gips, &c. Figuratively, a bond of union between persons.

CEMENTATION, in chemistry, the act of applying cements to substances so as to corrode or change them, which is done by surrounding them with the powder of an other body, and exposing them, in a close vessel, to a heat not sufficient to fuse them.

—**Cementation**, in the arts, is a general method of forming steel from iron, by means of the application of charcoal. In a proper furnace layers of bars of malleable iron and layers of charcoal are placed one upon another, the air excluded, the fire is raised to a great height, and kept up for eight or ten days. It after this the conversion of the iron into steel be complete, the fire is extinguished, and the whole is left to cool for six or eight days longer. Iron prepared in this manner is named blistered steel, from the blisters which appear on its surface. Copper is converted into brass by cementation with the powder of calamine and charcoal.

(**CEMETERY**, a repository for the dead. Among modern improvements, perhaps few are more deserving of commendation than the custom, recently introduced, of appropriating an eligible spot of ground, at a convenient distance from populous towns, for the purpose of human interment. Who is there, for instance, that has observed the neatness, order, and quietude which characterise the cemetery at Kensal Green (a few miles to the north west of London), and does not rejoice that the indecent practice of piling coffin upon coffin in the noisome churchyards of a crowded city, is likely in a few years more to be remembered only as a relic of barbarism. There is, indeed, a suitable solemnity about the hallowed precincts of a country church—the unassuming fane, the aged yew trees, and the artless tributes to departed worth. There undisturbed the ashes of our fathers rest,—there no other cemetery is needed but amid the crowded haunts of man, where the population is dense, and all around teems with the noise and bustle of commercial enterprise, the sensitive mind recoils, almost with horror, at the idea of such a spot being made a receptacle for the mouldering remains of frail mortality. Although the idea of public cemeteries did not originate with us, it is pleasing to know that the example set in the metropolis is rapidly extending to other large places, and that the feeling which at first existed against them is fast subsiding. Reason has in this instance triumphed over prejudice and though we are not very anxious to see the generality of Parisian customs followed, we are not the less disposed to adopt any which come so powerfully recommended as that of their interesting cemetery, *Père Lachaise*. This city of the dead is situated on a rising ground in the north west part of Paris, and from it you look down on the gayest scene in the world! It contains a great variety of tombs, and funeral monu-

ments of every style, some simple and unaffected, others elaborate both in workmanship and in the praise of those for whom they were erected, while many record not even the names of those whose bones repose beneath.

CENOTAPH, in antiquity, an empty tomb, erected in honour of the deceased, and differing from a sepulchre, in which the body was actually deposited.

CENSER, in the religious rites of the ancients, was a vase, containing incense to be used in sacrificing to the gods. Censers were likewise in use among the Jews, as we find in the 1 Kings vii. 50. "Solomon, when he prepared furniture for the temple of the Lord, among other things made censers of pure gold."

CENSOR, an officer in ancient Rome, whose business it was to reform the manners and to value the estates of the people. At first they were chosen out of the senate, but after the plebeians had got the consulate open to them, they soon arrived at the censorship. Censors reduce their functions to the numbering of the people, the correction and reformation of manners, the estimating the effects of each citizen, the proportioning of taxes, the superintendence of tribute, the exclusion from the temples, and the care of the public places. The office was so considerable, that none aspired to it till they had passed all the rest.

CENSURE, a judgment which condemns some book, person, or action, or more particularly a reprimand from a superior.—*Ecclesiastical censures* are penalties by which, for some striking malconduct, a member of a church is deprived of the communion of the church, or prohibited from executing the sacerdotal office.

CENSUS, in Roman antiquity, an authentic declaration made before the censor, by the several subjects of the empire, of their respective names and places of abode. This declaration was registered by the censor, and contained an enumeration of all their estates, lands, and inheritances, their quantity and quality, with the wives, children, domestics, tenants, and slaves of each citizen. The census was instituted by Servius Tullius, and was held every five years. The word *census* is still used to signify an enumeration of the inhabitants of any kingdom or state, taken by order of its legislature.

CENT, from *centum*, "a hundred," is used in commercial concerns to signify a hundred pounds. A profit of 10 per cent is the gain of 10l by the use of 100l.

CENTAUR, in classic antiquity, a monster, half man and half horse. It is intimated by Virgil, and generally believed, that the Centaurs were a tribe of Lapithæ, who inhabited the city of Pelathronum, adjoining to Mount Pelson, and who first broke and rode upon horses. Nations to whom the sight of a man on horseback was new, believed, as did the Americans of the Spaniards, the horse and his rider made but one animal.

CENTAURY, the name of a plant, and

PLASTER OF PARIS, MIXED WITH WATER, OR WITH ROBIN AND WAX, IS USED AS A CEMENT FOR JOINING PIECES OF MARBLE.

THE "CENSUS" WAS ONE OF THE MOST IMPORTANT INSTITUTIONS IN ANCIENT ROME, AND THE FOUNDATION OF ITS GREATNESS.

[CEN]

The Scientific and Literary Treasury ;

[CER]

a genus of plants, of numerous species; the *lesser centaury* is a species of *gen tiana*

CENTENARY, the number of a hundred, or pertaining thereto Hence the epithet *centennial* for what regularly occurs once in a century

CENTESIMATION, a military punishment, in cases of desertion, mutiny, &c., when every hundredth man is selected for execution

CENTIFOLIOLUS, in botany, an epithet for having a hundred leaves.

CENTINODIA, in botany, a herb so called from its having many knobs or joints the *Polygonum* of Linnaeus

CENTIPEDE, an insect having a hundred feet. In entomology, insects of the genus *Scelopendra*, all of which have numerous feet

CENIO, in poetry, a work wholly composed of verses or passages, promiscuously taken from other authors, and disposed in a new order.

CENTRAL FIRE a supposed perpetual fire, which, according to the theory of some philosophers, exists in the centre of the earth, and to which, in ancient times, volcanoes and other similar phenomena were attributed

CENTRE, or **CENTER**, a point equally distant from the extremities of a line, figure, or body — *centre of gravity*, that point about which all the points of a body, in any situation, exactly balance each other — *centre of motion*, the point which remains at rest, while all the other parts of a body move round it

CENTRIFUGAL FORCE, the tendency with which bodies restrained in circular motion, endeavour to fly off in a tangent to the periphery of the curve

CENTRIFUGAL FORCE, the tendency with which bodies move, or endeavour to move, towards the centre of a system of bodies such is gravity, or that force whereby bodies tend towards the centre of the earth, magnetical attraction, whereby the load stone draws iron, and that force, whatever it be, whereby the planets are continually drawn back from right lined motions, and made to move in curves

CENTIUMVIRI, in Roman antiquity, judges appointed to decide common causes among the people Three were chosen out of each tribe, and though there were five more than a hundred, they were nevertheless called *centumviri*, from the round number *centum*

CENTURION, among the Romans, an officer in the infantry, who commanded a century, or a hundred men The Roman legions were, in fact, divided into *centuries*

CENTURY, in a general sense, denotes a hundred; or anything divided into or consisting of a hundred parts. The Roman people, when they were assembled for the electing of magistrates, enacting of laws, or deliberating upon any public affair, were always divided into centuries, and voted by centuries, in order that their suffrages might be the more easily collected; whence these

assemblies were called *comitia centuriata*. This mode of dividing the Roman people was introduced by Servius Tullius. the first class contained eighty, to which were added the eighteen centuries of the knights, the three following classes had each twenty centuries, the fifth thirty, and the sixth only one century. — In chronology, it means the space of one hundred years, and this is the most common signification of the word. As we begin our common computation of time from the incarnation of Christ, the word is generally applied to some term of a hundred years subsequent to it.

CEPHALIC, an epithet for medicines which are good for the head ache.

CEPHREUS, in astronomy, a constellation of the northern hemisphere.

CEPHUS, a fowl of the duck kind, also the Mona, a species of monkey.

CERAMBYX, in entomology, a genus of beetles, whose antennae are long and setaceous, and the thorax oblong and rounded. Under this genus is comprehended the capricorn-beetle, and a number of other species

CERASTIUM, in botany, a genus of the *dianthia pentagynia* a class of plants, the flower of which consists of five birds petals, and its fruit is a long unilocular pod, containing numerous roundish seeds

CERASIN, any gummy substance which swells in cold water, but does not readily dissolve in it

CERASITE, a petrification resembling a cherry

CERASTES, in zoology, the name of a serpent, of the genus *Coluber*, which the ancients supposed to have horns

CERATIL, in medicine, a composition made of oil, wax, and other ingredients, used externally in several diseases, where plasters are necessary

CERATILIS, the fossil unicorn, a stone in the shape of a horn.

CERATOGLOSSUS, in anatomy, the name of a pair of muscles, serving to draw the tongue directly into the mouth, but if only one of them acts, it draws the tongue to one side of the mouth

CERATOIDES, in anatomy, a name for the *tunica cornea* of the eye

CERATOPHYLLUM, in botany, a genus of perennial plants, of the *monocotyledon* class

CERAUNIA, in mineralogy, thunderstones, a variety of the *helmintholites nautiles* of Linnaeus.

CERAUNUM, in botany, a kind of fungus which, according to Pliny, grows plentifully after thunder

CERBERA, in botany, a genus of the *pentandria monogynia* class of plants, the corolla of which consists of a single funnel-shaped petal, the fruit is a large, round, fleshy drupe, marked with a longitudinal furrow on the side, and containing two cells, in each of which is a single seed, or nut. The species are all shrubs.

CERCHINOS, in medicine, a wheezing noise made in respiration, owing to some disorder in the larynx, &c.

A "CENTURION" IN THE ROMAN ARMY COMMANDED A COMPANY, ANSWERING TO A CAPTAIN OF INFANTRY AT THE PRESENT DAY.

THE "CEPHALIC" VEIN, WHICH RUNS ALONG THE ARM, WAS SO NAMED, BECAUSE THE ANCIENTS USED TO OPEN IT FOR DISORDERS OF THE HEAD.

[CER]

A New Dictionary of the Belles Lettres.

[CES]

CEREA'LIA, in antiquity, feasts of Ceres, instituted by Triptolemus of Eleusis, in Attica. These feasts were celebrated with religious purity, but the votaries of the goddess ran about with lighted torches, in commemoration of her search after her daughter Proserpine.—The word also was used to denote all sorts of corn of which bread is made.

CEREBEL LUM, the part of the brain in the back of the skull, divided into two lobes, and the part which, when taken away or injured, deprives the animal of the power of volition.

CEREBRUM, that part of the brain which occupies the front and top of the skull, and which, when removed or injured, deprives the animal of sensation.

CEREMONY, an assemblage of several actions, forms, and circumstances, serving to render a thing more magnificent and solemn, particularly used to denote the external rites of religious worship, the formality of introducing ambassadors to audiences, &c.—*Master of the Ceremonies*, an officer instituted by James I for the more honourable reception of ambassadors and strangers of quality, and for the regulation of all matters of etiquette in the assemblies over which they preside.

CEROLITE, in chemistry, a substance which in appearance and softness resembles wax, sometimes mistaken for stearite.

CERES, a small planet, which revolves round the sun in four years, seven months, and ten days, at the distance of 260,000,000 of miles.

CEREUS, or **CREeping CEREUS**, a plant classed by Linnaeus under the genus *Cactus*. There are several kinds remarkable for the sweetness and beauty of their flowers.

CERIN, in chemistry, a peculiar substance which precipitates on evaporation from alcohol, which has been digested on grated cork.

CERINTHIANs, the followers of Cerinthus, one of the first heresiarchs in the church. They denied the divinity of Christ, but they held that a celestial virtue descended on him at his baptism in the form of a dove, by which he was consecrated and made Christ.

CERITE, the siliceous oxyde of cerium, a rare mineral, of a pale rose red colour, with a tinge of yellow.

CERIUM, a recently discovered metal, of a flesh-red colour, semi-transparent, and which becomes friable from heat, but does not melt. Cerium combines with several acids, and forms salts, as the nitrate of cerium, &c.

CERO MA, an ointment made of oil and wax, with which the ancient wrestlers rubbed themselves to render their limbs more pliant.

CERTHIA, the Creeper, in ornithology, a species of *lapida*, a bird, with a yellowish brown back, variegated with white, and a white breast.

CERTIFICATE, in a general sense, a testimony given in writing to declare or certify the truth of anything. Of these there are

many which are requisite in almost every profession, but more particularly in the law and in the army.

CERTIORA RI, a writ issuing out of some superior court, to call up the records of an inferior court, or remove a cause there depending, that it may be tried in a superior court.

CEROMANCY, an ancient mode of divination, by means of dropping melted wax in water, and observing the shapes, &c. it assumed.

CERUMEN, the wax, or viscid yellow liquid which flows from the ear, and hardens on exposure to the air.

CERUSE, **CERUSS**, or **White Lead**, a carbonate or calx of lead, made by exposing plates of that metal to the vapour of vinegar.—*Ceruse of antimony* is a white oxyde of antimony, which separates from the water in which diaphoretic antimony has been washed.

CERVUS, the **Stag** or **Deer**, in zoology, a genus of quadrupeds of the order *pecora*. They have deciduous horns, at first hairy, afterwards naked and smooth, and there is only one dog tooth on each side of the upper jaw, which is placed at a distance from the other teeth. Under this genus are comprehended the camelopard, the elk, the rein deer, the goat, the stag, and the fallow deer.

CERVUS VO LANS, in entomology, the name of the stag horned beetle, a remarkably large species of beetle, with its horns deeply jagged or ramified, somewhat like those of a stag.

CESsATION OF ARMS, an armistice or occasional truce, agreed to by the commanders of armies, to give time for a capitulation, or for other purposes.

CENSA VIT, in law, a writ to recover lands, when the tenant or occupier has *ceased* for two years to perform the service which constitutes the condition of his tenure, and has not sufficient goods or chattels to be distrained.

CESSION, in a general sense, a surrender, but particularly a surrender of conquered territory to its former proprietor or sovereign by treaty.—**Cession**, in the civil law, is a voluntary surrender of a person's effects to his creditors, to avoid imprisonment.—In the ecclesiastical law, when an ecclesiastical person is created a bishop, or when a person of a parish takes another benefice without dispensation, their first benefices become void by *cession*, without resignation.—A *cessonary bankrupt* is one who has given up his estate to be divided among his creditors.

CLSTRUM, in botany, a genus of plants, class 5 *Pentandria*, order 1 *Monogynia*, of which there are many species, all of them shrubs, and nearly all natives of South America and the West India Islands.

CLSTUS, a girdle said to be worn by Venus, to which Homer ascribes the power of exciting love towards the wearer. It was also a marriage girdle, richly studded, with which the husband guided his wife at the wedding, and loosed again at night.

ALL THE MENTAL PHENOMENA ARE IN SOME WAY ASSOCIATED WITH OR DEPENDANT ON, THE HEALTHY ACTION OF THE BRAIN.

IMMEDIATELY AFTER THE DELIVERY OF A WRIT OF "CERTIORARI" TO THE JUDGES OF AN INFERIOR COURT, THEIR POWER IS SUSPENDED.

[CHA]

The Scientific and Literary Treasury ;

[CHA]

CH TATE, in chemistry, a compound of cetic acid, with a base.

CH TE, an order of animals in the Linnaean system, including such as have breathing apertures on the head, tail horizontal, and pectoral fins instead of feet, as the dolphin, porpoise, and grampus, &c. *Cetaceous* fish suckle their young like land animals.

CETIC ACID, in chemistry, a white solid substance, tasteless and inodorous, formed from spermaceti.

CETOL'OGIST, one who is versed in the natural history of the whale and its kindred animals.

CETUS, in astronomy, the Whale, a large constellation of the southern hemisphere, containing 37 stars.

CEYLANITE, in mineralogy, an argillaceous kind of stone, found in the island of Ceylon. Its colour is a dark blue.

CHABASITE, in mineralogy, a precious stone, white and sometimes transparent a kind of *scapolite*.

CHAFER, a forge in an iron mill, where the iron is hammered into bars, and brought to perfection.

CHAFER-WAX, an officer of the chancery court, who fits the wax for sealing writs, &c.

CHAFF, in husbandry, the dry calyx of corn, that is separated from it by screening or winnowing. The word is sometimes used to denote straw or hay cut small for the food of cattle.

CHAFFINCH, in ornithology, the English name of the *fringilla*, a well known bird, with an iron coloured breast, and black wings spotted with white.

CHAIN, a series of connected rings, or links fitted into one another. Chains are made of various metals, sizes, and forms, suited to different purposes.—In surveying, a chain is a measure of length, made of a certain number of links of iron wire, serving to measure a certain quantity of ground. Gunter's chain consists of a hundred such links, each measuring 7 1/2 inches, and consequently equal to 66 feet or 4 poles.

—In nautical language, chains are strong links or plants of iron, the lower ends of which are bolted through a ship's sides to the timbers.—*Chain boat*, a large boat fitted for getting up mooring chains, anchors, &c.—*Chain shot*, two balls connected by a chain they are used at sea for cutting the shrouds and rigging of a ship.

—A *chain pump* consists of a long chain, equipped with a sufficient number of valves, moving on two wheels, and is managed by a long winch, on which several men may be employed at the same time.—*Chain-plates* of a ship, are broad and thick planks projecting from a ship's side, abreast of and behind the masts.—A *top-chain*, on board a ship, is a chain to sling the sail yards in time of battle, to prevent their falling, when the ropes that support them are shot away.

—*Chain work*, work consisting of threads, cords, and the like, linked together in the form of a chain, as tambour or net-work, &c.

CHAIR, (*cathedra*), was anciently the *suggestum*, or pulpit, whence the priest or public orator spoke to the people. (See *CATHEDRA*.) It is still applied to the place whence professors in universities deliver their lectures, thus we say, the professor's chair. It is commonly used for a speaker or president of a public council or assembly, as the *speaker's chair*, and by a metonymy, the speaker himself, as, to address the chair.—*Chair*, among the Roman Catholics, certain feasts held anciently in commemoration of the translation of the see or seat of the vicarage of Christ by St Peter.—*Curule Chair*, in Roman antiquity, an ivory seat placed on a car, wherein were seated the chief magistrates of Rome, and those to whom the honour of a triumph was granted.

CHALAZA, among naturalists, a white knotty string at each end of an egg, whereby the yolk and white are connected together.—In medicine, it is a disorder in the eye lids, well known by the name of a *stye*.

CHALCANTHA, in natural history, a kind of compound salts, of a coarse and irregular structure, hard, and naturally impure and opaque.

CHALCEDONY, or CALCEDONY, in mineralogy, a genus of semiprecious gems, of an even and regular texture, of a semi opaque crystalline basis, and variegated with different coloured cloudy spots. It occurs in small veins, or in cavities of other minerals, and appears to have been formed by the filtration of siliceous matter. Under it may be grouped common chalcedony, heliotrope, carnelian, chrysoprase, onyx, sardonyx, and sard.

CHALCEDONYX, a variety of agate, in which white and gray layers alternate.

CHALCITE, in chemistry, sulphate of iron, of a red colour, so far esteemed as to have lost a considerable part of its acid.

CHALCIS, in ichthyology, a fish of the turbot kind.—In entomology, a class of insects, order *Hymenoptera*.

CHALCIDIUM, in ancient architecture, a magnificent hall belonging to a tribunal or court of justice.

CHALDEE, or CHALDAIC, the language spoken by the Chaldeans, or people of Chaldea. It is a dialect of the Hebrew.

CHALICE, the communion cup, or vessel used to administer the wine in the sacrament of the eucharist.

CHALIZA, in Hebrew antiquity, the ceremony whereby a woman, left a widow, pulled off her brother-in-law's shoes, who should have espoused her, after which she was at liberty to marry whom she pleased.

CHALK, in natural history, a well known calcareous earth, of an opaque white colour, found in hard masses, and called *creta* and *terra creta*. Chalk thrown into water, raises a great number of bubbles, with a hissing noise, and slowly diffuses itself into an impalpable powder. It contains a large portion of carbonic acid, and is a subspecies of carbonate of lime.—*Black chalk*, is a kind of ochreous earth, of a close structure,

THE "CATACROUS" FISHES INCLUDE THE GERRA MURON, SALMATA, PRISTIGER, AND DELPHINUS; NONE OF WHICH HAVE GILLS.

[CHA]

A New Dictionary of the Belles Lettres.

[CHA]

and fine black colour used in drawing upon blue paper—*Red chalk* an indurated clayey ochre, used by painters and artists.

CHALLENGE in a general sense a summons to fight whether in a duel or in a pugilistic contest. In law an excitation to jurors made by the party put on his trial or the claim of a party that certain jurors shall not sit in trial upon him or his cause. The right of challenge is given both in civil and criminal trials and extends either to the whole panel or only to particular jurors. In criminal cases a prisoner may challenge twenty jurors without assigning a cause which is called a *peremptory challenge*.

CHALYBEATE an epithet for waters in which iron forms the principal ingredient, as the waters of Tonbridge Wells. Chalybeates act chiefly as absorbents and diuretics. The action of the particles of a chalybeate by their elasticity together with the momentum they give the blood by their ponderosity makes it not only preferable to most other diuretics but also proper in other cases especially where there is a viscosity of the juices the blood impoverished or the circulation languid.

CHAM or CHAM the title of the sovereign prince of Tartary. It is likewise applied to the principal noblemen of Persia.

CHAMA a bivalve shell inhabited by a polype sometimes weighing 500 pounds. Among a great many elegant species of this genus we may reckon the *concha venusta* or Venus's shell with a spinous edge the *agate chama* and the *ivak chama*—In zoology a sort of wolf in Ethiopia spotted like a panther.

CHAMADE in war a signal made by beat of drum or sound of trumpet for a conference with the enemy either to invite to a truce or to propose a capitulation.

CHAMBER in building any room situated between the lowermost and uppermost rooms. *Chamber* in polity the place where certain assemblies are held also the assemblies themselves. Of these are established for the administration of justice others for commercial affairs. In many languages *chamber* is used to designate a branch of government where members assemble in a common apartment.

Privy chamber Gentlemen of the privy chamber are servants of the king who are to wait and attend on him and the queen at court.—In gunnery that part of a mortar or great gun as far as the powder and shot reach when it is loaded.—A *powder chamber* is a place under ground for holding powder, &c. that it may be secure from the rain or damp.—The *chamber of a mine* is a place generally of a cubical form where the powder is confined.—The *chamber of a lock* is the space between the gates of a lock in a canal, in which the barge rises and sinks so as to pass the lock.

CHAMBERLAIN in a general sense is a person who has the management and direction of a chamber, or chambers.—The *Lord Chamberlain of Great Britain* is the sixth high officer of the crown, to whom

belongs various duties on the coronation day and to whom also appertain many privileges. He is to provide all things in the House of Lords during the sitting of Parliament and the government of the palace of Westminster and under him are the gentlemen usher of the black rod and other officers. The office is hereditary.—The *Lord Chamberlain of the Household* is an officer who has the oversight and direction of all officers belonging to the king's chambers (except the priest of the king's bed chamber).—The *Chamberlain of London* is the officer who keeps the city money, presides over the affairs of citizens and their apprentices and presents the freedom of the city to those who have faithfully served their apprenticeships.

CHAMBERS rooms or apartments belonging to the inn of court.—In anatomy, two spaces between the crystalline lens and the cornea of the eye divided off by the iris.

(CHAMBER ARDLNTL (French burning chamber) a chamber hung with black cloth in which state prisoners in France, if of high rank were tried by torch light. When Francis II. in the 16th century established a court to try the Protestants, who were usually condemned to be burned, the people called this court by the same name in allusion to its awful sentence.

CHAMILEON a reptile of the lizard tribe about twelve inches long including the tail. It feeds on insects and from the capacity of its lungs is enabled to expand its skin and thereby varying the angle of reflected light changes its colour to a spectator. Its natural colour in the shade and at rest is said to be a bluish gray. It is a native of Asia and Africa. Various poets and fabulists have at different periods contributed to its celebrity and by inaccurate or fanciful representations have rendered it far more of a prodigy than nature ever intended it to be. Chameleons are all exceedingly slow dull and almost torpid. The only part they move with celerity is their long tongue which is covered at its extremity with a viscid mucus and is darted out for the purpose of capturing insects, upon which the animal subsists.

CHAMOIS or the Wild Goat an animal which inhabits the Alpine mountains having horns erect round and smooth. Its skin is made into soft leather called *shammy*.

CHAMOMILE an odoriferous plant, which has a very bitter taste, but many medicinal virtues.

CHAMPAGNE a fine brisk kind of French wine so called from Champagne, a former province of France.

(CHAMPFRIE) in law a bargain made with either plaintiff or defendant in any suit for giving part of the land debt &c. and for to the party who undertakes the process at his own expense.

(CHAMPION) a person who undertakes a combat in the place of another some times the word is used for him who fights in his own cause. In ancient times when two champions were chosen to maintain a

IRON, IN SPRINGS, BINDS TOGETHER THE SAND AND GRAVEL INTO SOLID MASSES, AND THE CARBONATE FORMS CHALKY SPRINGS

THE INTOXICATING EFFECTS OF CHAMPAGNE ARE SPEEDY, BUT VERY TRANSIENT IT IS THEREFORE THE SAFEST WINE OF ANY TO DRINK.

[CHA]

UNDER THE CHANCELLOR OF OXFORD, WHO IS INSTALLED WITH GREAT CEREMONY, IS A VICE-CHANCELLOR AND FOUR PRO-VICE-CHANCELLORS.

cause, it was always required that there should be a decree of the judge to authorise the combat: when the judge had pronounced sentence, the accused threw a gage or pledge, originally a glove or gantlet, which being taken up by the accuser, they were both taken into safe custody, till the day of battle appointed by the judge. Before the champions took the field, their heads were shaved to a kind of crown or round, which was left at the top; they then made oath that they believed the person who retained them to be in the right, &c. They always engaged on foot, and with no other weapon than a club and a shield, and they always made an offering to the church, that God might assist them in the battle.—(*Champion of the King (or Queen)*), an officer who rides armed into Westminster Hall on the coronation, while the sovereign is at dinner, and by herald makes proclamation, "That if any man shall deny the king's (or queen's) title to the crown, he is there ready to defend it in single combat," which being done, the sovereign drinks to him, and then presents him with the cup for his fee.

CHAN'CEL, that part of the choir of a church between the altar and the balustrade that incloses it, where the minister is placed at the celebration of the communion. The *Chancel* is also the rector's freehold and part of his glebe, and therefore he is obliged to repair it, but where the rectory is inappropriate, the impropriator must do it.

CHAN'CELLOR. Under the Roman emperors, a chancellor signified a chief notary or scribe, but in England it means an officer invested with high judicial powers.—The *Lord High Chancellor of Great Britain* is one of the principal officers of the civil government, created without writ or patent, by the mere delivery of the king's great seal into his custody. He is a privy-counsellor by his office, and proclutor of the House of Lords by prescription. He also appoints all the justices of the peace throughout the kingdom. Persons exercising this office in former times having been ecclesiastics, and superintendants of the royal chapel, the Lord Chancellor is still styled *keeper of the king's conscience*, and for the same reason he is visitor, in right of the king, of all hospitals and colleges of the king's foundation, and patron of all the king's livings under the value of 20*l.* per annum in the king's books. He is the general guardian of all infants, idiots, and lunatics, has a controul over all public charities, and a jurisdiction of vast extent, as the head of the law, in his Court of Chancery, where he decides without the assistance of a jury, but from which there is an appeal to the House of Lords.—*Chancellor of a Diocese*, a lay officer under a bishop, versed in the canon and civil law, who is judge of his court.—*Chancellor of a Cathedral*, an officer who hears lessons in the church, inspects schools, hears causes, writes letters, and applies the seal of the chapter, keeps the books, &c.—*Chancellor*

of a University, an officer who seals the diplomas, or letters of degree, &c. The chancellors of Oxford and Cambridge are selected from among the prime nobility: the former holds his office for life; the latter is elected every three years.—*Chancellor of the Duchy of Lancaster*, an officer appointed chiefly to determine controversies between the king and his tenants of the dutchy land, and otherwise to direct all the king's affairs belonging to that court.

—*Chancellor of the Exchequer*, an officer who presides in that court, and takes care of the interests of the crown. He has power with the lord treasurer, to lease the crown lands, and with others, to compound for forfeiture of lands, on penal statutes: he has also great authority in managing the royal revenues, and in all matters relating to the finances of the state.—*Chancellor of the Order of the Garter*, and other military orders, is an officer who seals the commissions and mandates of the chapter and assembly of the knights, keeps the register of their proceedings, and delivers their acts under the seal of their order.

CHAN'CE-MEDLEY, in law, the accidental killing of a person, not altogether without the killer's fault, though without any evil intention.

CHAN'CEY, the grand court of equity and conscience, instituted to moderate the rigour of the other courts that are bound to the strict letter of the law. In this court all patents, the generality of commissions, deeds between parties respecting lands and estates, treaties with foreign princes, &c., are sealed and enrolled. Out of it are issued writs to convene the parliament and convocation, proclamations and charters, &c. And from this court issue all original writs that pass under the great seal, commissions of charitable uses, bankruptcy, idocy, lunacy, &c.

CHAN'CES, a branch of mathematics, which estimates ratios of probability.

CHAN'GEABLE ROSE, or MARTINICO ROSE, the *Hibiscus mutabilis* of Linnaeus. The flowers of this plant are white at their first opening, then change to a blush-rose colour, and as they decay turn to a purple.

CHAN'GES, in mathematics, the permutations or variations which any number of things may undergo in regard to position or order, &c. as, how many different ways letters may be transposed so as to form words, or how many changes may be rung on a given number of bells, &c.

CHAN'NEL, the deeper part of a strait, bay, or harbour, where the principal current flows, either of tide or fresh water, or which is most convenient for the track of a ship. Also, a narrow sea between two continents, or a continent and an island; as the British or Irish channel.

CHAN'TRY, a place to say mass for souls, or sing in divine worship.

CHA'OS, that confusion in which matter is supposed to have existed before the world was produced by the creative power of Omnipotence; or, in other words, the unformed primeval matter of which every

THE DOCTRINE OF "CHANCES" IS IMPORTANT FOR THE CALCULATION OF INSURANCE-RATES, AND THE VALUE OF LIFE-ANNUITIES.

A New Dictionary of the Belles Lettres.

[CHA

THE FAMOUS TEMPLE OF EPHESUS WAS BUILT UPON WOODEY PILARS, WHICH HAD BEEN CHARR'D ON THE OUTSIDE TO PRESERVE THEM.

thing was made. The ancient poets, and Ovid in particular, represent *chaos* thus: that there was neither sun to make the day, nor moon to enlighten the night, that the earth was not yet hung in the circumambient air, nor the sea bounded by any shore, but that earth, air, and water, were one undigested mass.

CHAPEAU, (Fr) in heraldry, an ancient cap of dignity worn by dukes, made of scarlet velvet and lined with fur.

CHAPEL, a place of divine worship, served by an incumbent under the denomination of a chaplain. There are various kinds of chapels, as *parochial chapels*, distinct from the mother church, *chapels of ease*, built in large parishes for the accommodation of the inhabitants, *free chapels*, which were founded by different kings, *chapels* belonging to particular colleges, *domestic chapels*, built by noblemen or gentlemen for the use of their families, and discharging meeting houses, which are sometimes, though improperly, denominated *chapels*.

CHAPELRY, the precinct belonging to a chapel, in distinction from a parish, or that belonging to a church.

CHAPLAIN, an ecclesiastic who performs divine service in a chapel, but it more commonly means one who attends upon a king, prince, or other person of quality, for the performance of his clerical duties in the private chapel.

CHAPLET, in a general sense, a garland or wreath to be worn on the head.—In architecture, a little moulding, carved into round beads, pearls, &c.—*Chaplet*, a string of beads used by the Roman Catholics, by which they count the number of their prayers, and are called *paternosters*. This practice is believed to have been introduced by Peter the Hermit into the church on his return from the Holy Land, the Orientals using a kind of chaplet called a chain, and reciting one of the perfections of God on each link or bead.

CHAPTER, in ecclesiastical polity, is an assembly for the transaction of such business as comes under its cognizance. Every cathedral is under the superintendence of the dean and *chapter* of its canons. A meeting of the members of an order of knighthood is also called a *chapter*.

CHARACTER, in its most obvious sense, denotes a mark or sign made by writing, engraving, &c., these are *literal*, as the letters of an alphabet, *numerical*, as the arithmetical figures, and *emblematical*, when they represent things or ideas.—In a more extended sense it signifies, the peculiar qualities impressed by nature or habit on a person, which distinguish him from others; hence we say, this person is an exalted *character*, that man's *character* is unimpeachable, or, his *character* is not formed, when the person alluded to has not acquired stable and distinctive qualities. We also say, in speaking of persons, "eminent characters," or "vicious characters," &c.—In natural history, the peculiar discriminating qualities or properties of ani-

mals, plants, and minerals, are called their *characters*.

CHARACTERISTIC, in a general sense, a peculiar mark or character, whereby a person or thing is distinguished from all others.

CHARADE, a syllabic enigma, so named from its inventor, made upon a word the two syllables of which, when separately taken, are themselves words. It consists of three parts, the two first describing the syllables separately, the second alluding to the entire word, and may be considered complete if the whole unite in an epigrammatic point.

CHARCOAL, an artificial fuel, consisting of wood half burnt, or charred, which is performed in the following manner: the wood is cut into proper lengths, and duly arranged in pits or stacks, and these being coated over with turf, and the surface covered with plaster made of earth and charcoal dust well tempered together, are set on fire.

In about two or three days, when the wood is known to be sufficiently charred, the apertures, which had been left to give vent to the flames, are closed up, and all access to the external air being excluded, the fire goes out of itself. The vapour of burning charcoal is found to be highly noxious, and is, in reality, absolute *pest*.

In the experiments and discoveries of modern chemistry, charcoal is frequently mentioned, and found to possess many extraordinary properties. It is black, brittle, light, and inodorous, is incapable of putrefying, or rotting like wood, and will endure for ages without alteration.

CHARGE, in a general sense, is that which is enjoined, committed, intrusted or delivered to another, implying care, custody, oversight, or duty to be performed by the party intrusted.—(*charge*, in civil law, the instructions given by the judge to the grand jury.—In ecclesiastical law, the instructions given by a bishop to the clergy of his diocese.—In gunnery, the quantity of powder and ball, or shot, with which a gun is loaded.—In electricity, the accumulation of electric matter on one surface of an electric machine.—In heraldry, whatever is borne on coats of arms.—In military affairs, a signal to attack, as, to sound the *charge*, or the attack itself, by rushing on an enemy with fixed bayonets, but it is used for an onset of cavalry as well as of infantry.

CHARIOT, in antiquity, a car or vehicle used formerly in war, and called by the several names of *biga*, *triga*, *quadriga*, &c., according to the number of horses which drew them. When the warriors came to encounter in close fight, they alighted and fought on foot, but when they were weary they retired into their chariot, and thence annoyed their enemies with darts and missile weapons. Besides this sort, we find frequent mention of the *curvus falcatus*, or chariots armed with hooks or scythes, with which whole ranks of soldiers were cut off together. These were not only used by the Persians, Syrians, Egyptians, &c. but we

THE DEANS OF THE THREAS AT BERGLAND WERE CONVERTED INTO CHARCOAL BY THE LAVA WHICH OVERFLOWED THAT CITY.

[CHA]

[CHB]

THE CITY OF LONDON IS STILL IN POSSESSION OF TWO ORIGINAL CHARTERS GRANTED BY WILLIAM THE CONQUEROR, IN 1066.

find them among our British ancestors.

—The Roman *triumphal chariot* was generally made of ivory, round like a tower, or rather of a cylindrical figure; sometimes gilt at the top and ornamented with crowns; and, to represent a victory more naturally, they used to stain it with blood. It was usually drawn by four white horses, but oftentimes by lions, elephants, tigers, bears, leopards, &c.

CHARISIA, a Roman nocturnal festival and dance kept in honour of the Graces, when sweet-meats called *charisia* were distributed among the guests.

CHARISTIA, a solemn festival among the Romans kept in the month of February. It was well worthy the imitation of Christians, for at this time the relations of each family compromised any differences that had arisen between them, and renewed their former friendships upon the principles of pure benevolence and good-will.

CHARITY, in a general sense, that disposition of heart which inclines men to think favourably of their fellow-men, and to do them good, or liberality and benevolence, either in aims-giving or in contributing to wards public charitable institutions.—In a theological sense, supreme love to God, and universal good-will to men.

CHARLATAN, one who makes unwarrantable pretensions to skill, and prates much in his own favour. The original import of the word was an empiric, or quack, who retailed his medicines on a public stage, and drew the people about him by his buffooneries.

CHARLES'S WAIN, in astronomy, seven stars in the constellation called *Ursa Major*, or the Great Bear.

CHARLOCK, the English name of a plant called by botanists *ragwortum*. It is a very pernicious weed among grain.

CHARM, some magical words, characters, verses, &c. imagined to possess some occult and unintelligible power by which, with the supposed assistance of the devil, witches and sorcerers have pretended to do wonderful things. The word, in its more modern acceptation, is used to describe that which delights and attracts the heart.

CHART, a hydrographical map, drawn for the use of navigators, and showing the situation of coasts, rocks, sand banks, and sea-marks; the course of currents, the depth of soundings, and the direction of regular winds.—*Mercator's Chart* is one on which the meridians are straight lines, parallel and equidistant, the parallels are also straight lines, and parallel to each other, but the distance between them increases from the equinoctial towards either pole, in the ratio of the secant of the latitude to the radius.—*Globular Chart*, is a meridional projection, in which the distance of the eye from the plane of the meridian, upon which the projection is made, is supposed to be equal to the sine of the angle of 45 degrees.—*Heliographic Charts*, descriptions of the body of the sun, and of the maculae or spots observed on its disk.—*Selenographic Charts*, are draughts of

particular places, or small parts of the earth.

CHARTER, in law, a written instrument, executed with usual forms, whereby the king grants privileges to towns, corporations, &c.; whence the name of *Magna Charta*, or the Great Charter of Liberties granted to the people of the whole realm.

CHARTER-PARTY, in commerce, an agreement respecting the hire of a vessel and the freight; which must contain the name and burden of the vessel, the names of the master and freighter, the price or rate of the freight, the time of loading and unloading, and other stipulated conditions.

CHARYBDIS, a much-dreaded vortex at the entrance of the Sicilian straits, celebrated for its engulfing perils, by the ancient writers. It is, however, no longer dreadful to navigators, who, in a quiet sea, and particularly with a south wind, cross it without danger.

CHASE, in law, a part of a forest for game, which may be possessed by a subject; though a forest cannot. The word *chase* has also several meanings in maritime language, as, *chase gun*, that he at the head, to fire on a vessel that is pursued, in distinction to *stern-chasers*, which fire on the pursuer.—With huntsmen, the *chase* is a figurative expression for their sport in general.

CHASING, in sculpture, the art of embossing on metals, or representing figures thereon by a kind of *baso-relievo*, punched out from behind, and carved on the front with small gravers.

CHASSEURS, a French term for a select body of light infantry, formed on the left of a battalion, and who are required to be particularly light, active, and courageous.—*Chasseurs a cheval*, a kind of light horse in the French service.

CHATEAU, a French word, formerly used for a castle or baronial seat in France; but now simply for a country seat.

CHATYANT, in mineralogy, a hard semi-transparent stone, generally very small, which being cut smooth, presents an undulating or wavy light, and is of a yellowish grey or green colour.—The word *chatoyant* is also used to express a changing undulating lustre, like that of a cat's eye in the dark.

CHATTELS, in law, personal goods, movable, or immovable.

CHECK-MATE, the movement in a game of chess that hinders the opposite men from moving, so that the game is finished, and the party who is checkmated has lost.

CHECKY, in heraldry, a term for the shield, or any part of it, when it is divided into checks, or squares.

CHEEK, a general name among mechanics for those pieces of timber, &c., in any machine, which form corresponding sides, or which are double and alike.

CHEESE, the curd of milk coagulated by rennet, and separated from the whey, then pressed or hardened in a vat, hoop, or mould.—*Cheese-press*, an engine for press-

CHARTERS WERE FIRST GRANTED TO TOWNS, TO EMANCIPATE THE INHABITANTS FROM THE LOCAL TYRANNY OF THEIR FEUDAL LORDS.

BY CHEMISTRY WE BECOME ACQUAINTED WITH THE RECIPROCAL ACTION OF ALL THE BODIES OF NATURE UPON EACH OTHER

ing curd in the making of cheese — Cheese rat, the case in which curds are pressed into the form of a cheese

CHEF D'ŒUVRE (French) a master piece or superior performance of any artist

CHEGOF a tropical insect that enters the skin of the feet and multiplies incredibly causing an itching

CHFLIDON, in entomology a brown fly with silvery wings

CHELIDONIUM in botany a genus of plants, class 13 Polyandria order 1 Monogynia

CHLONIAN, an epithet to designate animals of the tortoise kind

(CHEMISTRY or CHYMISTRY the science which investigates the nature of bodies and teaches the composition and properties of material substances, together with the changes they undergo There is no science more extensive, nor is it scarcely possible for one person to embrace it in its whole extent To chemistry more or less scientifically pursued, numerous arts owe their birth and progress and to chemistry the naturalist must resort for the explanation of phenomena that without its aid can only be spoken of by conjecture and on a true knowledge of which our happiness as thinking beings minutely depends To facilitate the study of this important science it is considered in different points of view, and thrown into divisions and subdivisions so that a person may devote himself to one department of it although the method of observing analyzing and combining is the same in all and although all the phenomena must be explained by the general theory and refer to certain laws, of which a previous knowledge is requisite These laws constitute what is called philosophical chemistry which explains what is meant by the affinity of aggregation or cohesion and by the affinity of composition or chemical affinity It also considers the effects of light heat and electricity, the nature of the simple and compound inflammable bodies of air and water the composition and decomposition of acids the nature and properties of the salts their relations to the acids the calcination, solution, and alloying of metals the composition and nature of plants the characteristics of the immediate elements of vegetable substances the phenomena of animalization the properties of animal compounds and the decay of organic substances These are its general views but as we have before observed in order to facilitate the study of chemistry it is divided into several separate branches There is a meteorological chemistry by which the great phenomena observed in the atmosphere are explained and a geological chemistry which seeks to account for the various combinations of nature beneath the earth's surface which produce volcanoes veins of metals, coal, basalt &c There is also a chemistry of the mineral kingdom, comprising the examination of all inorganic substances a chemistry of the vegetable kingdom, which analyzes plants and their

immediate products, a chemistry of the animal kingdom which studies all substances derived from living or dead animals a pathological and pharmaceutical chemistry which traces the changes produced by disease with the nature and preparation of medicines, and agricultural chemistry which treats of the nature of plants and soils and the laws of production The practical chemist distinguishes bodies into simple and compound substances Simple substances comprehend such as have hitherto not been decomposed Of these some are denominated combustibles because they can undergo combustion or, in other words can burn, as hydrogen, carbon, phosphorus and borax besides the alkalis, earths and metals Some are supporters of combustion, which though not of themselves capable of undergoing combustion are necessary to produce this effect in other bodies of which there are three namely the three gaseous bodies oxygen, chlorine, and iodine (or pound substances are formed by the union of simple substances with each other or by that of compound substances with others They result, 1 from the combination of oxygen, or one of the other simple supporters of combustion with one of the simple combustibles such as the acids 2 from that of a simple body combined with oxygen with another similar compound such as the salts 3 from that of two or three simple combustibles with one another 4 from that of oxygen with hydrogen and carbon forming vegetable matter 5 from that of oxygen with hydrogen carbon and azote forming animal matter When the constituent parts of bodies are separated from each other the bodies are said to be decomposed and the act of separating them is called decomposition on the other hand when bodies are so intimately united as to form new and distinct substances this chemical union is distinguished by the name of combination The chemical investigation of bodies therefore proceeds in two ways namely by analysis that is the separation of bodies by a series of decompositions and combinations to come at the knowledge of the constituent parts and synthesis by a series of processes to form new compounds and these two forms of investigation may accompany and assist each other The commencement of the 19th century forms a brilliant era in the progress of chemistry but great as have been the discoveries and preserving as are the researches of the most profound inquirers, every step that is taken confirms more strongly the fact that chemistry is a progressive science and that the discoveries of to day may be eclipsed by the discoveries of to morrow And therefore truly has it been said that its analysis is infinite its termination will have been attained only when the real elements of bodies shall have been detected and all their modifications traced but how remote this may be from its present state we cannot judge Nor can we, from our present knowledge, form

VEGETABLES ARE COMPOSED OF HYDROGEN OXYGEN, AND CARBON ANIMALS OF OXYGEN, HYDROGEN, CARBON PHOSPHORUS, AND LIME

The Scientific and Literary Treasury;

[CHE]

any just conception of the stages of discovery through which it has yet to pass.

CHERRY, the *Prunus Cerasus*, a fruit, the original stock of which is the wild cherry. The gradual effect of cultivation has been the production of several pleasant varieties, all superior to the fruits of the parent stock. The wood of the cherry-tree, which is hard and tough, is much used by turners, cabinet makers, &c. The gum that exudes from the bark is said to be, in many respects, equal to gum arabic, and is considered very nutritive.

CHERRY-LAUREL, the *Prunus lauro-cerasus*, which produces laurel-water, a most powerful poison, the strength of which (like that of peach-kernels, &c.), depends on the presence of prussic acid.

CHERTSE, a tract of land, of any indefinite extent, which is nearly surrounded by water, but united to a larger tract by a neck of land or isthmus.

CHERT, in mineralogy, a subspecies of rhomboidal quartz, which occurs often in metallic veins in primitive mountains. It is somewhat translucent, and of various colours.

CHERUBIM, the plural of *Cherub*, an order of angels, two of which, by the command of God, were represented as overshadowing the propitiatory or mercy-seat. They are usually represented by painters and sculptors by a child's head between wings, and in the celestial hierarchy they are placed next in order to the seraphim.

CHERVIL, a genus of umbelliferous plants whose leaves are divided into many segments. Two species are called *Cosmoed*.

CHESLIP, a small vermin that lies under stones and tiles.

CHESS, a game played by two persons sitting *vis-a-vis*, and having between them a checkerboard, containing sixty-four squares, alternately white and black. The game affords so much variety, so much scope for calculation, so many opportunities to exhibit foresight and penetration, that it has been held in great estimation by all persons acquainted with it, and all who have conquered the difficulties of learning it. Whilst it affords enjoyment worthy of mature minds, it is an excellent exercise for the young, as it teaches patience and circumspection, strengthens the judgment, and encourages perseverance in a plan affording a prospect of eventual success, though, at the moment, the situation of things may appear very critical. It is a game of Asiatic origin. The Chinese pretend to have known it 200 years before the Christian era. In the sixth century it was brought from India to Persia, whence it was spread by the Arabians and the Russians all over the civilized world.—Although it may trespass a little on our limits we deem it necessary to insert the laws of this unrivalled game.—The board must be so placed, that each player has a white square at his right hand. Each side has eight men, consisting of a king, queen, two knights, two bishops, and two

rooks or castles, besides eight pawns or foot-soldiers which are all moved according to the following rules. 1. If the board, or pieces, be improperly placed, the mistake cannot be rectified after four moves on each side are made. 2. When a player has touched a piece, he must move it, unless it was only to replace it; when he must say, *J'adoube*, or *I replace*. 3. When a player has quitted a piece he cannot recall the move. 4. If a player touch one of his adversary's pieces without saying *J'adoube*, he may be compelled to take it, or, if it cannot be taken, to move his king. 5. When a pawn has moved two steps, it may be taken by any adversary's pawn which it passes, and the capturing pawn must be placed in that square over which the other leaps. 6. The king cannot castle if he has before moved, if he is in *check*, if in casting he passes a check, or if the rook has moved. 7. Whenever a player *checks* his adversary's king, he must say *check*, otherwise the adversary need not notice the check. If the player should, on the next move, attack the queen, or any other piece, and then say *check*, his adversary may replace his last move, and defend his king.

8. When a pawn reaches the first row of the adversary's side, it may be made a queen, or any other piece the player chooses. 9. If a false move is made, and is not discovered until the next move is completed, it cannot be recalled. 10. The king cannot be moved into *check*, nor within one square of the adverse king, nor can any player move a piece or pawn that leaves his king in *check*—The object of the game is, to bring the adversary's king into such a situation that he cannot move, which is called *check mating*. The king can never be taken, and the play ends with a check-mate.

CHEST, which in anatomical language is called the *thorax*, is the cavity of the body between the neck and the belly, containing the plicura, the lungs, heart, œsophagus, thoracic duct, part of the vena cava, the vena azygos, &c.

CHEST NUT, or **CHESTNUT**, the nut of a tree belonging to the genus *Fagus*. It is enclosed in a prickly pericarp, which contains two or more seeds. The tree grows to a great size, and produces very valuable timber.

—The *Horse chestnut* is a tree of the genus *Aesculus*. The common tree of this sort is a native of the north of Asia, and admired for the beauty of its flowers. The *Scarlet-flowering horse chestnut* is a native of Carolina, Brazil, and the East.—There is also another, called the *Indian Rose-chestnut*, of the genus *Mussa*.

CHEVAL-DE-FRISE (generally used in the plural, *Chevaux-de-frise*, (Fr. pron. *shévo de frîez*), spikes of wood, pointed with iron, five or six feet long, fixed in a strong beam of wood, and used as a fence against cavalry, or to stop a breach, &c.

CHEVALIER, a gallant young man.—In heraldry, a horseman armed at all points.

CHEVRETTE, a military term for a

CHARLES XII. OF SWEDEN PLAYED AT CHESS WHEN HE WAS CLOSELY BESIEGED IN THE HOUSE NEAR BENDER, BY THE TURKS.

AL-AMIN, CALIPH OF BAGDAD, WOULD NOT BE DISTURBED IN CHESS-PLAYING WHEN THE CITY WAS CARRIED BY ASSAULT.

A New Dictionary of the Belles Lettres.

[CHI]

kind of gin, or machine, for raising guns or mortars into their carriages.

CHEVRON (in heraldry), an honourable ordinary, representing two rafters of a house joined together, or meeting at the top.—*Per Chevron*, is when the field is divided only by two single lines, rising from the two base points, and meeting in the point above, as the chevron does.

CHEVROTA'IN, in zoology, a small kind of antelope.

CHIAN EARTH, a medicinal, compact, dense kind of earth, from Chios, used anciently as an astrigent, and also as a cosmetic.

CHIARO SCURO (an Italian phrase, meaning *clear-obscure*), is the art of distributing lights and shadows in painting. This is of the highest importance, and one of the most difficult branches of an artist's study, because of the want of precise rules for its execution.

CHIASTROLITE, a curious kind of crystallized mineral, sometimes called *maele*.

CHICANERY, mean or unfair artifices to perplex a cause or obscure the truth; applied either in a legal sense, by which justice is somehow intended to be perverted; or to disputatious sophistry.

CHIEF, a term signifying the head, or principal part of a thing or person. Thus we say, the chief of a party, the chief of a family, &c.—**CHIEF** (in heraldry), one of the honourable ordinaries, which occupies the head or upper part of the escutcheon. As the head is the chief part of a man, so is the chief the principal part of the escutcheon, and contains a third part of the field.

CHIEFTAIN, a captain or commander of any class, family, or body of men: thus, the Highland chieftains, or chiefs, were the principal noblemen or gentlemen of their respective clans.

CHILBLAIN, a tumour occasioned by suddenly warming a cold part, or suddenly cooling a heated part: hence the parts of the body most subject to chilblains, are the toes, fingers, ears, &c.

CHIL'IAID, the sum or number of one thousand. Hence *Chil'arch* denotes the military commander or chief of a thousand men: *Chil'archy*, a body consisting of 1000 men: *Chil'arch'dron*, a figure of 1000 equal sides: and *Chil'agon*, a figure of 1000 angles and sides.

CHILTERN-HUNDREDS, a range of chalky hills on the borders of Bedfordshire and Buckinghamshire, belonging to the crown, and having the office of Steward of the Chiltern Hundreds attached to it. It being an established rule that a member of parliament receiving a place under the crown cannot sit, unless re-elected, the acceptance of a stewardship of the Chiltern Hundreds is a formal manner of resigning a seat. *Chiltern* is from the Saxon word *chilt*, and generally applied to the hundreds that lie in the hilly part of a county.

CHIMERA, in its modern acceptance, means a vain or idle fancy; a creature of the imagination, full of contradictions and

absurdities. In fabulous history, it denoted a monster with three heads, that of a lion, a goat, and a dragon, vomiting flames. The foreparts of the body were those of a lion, the middle was that of a goat, and the hinder parts were those of a dragon.

CHIMES, the musical sounds of bells struck with hammers, arranged and set in motion by clock-work. In a clock, a kind of periodical music, produced at certain hours by a particular apparatus.

CHIMNEY, in architecture, a body of brick or stone erected in a building, containing a funnel to convey smoke and other volatile matter through the roof from the grate or hearth. How far the Greek and Roman architects were acquainted with the construction of chimneys is a matter of dispute. No traces of them have been discovered in the ruins of Pompeii, and Vitruvius gives no rules for erecting them. The first certain notice of chimneys, as we now build them, is believed to be that contained in an inscription of Venice, over the gate of an edifice, which states that in 1347 a great many chimneys were thrown down by an earthquake.

CHINA-WARE, the most beautiful of all kinds of earthenware, takes its name from China, whence the Dutch and English merchants first brought it into Europe. It is also called *Porcelain*, from the Portuguese *porcellana*, a cup or vessel. The Japan china is considered superior to all other of oriental manufacture, in its close and compact granular texture, its sonorosity when struck, its extreme hardness, its smooth and shining appearance, and its capability of being used to boil liquids in. With the Chinese potters, the preparation of the clay is constantly in operation; and usually remains in the pits from ten to twenty years prior to being used; for the longer it remains there, the greater is its value. The Dresden China has some qualities which render it decidedly superior to the oriental. Its texture exhibits a compact, shining, uniform mass, resembling white enamel, while it possesses firmness, stolidity, and infusibility by heat. The requisite materials for the components of the best hard china are sparingly supplied by nature; but modern chemistry has thrown much light on the art, not only in enabling the manufacturer to analyze more perfectly the bodies which constitute these wares, but also in determining the exact proportions in which they combine; and when proper attention is paid to the proportions of the several components, there is seldom any failure. Silica obtained from *flints*, and alumine, are the grand ingredients; and when these substances are properly combined in water, their reciprocal tendencies cause strong adhesion, so that, when hardened merely by evaporation into a paste, they resist decomposition by the atmosphere. It is not our intention to advert to the various processes and manipulations which the clay undergoes previous to its being baked, the ingenuity with which the printer takes his impressions from the cop-

THE FIRST APPARATUS FOR PRODUCING CHIME-MUSIC, IS SAID TO HAVE BEEN MADE AT ALOST, IN THE NETHERLANDS, IN 1487.

FLOUR OF SULPHUR THROWN INTO THE GRATE WHEN A CHIMNEY IS ON FIRE, EXTINGUISHES IT, BY DECOMPOSING THE ATMOSPHERIC AIR.

IN THE EARLY AGES OF CHIVALRY, ARCHERY WAS CONSIDERED AS AN ESSENTIAL PART OF THE EDUCATION OF A GENTLEMAN.

per-plates, nor the still more ingenious process of transferring and adapting the print to the ware. We will merely add, that the colours, or enamels with which designs are executed on the glazed surface of ware, with colours so vitrifiable as readily to acquire lustre at a moderate heat, has not yet been practised quite a century in our potteries; but such have been the improvements in every branch of the art during late years, and with such laudable rivalry have the abilities of first-rate artists been displayed, that if absolute perfection could be attained by human labour, we might fairly expect to find it here.

CHINTZ, a fine kind of Indian painted calico.

CHIRA'GRA, in medicine, a name for the gout in the hands.

CHIROGRAPH, among the Anglo-Saxons, signified any public instrument of gift or conveyance, attested by the subscription and crosses of witnesses. Any deed requiring a counterpart was engrossed twice on the same piece of parchment, with a space between, on which was written *chirograph*, through which the parchment was cut, and one part given to each party. It was also anciently used for a fine: the manner of engrossing the fines, and cutting the parchment in two pieces, is still retained in the chirographer's office, in the Court of Common Pleas.

CHIROLOGY, the art or practice of communicating thoughts by signs made by the hands and fingers; as a substitute for language.

CHIROMANCY, a species of divination, drawn from the different lines and lineaments of a person's hand; by which means, it is pretended the inclinations may be discovered. The modern word is *palmystry*.

CHIRONOMY, in antiquity, the art of representing any past transaction by the gestures of the body, more especially by the motions of the hands: this made a part of liberal education; it had the approbation of Socrates, and was ranked by Plato among the political virtues.

CHISLEU, the ninth month of the Jewish year, answering to the latter part of November and the beginning of December.

CHIVALRY, the name anciently given to knighthood, a military dignity; also the martial exploits and qualifications of a knight. Chivalry, as a military dignity, is supposed by some to have taken its rise soon after the death of Charlemagne, and by others as arising out of the crusades, because in these expeditions many chivalrous exploits were performed, and a proud feeling of heroism was engendered. In describing the origin, object, and character of this military institution, Gibbon the historian thus alludes to a successful candidate for the honour of knighthood, and eulogises the institution: "He was created a knight in the name of God, of St. George, and of St. Michael the Archangel. He swore to accomplish the duties of his profession; and education, example, and the public opinion, were the inviolable guard-

ians of his oath. As the champion of God and the ladies, he devoted himself to speak the truth; to maintain the right; to protect the distressed; to practice *courtesy*, a virtue less familiar to the insidels; to despise the allurements of ease and safety; and to vindicate in every perilous adventure the honour of his character. The abuse of the same spirit provoked the illiterate knight to disdain the arts of luxury and peace; to esteem himself the sole judge and avenger of his own injuries; and proudly to neglect the laws of civil society and military discipline. Yet the benefits of this institution, to refine the temper of barbarians, and to infuse some principles of faith, justice, and humanity, were strongly felt, and have been often observed. The asperity of national prejudice was softened; and the community of religion and arms spread a similar colour and generous emulation over the face of Christendom. Abroad in enterprise and pilgrimage, at home in martial exercise, the warriors of every country were perpetually associated; and impartial taste must prefer a Gothic tournament to the Olympic games of classic antiquity. Instead of the naked spectacles which corrupted the manners of the Greeks, and banished from the stadium the virgins and matrons, the pompous decoration of the lists was crowned with the presence of chaste and high born beauty, from whose hands the conqueror received the prize of his dexterity and courage."

CHIVES, in botany, slender threads or filaments in the blossoms of plants.

CHL'ENA, in antiquity, a winter garment worn over the tunica. It was likewise used as a covering for a bed.

CHLA'MYS, in antiquity, a military habit worn over the tunica. It belonged to the patricians, and was the same in the time of war, that the toga was in the time of peace.

CHLORATE, in chemistry, a compound of chloric acid with a salifiable base.

CHLORIDE, in chemistry, a compound of chlorine with a combustible substance, as the chloride of azote, manganese, lime, &c.

CHLORINE, or **CHLORIC GAS**, formerly known as **OXYMURIATIC ACID GAS**, is by some considered as a compound, and by others as a simple substance. It combines with carburetted hydrogen, and thereby exhibits the mechanical phenomena of combustion; but will not support animal life. It discharges colours, and is used as a bleaching liquid.

CHLORITE, a mineral of a grass green colour, opaque, and composed of small shining grains. There are four subspecies: chlorite earth, common chlorite, chlorite slate, and foliated chlorite.

CHLORO-CARBONOUS ACID, in chemistry, a compound of chlorine and carbonic oxide, formed by exposing a mixture of the two gases to the direct solar rays.

CHLOROPAL, a recently discovered mineral, of two varieties, the conchoidal and the earthy; both possessing magnetic properties.

A TABLE SPOONFUL OF CHLORIDE OF LIME, IN A WINE-GLASS OF WATER, PURIFIES INFECTED AIR AND PREVENTS CONTAGION.

[CHO]

A New Dictionary of the Belles Lettres.

[CHO]

CHLOROPHANE, in mineralogy, a variety of fluor spar, found in Siberia. When placed on a heated iron, it gives a beautiful emerald green light.

CHLOROPHYL, the green matter of the leaves of vegetables.

CHLORO'SIS, a disease incident to females, characterised by a pale or greenish hue of the skin.

CHOCOLATE, a cake or paste, made from the kernel of cocoa, mixed with sugar and cinnamon; of which a nutritious beverage is made.

CHOIR, that part of a cathedral where the service is performed. Also, the body of singers there assembled. Hence the word *chorister* is used for a singer whose vocal powers are exercised in divine service.

CHOKO-DAMP, in mining, the noxious air occasionally found at the bottom of mines.—[See DAMPS.]

CHOLERA, a disease of which there are two species: *Cholera spontanea*, which happens in hot seasons without any manifest cause; and *Cholera accidentalis*, which occurs after the use of food that digests slowly and irritates. In warm climates it is met with at all seasons of the year, and its occurrence is very frequent; but in England and other cold climates, it is prevalent in the middle of summer, particularly in the month of August; and the violence of the disease has usually been greater in proportion to the intensity of the heat. It is characterised by an evacuation of bile, attended with anxiety, painful gripings, vomitings, spasms of the abdominal muscles, and those of the calves of the legs. The disease sometimes proceeds with violence, and if unchecked in its early stages, great depression of strength ensues, and it may quickly terminate in death. But it must not be confounded with the

CHOLERA MORBUS, or **CHOLERA EPIDEMICA**, or, as it is sometimes termed, **CHOLERA MALIGNA**. In Hindostan, sporadic cholera has probably always existed as a comparatively mild climatic disease; but there is no evidence to show that the Indian Cholera ever bore the epidemic character, or was entitled to rank with pestilential scourges of the worst description, till August, 1817, when it suddenly broke out with unprecedented malignity, attacking the natives first, and manifesting itself among the Europeans in the following month. From January to May, 1818, the pestilence raged with great violence, extending its destructive influence across the country from the mouth of the Ganges to its confluence with the Jumna. In its most malignant form it appeared at Benares, where in two months 15,000 persons perished. In the district of Gorakhpore 30,000 were carried off in a month. By November the epidemic had reached the grand army, commanded by the marquis of Hastings, consisting of 10,000 troops and 80,000 followers. In twelve days nearly 9,000 men had fallen victims to it. Previous to the 14th, it had overspread the camp, sparing neither age nor sex; from the 14th to the

20th, the mortality had become so extensive that the stoutest hearts were yielding to despair, and the camp wore the aspect of a general hospital. The noise and bustle almost insupportable from the presence of a multitude of human beings, had nearly subsided into stillness. Nothing was to be heard but the groans of the dying, or the wailing for the dead. In 1819 it reached the kingdom of Arracan: it then extended itself into Siam, and after destroying 40,000 in Baku, the capital of that kingdom, it passed into the peninsula of Malacca. From thence it travelled to China. Canton was attacked in 1820; and at Pekin its mortality was so frightful, that the government were obliged to have the dead interred at their own expense. From China it passed to the Philippine and Spice Islands. Thus, in little more than two years, did it traverse a space in Eastern Asia, of 1800 leagues from north to south, and about 1000 leagues from west to east. During the next two years, Arabia, Persia, Mesopotamia and Syria were overrun by the dreadful pestilence. In September, 1823, it entered Astracan, a large and populous town on the northern shore of the Caspian. As soon as this became known to the Russian government, they dispatched a medical commission, composed of six physicians, to investigate its character, and every preventive measure was resorted to: how far they were connected with the result it may be difficult to decide; but certain it is, the disease got no farther in that direction that year than Astracan, and did not again appear in Russia until towards the close of 1828, when it unexpectedly appeared at Orenburg, and in 1830 it again made its insidious entrance at Astracan. It at length reached Moscow, where a *cordon sanitaire* was speedily established, temporary hospitals erected, and the emperor himself visited the town when the disease was at its height. At first the mortality was as great as nine-tenths of all who were attacked, but the number who were infected gradually decreased, and the mortality proportionally diminished. Poland, Prussia, and other parts of Germany, soon after felt its devastating effects; in November, 1831, it reached England; in March, 1832, it broke out at Paris, where 20,000 fell a sacrifice to it in a short time; and in June, 1832, it appeared at Quebec, in Canada, and subsequently spread over the whole American continent. It is not our purpose, nor consistent with the nature of this work, to enter into a description of the symptoms, character, and treatment of this justly dreaded disease; but we thought it material to condense a history of its progress, from its origin in the East to its entrance in our own land; and we will conclude the article, by giving a brief definition of its distinctive features, as they appeared in Britain:—After watery diarrhoea, or other generally slight indisposition, vomiting or purging of a white or colourless fluid, violent cramps, great prostration and collapse, the last occurring simultaneously with the vomiting and cramps, or shortly after them.

FROM ALL THAT WE CAN LEARN OF THE NATURE OF CHOLERA EPIDEMICA, IT APPEARS CERTAIN THAT INSTANT MEDICAL ATTENTION IS INDISPENSABLE.

THE DANGER OF CHOLERA IS IN ALL CASES TO BE ESTIMATED FROM THE DEGREE OF COLLAPSE ATTENDING THE COLD STAGE OF THE DISEASE.

The Scientific and Literary Treasury;

[CHR.]

RELIGIOUS FEELS COMMENCED IN THE SECOND CENTURY IN REGARD TO THE DIVINITY OF CHRIST, WHICH LED TO PROSCRIPTIONS AND PERSECUTIONS

Should the patient survive the last train of symptoms, a state of excitement and fever supervenes.—For a considerable time the medical world was much divided in opinion as to its contagious or non contagious nature the disputes on this subject however have now nearly subsided and the great majority of medical men are persuaded that the disease is epidemic, and not contagious in its character.

CHOI OGOUES medicines which expel or evacuate bilious faces

CHOPIN a liquid measure in France about a pint in Scotland a quart

CHORD in music the union of two or more sounds uttered at the same time forming an entire harmony as a third fifth and eighth.—In geometry a right line drawn from one part of an arc of a circle to another

CHORLE RAPHY the art of representing dancing by signs as singing is by notes

CHOREUS in ancient poetry a foot of two syllables the first long and the second short the *trochee*

CHORIAMBUS in ancient poetry a foot compounded of a trochee and an iambus

CHOROGRAPHY the art of delineating or describing some particular country or province it differs from *geography* as a description of a particular country differs from that of the whole earth and from *topography* as the description of a country from that of a town or district

CHOROID in anatomy denotes the coat of the eye immediately under the sclerotics or the inner membrane investing the brain or the pia mater &c

CHORUS in ancient dramatic poetry one or more persons present on the stage during the representation uttering an occasional commentary on the piece preparing the audience for events that are to follow or explaining circumstances that cannot be distinctly represented several examples may be referred to by the English reader in the plays of Shakspeare In tragedy the chorus was at first the sole performer at present it is wholly discontinued on the stage.—**CHORUS** in music is when at certain periods of a song the whole company art to join the singer in repeating certain couplets or verses

CHOUGH (pron *chuff*) in ornithology a fowl of the genus *Cornus* nearly of the size of the crow and mischievous like the magpie It is black except the bill legs and feet which are red and is a native of the west of England more especially the county of Cornwall whence it is commonly called the *Cornish chough*

CHRISM or **CHRISOM** in the Romish and Greek churches an unction or anointing of children, which was formerly practiced as soon as they were born

CHRISTIANITY the religion of Christians who derive their name from the founder **CHRIST** (*The Anointed*) and were first so designated at Antioch The foundation of a Christian faith and practice his ultimate and in truth, only appeal must be to the facts the doctrines and the

precepts of the Scriptures, especially to those of the New Testament

CHRISTENING a term particularly applied to infant baptism denoting the ceremony of admitting a person into the communion of the Christian church by means of baptism or sprinkling with water

CHRISTMAS the festival observed in the Christian church on the 25th of December in commemoration of our Saviour's nativity and celebrated in the church of England by a particular service set apart for that holy day

CHRISTMAS ROSE in botany a plant of the genus *Helicorhiza* producing beautiful white flowers about Christmas

CHRISTOMACHI an appellation given to all heretics who deny Christ a divinity or maintain heterodox opinions concerning his incarnation

CHRIST'S THORN in botany the *Rhamnus palustris* a deciduous shrub having two thorns at each joint It grows in Palestine and the south of Europe and is supposed to have been the sort of which the crown of thorns for our Saviour was made

CHROMASTICUS a genus of colored gems comprehending all those of variable colours as viewed in different lights

CHROMACIL in chemistry a salt or compound formed by the chromic acid with a base

CHROMATIC in music an epithet descriptive of that which proceeds by several consecutive semitones

CHROMATICS that part of optics which explains the several properties of light and colour

CHROMYL in mineralogy a metal which in its highest degree of oxidation passes into the state of an acid of a ruby red colour It takes its name from the various and beautiful colours which its oxide and acid communicate to minerals into whose composition they enter Chrome gives a fine deep green to the enamel of porcelain &c.—*Chromic yellow* the artificial chrome of lead is a beautiful pigment

CHRONIC an epithet for inveterate diseases or those of long duration

CHRONOGRAM an inscription in which a certain date or epoch is expressed by numeral letters

CHRONOLOGY the science which determines the dates of events and the civil distinctions of time The divisions of time are either natural or artificial the natural divisions of time are the year month week day and hour deduced from the motions of the heavenly bodies and suited to the purposes of civil life the artificial divisions of time are the cycle or period the epoch and the era or epoch which have been framed for the purposes of history Truly has it been said 'history without chronology is dark and confused chronology without history is dry and misapplied'

CHRONOMETER a time piece of a peculiar construction or any instrument that measures time with great exactness They are at present much employed by navigators in determining the longitude at sea

THE EXHIBITION OF A CHORUS WAS IN ATHENS AN HONOURABLE CIVIL PRIZE AND THE LEADER OF IT WAS CALLED "CONTEPEUS"

CHY]

A New Dictionary of the Belles Lettres.

[C/M

CHRONIASIMA, in mineralogy a name for pellucid gems which appear of one simple and permanent colour in all shades of light

CHREYSALIS or **AURELIA** the second state of an insect which it passes into from the caterpillar or reptile form previous to its becoming a butterfly or a moth &c

CHRYSAN THEMUM in botany a genus of plants, class 19 *syngenesia* order 2 *Polygamia superflua* There are many well known species, annuals, perennials and shrubs

CHRYSOBERTYL a yellowish gem usually found in small round pieces or crystallized in eight sided prisms It is used in jewelry and is next to sapphire in hardness

CHREYSOLITE a mineral or stone of a greenish hue often transparent It is some small crystals

CHRYSOPTILA a genus of insects with times granular and at other times occurs in bracelet like antennae thickest towards the extremities the body of an oval form and the thorax rounded Of this genus which belongs to the order *Coleoptera* there are different species denominated from the tree on which they feed as the chrysomela of taney beech alder willow &c some being of one colour some of another with a tinge of gold colour diffused through it

CHREYSOPHRASE in mineralogy a sub species of quartz often of an extremely beautiful green colour and translucent or semi transparent In hardness it is scarcely inferior to flint

CHRYSOPHYLLUM in botany a genus of plants class 5 *Pentstemon* order 1 *Monogynia* The species are all shrubs

CHRYSOPEIA in alchemy that part of the art which teaches the making of gold out of more imperfect metals

CHRYSOPELIUM Golden saxifrage in botany a genus of the *octandria digynia* class of plants with six petals the fruit is an unilocular two horned capsule containing a number of very minute seeds

CHURCH in religious affairs is a word which is used in several senses 1 The collective body of persons professing one and the same religion or that religion itself thus we say the Church of Christ - Any particular congregation of Christians associating together as the Church of Antioch 2 A particular set of Christians as the Greek Church or the Church of England 3 The body of ecclesiastics in contradistinction to the laity 4 The building in which a congregation of Christians assemble

CHURCHWARDENS officers annually chosen by the ministers and vestry to superintend the church its property and concerns

CHYLE a white or milky fluid in the stomach consisting of the finer and more nutritious parts of the food which is received into the lacteal vessels assimilated into blood and converted into nutriment

CHYLIFICATION the process of digestion by which the aliment is converted into chyle

CHYLIOPTIC, having the power to convert into chyle

CHYME the humour which is immediately drawn from the aliment and afterwards by a farther process is converted into chyle

CIARI LEGES in Roman history, were sumptuary laws the intention of which was to limit the expense of feasts and introduce frugality amongst the people whose extravagance at table was notorious and almost incredible

CICADA the BAW CRICKET in entomology a genus of four winged insects, of the order *Hemiptera*

CICATRICA a small whitish speck in the yolk of an egg supposed to be the germinating point or first rudiments of the future chick

CICATRICE or **CICATRICE** in surgery a scar or elevation of callous flesh rising on the skin and remaining there after a wound or ulcer

CICATRIZANT a medicine or application that promotes the formation of a cicatrix called also an escharotic, agglutinant &c

CICERONIANS epithets given by Marcus Frassius &c to those moderns who were so ridiculously fond of Cicero as to reject every Latin word as obsolete or impure that could not be found in some one or other of his works The word *ciceronian* is also used as an epithet for a diffuse and flowing style and a vehement manner

CICISBEI an Italian word signifying one who dangles about female

CICUTA in botany Water hemlock This term was used by the ancients and by medical writers for the *Cicuta maculata* or common hemlock the juice of which was given as a poison Both Socrates and Phocion perished by it It is now often used medicinally with good effect

CIDARIS in antiquity the mitre used by the Jewish high priests

CILIA the EYELASHES in anatomy are certain rigid hairs situated on the arch or tarsus of the eyelids and bent in a very singular manner they are destined for keeping external bodies out of the eye and for moderating the influx of light

CILIARY in anatomy an epithet for several parts belonging to the cilia, or eyelashes as the *ciliary glands* &c

CILATED in botany furnished or surrounded with parallel filaments somewhat like the hairs of the cyclops whence its name

CIMCIUM in Hebrew antiquity a sort of habit made of coarse stuff formerly in use among the Jews in times of mourning and distress It is the same with what the Septuagint and Hebrew versions call sack cloth

CIMBRIC pertaining to the Cimbric inhabitants of the Cimbric Chersonese, now Julund

CIMMERIAN pertaining to *Cimmerium*, a town at the mouth of the Palus Maeotis, which the ancients pretended was involved in darkness whence the phrase Cimmerian

THE CHRYSOLITE EMPLOYED IN THE ARTS COMES CHIEFLY FROM THE DEKANY, AND IS SOMETIMES USED IN JEWELLERY

THE PATRIARCH OF CONSTANTINOPLE IS THE HEAD OF THE GREEK CHURCH, AS THE POPE IS THE HEAD OR CHIEF OF THE CHURCH OF ROME

[CIN]

The Scientific and Literary Treasury;

[CIN]

darkness" to denote a deep or continual obscurity. The country is now called the Crimea.

CIMOLITE, a species of earth, of which there are several varieties; one, of a purple colour, is the steatite, or soap rock, and from another sort, found in the Isle of Wight, tobacco-pipes are made.

CINCIONA, the Peruvian bark, obtained from certain trees growing to the height of fifteen or twenty feet, and natives of Peru. Linnaeus describes two species, the white and the coloured, and a third has been found in the West Indies, particularly in Jamaica and St. Lucia. The two latter are used in medicine. It was first introduced for the cure of intermittent fevers, and in these, when properly exhibited, it rarely fails of success.

CINCURE, in architecture, a ring, list, or orlo, at the top and bottom of a column, separating the shaft at one end from the base, and at the other from the capital.

CINERITIOUS, an appellation given to different substances, on account of their resembling ashes, either in colour or consistence.

CIN NABAR, in natural history, is either native or factitious. *Native* cinnabar is an ore of quicksilver, moderately compact, very heavy, and of an elegant striated red colour. It is called native vermilion, and when used by painters is rendered more beautiful by grinding it with gum-water and a little saffron. It is found amorphous, or under some imitative form, and crystallized. *Factitious* cinnabar is a mixture of mercury and sulphur sublimed, and thus rendered into a fine red colour.

CINNAMON, a fragrant spice, obtained from the bark of a low tree, (the *laurus cinnamomum*) growing on the island of Ceylon. The true cinnamon is a most grateful aromatic, and one of the best cordial, carminative spices. Its leaves resemble those of the olive, and the fruit resembles the acorn or olive, having neither the smell or taste of the bark, both yield an essential oil.

CINQUEFOIL, or **FIVE LEAVED CLOVER**, a perennial. This plant is sometimes borne in coats of arms.

CINQUE-PORTS, the five ancient ports on the east coast of England, opposite to France, namely, Dover, Hastings, Hythe, Romney, and Sandwich, to which were afterwards added, as appendages, Winchelsea and Rye. As places where strength and vigilance were necessary, and whence ships might put to sea in cases of sudden emergency, they formerly received considerable attention from government. They have several privileges, and are within the jurisdiction of the Constable of Dover Castle, who, by his office, is called Warden of the Cinque-Ports. Until the time of Henry VIII. the Crown seems to have had no permanent navy; the Cinque-ports having always furnished nearly the whole of the shipping required for the purposes of the state. In consideration of this service, many privileges and franchises were granted to

them by different sovereigns, valuable at the time, but which have now become in a great measure nominal, in consequence of the various exactions and restrictions to which they refer having long since been abolished. The freedom from toll and dues, still recognized at several ports, seems to be the most valuable right remaining to the freemen; the exemption from serving on county juries and from service in the militia are also understood as belonging to them. The jurisdiction of the Cinque ports extends along the coast continuously from Birchington, which is to the north-east of Margate, to Seaford in Sussex; and each has one or more ports or towns members of it, some of which are corporate, and others not. In ancient times there were several courts of jurisdiction, extending over all the ports and members, and intended either as courts of appeal for persons who considered themselves injured by any of the separate and local tribunals of the different ports, or for regulating the general affairs of the whole association, but these may now be considered as obsolete, their functions having dwindled to mere matters of form.

[We had scarcely penned the foregoing paragraph when we saw an account of the splendid banquet, given at Dover, August 30, 1839, in honour of that illustrious warrior the Duke of Wellington, as Warden of the Cinque-Ports. Participating, in common with the rest of our countrymen, in those feelings which gave birth to this patriotic tribute, we hope to be excused (though we may step a little out of the usual track) for thus endeavouring to perpetuate the remembrance of so proud a day.—Dover was thronged with visitors of rank from all parts of the kingdom the morning was ushered in by the ringing of bells and the firing of cannon, and every countenance beamed with delight. The pavilion in which the banquet was given was erected on the Priory meadow, directly opposite the large hall, called the Maeson Dieu. It was of immense size, (standing on 20,420 feet of ground, including its covered ways and entrance lobbies), and was intended for the accommodation of 2,250 persons. It was gorgeously and appropriately decorated with military emblems, &c. In all parts of the hall floated a profusion of flags, and the effect of this picturesque scene, when filled with the company, was brilliant in the extreme. Party feeling and factious hostility were nobly laid aside, and many members of the British senate, peers as well as commoners, were there assembled to do homage to "the great captain of the age." Among them was Lord Brougham—the bold politician, the astute reasoner, the great forensic orator—a man who had ever taken a prominent station among the political opponents of the Duke, but who on that day poured forth a torrent of panegyric, which was heard with grateful delight, and of which the following detached passages will at least convey some slight idea. "On this day, and on this occasion," said his lordship, "all personal, all political feelings are quelled— all strife of party is

THE LORD WARDEN OF THE CINQUE-PORTS PRESIDED AT THE SUPREME COURT, ASSISTED BY THE MAYORS, BAILIFFS, &c. FROM EVERY PORT AND TOWN.

THE OFFICES COGNIZABLE BY THE COURT OF SHEPWAY WERE, TREASURY, SHERIFF, SHERIFF, COUNTERFEITING COIN, AND CONCEALING TREASURE FOUND.

CIN]

[CIR]

A COURT OF "LUDENRAGE," FOR THE LICENSING AND REGULATION OF PILOTS, IS HELD BEFORE THE LORD WARDEN AND COMMISSIONERS.

hushed; and we are incapable, whatever our opinions may be, of refusing to acknowledge transcendent merits, and denying that we feel the irresistible impulse of unbounded gratitude. No long course of opposition, however contrasted on public principle—no political hostility (for any other than political never could be felt)—not even long inveterate habits of public opposition—are able so far to pervert the nature, so far to stifle the natural feelings of our hearts, so far to obscure our reason, as to prevent us from feeling, as we ought, boundless gratitude for boundless merits—to pluck from our minds an admiration proportioned to the transcendent genius in peace and war, of him who is our guest; or to lighten and alleviate that painful feeling, that deep sense which the mind never can get rid of when it is overwhelmed by a load of gratitude—a debt too boundless to be repaid."

"What else have I to do if I had all the eloquence of all the tongues that ever were attuned to speak? what else can I do, and how would a thousand words, and all the names that can be named, speak so powerfully, or even the tongue of an angel speak so powerfully, as that very one word—Sir Arthur Wellesley, Duke of Wellington—the hero of a hundred fields, in all of which his banner has waved in triumph; who never—I invoke both hemispheres—bear witness Europe, bear witness Asia—who never advanced but to cover his arms with glory! mighty captain, who never advanced but to be victorious—mighty captain, who never retreated but to eclipse the glory of his advance; performing the yet harder task of unwearied patience, of indomitable fortitude, of exhaustless resources, of transcendent skill; the wonders, the miracles of moral courage never yet subdued; despising all that thwarted him with ill-considered advice; neglecting all hostility, so he knew it to be groundless; leaving to scorn reviling enemies, jealous competitors, lukewarm friends; ay, hardest of all to neglect—despising even a fickle public—casting his eye forward to the time when that momentary fickleness of the people would pass away, well-knowing that in the end the public is always just to merit." His lordship then took a brief review of the Duke's matchless achievements in the field, his inexhaustible fertility in difficulties, his high moral courage, and his inflexible devotion to his country; beautifully contrasting all with the actions of the greatest heroes of ancient and modern times, from Cæsar to Napoleon, and acknowledging that he, whose deeds they were met to celebrate, infinitely excelled them. Alluding to the scenes of rapine which had marked the career of former conquerors, and the guilty ambition which led them to enslave their fellow-creatures, he exclaimed, "Our chief has never drawn his sword but in that defensive war, which alone of all warfare is not a great crime. He has never drawn his sword against the liberty of any people, but he has constantly unsheathed it, and, blessed

be God, he has triumphantly unsheathed it, to secure the liberty of all. The servant of his prince to command his troops, but the soldier and defender of his country; the enemy of her enemies, be they foreign or be they domestic; but the fast friend of the rights of his fellow-subjects, and the champion of their lawful constitution. The tempest which resounded all over the world is now, thanks to him, hushed; the shock which made the thrones of Europe to quake, and the horns of the altar themselves to tremble, has, thanks to him, expended its force. We may, thanks to him, expect to pass the residue of our days without that turmoil of war in which our youth was brought up; but if ever the materials of some fell explosion should once more be collected by human wickedness in any quarter of the globe—if the hushed tempest should again break loose from its cave—if the shock which is felt not now should once more make our institutions to quiver, happy this nation that knows to what wise counsel to look; happy the sovereign that has at his command the right arm that has carried in triumph the English standard all over the globe; happy the people who may yet again confide, not their liberties indeed, for that is a trust he would spurn from him with indignation—but who would confide in his matchless valour for their safety against all the perils which Providence may yet have in store for them."

CIPHER, or CYPHER, one of the Arabic characters, or figures, used in computation, formed thus 0. A cipher standing by itself signifies nothing; but when placed at the right hand of a figure, it increases its value tenfold.—By Cipher is also denoted a secret or disguised manner of writing; in which certain characters arbitrarily invented and agreed on by two or more persons, are made to stand for letters or words.

CIPOLIN, a green marble from Rome, containing white veins.

CIPPUS, in antiquity, a low column, with an inscription, erected on the high roads, or other places, to show the way to travellers, to serve as a boundary, to mark the grave of a deceased person, &c.

CIRCEAN, pertaining to Circe, the fabled daughter of Sol and Perseus, who was supposed to possess great knowledge of magic and venomous herbs, by which she was able to charm and fascinate.

CIRCENSIAN GAMES (*Circenses Ludi*), a general term, under which was comprehended all combats exhibited in the Roman circus, in imitation of the Olympic games in Greece. Most of the feasts of the Romans were accompanied with Circensian games; and the magistrates, and other officers of the republic, frequently presented the people with them, in order to gain their favour; but the grand games were held for five days, commencing on the 15th of September.

CIRCINAL, in botany, an epithet applied to plants whose leaves are rolled in spirally downwards, the tip occupying the centre.

EACH CINQUE-PORT AND CORPORATE TOWN FURNISHES NEARLY ALL THE JURISDICTION AND ARRANGEMENTS OF A SEPARATE COUNTY.

[CIR]

The Scientific and Literary Treasury;

[CIR]

CIRCLE, in geometry, a plane figure, bounded by a curve line, called its circumference, and which is everywhere equally distant from a point within, called its centre. The circumference or periphery itself is called the circle, though improperly, as that name denotes the space contained within the circumference. A circle is described with a pair of compasses, fixing one foot in the centre and turning the other round to trace out the circumference. The circumference of every circle is supposed to be divided into 360 equal parts, called degrees and marked °; and each degree into 60 minutes, marked '. The word *Circle* is also used to describe an assembly, or set of persons; as a political circle; our circle of friends, &c.—*Circles of latitude*, are great circles perpendicular to the plane of the ecliptic, passing through its poles and through every star and planet. *Circles of longitude* are lesser circles parallel to the ecliptic, diminishing as they recede from it.

—*Diurnal circles*, are immovable circles supposed to be described by the several stars and other points in the heavens, in the rotation of the earth round its axis.—*Horary circles*, in dialling, are the lines which show the hours on dials.

CIRCOCELE, in anatomy, a varix, or dilatation of the spermatic vein; hernia varicosa.

CIRCUITS, certain districts or divisions of the kingdom, through which the judges pass once a year, or oftener, to hold courts and administer justice. The six jurisdictions into which England is divided by the twelve judges, are called the Home, Norfolk, Midland, Oxford, Western, and Northern circuits. Wales is also divided into North and South circuits; and Scotland, into South, West, and North.

CIRCULATING MEDIUM, a term in commerce, signifying the medium of exchanges, or purchases and sales, whether this medium be gold or silver coin, paper, or any other article: and it is therefore of a more comprehensive nature than the term *money*. All people have a circulating medium of some description, and accordingly, we find all the tribes of savages hitherto discovered referring to some article in estimating the value of the various commodities which compose their capital. But from the earliest times, the precious metals, where they could be had, have been preferred for this purpose, because they comprised a sufficient value in a small compass and weight to be a convenient medium. A well-coutrived, skilfully-conducted system of banking, connected with one of circulation, is one of the greatest triumphs of national economy; for the interest, as well as the reputation of individuals, is thus pledged in support of the system, and in furtherance of the general industry and prosperity.

CIRCULATION, in anatomy, the natural motion of the blood in a living animal, whereby it proceeds from the heart to all parts of the body by the arteries, and returns to the heart by the veins. The *circu-*

lation of the blood is performed in the following manner: the blood is returned to the right auricle of the heart, by the descending and ascending *venæ cavæ*, which, when distended, contracts and sends its blood into the right ventricle; from the right ventricle it is propelled through the pulmonary artery, to circulate through, and undergo a change in the lungs, being prevented from returning into the right auricle by the closing of the valves, which are situated for that purpose. Having undergone this change in the lungs, it is brought to the left auricle of the heart by the four pulmonary veins, and thence is evacuated into the left ventricle. The left ventricle when distended contracts, and throws the blood through the aorta to every part of the body, by the arteries, to be returned by the veins into the *venæ cavæ*. It is prevented from passing back from the left ventricle into the auricle by a valvular apparatus; and the beginning of the pulmonary artery and aorta is also furnished with similar organs to prevent its returning into the ventricles.

CIRCULUS, in anatomy, any round or annular part of the body, as the *circulus oculi*, the orb of the eye.

CIRCUMAMBIENT, an epithet given to anything that surrounds or encompasses another on all sides; chiefly used in speaking of the air.

CIRCUMCISION, a ceremony in the Jewish and Mahometan religions, performed by cutting off the prepuce, or foreskin. This was a federal rite annexed by God, as a seal to the covenant which he made with Abraham and his posterity, and was accordingly renewed, and taken into the body of the Mosaic constitutions. The time for performing this rite was the eighth day, that is, six full days after the child was born. The Jews distinguished their proselytes into two sorts, according as they became circumcised, or not: those who submitted to this rite were looked upon as children of Abraham, and obliged to keep the laws of Moses: the uncircumcised were only bound to observe the precepts of Noah, and were called *Noachides*.

CIRCUMFERENTOR, a mathematical instrument used by land surveyors for taking angles by the magnetic needle. It is an instrument (where great accuracy is not desired) much used in surveying in and about woodlands, commons, harbours, sea-coasts, in the working of coal-mines, &c.

CIRCUMFLEX, in grammar, an accent serving to note or distinguish a syllable of an intermediate sound between acute and grave: generally somewhat long.

CIRCUMFORANEUS, an epithet for wandering about.—*Circumforaneous musicians*, male and female, are daily seen at the doors of hotels, in France; and sometimes they enter the room, expecting a few sous for their reward. Nor are characters of a similar description by any means rare in London.

CIRCUYGRAATION, in anatomy, the turning a limb round in the socket.

CIRCUMLOCUTION, a paraphrastical

THE BLOOD IS SAID TO BE ONE-FIFTH OF THE WEIGHT OF THE WHOLE BODY, AND THREE-FOURTHS OF IT ARE IN THE VEINS.

CIRCUMCISION WAS AN ANCIENT PRACTICE OF THE EGYPTIANS, ETHIOPIANS, SYRIANS, PERSIANS, AND OTHER ASIATIC NATIONS.

THE LENGTH OF THE CIRQUE MAXIMUS WAS 9381 FEET; ITS BREADTH, 2167 FEET.

PUBLIC CHARIOT-RACES, EXHIBITIONS OF FUGIUM, WRESTLING, AND OTHER ATHLETIC EXERCISES, WERE THE AMUSEMENTS OF THE ROMAN CIRCUS.

[CIT]

A New Dictionary of the Belles Lettres.

[CIV]

method of expressing one's thoughts, or saying in many words that which might have been said in few.

CIRCUMPOLAR, an appellation given to those stars which, from their vicinity to the pole, revolve round it without setting.

CIRCUMPOTATION, in antiquity, a funeral entertainment which was given in honour of the deceased to the friends that attended. It was afterwards abolished by law.

CIRCUMROTATION, the act of rolling or revolving round, as a wheel.

CIRCUMSTANTIAL EVIDENCE, in law, is that kind of evidence obtained from circumstances which necessarily or usually attend facts of a particular nature. It is used to corroborate personal evidence.

CIRCUMVALLATION, or *Line of Circumvallation*, in the art of war, is a trench bordered with a parapet, thrown up round the besieger's camp, by way of security against any army that may attempt to relieve the place besieged, or to prevent desertion.

CIRCUS, in antiquity, a round or oval edifice, used for the exhibition of games and shows to the people: one of these, the *Circus Maximus*, at Rome, was nearly a mile in circumference.—In modern times, the word is applied to designate a circular enclosure for the exhibition of feats of horsemanship.

CIRRI, in botany, fine strings or thread-like filaments, by which some plants fasten themselves to walls, trees, &c., such as those of the ivy.—*Cirri*, in ichthyology, certain oblong and soft appendages, not unlike little worms, hanging from the under jaws or mouths of some fishes: these cirri, commonly translated beards, afford marks to distinguish the different species of the fish on which they are found.

CIRRIFEROUS, in botany, an epithet for a leaf or a peduncle bearing tendrils.

CISALPINE, on this side the Alps, as regards Rome. It must be observed, however, that what was *Cisalpine* with regard to the Romans, is *Transalpine* with regard to us.

CISPADANE, on this side the river Po, with regard to Rome; that is, on the south side.

CISTERCIANS, in church history, a religious order founded in the 11th century by St. Robert, a Benedictine.

CISTUS, in botany, the Rock-rose: a genus of the *polyandria-monogynia* class of plants, many of which are beautiful evergreen flowering shrubs, and most of them natives of the southern parts of Europe.

CITATION, in ecclesiastical courts, is the same with *summons* in civil courts.—A *Citation* is also a quotation of some law, authority, or passage from a book.

CITHARA, in antiquity, a musical instrument, the precise structure of which is not known.

CITHARISTIC, an epithet for anything pertaining to or adapted for the harp.

CITHERN, an ancient stringed instrument, supposed to bear a resemblance of the guitar.

CITRATE, in chemistry, a neutral salt formed by a union of the citric acid with a base.

CITRIC ACID, in chemistry, that property found in the juice of lemons and limes, which gives it the sour taste. This acid by chemical preparation may be converted into crystals, and in that state it can be kept any length of time.

CITRINE, a species of very fine sprig crystal, of a beautiful yellow colour, found in columns, and terminating in a hexangular pyramid.

CITRON, the fruit of the citron-tree, a large species of lemon. The tree has an upright smooth stem, with a branching head, rising from five to fifteen feet, adorned with large oval spear-shaped leaves. The citron, lime, and lemon, are different varieties of the *citrus medica*, a native of Upper Asia, from whence it was brought into Greece, and afterwards transplanted into Italy. Lemon-juice, which is one of the sharpest and most agreeable of all acids, is used in cookery, confectionery, and various other ways, particularly in medicine, as one of the best remedies for the scurvy with which we are acquainted. Sometimes it is crystallized into a white and acid salt; but what is sold in the shops under the name of essential salt of lemons, for taking out ink-stains and iron-moulds from linen, is only a preparation from the juice of sorrel.

CITY, a large town, incorporated and governed by particular officers. In Great Britain, it means a town having a bishop's see, and a cathedral; but this distinction is not always observed in common discourse, for we say the town of Ely, which is a bishop's see, and the city of Westminster, which at present has no see.—War having rendered it requisite that cities should be defensible posts, the smallness of the space they occupied became a consideration of importance. Their inhabitants were taught to crowd themselves together as much as possible; and among the expedients resorted to was that of building apartments over one another, thereby multiplying the number of dwellings without increasing the superficial magnitude of the place. Trade, too, by requiring a multitude of persons upon one spot, has always been the foundation of what we now call cities. Cities usually possess, by charter, a variety of peculiar privileges; and these charters, though they now sometimes appear to be the supporters of a narrow policy, were, in their institution, grants of freedom at that time nowhere else possessed; and by these the spell that maintained the feudal tyranny was broken.—

CITY, (*civitas*), among the ancients, was used in synonymous sense with what we now call an imperial city; or, rather, answered to those of the Swiss cantons, the republics of Venice, Genoa, &c., as being an independent state, with territories belonging to it.

CIVET, (*zibethum*), a soft unctuous substance, like musk, the smell of which it resembles, is contained in a bag, growing from the lower part of the belly of a civet-cat.

ACCORDING TO PLINY, THE CIRQUE MAXIMUS WAS CAPABLE OF CONTAINING 260,000 SPECTATORS, AND ACCORDING TO AURELIUS VICTOR, 385,000.

CITRONS ARE IMPORTED, PRESERVED AND CANDIED, FROM MADEIRA.

[CLA]

The Scientific and Literary Treasury ;

[CLA]

Civet was formerly in high repute for its medicinal qualities, but is now used only as a perfume.

CIV'ET-CAT, an animal of the fox or weasel species, a native of the Indies and South America.

CIV'IC CROWN, (*corona civica*), in antiquity, a crown, or garland composed of oak leaves, given by the Romans to any soldier who had saved the life of a citizen. Various marks of honour were connected with it: the person who received the crown wore it at the theatre, and when he entered, the audience rose up as a mark of respect.

CIV'IL, an epithet applicable to whatever relates to the community as a body, or to the policy and the government of the citizens and subjects of a state. It is opposed to *criminal*, as a *civil* suit, a suit between citizens alone, and not between the state and a citizen. It is also distinguished from *ecclesiastical*, which respects the church, and from *military*, which includes only matters relating to the army and navy.—The popular and colloquial use of the word *civil*, means unpleasant polite.—*Civil Law*, is properly the peculiar law of each state, country, or city, but as a general and appropriate term, it means a body of laws composed out of the best Roman and Grecian laws, comprised in the Institutes, Code and Digest of Justinian, &c. and, for the most part, received and observed throughout all the Roman dominions for above 1200 years. This law is used under certain restrictions in our ecclesiastical courts, as also in the university courts and the court of admiralty.—*Civil List*, the revenue appropriated to support the civil government, also the officers of civil government who are paid from the public treasury. As used in England, it signifies the sum which is granted to every king, at the beginning of his reign, for the support of his court and household, of ambassadors, and of the civil government in general.—*Civil Death*, in law, that which cuts off a man from civil society, or its rights and benefits, as banishment, outlawry, &c., as distinguished from *natural death*.—*Civil War*, a war between people of the same state, or the citizens of the same city.—*Civil Year*, the legal year, or that form of the year which each nation has adopted for computing their time by. The civil year in England and other countries of Europe consists of 365 days for the common year, and 366 days for leap year.—*Civil Architecture*, the architecture which is applied to buildings constructed for the purposes of civil life, in distinction from military and naval architecture.

CIVIL'IAN, a doctor or professor of the civil law, or in a more extended sense, one who is versed in law and government.

CLAMP, in general, something that fastens or binds, as a piece of iron screwed on the corners where boards meet, &c.—In brick-making, a *clamp* is a pile of bricks laid up for burning, in which the end of one brick is laid over another, and a space is left between the bricks for the fire to

ascend.—In ship-building, a thick plank on the inner part of a ship's side, used to sustain the ends of the beams.—In joiner's work, to fit a piece of board with the grain, to the end of another piece of board across the grain, is called *clamping* it.

CLAN, a family or tribe, living under one chief. This appears to have been the original condition of the savages of northern Europe, and from this we ought to trace the germ of the feudal system. All the members of a clan held their lands of the chief, followed him to war, and were expected to obey him in peace.—The word *clan* is also sometimes used in contempt, for a sect or society of persons united by some common interest or pursuit.

CLANG, a sharp, shrill sound, implying a degree of harshness in the sound, as, the *clang* of arms. The words *clank* and *clink* denote a more acute and less harsh sound than *clang*.

CLAR ENCIEUX, the second king at arms, so called from the duke of Clarence, to whom he first belonged, (for Lionel third son to Edward III having by his wife the honour of Clare, in the county of Thoms, was afterwards declared duke of Clarence, which dukedom afterwards ennobled to Edward IV he made this earl king at arms). His office is to marshal and dispose of the funerals of all baronets, knights, and esquires, on the south side of the Trent.

CLAR ENDON. The "constitutions of Clarendon," are certain ecclesiastical laws drawn up at Clarendon, near Salisbury. They were sixteen in number, all tending to restrain the power of the clergy, and readily assented to by all the bishops and barons, the archbishop Becket excepted, who opposed them at first, but was afterwards prevailed upon to sign them. The pope Alexander III declared against and annulled most of them.

CLARICHORD, or CLAVICHORD, a musical instrument sometimes called a *mandichord*. It has fifty stops or keys, and seventy strings, and is in the form of a spinnet. The tone is soft and sweet, hence it is a favourite instrument with nuns.

CLARE OBSCURE, CLARO OBSCURO, Latin, CHIARO OSCURO, Italian, and CLAIR OSCUR, French, a phrase in painting, signifying light and shade. In pictorial criticism, it means the relief that is produced by light and shade, independently of colour. In the art itself, it denotes that species of painting or design, in which no attempt is made to give colours to the objects represented, and where, consequently, light and shade are everything.

CLARIFICATION, the process of clearing or fining any fluid from all heterogeneous matter or feculence, and is distinguished from filtration by the employment of chemical means, whereas the latter is only a mechanical operation.

CLARION, a kind of trumpet, whose tube is narrower, and its tone more acute and shrill, than that of the common trumpet.

THE SECURITIES OF CIVIL LIBERTY, AND THE FREE PARS OF THE ENGLISH CONSTITUTION, WERE OBTAINED BY MARYA EMERVA.

THE LAWS OF ENGLAND ARE MADE UP OF THE ACTS OF THE LEGISLATURE, JUDICIAL DECISIONS, AND THE ROMAN CIVIL LAW.

CLE

A New Dictionary of the Belles Lettres.

[CLI

CLARY-WATER, a composition of brandy, sugar, clary flowers, and cinnamon, with a little ambergris dissolved in it. It is a cardiac, and assists digestion.

CLASS, a term applied to the scientific division or arrangement of any subject; as in the Linnean system, wherein animals, plants, and minerals are divided into classes, each of which is to be subdivided by a regular downward progression, into orders, genera, and species, with occasional intermediate subdivisions, all subordinate to the division which stands immediately above them. Classes are *natural* or *artificial*, according as they are founded on natural relations or resemblances, or when formed arbitrarily. *Class* also denotes a number of students in a college or school, of the same standing, or pursuing the same studies.

CLASSICAL, a term signifying excellent, or of the first class. It is said to owe its origin to the division of the Roman people into classes, the first of which was called, by way of eminence, the *classic*. The word *classical* is also applied to authors of standard authority, particularly the writers among the Greeks and the Romans, whose works are comprehended under the name of the *Classics*.

CLAUSE, in law, an article in a contract or other writing; a distinct part of a contract, will, agreement, charter, &c.—In language, a subdivision of a sentence, in which the words are inseparably connected with each other in sense, and cannot with propriety be separated by a point.

CLAUSTRAL, relating to a cloister or religious house; as, a *claustral* prior.

CLAVATED, in botany, an epithet for plants which are club-shaped, or grow gradually thicker towards the top.

CLAVICLES, in anatomy, two bones situated transversely and a little obliquely opposite to each other, at the superior and anterior part of the thorax, between the scapula or shoulder-bone, and the sternum or breast-bone.

CLAY, a species of earths which are firmly coherent, weighty, compact, and hard when dry, but stiff, viscid, and ductile to a great degree, when moist; smooth to the touch, not readily diffusible in water, and when mixed, not readily subsiding from it. They become soft by absorbing water, but are so tenacious as to be moulded into any shape, and hence they are the materials of bricks, pottery-ware, &c.

CLAVAGE, in mineralogy, a term used in relation to the fracture of minerals which have natural joints and possess a regular structure.

CLECHE, in heraldry, a kind of cross, charged with another cross of the same figure, but of the colour of the field.

CLEDGE, among miners, the upper stratum of fuller's earth.

CLEF, or **CLIFF**, (derived, through the French, from the Latin *clavis*, "a key,") a character in music, placed in the beginning of a stave, to determine the degree of elevation occupied by that stave, in the general

claviary or system, and to point out the names of the notes which it contains in the line of that clef.

CLEMATIS, a climbing shrub, otherwise called Virgin's Bower. The common sort, bearing a bluish flower, is a native of the south of Europe.

CLEPSAMMIA, an ancient instrument for measuring time by sand, like an hour-glass.

CLEPSYDRA, a Roman and Grecian time-piece, or water-clock; an instrument to measure time by the fall of a certain quantity of water.

CLEERGY, a general name given to the body of ecclesiastics of the Christian church, in distinction from the laity. The revenues of the clergy were anciently more considerable than at present. Ethelwulf, in 856, gave them a tithe of all goods, and a tenth of all the lands in England, free from all secular services, taxes, &c. The charter whereby this was granted them, was confirmed by several of his successors; and William the Conqueror, finding the bishops so rich, created them into barones, each barony containing at least thirteen knight's fees.

CLERK, a word originally used to denote a learned man, or man of letters; whence the term is appropriated to churchmen, who were called clerks or clergymen: the nobility and gentry being bred to the exercise of arms, and none left to cultivate the sciences but ecclesiastics. In modern usage, the word *clerk* means a writer; one who is employed in the use of the pen, in an office, public or private, either for keeping accounts, or entering minutes. In some cases *clerk* is synonymous with secretary, but not always. A clerk is always an officer subordinate to a higher officer, board, corporation, or private individual; whereas, a secretary may either be a subordinate officer, or the head of an office or department.

CLEW-LINES, and **CLEW-GARNETS**, in marine language, a sort of tackle fastened to the clews of the sails to truss them up to the yard.

CLIENT, a person who seeks advice of a lawyer, or commits his cause to the management of one, either in prosecuting a claim, or defending a suit in a court of justice.—Among the Romans, a *client* meant a citizen who put himself under the protection of a man of distinction and influence, who was accordingly called his *patron*.

CLIMACTERIC, according to astrologers, is a critical year or period in a person's life. According to some, this is every seventh year, but others allow only those years produced by multiplying 7 by the odd numbers 3, 5, 7, 9, to be climacterical; which years, they say, bring with them some remarkable change with respect to health, life or fortune. The grand climacteric is the 63d year.

CLIMATE, in a geographical sense, a space upon the surface of the terrestrial globe, contained between two parallels, and so far distant from each other, that the longest day in the parallel nearest the pole

THE STUDY OF THE CLASSICS HAS A MOST SALUTARY INFLUENCE ON THE INTELLECTUAL DEVELOPMENT OF MODERN STUDENTS.

THE ANCIENT CLASSIC WRITERS SPENT THEIR LIVES IN CONSTANT EFFORTS FOR LIBERTY—PHYSICAL, MORAL, AND INTELLECTUAL.

[CLO]

The Scientific and Literary Treasury ;

[CLO]

is half an hour longer than that nearest the equator.—In a popular sense, the term climate is given to any country or region differing from another in the temperature of the air; or with respect to the seasons, the quality of the soil, or even the manners of the inhabitants, without any regard to the length of the days, or to geographical position. Thus we say, a warm or cold climate, a genial climate, &c.

CLIMAX, a figure in rhetoric, consisting of an assemblage of particulars, rising, as it were, step by step, and forming a whole in such a manner that the last idea in the former member becomes the first in the latter, till the climax, or gradation, is completed. Its strength and beauty consist in the logical connection of the ideas, and the pleasure the mind receives from perfect conviction; as may be perceived in the following example: "There is no enjoyment of property without government; no government without a magistrate; no magistrate without obedience; and no obedience where every one acts as he pleases."

CLINICAL, in its literal sense, means anything pertaining to a bed. Thus, a *clinical lecture* is a discourse from notes taken at the bed-side by a physician, with a view to practical instruction in the healing art. *Clinical medicine* is the practice of medicine on patients in hospitals, or in bed. And the term *clinic* was also applied by the ancient church historians, to one who received baptism on his death bed.

CLOACA, an ancient common sewer.

CLOCK, a machine for measuring time, called, when first invented, a nocturnal dial, to distinguish it from the sun-dial. This machine consists of wheels moved by weights, so constructed that by a uniform vibration of a pendulum, the hours, minutes, and seconds are measured with great exactness; and it indicates the hour by the stroke of a small hammer on a bell. The invention of clocks has been ascribed to Boethius, about the year 510; but clocks, like those now used, were either first invented, or revived, between two and three centuries ago. The clock measures even 24 hours, but the solar day is unequal, according to the situation of the earth in its orbit, and to the declination of the sun. Hence the clock is sometimes a few minutes faster or slower than the sun.

CLOISTER, the principal part of a regular monastery, consisting of a square, erected between the church, the chapter-house, and the refectory, and over which is the dormitory. In a general sense, *cloisters* mean covered passages, such as were formerly attached to religious houses.

CLOTH, any kind of stuff that is woven or manufactured in the loom, whether it be made of wool, hemp, flax, or cotton.

CLOTHING. Under this head we shall take the liberty of extracting and abridging from the Glasgow edition of the "Conversations Lexicon," a few paragraphs which strike us as being founded on careful observation, and given with a just notion of the importance of the subject. Nothing is

more necessary to a comfortable state of existence, than that the body should be kept in nearly a uniform temperature. The chief end proposed by clothing ought to be protection from the cold; and it never can be too deeply impressed on the mind (especially of those who have the care of children), that a degree of cold amounting to shivering cannot be felt, under any circumstances, without injury to the health, and that the strongest constitution cannot resist the benumbing influence of a sensation of cold constantly present, even though it be so moderate as not to occasion immediate complaint, or to induce the sufferer to seek protection from it. This degree of cold often lays the foundation of the whole host of chronic diseases, foremost amongst which are found scrophula and consumption. Persons engaged in sedentary employments must be almost constantly under the influence of this degree of cold, unless the apartment in which they work is heated to a degree that subjects them, on leaving it, to all the dangers of a sudden transition, as it were, from summer to winter. The inactivity to which such persons are condemned, by weakening the body, renders it incapable of maintaining the degree of warmth necessary to comfort, without additional clothing or fire. To heat the air of an apartment much above the ordinary temperature of the atmosphere, we must shut out the external air; the air also becomes extremely rarefied and dry; which circumstances make it doubly dangerous to pass from it to the cold, raw, external air. But in leaving a moderately well-warmed room, if properly clothed, the change is not felt; and the full advantage of exercise is derived from any opportunity of taking it that may occur. The only kind of dress that can afford the protection required by the changes of temperature to which high northern climates are liable, is *woollen*; and those who would receive the advantage which the wearing of woollen is capable of affording, must wear it next the skin; for it is in this situation only that its health-preserving power can be felt. The great advantages of woollen cloth are briefly these:—the readiness with which it allows the escape of the matter of perspiration through its texture; its power of preserving the sensation of warmth to the skin under all circumstances; the slowness with which it conducts heat; and the softness, lightness, and pliancy of its texture. *Cotton cloth* must be esteemed the next best substance of which clothing can be made; but *linen* is the worst of all the substances in use."

CLOUD, a collection of vapours suspended in the atmosphere; being a congeries chiefly of watery particles, drawn up from the sea and land by the solar or subterranean heat, or both, in vapour. Clouds are of various kinds according to the prevalence of any one of their component parts, and particularly according to the quantity of electric fluid they contain. Massive round clouds are called *cumulus*; flat long clouds

A WATCH DIFFERS FROM A CLOCK PRINCIPALLY IN THIS, THAT IT HAS A VIBRATING WHEEL INSTEAD OF A VIBRATING PENDULUM.

BY INDEFINITELY INCREASING THE NUMBER OF WHEELS, A TIME-PIECE MIGHT BE MADE TO GO FOR MANY CENTURIES.

A New Dictionary of the Belles Lettres.

[COC

BY WRITING SMALL COAL, SOME SUPPOSE IT LASTS LONGER, BUT IT RESTRAINS COMBUSTION, MAKES A BAD FIRE, AND WASTES THE HEAT.

are called *stratus*; feathery or hazy clouds, *cirrus*, and when the stratus intersects the cumulus, the combination is called *nimbus*, from its producing rain. The uses of clouds are evident to the commonest observer. From them proceeds the rain which refreshes the earth, and without which its whole surface must be one desert. Clouds are likewise screens interposed between the earth and the scorching rays of the sun, which are often so powerful as to destroy the more tender vegetables. In the less discoverable operations of nature, where the electric fluid is concerned, clouds have a principal share, and they particularly serve as a medium for conveying that subtle matter from the atmosphere to the earth, and from the earth into the atmosphere.

CLOVE, a very pungent aromatic Indian spice, the fruit, or rather the flower, of the clove tree, which grows in the Molucca Isles. The tree is of the size of the laurel, and its bark resembles the olive.

CLOVER GRASS, a genus of plants called *Trifolium*, trefoil, or three-leaved, of which the species are numerous. The red clover is generally cultivated for fodder and for enriching land. The white clover is also an excellent food for cattle, and from its flowers the bee collects no small portion of its honied stores.

CLYSTER, in medicine, a liquid substance injected into the lower intestines, for the purpose of promoting alvine discharges, and at other times for the support and nourishment of patients who can not swallow aliment.

COACH, a vehicle of pleasure, distinguished from others chiefly from being a covered box hung on leathers. The oldest carriages used by the ladies in England were called *chicaneles*, and we find that the mother of Richard II. who, in 1360, accompanied him in his flight, rode in a carriage of this sort. But coaches, properly so called, were introduced into England from Germany, or France, in 1540, in the reign of Elizabeth. In 1601, the year before the queen's death, an act was passed to prevent men from riding in coaches, as being effeminate, but in twenty five years afterwards hackney-coaches were introduced.

COADUNATE, in botany, an epithet for several leaves united at the base.

COAL, in mineralogy, a solid inflammable substance, supposed to be of a bituminous nature, and commonly used for fuel. By way of distinction it is called *fossil coal*, and is divided by recent mineralogists into three species, anthracite, or glance coal, black or bituminous coal, and lignite, or brown coal, under which are included many varieties. There is scarcely any substance so useful to mankind as this, and it is dealt out to us with an unsparing hand. It is always found in masses, sometimes in a heap, most frequently in beds, which are usually separated by layers of stones. The principal mines of this useful mineral are those of Newcastle and Whitehaven. The town of Newcastle absolutely

stands on beds of coals, which extend to a considerable distance round the place. The principal opening for men and horses to the mines at Whitehaven is by an opening at the bottom of the hill, through a long passage hewn in a rock, which by a steep descent leads down to the lowest vein of coal. The greatest descent is through spacious galleries, which continually intersect each other, all the coal being cut away except large pillars, which, in deep parts of the mine, are three yards high, and twelve square at the base. Thermes are sunk to a depth of seven or eight hundred feet, and are extended under the sea to places where, above them, the water is sufficient for ships of very large burden.

COAST, the edge or margin of the land next to the sea, or the country near the sea shore. It is applicable only to the seacoast, being never used for the borders or banks of a river.

COAT, a garment worn commonly upon the most. Also, a thin covering laid or done over anything, as a coat of paint, &c.—In anatomy, the membranous cover of any part of the body, as the coats of the eye, the stomach, &c.—*coat of arms*, in the modern acceptation, is a device, or assemblage of devices, supposed to be painted on a shield, which shield, in the language of heraldry, is called the *field*.—*Coat of Mail*, a piece of armour made in the form of a shirt, and wrought over with a kind of network of iron rings.

COATING, in chemistry, is used principally for the purpose of defending certain vessels from the immediate action of fire thus, glass retorts, and the inside of some furnaces, are coated, or securely covered, with various compositions.—In electricity it means the covering of electric bodies with conductors, or the latter with the former, or, lastly, electrics with other electrics. Electrics are coated with conductors for the purpose of communicating to, or removing from their surfaces, the electric fluid in an easy and expeditious manner, otherwise an electric body, on account of its non-conducting property, cannot be electrified or deprived of the electric fluid without touching almost every point of its surface with an electrified or other body.

COBALT, a mineral of a grayish white, or reddish gray colour, very brittle, and easily reducible to powder. It is never found in a pure state, but usually as a metallic oxyde, combined with arsenic, which is obtained from it in great quantities. The impure oxyde of cobalt is called *saffor*, but when fused with three parts of siliceous sand and an alkaline flux, it is converted into a blue glass, called *smalt*. Cobalt is used principally to give a permanent blue colour to glass and enamels upon metals, porcelain, and earthenwares.—*Cobalt-bloom*, acicular arseniate of cobalt.—*Cobalt crust*, earthy arseniate of cobalt.

COCOLITE, in mineralogy, a variety of *augite* or *pyroxene*. It is of a greenish hue, and is composed of granular concretions.

THE COAL MINES OF ENGLAND ARE OF DOUBLE THE ANNUAL VALUE OF ALL THE GOLD AND SILVER OF AMERICA.

[COC]

The Scientific and Literary Treasury ;

[CON]

THROUGHOUT THE WHOLE OF THE COAL STRATA, A VARIETY OF ANIMAL AND VEGETABLE REMAINS ARE CONTINUALLY FOUND.

COC'ULUS INDICUS, an Indian berry, growing on the *Menispermum Cocculus*. It is often unlawfully used as a deleterious ingredient in making malt liquors.

COC'US, in entomology, a genus of two-winged insects, the wings of which stand erect, and are only to be found in the males; the rostrum, or trunk, arises from the breast, and the body is setose behind.

COCHINEAL, the *Coccus Cacti*, an insect which infests different plants, but particularly the Nopal or Indian fig-tree. At a suitable time, these insects are taken and put in a pot, where they are confined for some time, and then killed by the application of heat. When formed into a mass, or drug, they become the *cochineal* of the shops, which is used in dyeing crimson and scarlet colours, and for making carmine.

COCH'LEA, the *SNAIL-HRILL*, a genus of univalve shell-fish, of a spiral figure, and containing only one cell. This is a very comprehensive genus, and therefore subdivided into three series.—*Cochlea*, in anatomy, the internal cavity of the ear; so called from its resemblance to the spiral shape of a snail's shell.

COCHLEA'RIA, in botany, a genus of plants, class 15 *Tetradynamia*, order 1 *Stiliclosa*. The species chiefly consist of the various kinds of scurvy grass.

COCK, (*gallus*), in ornithology, the male of gallinaceous or domestic fowls, but more especially used for the common dunghill-cock.—An instrument to draw out liquor from a cask, &c.—The part of a musket to which a flint is attached, and by which fire is struck.

COCK-CHAFER, known also by the name of *May-bug*, *door beetle*, &c., a species of coleopterous insect, the *Scurabeus melonthela* of Linnaeus, is remarkable for the length of its life in the grub or larva state, and for the injury it does to vegetation. The grub remains in the earth for three years before it is transformed into the perfect insect, and is very destructive to the roots of plants.

COCKET, a seal belonging to the custom-house: likewise a scroll of parchment, sealed and delivered by the officers of the custom-house to merchants, as a warrant that their merchandise is entered.

COCKLE, the *Cardium* of Linnaeus, a genus of shells the characteristics of which are: shells nearly equilateral and equivalvular; hinge with two small teeth; and prominent ribs running from the hinge to the edge of the valve.

COCK'-PIT, in ships of war, an apartment situated near the after-hatchway, under the lower gun-deck, in which the wounded men are dressed. The fore-cock-pit is a place leading to the magazine passage and the store-room of the boatswain, gunner, and carpenter.

COCK'-ROACH, in entomology, the *Blatta* of Linnaeus, a disagreeable and annoying insect, which haunts houses, and is very active by night, when it devours whatever food may lie in its way, and is also very destructive to woollen cloths, &c.

COCK'SWAIN, (contracted into *Coxen*), an officer who has charge of the boat and the boat's crew.

CO'COA, a tree belonging to the genus *Cocos*, of the order of *Palmae*. It grows in both the East and West Indies, is about sixty feet in height, and produces the fruit called the cocoa-nut, the shell of which is of a woody substance, containing a white fleshy kernel and a sweet refreshing liquor. The nuts, which are from three to seven inches long, hang in clusters on the top of the tree. If the body of the tree be bored, there exudes from the wound a white liquor called palm wine or toddy; the kernels yield a considerable quantity of oil, which is now made available in the manufacture of candles and soap; the leaves are wrought into sacks, hammocks, &c.; and the filaments of the outer coat of the nut are made into cables.

CO'COA, as it is generally called, but more properly **CACA'O**, or the Chocolate-tree, is a species of the *Theobroma*, growing in the West Indies and many parts of South America. The nuts or seeds, which are numerous, are contained in pods, much resembling a cucumber, that proceed from all parts of the body and larger branches; each pod containing from 20 to 30 nuts, about the size of an almond, and very compactly set. They yield by expression a great deal of oil; but they are cultivated only that they may be employed in the preparation of that excellent beverage cacao, and the manufacture of chocolate, of which they form the principal ingredient.

COCOON, the fibrous or silken cone which caterpillars weave around themselves when they assume the pupa or chrysalis form.

CO'COS, a genus of plants, class 20 *Monaria*, order 6 *Hexandria*. The species are shrubs and trees bearing large nuts, as the *cocos nucifera*, &c.

COCTION, in medicine, the reducing aliments to chyle. In surgery, the reducing morbid matter to a healthy state.

COC'ULA, in archaeology, a small drinking-cup in the shape of a boat.

COD, or **COD'-FISH**, in ichthyology, the English name of the variegated *gadus*, with three fins on the back, a serrated mouth, and the upper jaw longest. It inhabits the northern seas, particularly the banks of Newfoundland.

CODE, (from *codex*, a roll or volume), a collection or system of laws. The collection of laws and constitutions made by order of the emperor Justinian is distinguished by the appellation of *code* by way of eminence.—The *Code Napoleon*, or *civil code* of France, proceeding from the French revolution, and the administration of Napoleon while consul, effected great changes in the laws of France. It was a work of great magnitude, and will remain a perpetual monument of the state of things as they then existed in that country.

CODICIL, a supplement to a will, containing anything which the testator wishes

A PREPARATION OF TIN IS EMPLOYED TO GIVE A BRIGHTNESS TO COCHINEAL AND OTHER ARTICLES USED IN DYEING SCARLET.

COG]

[COI

to add or any explanation alteration or revocation of what has well contains

COEFFICIENTS in algebra such numbers or given quantities as are put before letters or unknown quantities into which letters they are supposed to be multiplied thus, in $3a$, or $b \times c$ or $c \times x$ 3 is the coefficient of a b of $b \times c$ and c of $c \times x$ —In fluxions the *coefficient* of any generating term is the quantity which arises from the division of that term from the generated quantity

COELIA in anatomy the cavities or hollows as they are called of the eyes

COELIAC an epithet for what pertains to the belly or the intestinal canal Thus *coeliac artery* is the artery which issues from the aorta just below the diaphragm the *coeliac vein* a vein of the *intestinum rectum* and *coeliac passion* a flux or diarrhoea of indigested food

COLINA the principal meal among the Greeks and Romans The time of the *cena* or supper was the ninth hour answering to three o'clock in the afternoon with us and it consisted of three courses They made a libation both before and after supper and concluded the evening with much festivity

COLTALOUS an epithet denoting of the same age or beginning with another The word *coetial* is synonymous with *contemporary* implies existing at the same time

COFFEE an evergreen shrub growing in Arabia and the West Indies It is seldom more than 16 or 18 feet high the flowers are of a pure white and the berries grow in clusters The use of coffee is said to have been introduced into England in 1721 at which is called Mocha coffee from Arabia felix is accounted the best but the coffee of Java Bourbon and the West Indies is what we usually obtain and constitutes an important article of commerce

COFFER a chest or trunk—In metallurgy a trough in which tin ore is broken to pieces—In fortification a trench cut in the bottom of a dry ditch—In architecture a square depression or sinking in each interval between the moldings of the Corinthian cornice

COIFERDAM in bridge building a circular double range of piles rammed with clay within which the foundations of bridges are laid

COIFIN a case or chest for the reception of a dead body that is to be buried—In the veterinary art the whole hoof of a horse is of oblique coronet

COGNATION in civil law natural relationship or that line of consanguinity between males and females both descended from the same father as *agnation* is for the line of parentage between males only descended from the same stock

COGNIZANCE (pron *cognizance*) in law the hearing of a thing judicially Also the acknowledgment of a fine—*Cognizance of Pleas*, a privilege granted by the king to a city or town to hold pleas of all

contracts &c within the liberty of the franchise

COGNIZEE (pron *cognizee*), in law, one to whom a fine is acknowledged or the plaintiff in an action for the assurance of land by fine

COGNIZOR (pron *cognisor*) one who acknowledges the right of the plaintiff or recognizee in a fine

COGNOMEN, the surname, or family name among the Romans Thus in Publius Cornelius Scipio the name of an eminent Roman Publius is the *prænomen* Cornelius the *nomen* and Scipio the *cognomen* or family name

COGNOVIT in law a writ by which the defendant admits the judgment against him

COHESIBILITY a term opposed to *distensibility* and denoting the tendency which one part of matter evinces to unite with another part of matter so as to form out of different bodies one common mass

COHESION in natural philosophy, is distinguished from adhesion as that species of attraction which uniting particle to particle retains together the component parts of the same mass

COHOBATION in chemistry the operation of repeatedly distilling the same liquor or returning the liquor back again upon the same substance and redistilling it

COHORT a military body among the Romans consisting of the tenth of a legion or from five to six hundred men

COIT the badge of sergeants of law, who are called sergeants of the coat from the lawn coat they wear under their caps when they are created sergeants

COIN a piece of metal stamped with certain marks and made current at a certain value Strictly speaking coin differs from money as the species differs from the genus Money is any matter whether metal or paper or beads, or shells &c which have currency as a medium in commerce Coin is a particular species always made of metal and struck according to a certain process called coining The British *coinage* is wholly performed at the Tower of London where there is a corporation for the purpose under the title of the Mint The coining engine is now worked by means of complicated machinery placed in an apartment over the coining room and connected with the steam engine So this is attached a contrivance by which it feeds itself with the blanks to be impressed, and removes them the instant they have received the impression and such is the excellence of the machinery that one workman may stamp 20 000 pieces in a single day—(current coin is coin legally stamped and circulating in trade—*counterfeit coin* that which is forged or stamped without authority

COINDICATION, in medicine a sign or symptom which, with other signs, assists to show the nature of the disease, and the proper remedy

COIR a species of yarn manufactured from the husk of cocoa nuts

THE SPRINGING PROPERTIES OF COFFEE ARE PRINCIPALLY DERIVED FROM THE LARGE PROPORTION OF NITROGEN WHICH IT CONTAINS

[COL]

The Scientific and Literary Treasury ;

[COL]

COLCHICUM, or Meadow Saffron, is a bulbous-rooted plant, which grows in various parts of Europe, and which of late years has become quite noted as a remedy for the gout. It should, however, be used with great caution.

COLCOTHAR, called also *crocus martii*, an impure brownish-red oxide of iron, which remains after the distillation of the acid from the sulphate of iron. It is used in polishing glass and metals. The best sort of polishing powder, called *jewellers' red rouge* or plate powder, is the precipitated oxide of iron prepared by adding solution of soda to solution of copperas, washing, drying, and calcining the powder in shallow vessels with a gentle heat, till it assumes a deep brown-red colour.

COLD, the sensation produced in animal bodies by the escape of heat, or that which accompanies a transition of the fine vessels of the human body from an expanded to a more contracted state. Great degrees of cold are produced by mixing together substances which dissolve rapidly. The reason of this will appear when it is recollected that in the conversion of solid bodies into fluids caloric is always absorbed. Mixtures to produce artificial cold are generally made of neutral salts and of snow : or of neutral salts, diluted acids, and powdered ice.—The word *cold* is also in common use, to express that indisposition occasioned by a sudden transition from heat to cold ; viz., *catarrh*.

COLEOPTERA, the first order of insects in Linnæus's zoological system, which includes all those whose wings are guarded by a pair of strong, horny, exterior cases or coverings, under which the wings are folded up when at rest. In common language these insects are called *beetles* ; and the order contains an immense number.

COLEWORT, a well-known variety of the cabbage, or *brassica* of Linnæus, which grows through the winter.

COLIC, an appellation given to almost all pains in the abdomen indiscriminately ; but it is chiefly known as that disease which is characterised by a spasmodic sensation in the intestines, bilious vomiting, and obstinate costiveness.

COLIPHUM, in antiquity, a sort of coarse bread which wrestlers used to eat in order to make them strong and muscular.

COLISE'UM, an elliptical amphitheatre, at Rome, built by Vespasian, in which were statues representing all the provinces of the empire, and in the middle stood that of Rome, holding a golden apple in her hand. This immense structure was 1612 feet in circumference, contained eighty arcades, and would hold 100,000 spectators. Down to the 13th century, this unrivalled monument of ancient grandeur remained almost uninjured ; afterwards pope Paul II. took all the stones from it which were used for the construction of the palace of St. Mark, and in later times some other palaces were erected from its fragments. At present, care is taken not to touch the ruins of the

Coliseum, but it is gradually crumbling away of itself, and in a few centuries, perhaps, nothing more may be seen of its upper part ; the lower part, however, may safely bid defiance to the ravages of time. Benedict XVI. caused a cross to be erected in the centre of the arena, where every Sunday afternoon, Catholic worship is performed. The great object of this magnificent building was to exhibit the brutal spectacles of the gladiators contending with wild beasts. We accordingly read, that on the triumph of Trajan over the Dacians, 11,000 animals were killed in the amphitheatres at Rome ; and 1000 gladiators fought during 123 days. The gladiators at first were malefactors, who fought for victory and life ; or captives and slaves, who were made to fight for their freedom ; but after a time many lived by it as a profession ; and these exhibitions continued, with modifications, for above 600 years.—

A very large and most ingeniously constructed building, erected in the Regent's Park, London, is called the Coliseum, or Colosseum. It is divided into three parts, viz. a grand panorama of London, suites of rooms for various kinds of entertainments, and a handsome conservatory. The grand panorama affords many points of view of the vast metropolis, by the ascent of a winding staircase ; but for people who would enjoy the sight without the trouble of walking up, an ascending room is provided. It is altogether a wonderful performance, and for extent and accuracy is unrivalled.

COLIUS, in ornithology, the Coly, a genus of birds, order *Passeres*. They inhabit the Cape of Good Hope and Senegal.

COLLAPSE, to close by falling together ; as, the fine canals or vessels of the body collapse in old age ; or, as a balloon collapses when the gas escapes from it.

COLLAR, in Roman antiquity, a chain put round the neck of slaves that had ran away, after they were taken.—In a modern sense, it denotes an ornament consisting of a chain of gold, enamelled, &c., frequently set with cyphers or other devices, with the badge of the order hanging at the bottom, and worn by the knights of several military orders over their shoulders.

COLLATERAL, in genealogy, signifies descending from the same stock or ancestor, but not in a direct line ; and is therefore distinguished from *lineal*.—*Collateral security*, in law, is security for the performance of covenants on the payment of money, besides the principal security.

COLLATION, in the canon law, the presentation to a benefice, by a bishop, who has it in his own gift or patronage. When the patron of a church is not a bishop, he presents his clerk for admission, and the bishop institutes him ; but *collation* includes both presentation and institution.

—*Collation*, in law, the comparison of a copy with its original, to ascertain its conformity ; or the report of the officer who made the comparison. Hence, a *COLLATOR* means one who compares copies or

THE COLISEUM IS SAID TO HAVE BEEN ERECTED IN ONE YEAR BY THE COMPULSORY LABOUR OF 12,000 JEWS AND CHRISTIANS.

THE COLISEUM HAS THREE ROWS OF COLUMNS, ONE ABOVE THE OTHER ; THE LOWEST DORIC, THE SECOND IONIC, AND THE UPPER, CORINTHIAN.

[col.]

A New Dictionary of the Belles Lettres.

[col]

manuscripts. And from the same is derived the term **COLLATING** among printers, by which is meant the examining the whole number of sheets belonging to a book, in order to see if they are all gathered properly.

COLLECT, a short and comprehensive prayer, particularly such prayers as are appointed with the epistles and gospels in the public service of the Church of England.

COLLECTA'NEA, in literature, notes, observations, or any matter collected from a variety of works.

COLLECTIVE, in grammar, an epithet for any noun which comprehends many persons or things; as a *multitude*, a *company*, a *congregation*, an *army*, &c.

COLLEGE, in its usual, though somewhat limited sense, is a public place endowed with certain revenues, where the several parts of learning are taught, and where the students reside, under a regular discipline. An assemblage of several of these colleges is called a *university*. The establishment of colleges or universities forms a remarkable period in literary history; for the schools in cathedrals and monasteries were confined chiefly to the teaching of grammar; and there were only one or two masters employed in that charge; but in colleges, professors are appointed to teach all the branches of science.—There are colleges of physicians and surgeons, a college of philosophy, a college of heralds, a college of civilians, &c.

COLLEGIATE CHURCHES, are those that, without a bishop's see, have the ancient retinue of a bishop; such as the church of St. Peter's, Westminster. This was anciently a cathedral; but the revenues of the monastery being vested in the dean and chapter by act of parliament (1 Elizabeth), it became a collegiate church.

COLLIER, a coasting-vessel employed in carrying coals from one port to another. Also, one who works in a coal mine.

COLLIMATION, line of, in a telescope, is that which passes through the tube, and cuts both the focus of the eye-glass and the centre of the object-glass.

COLLIQUAMENT, in natural history, an extreme transparent fluid in an egg, observable after two or three days incubation, containing the first rudiments of the chick. It is included in one of its own proper membranes, distinct from the albumen.

COLLIQUATION, in physic, a term applied to the blood, when it loses its crasis or balsamic texture; and to the solid parts, when they waste away, by means of the animal fluids flowing off through the several glands, &c. to an excessive degree, occasioning fluxes and clammy sweats.

COLLIQUATIVE, an epithet indicating a morbid discharge of the animal fluids; as a *colliquative fever*, which is accompanied with profuse sweating, &c.

COLLISION, in mechanics, is the meeting or mutual striking of two or more bodies, one of which, at least, is in motion.

COLLOBO'MA, in medicine, the growing together, or gluey adhesion, of the eyelids.

COLLOCATIO, in antiquity, a ceremony at the funerals of the Greeks and Romans, which consisted of placing the corpse, laid on a bier, near the threshold of the house, that all might see whether he had met his death by violence or not.

COLLUSION, in law, a deceitful agreement or compact between two persons to bring an action one against the other for some fraudulent or unlawful purpose.

COLLYRIUM, in medicine, any fluid application for the eyes.

COLOGNE-EARTH, a substance used in painting, much approaching to umber in its structure, and of a deep brown. It is supposed to be the remains of wood long buried in the earth.

COLON, in anatomy, the greater or upper portion of the large intestine.—In grammar, a point marked thus (:) to divide a sentence.

COLONEL, (pron. *cu' nel*), the chief commander of a regiment, whether infantry or cavalry.—**LIEUTENANT-COLONEL**, the second officer in a regiment, who commands in the absence of the colonel.

COLONNA'DE, a range of pillars running quite round a building.

COLONY, a company or body of people removed from their mother-country to a remote province or country, where they form a settlement under the sanction of the government. Also, the place where such a settlement is formed, as the colonies belonging to Great Britain in the East and West Indies, North America, &c.

COLOPHONITE, in mineralogy, a variety of garnet, of a reddish yellow or brown colour, occurring in small amorphous granular masses.

COLOPHANY, in pharmacy, black resin, or turpentine boiled in water and dried; or the residuum, after distillation of the ethereal oil of turpentine, after more intense and long continued action of the fire.

COLOQUINTIDA, **COLOCYNTH**, or **BITTER APPLE**, is the fruit of a wild gourd, the pulp of which is light, spongy, and white; and is remarkable for its intense bitterness. Coloquintida has been known in medicine from the earliest times as one of the most powerful cathartics with which we are acquainted: it is sent us from Syria, particularly from Aleppo.

COLOCYNTH, the **COLOQUINTIDA**, above described.

COLORATURE, in music, all kinds of variations, trills, &c. intended to make a song agreeable.

COLON'SUS, a statue of enormous or gigantic proportions. That particularly spoken of under this name, was an Apollo, of the height of 126 feet, erected at Rhodes; the workmanship of Chares, who devoted himself to this object during twelve years. It was placed at the entrance of the harbour, with the right foot standing on one side the land and the left on the other. It was of brass, and is said to have existed nearly fourteen centuries, before the period in which it fell by the shock of an earth-

THE ENGLISH UNIVERSITIES EXERCISE A VERY CONSIDERABLE INFLUENCE UPON THE ECCLESIASTICAL AND POLITICAL ESTABLISHMENTS.

THE FLAME OF COMBUSTIBLE BODIES MAY BE CONSIDERED AS THE COMBUSTION OF AN EXPLOSIVE MIXTURE OF GAS WITH AIR.

quake. When the Saracens became possessed of Rhodes, they found the statue in a prostrate state, and sold it to a Jew, by whom 900 camels were laden with the materials.

COLOR, in physics, a property inherent in light, (formerly supposed to be inherent in the coloured substance), which by a difference in the rays and the laws of refraction, gives to bodies particular appearances to the eye. The principal colours are red, orange, yellow, green, blue, indigo, and violet. White is not properly a colour; as a white body reflects the rays of light without separating them. Black bodies, on the contrary, absorb nearly all the rays, and therefore black is no distinct colour. But in common discourse, white and black are denominated colours; and all the colours admit of many shades of difference.—**Colours**, in painting, the various tints which are produced by the different mixture and application of certain colouring substances.

—**Colours**, in heraldry, the tinctures with which the field or any part of the escutcheon is distinguished: they are red, blue, black, green, and purple; which the heralds call *gules*, *azure*, *sable*, *vert*, and *purpure*. Tawny or tawny, and sanguine, are not so common. The yellow and white, called *or* and *argent*, are metals, not colours. The metals and colours are sometimes expressed in blazon by the names of precious stones, and sometimes by those of planets or stars.—**Colours** in military affairs, include the banners, flags, ensigns, &c. of all kinds, borne in the army or fleet.

COLUBER, in zoology, the Viper, a very numerous genus of serpents, distinguished by the belly being covered with a number of scuta, or hard scutes, and the tail with scales. The *Coluber ferus* is found in most parts of Europe; it lives in woods and thickets, and, in breeding time, in the open fields: it is poisonous, but not deadly; it grows to a foot and a half long. The flesh was formerly used in medicine as a restorative. The poisonous matter discharged is a real gum, and perhaps the only gum actually produced and secreted by animals of any kind. Olive oil is the most successful application to the bite of a viper.

COLUMBIAN, an epithet for anything pertaining to America, from its having been discovered by Columbus.

COLUMBINE, in botany, a genus of plants of several species. Also the name of the heroine in a pantomime.

COLUMBIUM, the name of a metal first discovered in an ore or oxyde, in Connecticut.

COLUMN, in architecture, a cylindrical pillar, or long round body of wood, stone, or iron, which serves either for the support or ornament of a building. It consists of a capital, which is the top or head; the shaft, which is the cylindrical part; and the base, or that on which it rests. Columns are distinguished as to their form into the Tuscan, Doric, Ionic, Corinthian, and Composite. The Tuscan is characterized by being rude, simple and massy; the Doric is

next in strength and massiveness to the Tuscan; the Ionic is more slender than the Tuscan and Doric; the Corinthian is more delicate in its form and proportions, and enriched with ornaments; and the Composite is a species of the Corinthian. In strictness, the shaft of a column consists of one entire piece; but it is often composed of different pieces, so united as to have the appearance of one entire piece.—The word **COLUMN** has also many other meanings; as, a division of a page, which may contain two or more columns. A large body of troops drawn up in order; as, a solid column. Any body pressing on its base, and of the same diameter as its base; as, a column of water, air, or mercury.

COLUMELLA, in botany, the central pillar in a capsule, which connects the inside with the seeds, and has the seeds fixed to it all round.—In conchology, the upright pillar in most of the univalve shells.

COLUMNA, in anatomy, a term applied to different parts: thus the *columna nasi*, is the lowest and fleshy part of the nose which forms a part of the septum; and the *columna oris*, is the same with the uvula.

COLUMNIFERÆ, the 37th Linnean natural order of plants, whose stamens and pistil resemble a pillar in the centre of a flower.

COLURES, in astronomy, two great circles supposed to intersect each other at right angles in the poles of the world, and to pass through the solstitial and equinoctial points of the ecliptic. They are hence called the solstitial and equinoctial colures.

COMA, or **COMA-VIGIL**, a preternatural propensity to sleep, or lethargic drowsiness. It is a symptom which often attends acute, burning, and malignant fevers.—*Coma somnolentum*, is when the patient continues in a profound sleep, and when awaked, immediately relapses, without being able to keep open his eyes.—*Coma Berenices*, in astronomy, a constellation of the northern hemisphere composed of stars near the tail of Leo.—The word *Coma* also denotes the hairy appearance that surrounds a comet, when the earth is between the comet and the sun.

COMATA, in medicine, an order of diseases in the class *Neuroses* in Cullen's system, consisting of those disorders in which the power of voluntary motion is suspended.

COMBINATION, in chemistry, denotes the intimate union of two or more bodies of different natures, from which a new compound results, differing in its nature from either of the constituents. Thus, an acid united with an alkali, gives a neutral salt, and furnishes a good instance of combination.—*Combination*, in mathematics, is the variation or alteration of any number of quantities, letters, sounds, or the like, in all the different manners possible.—The word *combination* in its general and most popular sense, is equivalent to league or to conspiracy; and may accordingly be used

THE SMOKE OF A FIRE IS THE HYDROGEN OF THE COAL BURNING IN COMBINATION WITH A PORTION OF CARBON.

COM]

A New Dictionary of the Belles Lettres.

[COM

either in a laudable sense or in an iniquitous one

COMBUSTION, in chemistry, a term which denotes the decomposition of certain substances, accompanied by light and heat. It is an important effect of caloric, but only particular bodies are subject to combustion. In popular language, *combustion* is the process of fire in consuming a body, attended with heat.—*Combustible bodies*, when inflamed, are sources of light and heat: thus sulphur, coal, &c are combustible bodies, and being raised to a certain degree of temperature, they give out light and heat

COMEDY, a dramatic representation of the light, humorous, and pleasant kind, particularly intended to ridicule the follies of men. Scaliger defines comedy to be a dramatic poem, representing the business of life, whose event is fortunate and style familiar. According to Bossu, comedy differs from tragedy in this, that comic writers invent both the names of the persons and the actions which they represent, whereas the tragic writers invent only the latter, taking the former from history. Among us, comedy is distinguished from farce, as the former represents nature as she is, the other distorts and overcharges her, but whether it be to recommend virtue, or to render folly ridiculous, the real intention and effect are amusements

COMET, in astronomy, an opaque, spherical, and solid body, like a planet, but accompanied with a train of light, and performing revolutions about the sun in elliptical orbits, which have the sun in one of the foci. It is divided into the *nucleus* or dense part, the *head*, the *coma*, a faint light surrounding the head, and the *tail*, which is the long train of light by which these bodies are distinguished. When a comet is westward of the sun, and rises or sets before it, the light appears in the morning like a train beginning at the body of the comet, and extending westward and diverging in proportion to its extent, and when the sun and the comet are exactly opposite each other, the earth being between them, the vapour appears to surround it like a fringe or border of hair

COMETARIUM, a machine constructed to represent the revolution of a comet about the sun

COMETOGRAPHY, a description of, or discourse upon, comets.

COMFREY, in botany, a herb whose root abounds in a pure, tasteless mucilage, and is therefore useful as an emollient and demulcent

COMITIA, in Roman antiquity, an assembly of the people, either in the *Comitium* or *Campus Martius*, for the election of magistrates, or consulting on the important affairs of the republic. The people originally gave their votes *and voce*, but in process of time this was superseded by the use of tablets

COMMA, in grammar, a point or character marked thus (,) denoting the shortest pause in reading, and separating a sen-

tence into divisions or members.—In theoretic music, it is a term to show the exact proportions between concords.

COMMANDANT, the commanding officer of a place or of a body of forces.

COMMANDER, the chief officer of an army, or one who has the command of a body of men. The Commander-in Chief in the British army is he who has the supreme command over all the land forces in Great Britain. In the naval service the chief admiral in any port or station is so called.—The *Commander of a Ship*, otherwise called the *Master*, is an officer next in rank to a post captain, who has the command of a ship of war under 18 guns, a sloop, &c.

COMMENCEMENT, an annual public assembly of the university of Cambridge, or the day on which degrees are publicly conferred on students who have finished a collegiate education.

COMMENDAM, in ecclesiastical law, the trust or administration of the revenues of a benefice, given to a layman to hold as a deposit for six months, in order to repairs, &c, or to an ecclesiastic to perform the pastoral duties till the benefice is provided with a regular incumbent. In England, the right of granting benefices in *commendam* is vested in the crown by a statute of Henry VIII.—One who holds a living in *commendam* is called a *commendatory*.—*Commendatory letters*, are letters sent from one bishop to another in behalf of any of the clergy, &c

COMMON SURABLE, among geometers, an appellation given to such quantities as are measured by one and the same common measure: thus a yard and a foot are commensurable, as both may be measured by inches

COMMENTARY, an explanation of the obscure passages in an author, or a historical narrative, as, the Commentaries of Cæsar

COMMENTACULUM, in antiquity, a wand which those who were going to sacrifice held in their hand, to make people stand out of the way

COMMERCE, in a general sense, is the intercourse of nations in each other's produce or manufactures, in which the superfluities of one are given for those of another, and thus are exchanged with other nations for mutual wants. Commerce is both *foreign* and *inland*. Foreign commerce is the trade which one nation carries on with another, inland commerce, or inland trade, is the trade in the exchange of commodities between citizens of the same nation. The benefits of commercial intercourse have been felt and admitted from the earliest times, but they have never been so highly appreciated, or carried to such an extent as at present. It gives a stimulus to industry, supplies mankind with enjoyments to which they would otherwise be strangers, tends greatly to obliterate unfounded prejudices between nations, excites a spirit of laudable competition among all classes, enables one country to profit by the inventions of another, diffuses the blessings of civiliza-

FREE TRADE WITH FOREIGNERS, UNLESS THEIR TRADE IS FREE WITH US, IS THE SYSTEM OF AN UNEQUAL BALANCE, AND PREJUDICIAL WITH RUIN.

NEITHER HOME TRADE NOR FOREIGN COMMERCE CAN ENRICH A NATION WHEN THE SUPPLY OF GOODS IS GREATER THAN THE DEMAND.

[OM]

The Scientific and Literary Treasury ;

[COM]

tion to the most remote corners of the earth enlarges the powers and faculties of the mind and advances human knowledge by the improvements which it carries into every art and service. On the other hand, it can not be denied that it has contributed to unjust aggressions, and that the peace and welfare of man have often been made subservient to commercial avarice. Yet much as the evils attributed to commerce have been deplored by some moral writers we cannot but adopt the sentiments of one who says "To commerce with all its mischiefs with all its crimes committed upon every shore its depopulation of fields and corruption of cities to commerce we must attribute that growing intimacy between the members of the human race from which great benefits have redounded and greater still may spring."

COMMISSARY in a general sense one who is sent or delegated to execute some office or duty as the representative of his superior.—In military affairs an officer who has the charge of furnishing provisions clothing &c for an army. There are various separate duties devolving on commissaries and they have names accordingly as the *commissary general* who is at the head of the department *deputy commissaries* &c.—In ecclesiastical law an officer of the bishop who exercises spiritual jurisdiction in distant parts of the diocese.

COMMISSARIAT the whole body of officers in the commissary department.

COMMISSION in law the warrant or letters patent by which one is authorized to exercise jurisdiction.—In military affairs the warrant or authority by which one holds any post in the army in distinction to the inferior or non-commissioned officers.—In commerce the order by which any one transacts or negotiates for another, also the percentage given to factors and agents for transacting the business of others.

COMMISSIONER a person authorized by commission letters patent or other lawful warrant to examine any matters, or execute any public office &c.

COMMISSURE in anatomy any suture or juncture, particularly the corners of the lips where they meet together and also certain parts of the brain.

COMMITMENT is the sending a person to prison by warrant or order either for a crime or contumacy.

COMMITTEE certain persons elected or appointed to whom any matter of business is referred either by a legislative body or by any corporation or society.—A *committee of Parliament* signifies a certain number of members appointed by the house to proceed on some specific business. The whole house frequently resolves itself into a committee in which each member has a right to speak as often as he pleases. When the house is not in committee, each gives his opinion regularly and is only allowed to speak once unless to explain himself.—*Standing committees* are such as continue during the existence

of the legislature. *Special committees* are appointed to consider and report on particular subjects.

COMMODITY, in commerce, any merchandise which a person deals in.—*Staple commodities* such wares and merchandises as are the proper produce or manufacture of the country.

COMMODORE an officer in the British navy invested with the command of a detachment of ships of war destined for a particular purpose.—The *commodore of a fleet* is the leading ship in a fleet of merchantmen and carries a light in her top to conduct the other ships.

COMMON a tract of ground, or open space the use of which is not appropriated to an individual but belongs to the public or to a number. The right which a person has to pasture his cattle on land of another or to dig turf or catch fish or cut wood or the like is called *common* of pasture of turbarry of piscary and of estovers.

COMMON PRAYER the liturgy, or public form of prayer prescribed by the church of England to be used in all churches and chapels and which the clergy are enjoined to use under a penalty.

COMMON COUNCIL the council of a city or corporate town empowered to make by laws for the government of the citizens. It is generally used in speaking of a court in the city of London composed of the lord mayor aldermen and a certain number of citizens called common councilmen. The city of London is divided into 24 wards the chief magistrate of each ward has the title of alderman the 24 aldermen with the lord mayor form the court of aldermen and certain inhabitants chosen out of each ward for the purpose of assisting the aldermen with their advice in public affairs form the court of common council.

COMMON HALL a court in the city of London at which all the citizens or such as are free of the city, have a right to attend.

COMMON LAW the law that receives its binding force from immemorial usage and universal reception in distinction from the *written* or statute law and which chiefly reigns in judicial decisions and is founded on natural justice and equity or on local customs.

COMMON PLACE BOOK a register of such thoughts and observations as occur to a person of reading or reflection.

COMMON PLACES one of the superior courts at Westminster hall where pleas or causes are heard between subject and subject. A writ of error in the nature of an appeal lies from this court to the court of Queen's Bench.

COMMONS the lower house of Parliament consisting of the representatives of cities boroughs and counties chosen by men possessed of the property or qualifications required by law. This body is called the *House of Commons* and may be regarded as the basis of the British constitution. The origin of this assembly ought perhaps to be attributed to the necessity under which the

IN CONSEQUENCE OF THE UNION WITH IRELAND, IN 1801, ONE HUNDRED IRISH MEMBERS WERE ADDED TO THE BRITISH PARLIAMENT.

BY THE REFORM BILL OF 1832, THE NUMBER OF MEMBERS WAS 50 FOR ENGLAND AND WALES 53 FOR SCOTLAND AND 105 FOR IRELAND.

[COM]

A New Dictionary of the Belles Lettres.

[COM]

"COMMUNITIES" COME NEXT IN ORDER TO PRIVATE FAMILIES, IN THE FORMATION OF THE GREAT BOND BY WHICH MANKIND ARE UNITED.

first Edward perceived himself of counter-acting a powerful aristocracy. The feudal system had erected a band of petty monarchs from whom the crown was in perpetual danger. It is to the struggles of these men with regal authority, in the course of which, in order to strengthen their opposition, they were obliged to make a common cause with the people, that the existence of English liberty may be attributed. In a word, the House of Commons arose on the ruins of the feudal fabric, gained ground as that decayed, pressed on its weaker parts, and, finally, levelled it with the dust. Though each member is elected by a distinct body of people, he is, from the moment of his election, the representative not of those particular persons only, but of the kingdom at large, and is to consider himself not merely as the organ through which his constituents may speak, but as one who having been intrusted with a general charge, is to perform it to the best of his judgment. In performance of this great function, his liberty of speech is bounded only by those rules of decency of which the house itself is the judge, and while, on the one hand, he is free to propose what laws he pleases, on the other, he is exposed, as a private man, to the operation of the laws he makes. This assembly is composed of six hundred and fifty eight members, and though many small boroughs were disfranchised by the Reform Bill, the elective franchise was given to several places of rising importance, and a variety of alterations took place by adding to the number of representatives of counties, &c., so that the total number of members remains the same.

COMMONWEALTH, in a general sense, applies to the social state of a country, without regarding its form of government.—In the usual, though more restricted sense, a republic, or that form of government in which the administration of public affairs is open to all with few, if any, exceptions.

COMMUNION, the act of communicating in the sacrament of the eucharist, or the Lord's supper.—*Communion Service*, the office for the administration of the holy sacrament in the church of England.—*Communion Table*, the table erected at the east end of a church, round which the communicants kneel to partake of the Lord's supper.

COMMUNITY, a society of people living in the same place, under the same laws and regulations, and who have common rights and privileges. History shows that the establishment of communities has been one of the greatest advances in human improvement, and they have proved, in different ages, the cradle and the support of freedom.

COMMUTATION, in law, the change of a penalty or punishment from a greater to a less, as when death is commuted for transportation or imprisonment.

COMPANY, in a commercial sense, a society of merchants, mechanics, or other traders, joined together in a common interest. The mechanics of incorporated towns

are thus erected into companies. The term is also applied to large associations set on foot for the purposes of commerce, as, the East India Company, a banking or insurance company, &c. When companies do not trade upon a joint stock, but are obliged to admit any person properly qualified, upon paying a certain fine, and agreeing to submit to the regulations of the company, each member trading upon his own stock, and at his own risk, they are called *regulated companies*, when they trade upon a joint stock, each member sharing in the common profit or loss, in proportion to his share in the stock, they are called *joint stock companies*. In military affairs, a small body of foot, consisting usually of a number from 60 to 100 men, commanded by a captain, who has under him a lieutenant and ensign.—Also, the whole crew of a ship, including the officers.

COMPACT, a word denoting an agreement or contract, but generally applied in a political sense, as, a compact or agreement entered into between nations and states for any particular object.

COMPARATIVE ANATOMY, is that branch of anatomy, or extension of the art of dissection, which anatomists have practised for the purpose of comparing the structure of all organized bodies with one another. It is otherwise called the anatomy of beasts, and sometimes zootomy, and named *comparative* in relation to that of the human body. The number of its discoveries is highly curious and instructive.

COMPARTMENT, in architecture, a proportionable division in a building, or some device marked in an ornamental part of the building.—In horticulture, a design composed of several different figures, disposed with symmetry to adorn a parterre.—*Compartments*, in heraldry, are partitions and quarterings of the escutcheon, when the arms of several families are borne in one and the same coat, in consequence of marriages, &c.

COMPARISON, in a general sense, the consideration of the relation between two persons or things, when opposed and set against each other, by which we judge of their agreement or difference.—*Comparison of ideas*, among logicians, that operation of the mind whereby it compares its ideas one with another, in regard of extent, degree, time, place, or any other circumstance, and is the ground of relations.—

Comparison, in rhetoric, a figure by which two things are considered with regard to a third, which is common to them both, as, a hero is like a lion in courage. Here courage is common to hero and lion, and constitutes the point of resemblance.

COMPASS, or the MARINER'S COMPASS, an instrument used by mariners to point out the course at sea. It consists of a circular box, containing a card or dial, on which are drawn the several points of the compass, and the magnetic needle, which has the property of turning one of its ends to the north pole. The box is covered with glass, to prevent the motion of the card from being disturbed by the wind. The

ENGLAND IS THE ONLY COUNTRY IN WHICH THE BROTHERS AND POSSESSORS OF FREEDOMS CONTINUE TO FORM ONE BODY OF REPRESENTATIVES.

COM]

The Scientific and Literary Treasury ;

[CON

BY THE AID OF THE MARINER'S COMPASS, THE WHOLE WORLD HAS BEEN BROUGHT TOGETHER, AND BECOME ONE VAST COMMERCIAL COMMONWEALTH

utility of this instrument results from the magnetic virtue of the needle, through which it constantly places itself in a direct line from pole to pole. A small declination peculiar to various parts of the world excepted.—A pair of compasses, an instrument used in describing circles, measuring figures, &c., consisting of two pointed legs or branches, made of iron, steel, or brass, joined at the top by a rivet, on which they move. There are also compasses of three legs cylindrical spherical, compasses, &c.

COMPENSATION, in civil law, a set off or right whereby a person, who has been sued for a debt demands that the debt may be compensated with what is owing him by the creditor, which, in that case, is equivalent to payment.—Compensation balance in a watch, is a contrivance by means of which the errors occasioned by the variation of temperature may be corrected by varying the diameter of the balance.

COMPLURITUM, a judicial inquest in the civil law made by delegates or commissioners, to find out and relate the truth of a cause.

COMPLEMENT, in astronomy, the distance of a star from the zenith, or the arch comprehended between the place of the star above the horizon, and the zenith.—Complement of an arc in geometry what an arc wants of 90 degrees or the quadrant of a circle, thus the complement of forty degrees is fifty.—The word is also used to denote the full or complete number as a company has its complement of men.

COMPLEX TERMS and COMPLEX IDEAS in logic arc such as are compounded of several simple ones.

COMPLEXION, among physicians the temperamental habit and natural disposition of the body, but in general use, the word means the colour of the skin.

COMPOSING that branch of the art of printing which consists in taking the types or letters from the cases and arranging them in such an order as to fit them for the press. The instrument in which they are adjusted to the breadth of the lines is called a composing stick.

COMPOSITUM the 21st natural order in the Linnæan botanic system comprehending the plants with compound flowers as the dandelion sun flower &c.

COMPOSITUM ORDER, in architecture the last of the five orders of columns so called because its capital is composed out of those of the other columns. It is also called the Roman or Italian order from having been invented by the Romans. It is generally ranked after the Corinthian either as being the next richest, or the last invented.

COMPOSITE NUMBERS such numbers as can be measured exactly by a number exceeding unity as 6 by 2 or 3 so that 4 is the lowest composite number. Composite numbers between themselves are those which have a common measure besides unity as 12 and 15, both which are measured by 3.

COMPOSITION in a general sense the

putting together, and uniting of several things, so as to form of the whole one mass or compound.—Composition of ideas, an act of the mind, whereby it unites several simple ideas into one conception, or complex idea.—In literature, the act of inventing or combining ideas, furnishing them with words, arranging them in order, and committing them to writing.—In logic, a method of reasoning, whereby we proceed from some general self evident truth to other particular and singular ones. This method of reasoning is opposed to analysis which begins with first principles, and by a train of reasoning from them, deduces the propositions or truths sought but composition or synthesis collects the scattered parts of knowledge and combines them into a system, so that the understanding is enabled distinctly to follow truth through its different stages of gradations.

—In music, the art or act of forming tunes either to be performed vocally or instrumentally.—In painting, the putting together the several parts of a picture so as to set off the whole to the best advantage.

—In commerce an agreement entered into between an insolvent debtor and his creditor by which the latter accepts a part of the debt in compensation for the whole.

—In chemistry, the combination of different substances from which results a compound substance differing in properties from either of its component parts. Thus water is a composition of hydrogen and oxygen which are invisible gases.—Composition of motion is an assemblage of several directions of motion resulting from several powers acting in different though not opposite directions.

COMPOST in husbandry, several sorts of soils or earths and other matters mixed together in order to make a particularly fine kind of mould for fertilizing land.

COMPOUND, a term in botany variously applied. Thus a compound flower consists of several distinct florets inclosed in a common receptacle. A compound stem is one that divides into branches. A compound leaf connects several leaflets in one petiole. A compound umbel is one which has all its rays or peduncles bearing small umbels at the top.—In computation compound interest is interest upon interest when the interest of a sum is added to the principal and then bears interest.—In algebra compound quantities are such as are joined by the signs + and —, plus and minus and expressed by more letters than one, or by the same letters unequally repeated thus $a+b-c$, and $ab-b$, are compound quantities.

COMPRESSIBILITY, in physics, that property in a solid or fluid of yielding to the pressure of another body or force, so as to be brought into a smaller compass.

COMPRESSION, in surgery a diseased state of the system arising from the pressure of something on the brain.

CONCATENATION, a term chiefly used in speaking of the mutual dependence of second causes upon each other.

LORD BACON SAYS THAT TEARS ARE THE EFFECTS OF THE 'COMPRESSION' OF THE MOUNTAINS OF THE BRAIN, UPON DILATATION OF THE SPIRITS

CON]

A New Dictionary of the Belles Lettres.

[CON

CON, in language, a Latin inseparable preposition or prefix to other words. Ainsworth remarks that *con* and *cum* have the same signification, but that *cum* is used separately, and *con* in composition — In the phrase *pro* and *con*, for and against, *con* denotes the negative side of a question.

CON CAVE GLASSES, in optics, such as are ground hollow, and are usually spherical, though they may be of any other figure. The apparent place of objects seen through concaves is always brought nearer to the eye, which is the reason they are used by short sighted persons.

CONCAVO CONCAVE, hollow or concave on both surfaces.

CONCAVO-CONVEX, concave on one side, and convex on the other.

CONCENTER, to meet in a point, or common centre, used of converging lines, or other things that meet in a point.

CONCENTRATE, to bring nearer to each other, as, to concentrate particles of salt by evaporating the water that holds them in solution, or to concentrate rays of light into a focus.

CONCEPTACLE, in botany, a pericarp of one valve, opening longitudinally on one side and having the seeds loose in it.

CONCENTRIC, an epithet for figures having one common centre.

CONCEPTION, in logic, the simple apprehension or perception which we have of anything, without proceeding to affirm or deny any thing about it.

CONCERTO, a piece of music consisting of several parts that are all to be performed at the same time. — *Concerto grosso*, the grand chorus of a concert, or those places where all the several parts perform or play together.

CONCESSION, in rhetoric or debate, the yielding, granting, or allowing to the opposite party some point or fact that may bear dispute, in order to show that even admitting the point conceded, the cause can be maintained on other grounds.

CONCHA, a genus of bivalve shells, comprising the oyster, chama, muscle, heart shell, pecten, &c. — *Concha*, in anatomy, the larger cavity of the external ear, situated before the *meatus auditorius*, or passage into the internal ear.

CONCHITE, a petrified shell, or conch.

CONCHOID, in geometry, the name of a curve, used by Archimedes and other ancient in the construction of solid problems. Sir Isaac Newton observes that he prefers it before other curves, or even the conic sections, in the construction of cubic and bi-quadratic equations, on account of its simplicity.

CONCHOIDAL, in mineralogy, having concave elevations and concave depressions like shells, as a *conchoidal* fracture.

CONCHOLLOGY, the study or science of shells, or that branch of natural history which treats of testaceous animals, or such animals as have a permanently testaceous covering, which are comprehended under the *testacea* in the Linnæan system. Shells consisting of a single piece are called uni-

valves, those of two parts *bivalves*, and those of many parts *multivalves*. Between bivalve and multivalve no distinction is drawn, shells consisting of not more than two such parts being called multivalve, without any regard to the number. Linnæus begins with the multivalves and the most complex structure, and ends with those of the simplest form.

CONCHOMETER, an instrument for measuring shells.

CONCIATOR, in glass works, the person who weighs and proportions the salt or ashes and sand, and who works and tempers them.

CONCINNOUS, in music, an epithet for a performance in concerts, which is executed with delicacy, grace, and spirit.

CONCIONATORIALS, in law, the common-councilmen of the city of London.

CONCLAMATIO, in antiquity, the funeral cry over the body of a deceased person previous to its being burnt, by which it was expected to recall, as it were, the soul of the deceased from everlasting sleep.

CONCLAVE, the place in which the cardinals of the Roman church meet for the election of a pope. It consists of a range of small cells or apartments standing in a line along the halls or galleries of the Vatican. — *Conclave* is also used for the assembly or meeting of the cardinals when shut up for the election of a pope.

CONCOCTION, in medicine, the process by which food is turned into chyle, or otherwise prepared to nourish the body.

CONCORD, in music, the union of two or more sounds in such a manner as to render them agreeable to the ear. Concord and harmony are, in fact, the same thing, though custom has applied them differently, for as concord expresses the agreeable effects of two sounds in consonance, so harmony expresses the agreement of a greater number of sounds in consonance. — In grammar, that part of syntax which treats of the agreement of words in a sentence. — In law, an agreement between the parties in a fine, made by leave of the court.

CONCORDANCE, a dictionary of the Bible, in which every word is given with references to the book, chapter, and verse, in which it occurs.

CONCORDAT, a treaty or public act of agreement between the pope and any prince, relative to some collation of benefices.

CONCRETE, in natural philosophy, signifies a body made up of different principles, or any mixed body. Thus, soap is a factitious concrete, or a body mixed together by art, and antimony is a natural concrete, or a mixed body, compounded in the bowels of the earth. — *Concrete*, in logic, is used in contradistinction to *abstract*.

CONCRETIONS, (*Мокрид*), in animal economy, hard substances that occasionally make their appearance in different parts of the body, as well in the solids as in those cavities destined to contain fluids in the first place they are denominated concretions or ossifications, in the other, *calculi*.

— In chemistry, the condensation of any fluid substance into a more solid state.

A CONCAVE GLASS COLLECTS THE RAYS OF THE SUN'S BEAM TO A SINGLE POINT, AND THUS PRODUCES CONSUMPTION.

THE CARDINALS IN "CONCLAVE" ARE STRICTLY GUARDED BY TROOPS, AND THE GREATEST PRECAUTIONS ARE TAKEN TO PREVENT FOREIGN INTERFERENCE.

[CON]

The Scientific and Literary Treasury ;

[CON]

CONDENSATION, the act whereby a body is rendered more dense, compact, and heavy. Hence condensation stands opposed to dilatation or rarefaction.

CONDENSER, a pneumatic machine by which a volume of air may be reduced into a much smaller space.

CONDITION, in law, a clause in a bond or other contract containing terms or a stipulation that it is to be performed, and in case of failure, the penalty of the bond is to be incurred.—We speak of a good condition in reference to wealth and poverty, or to health and sickness, &c. Or, we say, —a nation with an exhausted treasury is not in a condition to make war, religion affords consolation to man in every condition of life —*Conditional propositions*, in logic such as consist of two parts connected together by a conditional particle —*Conditional syllogism*, a syllogism where the major is a conditional proposition.

CONDOR, an extremely large kind of vulture, measuring with the wings extended from twelve to sixteen feet. It preys on birds, lambs, or kids, and has strength to bear off a calf. It is a native of South America.

CONDUCTOR in electrical experiments, a term used to denote those substances which are capable of receiving and transmitting electricity, in opposition to electrics, in which the electric fluid may be excited or accumulated. If a conductor received or imbibed the electrical action, it would be like a water-pipe made of absorbing material, but every surface is a conductor, exactly in the proportion in which its parts do not receive and exhaust the electrical action —Bodies which repel it, or into which it will not pass, are called *non conductors* —**CONDUCTOR OF LIGHTNING**, a pointed metallic rod fixed to the upper parts of buildings to secure them from the effects of lightning.

CONDUIT, a subterranean or concealed aqueduct. The ancient Romans excelled in this, and formed the lower parts, whereon the water ran, with cement of such an excellent quality, that it has become as hard as the stone itself which it was employed to join —*Conduits*, in modern times, are generally pipes of wood, iron, or pottery, for conveying the water from the main spring, or reservoirs, to the different places where it is required.

CONDUPLICATE, in botany, an epithet for that which is doubled or folded over or together, as the leaves of a bud.

CONDYL, in surgery, a protuberance on the end of a bone, a knuckle.

CONDYLOID, in anatomy, the projecting soft end, or process of a bone —The *condyloid process* is the posterior protuberance at the extremities of the under jaw, an oblong rounded head, which is received into the fossa of the temporal bone, forming a moveable articulation. The anterior is called the *coronoid process*.

CONE, in geometry, a solid figure having a circle for its base, and its top terminating in a point or vertex, like a sugar loaf —

A *right cone*, is when its axis is perpendicular to its base, and its sides equal. It is formed by the revolution of a right angled plane triangle about one of its sides.

Cone, in botany, the fruit of several evergreen trees, as of the fir, cedar, cypress, &c. called from its conical shape. It is composed of woody scales that are usually open, each of which has a seed at the end —In conchology, a beautiful sort of shell inhabited by the limax. Shells of this sort mostly bear the highest price of any, one species being valued as high as a hundred pounds.

CONFAREATION, in antiquity, a ceremony observed by the Romans in their nuptial solemnities. It consisted in the offering up some pure wheaten bread, and rehearsing at the same time a certain formula in presence of the high-priest and at least ten witnesses.

CONFECTIO, a sweetmeat or anything prepared with sugar. It also signifies a liquid or soft electuary, of which there are various sorts.

CONFECTOR, an officer in the Roman games, whose business was to kill any beast that was dangerous.

CONFEDERACY, in law, a combination of two or more persons to do some damage or injury to another, or to commit some unlawful act.

CONFEDERATION, a league, or compact, for mutual support, particularly of princes, nations, or states.

CONFERVA, in botany, a genus of plants of the *cryptogama* class, consisting of oblong, capillary filaments, divided into joints of a globular figure.

CONFESSION, in a legal sense, the acknowledgment of something prejudicial to the person making the declaration. A confession, according to law, must never be divided, but always taken entire, nor must a criminal be condemned upon his own confession, without other concurring proofs —In theology, a public declaration of one's faith, or the faith of a public body. Also a part of the Liturgy, in which an acknowledgment of guilt is made by the whole congregation —*Individual confession*, a private confession or acknowledgment of one's sins made by each individual in the Romish church to the priest or father confessor. It is so called because it is made by whispering in his ear —Among the Jews, it was a custom, on the annual feast of expiation, for the high priest to make confession of sins to God in the name of the whole people.

CONFESSOR, a Roman catholic priest, who hears confessions, and is empowered to grant absolution to those who confess —The seal, or cell, where the priest or confessor sits to hear confessions, is called the *confessional*.

CONFIGURATION, in astrology, the aspects of the planets at a certain time, by which they are pretended to aid or oppose each other.

CONFIRMATION, the act or ceremony in the Christian church of laying on of hands, by which baptized persons are confirmed in their baptismal vows. This cere-

ROOT ACTS AS A "CONDUCTOR" FOR LIGHTNING. THE FINE SIDE IS THEREFORE AN UNSAFE PLACE DURING A THUNDER-STORM.

A COPPER ROD IS A BETTER MATERIAL FOR A "LIGHTNING CONDUCTOR" THAN ONE OF IRON, FROM ITS BEING LESS LIABLE TO RUST.

MERCURY IS LESS SUSCEPTIBLE OF CONGELATION THAN ANY OTHER METAL, IT WAS LONG THOUGHT CAPABLE OF RESISTING ANY DEGREE OF COLD.

[CON]

A New Dictionary of the Belles Lettres.

[CON]

mony is performed by the bishop, and the antiquity of it is, by all ancient writers, carried as high as the apostles, upon whose example and practice it is founded.—*Confirmation* in law, an assurance of title, by the conveyance of an estate or right in esse, from one person to another, by which a possession is made perfect, &c.—*Confirmation*, in rhetoric, the third part of an oration, wherein the orator undertakes to prove the truth of the proposition advanced in his narration.

CONFISCATION, in law, the condemnation and adjudication of goods or effects to the public treasury, as the bodies and effects of criminals, traitors, &c.

CON FLUENCE, the meeting or junction of two or more streams of water, also, the place of their meeting.

CONFLUENT, in botany, united at the base, or growing in tufts, as *confluent* leaves.—In medical science, running to gether, and spreading over a large surface of the body, as the *confluent* small pox.

CONFORMATION, the particular texture or structure of a body, or disposition of the parts which compose it.—*Mal conformation*, in anatomy, denotes some defect in the first rudiments, whereby a person is born either crooked, or with some viscera unduly proportioned, &c.

CONFORMIST, in ecclesiastical concerns, one that conforms to the established church, the seceders or dissenters from which are called *Non conformists*.

CON GE, in architecture, a mould in form of a quarter round, or a casetto, which serves to separate two members from one another, such as that which joins the shaft of the column to the cincture, called also *apophyge*.

CONGE D'ELIRE, (French), in ecclesiastical affairs, the king's permission to a dean and chapter in the time of a vacancy, to choose a bishop.

CONGELATION, such a change produced by cold in a fluid body, that it quits its former state, and becomes congel'd. It differs from crystallization in this: in congelation the whole substance of a fluid may become solid, in crystallization, when a salt is formed, a portion of liquid is left.

CON GER, an eel of an extraordinary size, and extremely voracious, which preys on caracases, and other fish. It is common on the Cornish coast, sometimes growing to the length of ten feet, and weighing a hundred pounds.

CONGERILLS, a collection of several particles or bodies united into one mass or aggregate.

CONGES TION, a collection of humours in an animal body, hardened into a tumour, or an accumulation of blood in a particular part.

CONGIARY, in Roman antiquity, a present of wine or oil, given to the people by their emperors, and so called from the *congius*, wherewith it was measured out to them. Sometimes, however, the congiary was made in money or corn.

CON GIUS, a liquid measure of the an-

cient Romans, containing the eighth part of the amphora, or rather more than a gallon.

CONGLOBATE GLAND, in anatomy, a single or lymphatic gland wrapt up in a fine skin, admitting only an artery and a lymphatic vessel to pass in, and a vein and excretory canal to come out.

CONGLOMERATE, in botany, an epithet for flowers growing on a branching peduncle or foot stalk, on short pedicles, closely compacted together.—In mineralogy, a sort of pudding stone, composed of pebbles of quartz, flint, siliceous slate, &c.—In anatomy, a *conglomerate gland* is composed of many smaller glands, whose excretory ducts unite in a common one, as the liver, pancreas, kidneys, &c.

CONGLUTINATION, the act of gluing or fastening together by means of some tenacious substance.

CONGREGATIONALISTS, in church history, a sect of Protestants who reject all church government, except that of a single congregation, which, they maintain, has the right to choose its own pastor and govern itself.

CONGRESS, an assembly of envoys, commissioners, deputies, &c. from different courts, who meet to concert measures for their common good, or to adjust their mutual concerns. Having exchanged their credentials, the envoys of the different powers carry on their negotiations directly with each other, or by the intervention of a mediator, either in a common hall, or in their own residences by turns, or, if there is a mediator, in his residence. These negotiations are continued either by writing or by verbal communication, until the commissioners can agree upon a treaty, or until one of the powers dissolves the congress by recalling its minister.—*Congress of the United States of America*. The assembly of senators and representatives of the several states of North America, forming the legislature of the United States, is designated, in the constitution of the general government, by this title. It consists of a senate and a house of representatives, each constituting a distinct and independent branch.—The *house of representatives* is chosen every second year, by the people of the several states, and the voters and electors are required to have the same qualifications as are requisite for choosing the members of the most numerous branch of the state legislature of the state in which they vote. Each state, however small its population, is entitled to at least one representative, but upon the whole population there cannot be more than one for every 30,000 persons. No person can be a representative who shall not have attained the age of twenty five years, and have been seven years a citizen of the United States, and who shall not, when elected, be an inhabitant of that state in which he shall be chosen. No other qualifications are required.—The *senate* is composed of two senators from each state, who are chosen by the legislature of the state for six years. They are divided into

FLUIDS ARE SEPARATED FROM THE BLOOD IN THE LIVER, AND FROM THE OTHER "CONGLOMERATE" GLANDS.

[CON]

The Scientific and Literary Treasury ;

[CON]

three classes, so that one third thereof is, or may be, changed by a new election every second year. No person can be a senator who is not thirty years of age, and has not been nine years a citizen of the United States, and is not, when elected, an inhabitant of the state for which he is chosen. The times, places, and manner of holding elections for senators and representatives, are appointed by the state legislatures. Each house determines the rules of its own proceedings, and has power to punish its members for disorderly conduct. Neither house, during the session of congress, can, without the consent of the other, adjourn more than three days, nor to any other place than that in which the two houses shall be sitting. The senators and representatives are entitled to receive a compensation, provided by law, for their services, from the treasury. They are also privileged from arrests, except in cases of treason, felony, or breaches of the peace, during their attendance at the session of their respective houses, and in going to and returning therefrom. The foregoing outline of their duties and privileges may be sufficient for the general reader, if to it we add, that the rules and practice of the British House of Commons form the basis of their proceedings, modified from time to time, as each house deems fit.

CONGREVE ROCKET, so named from its inventor, the late Sir W. Congreve, is a formidable weapon of destruction, consisting of a tubular case of copper or iron, filled with combustibles, which are impelled with resistless force against the hostile ranks of an army, or the walls of a fortress. The Congreve rockets were first used in the attack of Boulogne in 1806. The *carcase rockets*, as those for bombardment are called, are armed with strong iron conical heads, pierced with holes, and containing a substance as hard and solid as iron itself, which, when once inflamed, is inextinguishable, and scatters its burning particles in every direction. When this substance is consumed, the ball explodes like a grenade. The rocket is projected horizontally, and whizzes loudly as it flies through the air. They were at first considered a most important invention, but experience has shewn that in the field they are much less efficient than the common artillery, and in sieges do less injury than red-hot shot and bombs.

CONIC SECTIONS, in geometry, such curve lines as are produced by the mutual intersections of a plane and the surface of a solid cone. In different positions of the plane there arise five different figures or sections, viz. the triangle, the circle, the ellipse, the parabola, and the hyperbola. The last three are peculiarly called Conic Sections, to investigate the properties of which is the business of *Conics*, and this depends on a knowledge of geometry plane and solid.

CONIFERÆ, the 51st Linnæan natural order of plants, with cone-shaped flowers, as the fir, juniper, &c. Hence the term *co-*

niferous is applied to all trees bearing cones.

CONISSA'LE, an old term for a class of fossils, naturally and essentially compounded, not inflammable, nor soluble in water, found in detached masses, and formed of crystalline matter debased by earth.

CONIIE, a mineral of an ash or greenish gray colour, which becomes brown by exposure to the air. It occurs massive or stalactitic, and is found in Saxony and Iceland.

CONIUM, Hemlock, in botany, a genus of plants, class 5 *Pentandria*, order 2 *Digynia*, the flower of which is compound, the particular ones consisting of five unequal and cordated petals.

CONJUGATE, in botany, an epithet for a pinnate leaf, which has only one pair of leaflets.—In geometry, a *Conjugate axis* is that which crosses another axis.—*Conjugate diameter*, the shortest axis of an ellipse.—*Conjugate hyperbolas*, hyperbolas having the same axis, but in contrary order.

CONJUGATION, in anatomy, is applied to a pair of nerves arising together, and serving the same operation, sensation, and motion.—*Conjugation*, in grammar, the distribution of the several inflections or variations of a verb, in their different voices, moods, tenses, numbers, and persons.

CONJUGAL RIGHTS. The restitution of conjugal right is a species of matrimonial suit, which may be brought either by the wife or husband against the party who is living in a state of separation.

CONJUNCTION, in astronomy, the meeting of two or more stars or planets, in the same degree of the zodiac. Conjunction is either true or apparent. *True conjunction* is when a right line, drawn from the eye through the centre of one of the bodies, would pass through that of the other. *Apparent conjunction*, is when the two bodies do not meet precisely in the same point, but are joined with some latitude. The moon is in conjunction with the sun, when they meet in the same point of the ecliptic, which happens every month, and eclipses of the sun are always occasioned by the conjunction of the sun and moon in or near the nodes of the ecliptic.—*Conjunction*, in grammar, an undecidable word, or particle, which serves to join words and sentences together.

CONNAIE, in botany, an epithet for leaves, filaments, and anthers thus *folium connatum*, two leaves so united at their bases as to have the appearance of one leaf, as in the garden honeysuckle.

CONNI'VENT, in botany, an epithet denoting closely united or converging together.—*Connent'iales*, in anatomy, those wrinkles, cellulæ, and vascules, which are found in the inside of the two intestines, *ileum* and *cecum*.

CONOID, in geometry, a solid formed by the revolution of a conic section about its axis.—In anatomy, a gland found in the third ventricle of the brain called *pin-*

CONGREVE ROCKETS HAVE OFTEN BEEN MADE SERVIENT TO THE CAUSE OF HUMANITY, IN CASES OF BRITWICK NEAR THE COAST.

FOWLEY AND CESAR WERE TWO STARS OF SIXTY WAGTILDE, THAT THEIR "CONJUNCTION" WAS AS FATAL AS THEIR OPPOSITION.

[CON]

A New Dictionary of the Belles Lettres.

[CON]

WHERE A CONQUEST IS MERELY TEMPORARY, THE RIGHTS OF FORMER PROPRIETORS REVIVE AS SOON AS THE CONQUEST IS ABANDONED.

calis, or the pineal gland, from its resemblance to a cone or pine-apple.

CONNOISSEUR, a critical judge or master of any art, particularly of painting, sculpture, and the belles lettres.

CONOPEA, in botany, a genus of plants, class 14 *Didymia*, order 2 *Angiospermia*. Of this there is only one species, the *conopea aquatica*, a native of Guiana.

CONQUEST, the right over property or territory acquired in war. It presupposes a just war, and is generally admitted as a part of the law of nations. Conquest may respect either persons or things: it may apply to a whole nation, or to a single town or province; and it may be temporary or permanent. Where persons are not found in arms, but are included as inhabitants of a town or province which has surrendered, they are treated generally as subjects. The original allegiance to their own government is suspended, and they come under the implied obligation to the conqueror, to submit to his orders, and to demean themselves, for the time, as faithful subjects. Under such circumstances, the conqueror generally leaves them in possession of their property, and punishes them only for rebellious or traitorous conduct. It is not usual, in modern times, to change the fundamental laws of a conquered country; but the sovereign power of the conqueror so to do is conceded by the law of nations.

CONSANGUINITY, the relation which subsists between persons who are sprung from the same stock or common ancestor, in distinction from affinity or relation by marriage. It terminates in the sixth or seventh degree, except in the succession to the crown, in which case it is continued to infinity. Marriage is prohibited by the church to the fourth degree of consanguinity inclusive.

CONSCIENCE, in ethics, a secret testimony of the soul, whereby it gives its approbation to things that are naturally good, and condemns those that are evil. Some writers term conscience the "moral sense," and consider it as an original faculty of our nature; others allege that our notions of right and wrong are not to be deduced from a single principle or faculty, but from various powers of the understanding and will.

CONSCIOUSNESS, the knowledge of sensations and mental operations, or of what passes in one's own mind.

CONSCRIPT, in Roman antiquity, an appellation given to the senators of Rome, who were called *conscripti-fathers*, on account of their names being entered in the register of the senate.—In the French armies, an enrolled soldier, or recruit.

CONSCRIPTION, the enlisting the inhabitants of a country capable of bearing arms, by a compulsory levy, at the pleasure of the government. The name is derived from the military constitution of ancient Rome. Under the consuls, all persons capable of bearing arms were obliged, under penalty of losing their fortune and

liberty, to assemble in the Campus Martius, or near the capitol, where the consuls, seated in their curule chairs, made the levy by the assistance of the legionary tribunes. The consuls ordered such as they pleased to be cited out of each tribe, and every one was obliged to answer to his name, after which as many were chosen as were wanted.—France, in the beginning of the revolution, declared it the duty and honour of every citizen to serve in the army of his country. Every French citizen was born a soldier, and obliged to serve in the army from sixteen to forty years of age: from forty to sixty he belonged to the national guard. Every year the young men of the military age were assembled, and distributed in the different military divisions; and it was decided by lot who, among the able-bodied men of suitable age should take arms. Thus it was that those prodigious masses were so quickly raised, and sent to the field of slaughter.

CONSECRATION, the act of devoting and dedicating anything to the service and worship of God. Among the ancient Christians, the consecration of churches was performed with a great deal of pious solemnity. In England, churches have been always consecrated with particular ceremonies, the form of which was left to the discretion of the bishop.—Consecration was also a religious rite among the Romans, by which they set any person or thing apart for sacred purposes, as their high-priests; or made it sacred, or a fit object of divine worship; as the emperors, their wives, or children, who were in this manner enrolled among the number of their gods. This was sometimes called *apotheosis*, but on medals it is distinguished by the word *consecratio*, with an altar or some other sacred symbol.

CONSENT, in the animal economy, an agreement or sympathy by which one affected part of the system affects some distant part. This *consent of parts* is supposed to exist in, or be produced by the nerves; and the affections to be communicated from one part to another by means of their ramifications and distribution through the body.

CONSECUTARY, in geometry, some consequent truth obtained from a demonstration.

CONSEQUENCE, that which follows as an inference of truth and reason, from admitted premises or arguments. Thus "every rational being is accountable to his Maker," man is a rational being; the *consequence* then must be, that man is accountable to his Maker.

CONSERVATOR, an officer appointed for the security and preservation of the privileges of some cities, corporations, and communities. The ancient office of *conservator of the peace* is now performed by all judges and magistrates, but particularly by what we now term *justices of the peace*.

CONSERVATORY, a term sometimes used for a green-house. It is, properly, a large green-house for exotics, in which the plants are planted in beds and borders, and

IF GOODS ARE IMPORTED INTO A CONQUERED COUNTRY, WITH THE CONSENT OF THE CONQUEROR, THEY ARE NOT LIABLE TO FORFEITURE AFTERWARDS.

[CON]

The Scientific and Literary Treasury ;

[CON]

THE SPIRITUAL OR "CONSISTORY" COURT, IN THE 1 ME OF THE ANGLO-SAXONS, WAS JOINED WITH THE COURT OF HUNDRED COURTS.

not in tubs or pots, as in the common greenhouse—In various parts of Italy and France there are musical schools, called *conservatores*, which are expressly intended for the scientific cultivation of musical talents, and from which many first rate composers, as well as vocalists, have attained their proficiency.

CONSERVE, in pharmacy, a form of medicine contrived to save the flowers, herbs, roots, fruits, or simples, as nearly as possible in their natural fresh state.

CONSIDERATION, in law, the material cause or ground of a contract, without which the party contracting would not be bound. A consideration is either express or implied, *express*, when the thing to be given or done is specified, *implied*, when no specific consideration is agreed upon, but justice requires it, and the law implies it as when a man labours for another, without stipulating for wages, the law infers that he shall receive a reasonable *consideration*.

CONSIGNMENT of goods, in commerce, is the delivering or making them over to another, thus, goods are said to be consigned to a factor, when they are sent to him for sale, &c. He who consigns the goods is called the *consignor*, and the person to whom they are sent is the *consignee*.

CONSISTENCE, or CONSISTENCY, that state of a body in which its component parts remain fixed. Also, congruity and uniformity in opinions and actions.

CONSISTORIUM, in antiquity, a council house, or place of audience.

CONSISTORY COURT, the place or court in which the session or assembly of ecclesiastical persons is held by the bishop or his chancellor.

CONSOLIDATION, in the civil law, signifies the uniting the possession or prout of land with the property, and vice versa. In the ecclesiastical law, it is the uniting two benefices into one by assent of the ordinary, patron, and incumbent—*Consolidation*, in surgery, the action of uniting broken bones, or the lips of a wound, by means of application.

CONSOLS, in commerce, funds formed by the *consolidation* (of which word it is an abbreviation) of different annuities, which had been severally formed into a capital [See FINES.]

CONSOLE, in architecture, a bracket or shoulder-piece or an ornament cut upon the key of an arch, which has a projecture, and on occasion serves to support little columns, figures, busts, and vases.

CONSONANT, a letter so named because it is considered as being sounded only in connection with a vowel. But some consonants have no sound, even when united with a vowel, and others have a very imperfect sound hence some are called *mutæ*, and others *semi-vowels*.

CONSONANTE, in music, an Italian epithet for all agreeable intervals.

CONSPIRACY, a combination of men for an evil purpose, or an agreement between them to commit some crime in concert, as, a conspiracy against the govern-

ment—In law, it signifies an agreement between two or more, falsely to indict, or procure to be indicted, an innocent person of felony.

CON SPIRITO, in music, an Italian phrase, denoting that the part is to be played with spirit.

CONSTABLE, a civil officer, anciently of great dignity, as the Lord High Constable of England, and also the constables or keepers of castles, &c. It is now the title of an officer under the magistrates for the preservation of the peace, whose duty principally consists in seizing and securing persons guilty of tumultuary offences. There are high constables and petty constables, the former are chosen at the court leets of the hundred over which they reside, or in default of that, by the justices of the quarter-sessions, and are removable by the same authority that appoints them. The petty constables are chosen by the jury of the court-leet, or if no court is held, they are appointed by two justices of the peace—The Lord High Constable of England had the care of the common peace, in deeds of arms, and matters of war. His power was so great and so improperly used, that it was abridged by Richard II, and was afterwards forfeited in the person of Edward Stafford, duke of Buckingham, in 1521.

CONSTAT, a certificate given out of the exchequer to a person who intends to plead or move for a discharge of anything in that court. The effect of it is to show what appears upon the record, respecting the matter in question.

CONSTELLATION, an assemblage or system of several stars, expressed or represented under the name and figure of some animal or other object, as a bear, a ship, and the like, whence they have derived those appellations which are convenient in describing the stars. The division of the heavens into constellations is very ancient, probably coeval with astronomy itself. Modern astronomers divide the whole starry firmament into three parts, viz 1. The constellations in the zodiac, 2. Constellations north of the zodiac, and 3. Constellations south of the zodiac. The constellations in the zodiac are Aries, Taurus, Gemini, Cancer, Leo, Virgo, Libra, Scorpio, Sagittarius, Capricornus, Aquarius, Pisces. Many young persons have found an easy mode of remembering the names and order of the twelve signs by the aid of the following lines, and therefore, although they have no other novelty nor elegance to recommend them, their insertion here may not be altogether useless.

The ram, the bull, the heavenly twins,
And next the crab the lion shines,
The virgin and the scales,
The scorpion, archer, and sea-goat,
The man that holds the watering-pot,
And fish with glittering tails.

CONSTITUENT, in politics, one who by his vote constitutes or elects a member of parliament—*Constituents*, in physics, the elementary or essential parts of any substance.

THE POETS OF ANTIQUITY VERY INGENUOUSLY CONNECTED THE MOST POPULAR FABLES OF MYTHOLOGY WITH THE DIFFERENT CONSTELLATIONS.

CON]

The Scientific and Literary Treasury ;

[CON

CONSTITUTION, in politics, any form or principle of government, regularly constituted. Constitutions are either democratic, aristocratic, or of a mixed character. They are, 1. *Democratic*, when the fundamental law guarantees to every citizen equal rights, protection, and participation, direct or indirect, in the government, such as the constitutions of the United States of America, and of some cantons of Switzerland. 2. *Aristocratic*, when the constitution establishes privileged classes, as the nobility and clergy, and entrusts the government entirely to them, or allows them a very disproportionate share of it: such a constitution was that of Venice. 3. *Of a mixed character*; to which latter division belong some monarchical constitutions, which recognize the existence of a sovereign whose power is modified by other branches of government, of a more or less popular cast. Of this kind is the *BRITISH CONSTITUTION*. It assigns the making of laws to the sovereign, and the Houses of Lords and Commons, the sovereign being at the same time the executive power and personal representative of the nation: the House of Lords being a court of appeal from the Courts of Law; and the House of Commons, the originator of all taxes and financial grants, for the use of the executive. It has been truly said, that "it is not absolutely essential to the existence of a constitution, that it should be producible in a visible form. The period of time when the foundations of the present English government were laid by the association of the people in their original character cannot, indeed, be ascertained. Many of the laws which are in use to this day in Great Britain, may be traced back to the remotest period of antiquity; and the origin even of the institution of juries, an institution so congenial to the genuine spirit of freedom, is lost in the obscurity of the fabulous ages. The constitution of Great Britain is a constitution of principles, not of articles; and however frequently it may have been violated by tyrants, monarchical, aristocratical, or democratical, the people have always found it expedient to restore the original foundation, while, from time to time, they have been successful in improving and ornamenting the building."—By the word **CONSTRIC-TION**, is also meant, a particular law, ordinance, or regulation made by the authority of any superior; as, the novel *constitutions* of Justinian and his successors; the *Constitutions* of Clarendon, &c.—**CONSTITUTION**, in medicine, the temperament of the whole body, arising from the quality and proportion of the parts. In this sense we speak of a robust or feeble constitution, a cold, phlegmatic, or sanguine constitution, &c.

CONSTRUCTOR, in anatomy, an appellation given to several muscles on account of their contracting or closing some of the orifices of the body; as the *Constructor labiorum*, a muscle which constitutes the very substance of the lips and draws them up as in kissing; or the *Constructor nasi*, a

muscle arising above the *dentes incisores* of the upper jaw, and terminating in the *ala* of the nose.

CONSTRUCTION, in a general sense, the manner of putting together the parts of a building, or of a machine, &c.—In grammar, syntax, or the proper arrangements of words in a sentence. Also, the manner of understanding the arrangement of words, or of understanding facts: thus we say, "let us give the author's words a rational and consistent construction."

CONSUALIA, in Roman antiquity, a festival instituted by Romulus, and dedicated by him to Neptune, whom he termed Consus, or the god of counsel, in consequence of his successful scheme on the Sabine virgins.

CONSUBSTANTIAL, in theology, an epithet signifying of the same substance: thus, in the articles of the Church of England, Christ is declared *consubstantial*, or of one substance with the Father.

CONSUBSTANTIATION, a tenet of the Lutheran church, the members of which maintain that after consecration of the sacramental elements, the body and blood of our Saviour are substantially present, together with the substance of the bread and wine, which is called consubstantiation, or impanation.

CONSUL, in the Roman commonwealth, the title of the two chief magistrates, whose power was, in a certain degree, absolute, but who were chosen only for one year. The authority of the two consuls was equal; yet the Valerian law gave the right of priority to the elder, and the Julian law to him who had the greater number of children; and this was generally called *consul major*, or *prior*. In the first ages of Rome they were elected from patrician families; but in the year of Rome 398, the people obtained the privilege of electing one of the consuls from their own body, and sometimes both were plebeians.—In modern usage, the name *consul* is given to an officer appointed to reside in a foreign country, to protect the interests of trade, and to aid his government in any commercial transactions with such country.

CONSULTATION, a council for deliberation; as a *consultation* of physicians was called.

CONSUMPTION, in medicine, a word of very extensive signification, implying all disorders that bring decay or waste upon the constitution. But it is more particularly the disease called *phthisis pulmonalis*, a disorder seated in the lungs, attended with hectic fever, cough, &c. Hence the word *consumptive* is used to denote the incipient state of that disease, or to a constitution predisposed to it.

CONTAGION, that subtle matter which proceeds from one diseased person and communicates the disease to another; as in cases of small-pox, malignant fevers, &c., which are often communicated without contact.

CONTENTS, any thing or things held, included, or comprehended within a limit

FAMILIES ARE UNITED BY NATURE, STATES BY LAW; THE RULING PRINCIPLE OF THE FORMER IS LOVE AND KINDNESS, THAT OF THE LATTER, STERN JUSTICE.

CON]

A New Dictionary of the Belles Lettres.

[CON

or line as, the contents of a cask or bale the contents of a book &c.—In geometry, the area or quantity of matter or space included in certain lines.

CON TAIL the parts of a discourse which precede or follow the sentence quoted for instance the sense of a passage of Scripture is often illustrated by the context.

CONTINENT, in geography a great extent of land not dyed or interrupted by a sea or a connected tract of land of great extent as the Eastern or Western continent.—The continental powers those whose territories are situated on the continent of Europe.

CONTINENTAL SYSTEM a term given to a plan devised by Napoleon to exclude this country from all intercourse with the continent of Europe thereby to prevent the importation of British manufactures and commerce and thus to compel the English government to make peace upon the terms prescribed by the French ruler. The history of Napoleon's continental system begins with the decree of Berlin of Nov 21 1806 by which the British islands were declared to be in a state of blockade all commerce intercourse, and correspondence were prohibited every Englishman found in France or in any country occupied by French troops was declared a prisoner of war all property belonging to Englishmen for prize and all trade in English goods entirely prohibited Great Britain immediately directed reprisals against the Berlin decree prohibiting all neutral vessels from sailing from one port to another belonging to France or one of her allies &c. This was met by counter reprisals and for a long time a fierce and most annoying system was carried on for the annihilation of British commerce the effects of which are still felt from the rival products and manufactures on the continent to which the system gave rise.

CONTOUR one of Linnaeus' natural orders including plants with a single twisted petal. Thus we say a contorted corolla when the edge of one petal lies over the next in an oblique direction.

CONTOURION in medicine a twisting or wresting of a limb or member of the body out of its natural situation partial dislocation.

CONTOUR in painting sculpture, &c. the outline or that line which defines or terminates a figure.

CONTOURNE in heraldry, an epithet for a beast standing or running with his face to the sinister side being always supposed to look to the right.

CONTRACT a Latin preposition signifying against which is used as a prefix to many English words.

CONTRABAND, in commerce is a term applied to such goods as are prohibited to be imported or exported either by the laws of a particular state or by special treaties.—By the ancient law of Europe a ship conveying any contraband article was lia-

ble to confiscation as well as the article. But in the modern practice of the courts of admiralty of this and other countries a mild rule has been adopted and the carriage of contraband articles is attended only with the loss of freight and expenses, unless when the ship belongs to the owner of the contraband cargo or when the simple misconduct of conveying such a cargo has been connected with other aggravating circumstances.

CON TRA BASSO in music, Italian for thorough bass. Also the name of the instrument called a double bass.

CONTRACT a covenant or agreement between two or more persons with a lawful consideration or cause which binds the parties to a performance.—*I serious contract*, is an agreement to pay more interest for money than the law allows.

CONTRACT III FOR E that property or power inherent in certain elastic bodies whereby when extended they are enabled to draw themselves up again to their former dimensions.

CONTRACTION in a general sense the diminishing the extent or dimensions of a body.—In surgery the shrinking up of the muscles or arteries.—In grammar, the reducing two syllables into one by the omission of a letter or syllable.

CONTRAINDICATION in medicine an indication from some peculiar symptom or fact that forbids the method of cure which the general tenor of the disease requires.

CONTRAPUNTIST, in music one skilled in counterpoint.

CONTRAST in painting the due placing of the different parts and objects of a picture that they may be suitably opposed to each other.

CONTRAVALLATION line of intrenchation a trench guarded with a parapet thrown round a place by the besiegers, to defend themselves against the sallies of the garrison.

CONTRAYEVA, the genus of plants *Dorstenia* all low herbaceous plants natives of the warm climates of America, and useful as diaphoretics.

CONTRI in heraldry an epithet given to several bearings, on account of their cutting the shield contrary and opposite ways; thus we meet with *contre bend*, *contre chevron* *contre pale*, &c.

CONTRI TION in a general sense, the act of going to a common stock. In a military sense, impositions upon a country in the power of an enemy which are levied under various pretences and for various purposes, usually for the support of the army.

CONTROLLER, in law an overseer or officer appointed to control or verify the accounts of other officers.

CONUMACY in law a refusal to appear in court when legally summoned, or disobedience to its rules and orders.

CONVALESCENCE the insensible recovery of health and strength after disease.

CONVALLARIA, in botany, a genus of

A COVENANT DIFFERS FROM AN ISLAND ONLY IN EXTENT, THUS GREAT BRITAIN, THOUGH AN ISLAND, IS A COVENANT TO THE ISLE OF ANGLESIA.

IN TIME OF WAR, ARMS AND MUNITIONS OF WAR ARE NOT PERMITTED BY ANY BELLETTRENT TO BE CARRIED TO ANOTHER, BUT ARE SHIPPED AS CONTRABAND.

BY THE ACT OF PARLIAMENT, DISSENTERS MAY ASSEMBLE FOR RELIGIOUS WORSHIP, PROVIDED THE DOORS BE NOT LOCKED, BARRED OR BOLTED.

the *hexandria-monogynia* class of plants ; comprehending the lily of the valley, and a few other similar plants.

CONVENTICLE, a private assembly or meeting, for the exercise of religion ; the word was at first an appellation of reproach to the religious assemblies of Wickliffe, in the reigns of Edward III. and Richard II., and is now usually applied to a meeting of dissenters from the established church.—As the word *conventicle*, in strict propriety, denotes an unlawful assembly, it cannot be justly applied to the assembling of persons in places of worship, which are licensed according to the requisitions of law.

CONVENTION, in law, an extraordinary assembly of the estates of the realm.—In military affairs, an agreement entered into between two bodies of troops opposed to each other ; or an agreement previous to a definitive treaty.—*National convention*, the name of the assembly by which the government of France was conducted during a period of the revolution.

CONVERGING, tending to one point.—*Converging lines*, in geometry, lines which occasionally approximate.—*Converging rays*, in optics, those rays that proceed from different points of an object, and incline towards one another until they meet.—*Converging series*, in mathematics, is that in which the magnitude of the several terms gradually diminishes.

CONVERSE, in mathematics, an opposite proposition : thus, after drawing a conclusion from something supposed, we invert the order, making the conclusion the supposition or premises, and draw from it what was first supposed.

CONVERSION, in a theological sense, that change in man by which the enmity of the heart to the laws of God, and the obstinacy of the will are subdued, and are succeeded by supreme love to God and his moral government ; and a reformation of life.—*Conversion of equations*, in algebra, the reducing of a fractional equation into an integral one.—*Conversion of a proposition*, in logic, is a changing of the subject into the place of the predicate, and still retaining the quality of the proposition.

CONVEX, anything rising or swelling on the exterior surface into a spherical or round form ; as, a *convex* lens or mirror.

CONVEYANCE, in law, a deed or instrument by which lands, &c., are conveyed or made over to another.

CONVEYANCER, one who professes to draw deeds, mortgages, and conveyances of estates. This profession requires great knowledge of the law, and a solid and clear understanding ; for on conveying the security of property greatly depends.

CONVIVIAL, in antiquity, a banquet or entertainment given to a friendly party.

CONVICT, in law, a person found guilty of a crime charged against him, either by the verdict of a jury, or other legal decision.

CONVICTION, the act of proving guilty of an offence charged against a person by a legal tribunal. Also, the state of being

sensible of guilt ; as, by *conviction* a sinner is brought to repentance.

CONVOCAATION, an assembly of the clergy of England, which at present is merely nominal. Its province is stated to be the enactment of canon-law, subject to the licence of the king ; and the examination and censuring of all heretical and schismatical books and persons ; but from its judicial proceedings lies an appeal to the king in chancery, or his delegates. It is held during the session of parliament, and consists of an upper and a lower house : in the upper sit the bishops, and in the lower the inferior clergy, who are represented by their proctors, and all the deans and archdeacons ; in all, 143 divines.

CONVOLUTED, in botany, an epithet denoting that one part is rolled on another ; as the sides or margins of nascent leaves in plants.

CONVOLVULUS, Bindweed ; a genus of plants of many species. Class 6 *Pentandria*, order 1 *Monogynia*.

CONVOY, ships of war which accompany merchantmen in time of war, to protect them from the attacks of the enemy.

—By land, any body of troops which accompany provision, ammunition, or other property for protection.

CONVULSION, (*spasmus*), in medicine, a preternatural and violent contraction of the membranous and muscular parts, arising from a spasmodic stricture of the membranes surrounding the spinal marrow, and the nerves distributed from it.

CONUS, in conchology, a genus of animals, class *Vermea*, order *Testacea*. These cones inhabit the ocean, and are generally found on rocky shores : many of the shells are extremely beautiful.

COOM, a term applied to the soot that gathers over an oven's mouth ; also for that black, greasy substance, which works out of the wheels of carriages.

COOT, in ornithology, a fowl of the genus *Fulica*, frequenting lakes and other still waters. It makes its nest among rushes, with grasses and reeds, floating on the water.

COPATIBA, BALSAM OF, a liquid resinous juice flowing from incisions made in the stem of a tree called *Copaifera officinalis*, growing in South America. It is of the consistence of oil, and as a medicine is corroborating and detergent.

COPAL, improperly called gum copal, a gum of the resinous kind, the concrete juice of a tree, called *res copallina*, which grows in South America. Copal greatly resembles amber in appearance : it is hard, transparent, and odoriferous, and makes an excellent varnish.

COPPECK, a small Russian coin, equal to about one farthing English.

COPERNICAN SYSTEM, that system of the universe which was anciently taught by Pythagoras, and afterwards revived by Copernicus, a Polish astronomer. According to this system, the sun is supposed to be placed in the centre, and all the other bodies to revolve round it in a particular

THE BEST COPAL IS HARD AND BRITTLE, EASILY REDUCIBLE TO A FINE POWDER OF A LIGHT LEMON COLOUR, AND BEAUTIFULLY TRANSPARENT.

[cop]

A New Dictionary of the Belles Lettres.

[COR]

order which theory is now universally adopted, under the name of the Solar system.

COPING in masonry the stone covering on the top of a wall.

COPPER one of the six primitive metals, of a pale red colour tinged with yellow. Copper is not unfrequently found native sometimes in small and slender fibres and sometimes in little globular and irregular masses but it is most frequently found in the state of ore. Next to gold silver and platinum it is the most ductile and malleable of the metals and it is more elastic than any metal except steel and the most sonorous of all the metals. Copper in sheets is much used for covering the bottoms of ships for boilers and other utensils mixed with tin it forms bell metal with a smaller proportion in bronze and with zinc it forms brass punchbeck &c.—Great Britain has various copper mines in Cornwall Devonshire Wales &c. but particularly in the first. Though known long before the Cornish copper mines were not wrought with much spirit till last century. From 1726 to 1750 they produced at an average about 700 tons per year of pure copper during the ten years from 1776 to 1778, they produced at an average 2450 tons. In 1794 the produce exceeded 5000 and it now amounts to about 12000 tons, worth at 100*l* a ton no less than 1 200 000*l* sterling. In 1768 the famous mines in the Pna mountain near Amlwch in Anglesea were discovered. The supplies of ore furnished by them were for a long time abundant and all precedent but for many years past the productiveness of the mine has been declining, and it now yields comparatively little copper. At present the entire produce of the copper mines of England Wales Scotland and Ireland may be estimated at about 15000 tons and Great Britain instead of being as formerly dependent on foreigners for the greater part of her supplies of this valuable metal has for many years past been one of the principal markets for the supply of others.

COPPERAS sulphate of iron commonly called green vitriol a salt of a peculiar fragrant taste and of various colours though most usually green. It sulphuric acid diluted with water and poured upon it in much effervescence will be perceptible the metal will be dissolved and the solution when evaporated will exhibit the sulphate of iron or copperas which is a neutral salt in a very impure state. Copperas is the basis of many dyes it gives a fine black though it rather subjects the material to decay unless used with extreme caution the least excess occasioning the cloth to rot very soon.

COPPER PLATE a plate of copper on which figures are engraved also the impression taken from that plate—*Copper plate Printing* is performed by means of what is called a rolling press. The engraved plate is covered with ink made of oil and Frankfort black, then cleanly wiped on the

smooth parts, and laid on wet soft paper and on being passed between two cylinders with great force, the impression of the engraved part is perfectly transferred to the paper.

COPFICE or **COPSE**, a wood of small growth cut at certain times, and used principally for fuel.

COPIL DUST, powder used in purifying metals.

COPPLE STONES lumps and fragments of stone brought from adjacent cliffs, and rounded by the continual action of the waves.

COPTIC the language of the Copts, or any thing pertaining to those people who are the descendants of the ancient Egyptians and called *opthi* or *opis* as distinct from the Arabians and other inhabitants of modern Egypt.

COPULA the word that connects any two terms in an affirmative or negative proposition as *God made man* Religion is indispensable to happiness.

COPULATIVE PROPOSITION in logic those where the subject and predicate are so linked together by copulative conjunctions that they may be all severally affirmed or denied one of another. Science and literature enlighten the mind and greatly increase our intellectual enjoyments.

COPY in law signifies the transcript of any original writing as the copy of a patent charter deed &c. A common deed can not be proved by a copy or counterpart where the original may be procured. But if the deed be enrolled certifying an attested copy is proof of the enrolment such copy may be given in evidence.—*Copy* is also used for the imitation of an original work more particularly in paintings and other works of art.—*Copy* among printers denotes the manuscript or original of a book given to be printed. Also when we speak of a book or a set of books we say a *copy* as a copy of the Scriptures a copy of Sir Walter Scott's works &c.

COPYHOLD a tenure of landed property by which the tenant holds his land by copy of court roll of the manor at the will of the lord or rather according to the custom of the manor by which such estate is discernible.

COPYRIGHT the exclusive right of printing and publishing copies of any literary performance either by an author in his own right or vested in the hands of those to whom he may have assigned that right.

COURTESY a light trifling girl who endeavours to attract admiration by making a display of her amatory arts from a desire to gratify vanity rather than to secure a lover. The species is very numerous and by no means confined to the fair sex. In France the males are easily designated by the masculine termination as *courts* but in England we have to use male as a prefix to the word when we speak of one of these silly flatterers.

COR in anatomy the heart—*Cor* or *cori* in astronomy, a constellation in the

[COR]

northern hemisphere, situated between the *Coma Berenices* and *Ursa Major*, so called by Dr. Halley in honour of King Charles.

—*Cor Hydra*, a fixed star of the first magnitude, in the constellation *Hydra*.—*Cor Leonis*, or *Regulus*, a fixed star of the first magnitude, in the constellation *Leo*.—*Cor Venetia*, the name of a beautiful kind of heart shells.

CORACOBRACHIALIS, in anatomy, a muscle that has its origin at the coracoid process of the scapula, and its termination about the middle part of the arm. Its use is to raise the arm upward and forward.

CORACOHYOIDÆUS, in anatomy, a muscle which arises from the upper edge of the scapula, and inserted in the *os hyoides*, which it serves to pull obliquely downwards.

CORACOÏD, in anatomy, a small sharp process of the scapula, shaped like a crow's beak.

CORAL, in zoology, a genus of zoophyte found in the sea, attached to stones, bones, shells, &c. Coral is red, white, and black, and was formerly believed to be a vegetable substance, but is now ascertained to be composed of a congeries of animals. The islands in the South Seas are principally coral rocks covered with earth, which have been formed by them from the bottom of the ocean. The coral fishery is particularly followed in the Mediterranean, on the coast of France, where the red coral most abounds. The coral is attached to the sub marine rocks, as a tree is by its roots, but the branches, instead of growing upwards, shoot downwards towards the bottom of the sea, a conformation favourable to breaking them off, and bringing them up. For this kind of fishing, eight men, who are excellent divers, equip a felucca or small boat, called commonly a coralline, carrying with them a large wooden cross, with strong, equal, and long arms, each bearing a stout bag net. They attach a strong rope to the middle of the cross, and let it down horizontally into the sea, having loaded its centre with a weight sufficient to sink it. The diver follows the cross, pushes one arm of it after another into the hollows of the rocks, so as to entangle the coral in the nets, when his comrades in the boats pull up the cross and its accompaniments.

CORAL-TREE, or *Erythrina*, a genus of plants, of several species, natives of Africa and America. They are all shrubby flowering plants, adorned chiefly with trifoliate or three-lobed leaves, and scarlet spikes of papilionaceous flowers.

CORALLIFORM, forked, crooked, and irregular, like coral.

CORALLINE, a submarine plant-like body, consisting of many slender jointed branches, resembling some species of moss. In the Linnaean system, corallines are classed with the zoophytes.—*Coralline* is also a small boat, used in the coral fisheries.

CORALLITE, a mineral substance or petrification, in the form of coral.

CORALLOID, a species of coralline, re-

sembling woven cloth in texture, consisting of arrangements of very small cells.

CORREIL, in fortification, a little basket, to be filled with earth, and set upon a parapet, to shelter men from the fire of besiegers.

CORBEL, in building, a short piece of timber in a wall, jutting six or eight inches, in the manner of a shoulder pier; sometimes placed for strength under the semigirder of a platform.

CORCULUM, or **CORCULE**, in botany, the embryo of the seed, or rudiment of a future plant, attached to and involved in the cotyledons.

CORDAGE, every description of ropes and haws used on shipboard, but more particularly that used in the running rigging of a ship.

CORDATE, a term used by naturalists for heart-shaped; thus, in botany, a *cordate leaf* means one which resembles the longitudinal section of the heart, *cordate-lanceolate*, shaped like a heart, but gradually tapering towards each extremity, *cordate-sagittate*, heart-shaped, but resembling the head of an arrow.

CORDELIER, in church history, a grey friar or monk of the order of St. Francis. The cordeliers wear a white girdle or rope tied with three knots, and called the *cord of St. Francis*, but the design of it, they say, is to commemorate the bands wherewith Christ was bound.

CORDELIER. This word, as we have seen above, originally signified an order of Franciscan monks, but it was afterwards given to a society of Jacobins in France from 1792 to 1794, who were so called from their place of meeting. They were distinguished by the violence of their speeches and conduct, and contributed not a little to the execrable crimes which disgraced the French name and nation during the early periods of revolutionary anarchy.

CORDIA, in botany, a genus of plants, class *Pentandria*, order *Monogynia*. The species are all trees.

CORDIAL, in medicine, whatever excites the system, raises the spirits, and quickly produces strength and cheerfulness.

CORDON, in fortification, a row of stones jutting before the rampart, and the basis of the parapet. The word cordon is still more used to denote a line or series of military posts, as, a *cordon of troops*. Cordon also signifies a ribbon, as the *cordon bleu*, the badge of the order of the Holy Ghost.

CORDOVAN, leather made of goat skin, and named from Cordova in Spain.

COREIA, in antiquity, a festival in honour of Proserpine.

COREOPSIS, in botany, a genus of plants, class *14 Syngenesia*, order *3 Polygamia frustanea*. The species are mostly perennials.

CORIA'CEOUS, stiff, like leather, a botanical term for leaves, capsules, &c. when in that state.

CORIAN'DER, the *Coriandrum sativum* of Linnaeus, an annual plant, the seed of which when dry is an agreeable aromatic.

COAL FISHING, LIKE PEARL FISHING, IS ATTENDED WITH MUCH DANGER, IN CONSEQUENCE OF THE DANGERS WHICH INFEST THOSE SEAS.

TO BE 100 MILES IN LENGTH, AND UPWARDS OF TWO HUNDRED FATHOMS PERPENDICULAR.

[COR]

BY CLOSING WINE BOTTLES WITH BLADDER INSTEAD OF CORKS, THE WAISTY PARTS ONLY ESCAPE, AND THE STRENGTH OF THE WINE IS IMPROVED.

It is occasionally employed as a sudorific, and as a corrective of certain purgatives.

CORLIARIA, in botany, a genus of plants, class 22 *Dioclea*, order 10 *Decandria*. The species are shrubs, as *Corliaria myrtifolia*, myrtle leaved sumach, &c.

CORINTHIAN, pertaining to Corinth, a celebrated city of Greece. The *Corinthian Order*, in architecture, is the noblest and richest of the five orders. Its capital is adorned with two rows of leaves, between which arise little stalks or caulicoles, forming sixteen volutes.

CORIUM, in anatomy, any thing which serves as an integument or covering, as the skin or hide of an animal, the shell of an egg, &c.

CORK, the bark of the cork-tree, a species of *quercus*, or oak, growing, in great abundance, in Spain, Italy, and France. The bark is taken from the tree by making an incision down the whole length of the trunk, and, at each extremity, another round the girth. The tree is supplied with this coat in a degree so peculiarly abundant, that it not only continues to flourish uninjured by the act of barking, but, in its natural state, regularly sheds the whole, and acquires a new covering. Cork is light, porous, nearly impervious to most liquors, and wonderfully elastic. Qualities which render it superior to all other substances for stoppers for bottles, in the manufacture of which it is principally made use of. It is also employed as buoys to float nets, in the construction of life boats, the making of water-proof shoes, and in various other ways. There are two sorts of cork, the white and the black, the former grows in France, and the latter in Spain. The corks of the white are usually more beautiful, more smooth, lighter, and of a finer grain than the black, and when this kind is burned in close vessels it forms the pigment called *Spanish black*. The uses of cork were well known to the ancients, and were nearly the same to which it is applied by us.

CORMORANT, or **CORVORANT**, an exceedingly voracious bird of the pelican tribe. It builds on the highest cliffs hanging over the sea, and feeds on fish.

CORN, farinaceous seed, as that of wheat, rye, barley, oats, and maize. In short, it comprehends all the kinds of grain which constitute the food of men and horses. We also use the word for grain growing in the fields, the plants or stalks, being included in the word corn, until separated from the ears.—**CORN**, in surgery, an excrescence or hard tubercle like a flat wart, growing in the feet, especially upon the joints of the toes. Corns are justly attributed to the pressure of tight or narrow tied shoes, especially if a person is obliged to stand or walk much.

CORNEA, in anatomy, the transparent membrane in the fore part of the eye, through which the rays of light pass.

CORNEL-TREE, or **CORNELIAN-TREE**, the dog wood, or cornelian cherry-tree, a genus of plants of several species.

The *mascula*, or cornelian cherry-tree, has a stem twenty feet high, and produces a small, red, acid fruit.

CORNET, an instrument very similar to a trumpet, which is used in the army.—Also a commissioned officer in a troop of cavalry. He bears the colours, and commands in the absence of the lieutenant. His rank or commission is called a *cornetcy*.

CORN'FLAG, in botany, the *Gladolus*, a genus of plants, having a double tuberosc root, with leaves like the fleur-de-lis, and a flower consisting of one petal, shaped like the lily.

CORNICE, in architecture, the uppermost member of the entablature of a column, or any moulded projection that crowns or finishes the part to which it is affixed, as the cornice of a room, a door, &c.

CORNIC ULATE, in botany, bearing a little spur or horn.

CORNUCOPIA, or the **HORN OF PLENTY**, a source whence, according to the ancient poets, every production of the earth was lavished, a gift from Jupiter to his nurse, the goat Amalthea. In elucidation of this fable, it has been said that in Libya, the ancient name of a part of Africa, there was a little territory, in shape not ill resembling a bullock's horn, which Ammon, the king, gave to his daughter Amalthea, the nurse of Jupiter. Upon medals the cornucopia is given to all deities, genii, and heroes, to mark the felicity and abundance of all the wealth procured by the goodness of the former, or the care and valour of the latter.

CORNUCOP'IE, in botany, a genus of plants, class 3 *Triandria*, order 2 *Digynia*. It is so called from the resemblance of the flowers in the involucre to a horn of plenty.

CORNUS, in botany, a genus of plants, class 4 *Tetrandria*, order 2 *Digynia*. The species are trees or shrubs, as *cornus mascula*, the cornelian cherry, *cornus florida*, and many others.

CORNU AMMONIS, a shell, in shape resembling a ram's horn.

COROLLA or **COROL**, in botany, the leafy parts of a flower, which is marked with divers colours, and which surrounds the parts of fructification. Each leaf or division of the corolla is called a petal, and according as there is one, two, or three of these petals, the corolla is said to be monopetalous, dipetalous, tripetalous, &c.

COROLLARY, a conclusion or consequences drawn from premises, or from what is advanced or demonstrated.

COROLLULE, or **COROLLET**, a term used by botanists for one of the little partial flowers, which together make up the compound ones, the florets is an aggregate flower.

CORONA, in architecture, a large flat member of a cornice, crowning the entablature and the whole order.—In anatomy, the upper surface of the molar teeth or grinders.—In optics, a halo or luminous circle round the sun or moon.—In botany, the circumference or margin of a radiated compound flower.

CORONALIS SUTURA, in anatomy,

THE PRACTICE OF EMPLOYING CORK TO ANALYST IS BEGINNING IN VERY ANCIENT, AND ITS USE HAS PROVED OF GREAT VALUE IN CASES OF SHIVERING.

[COR]

A New Dictionary of the Belles Lettres.

[COR]

the coronal suture, or first suture of the skull, which reaches transversely from one temple to the other, and joins the *os frontis* with the *ossa parietalia*.

CORONARY VESSELS certain vessels which furnish the substance of the heart with blood—*Coronary arteries*, two arteries springing out of the *aorta*, before it leaves the *pericardium*—*Coronary vein*, a vein diffused over the exterior surface of the heart. It is formed of several branches arising from all parts of the *ventricles*, and terminates in the *vena cava*, whither it conveys the remains of the blood brought by the coronary arteries.

CORONARIÆ, the tenth Linnæan natural order of plants, containing hyacinths, lilies, and other herbaceous and perennial plants.

CORONATION, the public and solemn ceremony of crowning, or investing a prince with the insignia of royalty, in acknowledgment of his right to govern the kingdom at which time the prince swears reciprocally to the people, to observe the laws, customs and privileges of the kingdom and to act and do all things conformable thereto. The form of the coronation oath of a British monarch is as follows: "I solemnly promise and swear to govern the people of this United Kingdom of Great Britain and Ireland, and the dominions thereto belonging according to the statutes in parliament agreed on, and the laws and customs of the same to the utmost of my power to maintain the laws of God the true profession of the gospel, and the Protestant reformed religion established by the law to preserve unto the bishops and the clergy of this realm, and the churches committed to their charge, all such rights and privileges as by law do or shall appertain unto them or any of them." After this the king or queen, laying his or her hand upon the holy Gospels, shall say, "The things which I have before promised, I will perform and keep, so help me God."

CORONER, the presiding officer in a jury convened to inquire into the cause of sudden deaths.

CORONET, in heraldry a small crown worn by the nobility. The coronet of a duke is adorned with strawberry leaves, that of a marquis has leaves with pearls interspersed, that of an earl has the pearls raised on the tops of the leaves, that of a viscount is surrounded with pearls only, that of a baron has only four pearls.

CORONET, or **CORNET**, in falconry, the upper part of a horse's hoof.

CORPORAL, the lowest military officer in a company of foot who has charge over one of the divisions places and replaces sentinels, &c.—*Corporal* in law, an epithet for any thing that belongs to the body, as *corporal punishment*. Also, a *corporal oath*, so called because the party taking it is obliged to lay his hand on the Bible.

CORPORATION, a body politic or corporate, so called because the persons or members are joined into one body and authorized by law to transact business as an

individual. Corporations are either spiritual or temporal *spiritual*, as bishops, deans, archdeacons &c., *temporal*, as the mayor, and aldermen of cities. And some are of a mixed nature, being composed of spiritual and temporal persons, such as heads of colleges and hospitals, &c. Corporations may be established either by prescription, letters patent, or act of parliament, but they are most commonly established by patent or charter. It has been truly said, that the whole political system is made up of a concatenation of various corporations, political, civil, religious, social, and economical. A nation itself is the great corporation, comprehending all the others, the powers of which are exerted in legislative, executive and judicial acts.

CORPS, (French pron *kor*) a body of troops, any division of an army, as, a *corps de reserve*, the troops in reserve, *corps de bataille* the whole line of battle &c.

CORPUS, in anatomy, a name given to several substances, or parts in the human body.

CORPUSCULE a minute particle or physical atom. Corpuscles are not the elementary principles of matter, but such small particles simple or compound, as are not dissolved or dissipated by ordinary heat.

CORPUS CHRISTI DAY a festival appointed by the church of Rome in honour of the sacrament of the Lord's Supper.

CORPUSCULAR PHILOSONY that method of philosophising which endeavours to explain things and to account for the phenomena of nature by the motion figure, position, &c. of the minute particles of matter.

CORRELATIVE an epithet denoting the having a reciprocal relation so that the existence of one in a certain state depends on the existence of another, as, father and son, light and darkness, motion and rest, all of which are correlative terms.

CORRIDOR, in architecture a gallery or long aisle round a building, leading to several chambers at a distance from each other.—In fortification, the covered way lying round the whole compass of the fortifications of a place.

CORROBORANT of a strengthening nature, as a *corroborant medicine*.

CORROSION, the action of eating or wearing away by slow degrees, as by the action of acids or metals.

CORROSIVE SUBLIMATE, oxymercure of mercury, an extremely acrid and poisonous preparation.

CORUGATOR a muscle which contracts the skin of the forehead into wrinkles.

CORSAIR a pirate or cruiser, a name commonly given to the piratical cruising vessels of Barbary, which, from the beginning of the sixteenth century to a recent period infested the Mediterranean.

CORUSCILLI, in natural history, that part of winged insects which answers to the breast in other animals.—Also, a small curlew.

CORSET an article of dress especially intended to preserve the beauties of the

REGAL CORONATIONS HAVE BEEN PERFORMED IN WESTMINSTER ABBEY, EVEN TO THE LATEST TIMES, WITH GREAT SPLENDOUR AND FEUDAL CEREMONIES.

CORPORATIONS MAY BE USED FOR THE BEST OR MOST BENEFICIAL PURPOSES, FOR READING INSTITUTIONS OR FOR DESTROYING THEM.

[COR]

female form To display the general contour of the figure without impeding the gracefulness of its motions, and to guard it from slight imperfections, resulting from improper position, or the character of exterior drapery, are the legitimate objects of the corset. But it often happens that females, naturally endowed with fine forms, wear corsets which are only fit for those who are disproportionately shaped, and destroy the graceful ease of their movements, by encasing themselves in barriers of steel and whalebone Ladies of a certain age who from luxurious living or indolent habits have grown corpulent may be permitted to adopt any mode of dress they please their experience ought to be sufficient to direct them but for young persons, in whom the organs of the body are in a state of development the corset should be of the simplest character so that the lungs should have their full play and no undue compression of the muscles be allowed to take place whatever the capricious dictates of fashion may urge to the contrary

CORTEGE A French word signifying the train or retinue that accompanies a person of distinction

CORTES, the assembly of the states of Spain and Portugal answering in some measure to the parliament of Great Britain

CORTICE the outer bark of a plant

CORTICAL consisting of bark or rind belonging to the external covering as the cortical part of the brain

CORUNDUM a mineral of the sapphire kind which is found in the East Indies

CORUSCATION a sudden flash of light in the atmosphere or the light produced by the combustion of inflammable gas in the earth — Artificial coruscations may be produced by phosphorus and sulphuric acid or by sulphuric acid and iron filings

CORVETTE a French word for any vessel of war carrying less than twenty guns

CORVUS LAPIDIS in mineralogy a stone found in India remarkable for its making a noise like thunder when heated

CORVUS the Raven or Crow kind in ornithology a genus of birds of the order of pica — In astronomy a constellation of the southern hemisphere — Corvus in antiquity a military engine invented by the Romans at the time of their wars in Sicily when they first engaged the Carthaginian fleet It consisted of a strong platform of boards at the prow movable as on a spindle and thrown over the side of an enemy's vessel when grappled

CORYMBANTIS in antiquity priests of the goddess Cybele celebrated for their wild and extravagant attitudes in dancing, &c

CORYDALIS the twenty fourth Linnaean natural order of plants with helmet shaped flowers

CORYMB in botany a species of inflorescence in which the lesser flower stalks are produced along the common stalk on both sides, rising to the same height so as to form an even surface

CORYMBIATED, in botany, garnished with corymba

CORYMBIFEROUS, bearing fruit or berries in clusters, or producing flowers in clusters

CORYPHÆUS, a leader of a chorus

CORYPHENE, in ichthyology a fish with a sloping truncated head, and dorsal fin extending the whole length of the back

COSMICOMANCY the ancient art of divination by means of a sieve The sieve was suspended and if it trembled or turned when the name of a suspected person was mentioned the party was deemed guilty

COSINE (ANT), in geometry the secant to an arc which is the complement of another to ninety degrees

COSINE, in geometry, the sine of an arc which is the complement of another to ninety degrees

COSMETIC any preparation that renders the skin soft and white or helps to beautify and improve the complexion

COSMICAL, relating to the whole system of visible bodies, including the earth and stars

COSMOGONY in physics, the science or theory of the formation of the world

COSMOGRAPHY a description of the world or universe or the science of describing the several parts of the visible world

COSMOLABI an ancient instrument very similar to the astrolabe for measuring distances in the heavens or on earth

COSMOLOGY a treatise relating to the structure and parts of creation the elements of bodies the laws of motion, and the order and course of nature

COSMOPLITE a citizen of the world, one who makes himself at home everywhere

COSYACKS the tribes who inhabit the southern and eastern parts of Russia Poland the Ukraine &c paying no taxes but performing, instead of the duty of soldiers they form a kind of military democracy and have proved highly serviceable as irregular cavalry in the Russian campaigns Their principal weapon is a lance from ten to twelve feet in length they have also a sabre a gun and a pair of pistols as well as a bow and arrows The lances in riding are carried upright by means of a strap fastened to the foot the arm or pommel of the saddle Those who use bows carry a quiver over the shoulder Though little adapted for regular movements they are very serviceable in attacking baggage magazines and in the pursuit of troops scattered in flight They fight principally in small bodies with which they attack the enemy on all sides but mostly on the flanks and in the rear rushing upon them at full speed with a dreadful hurrah and with level lances

COSYUM in painting and the fine arts generally the observance of that rule or precept by which an artist is enjoined to make any person or thing sustain its proper character the same dress arms manners, &c all corresponding

COPLANAR, in geometry the tan

IN EARLY TIMES THE KING OF SPAIN WAS VERY DEPENDENT ON THE 'CORTEZ' OF CASTILE, WHO WERE INVESTED WITH THE POWER OF MAKING WAR

NAPOLEON OFFERED TO RESTORE "THE CORTEZ" TO THEIR ANCIENT IMPORTANCE, IN ORDER TO GAIN OVER THE SPANISH NOBILITY, BUT FAILED

[COT]

A New Dictionary of the Belles Lettres.

[COT]

THERE ARE MANY VARIETIES OF RAW COTTON IN THE MARKETS, USUALLY CLASSED UNDER THE DENOMINATIONS OF "LONG AND SHORT STAPLED."

gent of an arc which is the complement of another to ninety degrees

COIERIE, a fashionable association, or a knot of persons forming a particular circle. The origin of the term was purely commercial, signifying an association in which each member furnished his part, and bore his share in the profit and loss.

COIHURNUS, in antiquity, a kind of high shoes, laced high such as Diana and her nymphs are represented as wearing. The tragic actors also wore them, in order to give additional height to those who personated heroes. the *coihurnus* used for this purpose differing from the one used in hunting by its having a sole of cork, at least four fingers thick.

COTTON, a soft downy substance, resembling fine wool, growing in the capsules or pods of a shrub called the cotton plant, and is the material of which an immense quantity of cloth is made. The *Cotton plant* or *sarus* belongs to the genus *Gossypium*, of several species, all growing in warm climates. In the southern states of America, the cotton cultivated is distinguished into three kinds, the *navvies cotton*, so called from its colour, the *green seed cotton* producing white cotton with green seeds and the *black seed cotton*. The latter produces cotton of a fine, white, silky appearance, very strong and of a long staple. It appears that the manufacture of cotton has been carried on in Hindostan from the remotest antiquity and there it is still continued by hand labour in all its primitive simplicity. In England, however, during the last half century it has become of immense importance, and as we can not allow it to pass unnoticed we take the liberty of quoting from Mr McCulloch's excellent Dictionary of Commerce the following appropriate remarks:—The rapid growth and prodigious magnitude of the cotton manufacture of Great Britain are, beyond all question the most extraordinary phenomena in the history of industry. Our command of the finest wool naturally attracted our attention to the woollen manufacture and paved the way for that superiority in it to which we have long since attained but when we undertook the cotton manufacture we had comparatively few facilities for its prosecution, and had to struggle with the greatest difficulties. The raw material was produced at an immense distance from our shores and in Hindostan and China the inhabitants had arrived at such perfection in the arts of spinning and weaving, that the lightness and the delicacy of their finest cloths imitated the web of the gossamer and seemed to sustain its tenuity. Such, however, has been the influence of the stupendous discoveries and inventions of Hargreaves, Arkwright, Crompton, Cartwright and others, that we have overcome all these difficulties—that neither the extreme cheapness of labour in Hindostan nor the excellence to which the natives had attained has enabled them to withstand the competition of those who buy their cotton and who, after carrying

it 5000 miles to be manufactured, carry back the goods to them. This is the greatest triumph of mechanical genius and what perhaps is most extraordinary, our superiority is not the late result of a long series of successive discoveries and inventions, on the contrary, it has been accomplished in a very few years. Little more than half a century has elapsed since the British cotton manufactory was in its infancy, and it now forms the principal business carried on in this country, affording an advantageous field for the accumulation and employment of millions upon millions of capital, and thousands upon thousands of workmen! The skill and genius by which these astonishing results have been achieved, have been one of the main sources of our power: they have contributed in no common degree to raise the British nation to the high and conspicuous place she now occupies. Nor is it too much to say, that it was the wealth and energy derived from the cotton manufacture that bore us triumphantly through the late dreadful contest, at the same time that it gives us strength to sustain burdens that could not be supported by any other people.

—The following progress of a pound of cotton may not be uninteresting to our readers. It appeared originally in the Monthly Magazine. "There was sent to London lately from Paisley, a small piece of muslin, about one pound weight, the history of which is as follows.—The wool came from the East Indies to London from London it went to Lancashire, where it was manufactured into yarn, from Manchester it was sent to Paisley, where it was woven. It was sent to Ayrshire next, where it was tumbled, it was then conveyed to Dumbarton where it was hand sewed, and again returned to Paisley whence it was sent to Glasgow and finished and then sent up per coach to London. It may be reckoned about three years that it took to bring this article to market, from the time when it was packed in India, till it arrived complete in the merchant's warehouse in London whither it must have been conveyed 5000 miles by sea, nearly 1000 by land and contributed to reward the labour of nearly 150 persons whose services were necessary in the carriage and manufacture of this small quantity of cotton and by which the value has been advanced more than 2000 per cent.—(*cotton mill*, a mill or building with machinery for carding, roving and spinning cotton, either by means of water or steam.—(*cotton gin*, a machine to separate the seeds from cotton.

COTTON GRASS the *Triphorum*, a perennial of the grass tribe so called because its seeds have a downy substance attached to them which resembles cotton.

COTTON THISTLE an herbaceous plant with a biennial root so called because it has downy leaves.

COTYLA in anatomy, any deep cavity in a bone in which another bone is articulated but it is generally used to express the ac-

THE COTTON MANUFACTURING DISTRICT OF LANCASHIRE INCLUDES MANCHESTER, OLDHAM, ROCHDALE, STOCKPORT, BURY, &c., WITH A POPULATION OF 500,000.

tabulum, or cavity which receives the head of the thigh-bone.

COTYLEDON, in botany, the perishable lobe or placenta of the seeds of plants, of which there are mostly two. They are destined to nourish the embryo plant, and then perish.

COUCH, in painting, a term used for each lay or impression of colour either in oil or water, covering the canvas wall, or other matter to be painted. Gilders use the term *couch*, for gold or silver leaf laid on metals in gilding or silvering.

COUCHANT, in heraldry, lying down, but with the head raised, which distinguishes the posture of *couchant* from *dormant*, or asleep — *Lecant* and *couchant*, in law rising up and lying down, applied to beasts, and indicating that they have been at least one night on the land.

COUCH GRASS, a weed, which spreads very fast in arable land, and chokes every thing else.

COUCHING, one of the modes of operating in cases of cataract, by which the opaque lens is removed out of the axis of vision.

COUGH, a convulsive motion of the diaphragm, muscles of the larynx, thorax, &c., expelling the air that was drawn into the lungs by inspiration, and carrying along with it the phlegm or irritating matter which causes the convulsive effort of the muscles. This disease is generally considered unimportant, particularly if there be no fever connected with it, but every cough of a fortnight's duration is suspicious, and ought to be medically treated.

COUNCIL, in national affairs, an assembly of persons for the purpose of concerting measures of state. In England, that is called the *Privy Council*, wherein the sovereign and privy counsellors meet in the palace to deliberate on affairs of state. When the council is composed only of cabinet ministers, it is called a *Cabinet Council* — *Council of war*, an assembly of the principal officers of a fleet or army, called by the admiral or general to concert measures for requisite operations.

COUNSEL, in law, any counsellor or advocate, or any number of counsellors, barristers, or sergeants, as, the plaintiff's or defendant's counsel.

COUNT, a title of foreign nobility, equivalent to an English earl — In law, a particular charge in an indictment, or narration in pleading, setting forth the cause of complaint. There may be different *counts* in the same declaration.

COUNTENANCE, the whole form of the face, or system of features. This word has many figurative applications thus, by the *light of God's countenance*, we mean grace and favour — *the rebuke of his countenance* indicates his anger — *To keep the countenance*, is to preserve a calm, natural, and composed look — *To keep in countenance*, to give assurance to one, or protect him from shame — *To put out of countenance*, to intimidate and disconcert.

COUNTER, a term which enters into

the composition of many words of our language, and generally implies opposition.

COUNTER APPROACHES, in fortification, lines and trenches made by the besieged in order to attack the works of the besiegers, or to hinder their approaches.

COUNTRE-DEED, a secret writing either before a notary or under a private seal, which destroys, invalidates, or alters a public one.

COUNTERDRAWING, in painting, copying a design or painting by means of lines drawn on oiled paper, or other transparent substance.

COUNTERFEIT, that which is made in imitation of something, but without lawful authority, and with a view to defraud by passing the false for the true. Thus we say, *counterfeit coin*, a *counterfeit bond*, *deed*, &c.

COUNTERGUARD, in fortification, a small rampart or work raised before the point of a bastion, consisting of two long faces parallel to the faces of the bastion, making a salient angle, to preserve the bastion.

COUNTERMARK, a mark put upon goods that have been marked before. It is also used for the several marks put upon goods belonging to several persons, to show that they must not be opened but in the presence of all the owners or their agents — The mark of the goldsmith's company, to show the metal to be standard, added to that of the artificer.

COUNTERMINE, in military affairs, a well and gallery sunk in the earth and running underground, to meet and defeat the effect of the enemy's mine, or, in other words, a mine made by the besieged, in order to blow up the mine of the besiegers.

COUNTERPALEI, in heraldry, is when the escutcheon is divided into twelve parts *per pale*, the two colours being counterchanged, so that the upper and lower are of different colours.

COUNTERPART, the correspondent part or duplicate. Also, the part which is another, as the key of a cipher — In music, the part to be applied to another, as, the base is the counterpart to the treble.

COUNTERPASSANT, in heraldry, is when two lions in a coat of arms are represented as going contrary ways.

COUNTERPOINT, in music, the art of combining and modulating consonant sounds, or of disposing several parts in such a manner as to make an agreeable whole of a concert.

COUNTERPROOF, an engraving taken off from another fresh printed, which by being passed through the rolling press gives an inverted figure of the former.

COUNTER REVOLUTION, a revolution opposed to a former one, and restoring a former state of things.

COUNTERSCARP, in fortification, that side of the ditch which is next the camp, and faces the body of the place, but it often signifies the whole covered way, with its parapet and glacis.

COUNTER-SECURITY, security given

cou]

A New Dictionary of the Belles Lettres.

to one who has entered into a bond or become surety for another.

COUNTERSIGN, a military watchword; or a private signal given to soldiers on guard, with orders to let no man pass unless he first names that sign.—Also, to sign, as secretary or other subordinate officer, any writing signed by a principal or superior, to attest the authenticity of his signature.

COUNTER-TENOR, in music, one of the middle parts, between the treble and the tenor.

COUNTING-HOUSE, the house or room appropriated by merchants, traders, and manufacturers, to the business of keeping their books, &c.

COUNTRY, any tract of inhabited land or any region as distinguished from other regions; any state or territory; and also any district in the vicinity of a city or town. Thus we say, This gentleman has a seat in the country; England is my native country; the countries of Europe, Asia, &c.

COUNTY, originally, the district or territory of a count or earl: one of the ancient divisions of England, which by the Saxons were called *shires*. England is divided into forty counties or shires, Wales into twelve, Scotland into thirty. Each county has its sheriff and its court, with other officers employed in the administration of justice and the execution of the laws; and each lord-lieutenant of a county has the command of its militia.—*County corporate*, a title given to several cities or ancient boroughs (as Southampton and Bristol), on which certain kings of England have thought proper to bestow peculiar privileges; annexing territory, land, or jurisdiction, and making them counties within themselves, with their own sheriffs and other officers.—*County Palatine*, a county distinguished by particular privileges, and named from *palatio*, the palace, because the owner had originally royal powers in the administration of justice; these are now, however, greatly abridged. The counties palatine in England are Lancaster, Chester, and Durham.

COUP, a French term for a stroke or sudden blow.—*Coup de Grace*, the finishing blow.—*Coup de Main*, a sudden unpremeditated attack.—*Coup d'Œil*, the first glance of the eye, with which it surveys any object at large.—*Coup de Soleil*, any disorder suddenly produced by the violent scorching of the sun.

COUPED, or **COUPE**, in heraldry, is used to express the head, or any limb, of an animal, cut off from the trunk smooth; distinguishing it from that which is called *erased*, or forcibly torn off.—*Couped* is also used to signify such crosses, bends, bars, chevrons, &c. as do not touch the sides of the escutcheon, but are, as it were, cut off from them.

COUPÉE, a motion in dancing, when one leg is a little bent and suspended from the ground, and with the other a motion is made forward.

COUPLE, two of the same species or

kind; as, a couple of men, a couple of apples, &c. A pair is a couple, and a brace is a couple; but a couple may or may not be a pair or a brace.

COUPLE-CLOSE, in heraldry, an ordinary, so termed from its enclosing the chevron by couples, being always borne in pairs, one on each side a chevron.

COUPLET, the division of a hymn, ode, or song, wherein an equal number or an equal measure of verses is found in each part, called a *strophe*.

COURAGE, firmness of mind, inspired by a sense of what is just and honourable; that which, amidst all the dangers and trials to which human life is incident, enables a man steadily to pursue the dictates of conscience and prudence. It includes valour, boldness, and resolution; and is a constituent part of fortitude.

COURANT, in heraldry, an epithet for any beast represented in a running attitude.

COURANT, a piece of music in triple time; also, a kind of dance.

COURSE, in its general sense, a motion forward, either in a direct or curving line; and may be applied to animals, and to solid or fluid bodies.—*Course*, in navigation, that point of the compass on which a ship steers.—*Course*, in masonry, a continued range of bricks or stones of the same height.—Applied to the arts and sciences, *course* denotes a methodical series; as, the author has completed his course of lectures; or the medical student has completed his course in anatomy.—*Of course*, in natural and regular order; as, this effect will follow of course.—In a ship, the principal sails are called *courses*.—The *Course of Exchange*, in commerce, the current price or rate at which the coin of one country is exchanged for that of another; which, as it depends upon the balance of trade and the political relations which subsist between the two countries, is always fluctuating.

COURSING, the act or sport of pursuing any beast of chase, as the hare, &c. with greyhounds.

COURT, a palace; a place where justice is administered; also the persons or judges assembled for hearing and deciding causes, civil, criminal, &c. Thus we have a *court of law*; a *court of equity*; a *court martial*; an ecclesiastical *court*, &c.

COURT-BARON, a court incident to manorial rights.

COURT-LEET, a court of record held once a year, in a particular hundred, lordship, or manor, before the steward of the leet.

COURT-MARTIAL, a court consisting of military or naval officers, for the trial of offences within its jurisdiction.

COURT-ROLL, a roll containing an account of the number, &c. of lands which depend on the jurisdiction of the manor, &c.

COURTESY, elegance or politeness of manners, combined with kindness.—A respectful inclination of the body, performed by a woman, corresponding in design to the

IN ANCIENT TIMES THE COUNTY COURT WAS A COURT OF GREAT DIGNITY AND SPLENDOUR, WHERE THE EARL AND BISHOP SAT TO ADMINISTER JUSTICE.

JUSTICES OF THE PEACE ASSEMBLED AT THEIR GENERAL OR QUARTER SESSIONS, ARE EMPowered TO MAKE AND LEVY THE COUNTY RATES.

[CRA]

The Scientific and Literary Treasury;

[CRA]

bow of a gentleman.—*Tenure by courtesy*, in law, is where a man marries a woman seized of an estate of inheritance, and has by her issue born alive, which was capable of inheriting her estate: in this case, on the death of his wife, he holds the lands for his life, as tenant by courtesy.

COUSIN, the son or daughter of an uncle or aunt; the children of brothers and sisters being usually denominated *cousins*, or *cousins-germans*. In the second generation they are called *second cousins*.

COVENANT, in law, a writing containing the terms of agreement or contract between parties, or the clause of agreement in a deed containing the covenant.

—In theology, the promise of God to man, that man's perfect obedience should entitle him to happiness. The covenant of grace, is that by which God engages to bestow salvation on man, upon the condition that man shall believe in Christ, and yield obedience to the terms of the Gospel.

COW-POX, the vaccine disease, a pustule transferred from the udder of a cow to the human body, where it exhausts or neutralizes some morbid action of the *rete mucosum*, which prevents a disease of the same membrane, called *variola*, or small-pox.—The following paragraph having appeared in the public papers at the moment we were going to press with this sheet, we are glad to give it insertion. Much has been before written on the subject; but nothing that we have seen appears so conclusive and satisfactory. "Mr Ceely, surgeon, of Avlesbury, has demonstrated the important fact, that small pox and cow-pox have the same origin, the latter being small pox communicated to the cow. Mr C. inoculated cows with small pox matter, the vesicle produced in the animal had every appearance of the vaccine pock. To ascertain the point, children were inoculated with matter taken from the cow thus artificially infected, the result was, a fine, genuine vaccine vesicle. To establish the fact satisfactorily, these children were submitted to small pox inoculation, and found to be protected from the disease. Twenty-five successive inoculations have now been performed with this new virus, which may truly be named *variola vaccina*, and it continues to produce the most satisfactory vesicles, the matter has been employed in Bristol with perfect success."

COWRY, shell-money. The *cypræa moneta* is used for this purpose, and of which 100 in the East Indies pass for a penny.

CRAB, or CANCR, a genus of crustaceous fish, of which there are numerous species, having in general eight legs, besides two large claws. The habits of crabs are various, some are exclusively aquatic, and remain on the sands or rocks, at great depths in the sea; others inhabit excavations formed in the soft coral reefs or bars on certain coasts; some spend their days altogether on shore, living in burrows or dens, others live on rocky beaches, basking in the sun, and only retiring into the

sea when alarmed; while some species are completely terrestrial, inhabiting holes upon the highest hills and mountains of the West Indies. The most remarkable are the violet crabs of the Bahamas, which live in the mountains, but once a year proceed to the sea in a body of many millions, a journey which employs them some weeks. Here they cast their spawn, and soon after millions of young crabs travel into the mountains. The crabs which abound on our coasts, are the *locusta* and *manes* species.

CRAB'S CLAWS, in the materia medica, are the tips of the claws of the common crab broken off at the verge of the black part. They are used as an alkaline absorbent, and form the base of many of the compound sudorific powders.

CRAB'S EYES, concretions in the head of the cray-fish. They are accounted not only absorbent and drying, but also discutient and diuretic.

CRAMP, a convulsive contraction of a muscular part of the body, with pain.

CRANBERRY, in botany, a species of *vaccinium*, growing only on peat bogs or swampy land, and bearing small bright red berries, which have a pleasant acid flavour, and are much used in tarts.

CRANE, a migratory fowl of the genus *Ardea*. The common crane, or *ardea graus*, has black wing feathers, with an ash coloured body, and flies in great flocks in many countries. There are a great many species, but the characteristics of all consist in a straight long bill, with a furrow from the nostrils towards the point, long legs, and a long neck. The Siberian crane is noted for its sagacity, and the flocks keep a sentinel to warn them of danger.—Crane, a machine for raising great weights, consisting of a horizontal arm, or piece of timber, projecting from a post, and furnished with a pulley. They are also made of cast iron, on the principle of the wheel and pinion, by which they are rendered very commodious, and capable of raising immense weights.

CRANE LINES, in a ship, are lines going from the upper end of the sprit-sail top mast, to the middle of the fore-stays. They serve to keep the sprit-sail top mast upright and steady in its place, and to strengthen it.

CRANE'S BILL, in botany, the plant *Geranium*, of many species, so named from an appendage of the seed vessel, which resembles the beak of a crane.

CRANE FLY, an insect of the genus *Tipula*, of many species.

CRANIOLOGY, the science which investigates the structure and uses of the skulls in various animals, particularly in relation to their specific character and intellectual powers. One who is versed in this science is termed a *Cranologist*.

CRANIOMETER, an instrument for measuring the skulls of animals. The art of measuring them for the purpose of discovering their specific differences, is called *Cranometry*.

IN THE DAYS OF CHIVALRY "COURTS OF LOVE" WERE ESTABLISHED; WHERE KNIGHTS AND LADIES DECIDED QUESTIONS OF LOVE AND GALLANTRY.

CRANBERRIES ARE VERY ABUNDANT IN NORTH-AMERICA, SWEDEN, AND IN THE NORTHERN PARTS OF RUSSIA; THE LATTER BEING OF A SUPERIOR QUALITY.

[CRA]

A New Dictionary of the Belles Lettres.

[CRE]

CRAPE IS A BOLOGNESE INVENTION, BUT HAS BEEN LONG MANUFACTURED WITH SUPERIOR EXCELLENCE AT LYONS IN FRANCE, AND AT NORWICH.

CRANIOSCOPY, the science of discovering, by the eminences produced by the brain on the cranium, the particular parts in which reside the organs that influence certain passions or faculties.

CRA'NIUM, the skull; the assemblage of bones which enclose the brain.

CRANK, an iron axis with the end bent like an elbow, for moving a piston, &c., and causing it to rise and fall at every turn. Also a piece of brass work of a similar shape, on which the bell wire is fixed, so as to move the bell.—A ship is said to be *crank-sided* when she can bear but little sail, for fear of over-setting; and when a ship cannot be brought on the ground without danger, she is said to be *crank* by the ground.

CRAPE, a light transparent stuff, resembling gauze. It is made of raw silk, gummed and twisted on the mull, and much used in mourning.

CRA'SIS, the healthy constitution of the blood in an animal body.

CRANPEDA'RIA, in zoology, a genus of animalcules, without any tail or limbs, but with an apparent mouth, and a series of *junbræ* round it in the manner of a fringe. Some species are roundish, others oval, and others cylindrical.

CRASSAMENTUM, in phisic, the thick red, or fibrous part of the blood, as distinct from the serum or aqueous part.

CRATCH'ES, in farriery, a swelling on the pastern, under the fetlock, and sometimes under the hoof of a horse.

CRATE, a large case made of open bars, in which earthenware is packed.

CRATER, the aperture or mouth of a volcano, from which the fire issues.—In antiquity, a very large wine-cup or goblet, out of which the ancients poured their libations at feasts.

CRAW'FISH, or **CRAWFISH**, a small sort of lobster, found in fresh-water streams. There is also a large kind peculiar to salt water.

CRAYON, a general name for all coloured mineral substances, used in designing or painting in pastel; whether they have been beaten and reduced to a paste, or are used in their primitive consistence, after sawing or cutting them into long narrow slips.

CREAM, the oily part of milk, which rises to the surface and forms a scum. By a species of agitation, called churning, it forms butter.—*Cream of lime*, that part of lime which, after being dissolved in its caustic state, separates from the water in the mild state of chalk or limestone.—*Cream of tartar*, the common white tartar freed from its impurities: the crystallized superhydrate of potash.

CREANCE, in falconry, a fine small line, fastened to a hawk's leash when she is first lured.

CREATION, the act of causing to exist, or of shaping and organizing matter so as to form new beings; as the *creation* of man and other animals, of plants, minerals, &c.—Also, the act of investing with a

new character; as, the *creation* of peers by the sovereign.

CREDE'NDA, in theology, things to be believed; articles of faith; distinguished from *agenda*, or practical duties.

CREDENTIALS, that which gives a title or claim to confidence; as the letters of commendation and power given to an ambassador, or public minister, by the prince that sends him to a foreign court.

CREDIT, a reliance or resting of the mind on the truth of something said or done.—In a commercial sense, the transfer of goods on trust in confidence of future payment. The seller believes in the solvency and probity of the purchaser, and delivers his goods to him in confidence of it; or he delivers them on the credit or reputation of his customer. It has been said, and we believe, with much truth, that credit with shopkeepers has become so universal, that seven-tenths of the community are in the constant practice of anticipating their incomes; and there is hardly one so bankrupt in character and fortune as to be unable to find grocers, bakers, butchers, tailors, &c., ready to furnish him upon credit with supplies of the articles in which they respectively deal. This facility of obtaining credit is productive of very pernicious results. The system tempts very many, and sometimes even the most considerate individuals, to indulge in expenses beyond their means; and thus becomes the most fruitful source of bankruptcy, insolvency, and bad faith. To guarantee themselves from the extraordinary risk to which such proceedings expose them, tradesmen are obliged to advance the price of their goods to a most exorbitant height; so that those who are able and who really mean to pay the debts they contract, are, in fact, obliged to pay those of the hosts of insolvents and swindlers maintained by the present system.—*Credit*, in book-keeping, the side of an account in which payment is entered: opposed to *debit*; thus we say, the *credit* or *debit* side; or put that sum to his *credit*.—The confidence which men entertain in the ability and disposition of a nation, to make good its engagements with its creditors, is called *public credit*.—*Letters of credit*, letters given by merchants to persons whom they can trust to draw money from their correspondents.

CREED, a summary of belief, (from *credo*, I believe); the principal articles of the Christian faith; as the Apostle's Creed, the Athanasian Creed, &c.

CREEK, that part of a haven or small channel running from the sea, where goods are landed.

CRE'NATE, in botany, an epithet for leaves, the edges of which are furnished with continuous indentings, neither inclining towards the point nor base.—When the edge of a leaf is cut into very minute notches, the word *crenulate* is used.

CRE'NOR, in chemistry, the cream, or that which floats on the top of a liquid, and is skimmed off.

COLOURED CRAYONS ARE MADE WITH FINE PIPE OR CHINA CLAY PASTE, INTIMATELY MIXED WITH EARTHY OR METALLIC PIGMENTS, AND THEN MOULDED.

[CRE]

The Scientific and Literary Treasury;

[CRI]

CREMONA, in music, an appellation for the superior sort of violins, which were originally made at Cremona.

CRENOPHYLLAX, in antiquity, a magistrate at Athens, who had the inspection of fountains.

CREPUNDIA in antiquity, a term used to express such things as were worn as ornaments by children, as rings, jewels, &c., which might serve as tokens whereby they afterwards might be recognised, or as an inducement for others to take charge of them.

CREPITATION, the crackling noise made by some salts during the process of calcination.

CREPUS CULUM or **CREPUSCULE**, the twilight, which begins and ends when the sun is 18 degrees below the horizon. It is occasioned by the refraction of the sun's rays.

CRESCENDO, in music, an Italian term for the gradual swelling of the notes over which it is placed.

CRESCENT, the increasing or new moon, which, when receding from the sun, shows a curving rim of light, terminating in points or horns.—The Turkish standard, on which a crescent is depicted, and, figuratively, the Turkish power or empire of the crescent.—In heraldry, it is an honourable ordinary, or a mark of distinction for the second sons of families, or those descended from them.

CRESCENTIA, in botany, a genus of plants, class 14 *Diosy amni*, order 2 *Angiosperma*. The species are the *Crescentia cujete*, or narrow leaved calabash tree, and the *Crescentia cucurbitina*, or broad leaved calabash tree.

CRESS, the name of several species of plants, of which the most useful are water cresses, which are eaten as a salad, and are valued in medicine for their antiscorbutic qualities. They grow on the banks of rivulets and other moist places.

CRIST, the plume of feathers or other material on the top of the ancient helmet. The crist is considered a greater criterion of nobility than the armour generally, and therefore forms an important subject in the science of heraldry.

CRETA, a genus of earths, of the calcareous order, which, by a chemical analysis, is found to consist of carbonate of lime, carbonic acid, &c. It is soluble in acids, and calcines in the fire.

CRETACEOUS, partaking of the qualities of, or abounding in chalk.

CREUX, a French term used in sculpture, where the lines and figures are cut below the surface of the substances engraved, and thus stands opposed to *relievo*, which latter term intimates the prominence of the lines and figures which appear above the surface.

CREW, the company of seamen belonging to a ship or boat.

CRIBRIFORM, in anatomy, a term applied to the lamm of the ethmoid bone, through which the fibres of the olfactory nerve pass to the nose.

CRIBROSUM OS, in anatomy, called also *os ethmoides*, a bone situated internally in the fore part of the basis of the skull. The uses of it are to be a principal part of the organ of smelling, and to give a very great extent to the pituitary membrane in a small compass.

CRICKET, an active, manly game, played with bats and a ball, and which is almost peculiar to this country. The number of the party on each side is eleven, who alternately take the innings, and alternately the bowling and watching.—*Cricket*, the *Gryllus*, in zoology, a harmless insect of the grasshopper species, common near ovens, and fire-places. Their noise, called *chirping*, is produced merely by the friction of the bases of their *elytra*, or wing cases, against each other.

CRICOIDES, in anatomy, a cartilage of the larynx, called also the annular cartilage.

CRIMINAL, in the sense usually applied, signifies, a person indicted or charged with a public offence, and one who is found guilty.

CRIME, the transgression of a law, either natural or divine, civil or ecclesiastic. In the general sense of the word, crimes are understood to be offences against society or morals, as far as they are amenable to the laws. To this we may add, in order more clearly to distinguish between words often esteemed synonymous, that actions contrary to the precepts of religion are called *sins*, actions contrary to the principles of morals are called *vices*, and actions, contrary to the laws of the state, are called *crimes*.

CRITCHTONITE, a mineral, occurring in primitive rocks with octahedrite. It is of a velvet black colour, and crystallizes in very acute small rhomboids.

CRIN GLE, in marine language, a hole in the bolt rope of a sail, to receive the ends of the ropes by which the sail is drawn up to its yard, or to extend the leech by the bow line-bridles.—*Iron cringles*, or *hanks*, are open rings running on the stays, to which the heads of the stay-sails are made fast.

CRISIS, in medicine, according to Galen, is a sudden change, either for the better or the worse, indicative of recovery or death. In its more general sense, it denotes that stage of a disorder from which some judgment may be formed of its termination. At the approach of a crisis, the disease appears to take a more violent character. If the change is for the better, the violent symptoms cease with a copious perspiration, or some other discharge from the system. After a salutary crisis, the patient feels himself relieved, and the dangerous symptoms cease.—By a *crisis* is also meant the point of time when an affair is arrived at its height, and must soon terminate or suffer a material change.

CRISP, in botany, an epithet for a leaf folded over and over, at the edges, which are always serrated, dentated, or lacerated. *Crispature* is the state of its being curled.

NO SHIP IS ADMITTED TO BE A BRITISH SHIP, UNLESS DULY REGISTERED AND NAVIGATED AS SUCH BY A "CREW," FREELY COMPOSED OF WHICH ARE BRITISH.

IN THE ANCIENT TOURNAMENTS, THE CAVALIERS HAD PLUMES OF FEATHERS, ESPECIALLY THOSE OF OSTRICHES AND HERONS, FOR THEIR CRESCENTS.

[CRO]

A New Dictionary of the Belles Lettres.

[CRO]

CRISTATE, or **CRISTATED**, a botanical epithet for having an appendage like a tuft or crest, as some anthers and flowers.

CRITERION, any established rule, principle, or fact, which may be taken as a standard to judge by, and by which a correct judgment may be formed.

CRITHOMANCY, a kind of divination by means of the dough of cakes, and the meal strewn over the victims, in ancient sacrifices.

CRITIC, a person who, according to the established rules of his art, is capable of judging with propriety of any literary composition, or work of art, particularly of such as are denominated the Fine Arts. To which may be added, as within the province of a critic, that he should be able to explain what is obscure, to supply what is defective, to amend what is erroneous, and to reconcile the discrepancies he may meet with between different authors who have treated on the subject under review.

CRITICISM, the art of judging with propriety concerning any work of literature or art, and of giving the result of that judgment to the public with candour.

CRITIQUE, a skilful examination of the merits of a performance, with remarks on its beauties and faults.

CROCEOUS, resembling saffron.

CROC'ODILE, in zoology, a large and ferocious animal of the genus *Lacerta*. It is amphibious, has a naked body, with four feet and a tail, and grows to the length of sixteen or eighteen feet. It inhabits the large rivers in Africa and Asia, and lays its eggs in the sand to be hatched by the sun.

CROCUS, in chemistry, a metal calcined to a red or deep yellow colour.—In botany, a genus of plants, class 3 *Triandria*, order 1 *Monogynia*.

CROISEN, in English antiquity, pilgrims bound for the Holy Land, or such as had been there; so called from a badge they wore in imitation of a cross. The knights of St. John of Jerusalem, created for the defence and protection of pilgrims, were particularly called *croises*; and so were all those of the English nobility and gentry, who, in the reigns of Henry II. Richard I. Henry III. and Edward I. were *cruce signati*, that is, devoted for the recovery of Palestine.

CROM'LECH, in British antiquity, large, broad, flat stones raised upon other stones set up to support them. They are common in Anglesea, and are supposed to be remains of druidical altars.

CROSS, in antiquity, an instrument of ancient vengeance, consisting of two pieces of timber, crossing each other, either in the form of a T or an X. That on which our Saviour suffered, is represented on coins and other monuments to have been of the former kind. This punishment was only inflicted on malefactors and slaves, and was thence called *servile supplicium*. The most usual method was to nail the criminal's hands and feet to this gibbet, in an erect posture; though there are instances of criminals so nailed with their head down-

ward.—**CROSS**, the ensign of the Christian religion; and hence, figuratively, the religion itself. Also, a monument with a cross upon it to excite devotion, such as were anciently set up in market places.—In theology, the doctrine of Christ's sufferings and of the atonement.—**Cross**, in heraldry, the most ancient and the noblest of all the honourable ordinaries, formed by the meeting of two perpendicular with two horizontal lines, so as to make four right angles in the figure of a cross.

CROSS' BILL, in ornithology, the *cloria cuculirostris*, a bird so called because the mandibles of its beak cross each other.

CROSS'-BOW, a missile weapon formerly much used, which was strung and set in a shaft of wood, with a trigger, &c.

CROS'LET, in heraldry, a little or diminutive cross: the shield is frequently seen covered with croslets. Also, fesses and other honourable ordinaries, charged or accompanied with croslets.

CROSS-EXAMINATION, in law, a close and rigid examination of a witness by the counsel of the adverse party, consisting of cross questions, in order to elicit the truth.

CROTCH'ET, in music, half a minim.—In printing, this mark, [], to separate what is not the necessary part of a sentence.

CROSS-BAR-SHOT, a bullet with an iron bar passing through it, and standing out a few inches on each side; used in naval actions for cutting the enemy's rigging.

CROSS-CUT-SAW, a saw managed by two men, one at each end.

CROSS-STAFF, an instrument to take the altitude of the sun or stars.

CROSS'-STONE, a mineral of a grayish white colour, called also *haemotone*, occurring in double and single crystals.

CROSS'-TREES, pieces of timber in a ship, supported by the cheeks and trestle-trees, at the upper ends of the lower masts, to sustain that which is above, and to extend the top-gallant shrouds.

CROT'ON OIL, one of the most valuable of the late additions to the materia medica, is expressed from the seeds of an East Indian plant. It is so strongly purgative, that one drop is a full dose, and half a drop will sometimes produce a powerful effect. In the hands of an experienced physician it is of great value, but it is so extremely active that it should never be used without the greatest caution.

CROUP, in medicine, the disease called *cynanche trachealis*, an affection of the throat, accompanied with a hoarse, difficult respiration. It mostly attacks young children, who are suddenly seized with a difficulty of breathing and a crouping noise. The application of cold seems to be the general cause of the disease, and it is consequently more prevalent in winter and spring than in the summer.

CROUPA'DE, in the manege, a leap in which the horse pulls up his hind legs, as if he drew them up to his belly.

CROTALUS, the rattlesnake, a genus of

THE EMPEROR CONSTANTINE THE GREAT IS SUPPOSED TO HAVE BEEN THE FIRST WHO USED THE CROSS AS A MILITARY EMBLEM OR BANNER.

THE EMPRESS HELENA (CONSTANTINE'S MOTHER) FOUND, AS IT IS SAID, THE CROSS ON WHICH CHRIST SUFFERED, AND CONVERTED IT TO CONSTANTINOPLE.

INGERS ARE BOILED FOR PICKLING, IN ORDER THAT THE INFERTILES, COAGULATED BY HEAT, MAY BE SEPARATED BY STRAINING, WHEN COOL.

serpents, furnished with poisonous fangs. The serpents of this family seldom bite except when irritated, or for the purpose of securing their prey. The rattle consists of hollow, hard, dry, and semi-transparent bones, resembling, in some measure, the shape of the human os sacrum: the tip of every uppermost bone runs within two of the bones below it; by which contrivance they have not only a moveable coherence, but also are enabled to make a more multiplied sound, each bone hitting against the other two at the same time. The number of joints in the rattle of each reptile is various, from five to forty. The poisonous secretion is discharged from the fangs of the dog teeth, or tusks placed without the upper jaws, after the manner of the viper; and after the first time the animal seems progressively to lose its power of poisoning, till it has had time to recruit itself by a repast of some hours.

CROUT, KROUT, or SOUR-CROUT, is cabbage chopped fine, and pickled. It is made by placing chopped cabbage in layers in a barrel, with salt and carraway seeds sprinkled between the layers, then pressing it down, and suffering it to remain till it has undergone fermentation. It is considered an efficacious preservative against the scurvy, and is used at sea, particularly in the Russian navy.

CROW, in ornithology, a species of *Corvus*, about the size of the largest tame pigeon, and of a fine deep black colour. The crow is a voracious fowl, feeding on carrion, grain, &c.—*Scaur-crow*, the black *Larus*, with grey wings and red legs.

CROW-BAR, in mechanics, an iron lever with a claw at one end, and a sharp point at the other: used for raising and moving weights.

CROW'-FOOT, a complication of small cords, spreading out from a long block: used on board of ships, for suspending the awnings, or keeping the top-sails from striking against the tops.

CROW'S-BILL, in surgery, a kind of forceps, for extracting bullets and other things from wounds.

CROW'S-FEET, in the art of war, an iron instrument with four points, thrown upon breaches, or in passes where the enemy's cavalry are expected. [See *Caltrop*.]

CROWN, an ornamental badge of regal power, worn on the head by sovereign princes.—The top of the head; also the top of any elevated object.—In architecture, the uppermost member of a cornice.

—Among jewellers, the upper work of the rose diamond.—An English silver coin, of the value of five shillings.—In botany, an appendage to the top of a seed, which serves to bear it in the wind.—Among the various crowns and wreaths in use among the Greeks and Romans were the following: *Corona aurea* (the golden crown); the reward of remarkable bravery. *Corona castræ*; given to him who first entered the camp of an enemy. *Corona civica*; one of the highest military rewards: it was given to him who saved the life of a citizen.

Corona convivalis; the wreath worn at feasts. *Corona muralis*; given by the general to the soldier who first scaled the enemy's wall. *Corona navalis*; given to him who first boarded and took an enemy's vessel: it was next in rank to the civic crown. *Corona nuptialis*; a crown or wreath worn by brides. *Corona obsidionalis*; a reward given to him who delivered a besieged town, or a blockaded army. It was one of the highest military honours, and very seldom obtained. *Corona triumphalis*; a wreath of laurel which was given by the army to the *imperator*, who wore it on his head at the celebration of his triumph.

CROWN-GLASS, the finest sort of window glass.

CROWN-IMPERIAL, a plant of the genus *Fritillaria*, having a beautiful flower.

CROWN-IMPERIAL-SHELL, a beautiful species of *Volva*, the head of which is surrounded with a series of sharp-pointed tubercles, so as to resemble an open crown: it has also two broad and very beautiful zones running round it.

CROWN-OFFICE, an office belonging to the court of Queen's Bench, in which the attorney-general exhibits informations for crimes and misdemeanors.

CROWN'-POST, in building, a post which stands upright in the middle, between two principal rafters.

CROWN'-WHEEL, the upper wheel next the balance in a watch, and which drives the balance.

CROWN'-WORK, in fortification, an out-work running into the field, consisting of two demi-bastions at the extremes, and an entire bastion in the middle, with curtains. It is designed to gain some advantageous post, and cover the other works.

CRYOL-STONE, in mineralogy, crystallized caulk.

CRUCIAL, in surgery, an epithet for transverse, or in the form of a cross; as, a *crucial* incision.

CRUCIBLE, a vessel or melting-pot, made of clay, and so tempered and baked as to endure the greatest fire. It is used in chemical operations, and by workers in gold and silver. Silver, platinum, and iron are also used occasionally as crucibles.

CRUCIFIXION, the act or punishment of putting to death by nailing or fastening a person to a *crucifix*, or cross.

CRUCIFORM, in botany, an epithet for flowers consisting of four petals disposed in the form of a cross.

CRUDITY, among physicians, is applied to undigested substances in the stomach, to humours in the body which are uncoagulated, and not prepared for expulsion; and to the excrements.

CRUISER, a small armed vessel that sails to and fro in quest of the enemy, to protect the commerce of its own nation, or for plunder.

CRUPELLA'RIL, in antiquity, nobility among the Gauls, who were armed with a complete harness of steel.

CRU'OR, sometimes signifies the blood in general; sometimes only the venous

CRU]

A New Dictionary of the Belles Lettres.

[CUB

blood; and at others, extravasated or coagulated blood; but the word is most frequently used for the red globules of blood, in distinction from the limpid or serous part.

CRUSA'DES, the name by which the wars or military expeditions were distinguished, that were carried on by the Christian nations of the West, from the end of the 11th to the end of the 13th century, for the conquest of Palestine. They were called crusades, because all the warriors fought under the banner of the cross, and wore that emblem on their clothes. The Christians had long grieved that the Holy Land, where Jesus had lived, taught, and died for mankind, where pious pilgrims resorted to pour out their sorrows, and ask for aid from above at the tomb of their Saviour, should be in the power of unbelievers. The dawn of civilization and mental cultivation had just commenced. They were at that period in a state to receive a strong religious excitement; the spirit of adventure burned within them; and their imaginations were also easily roused by the reports of the riches of the East. The Pope considered the invasion of Asia as the means of promoting Christianity amongst the infidels, and of winning whole nations to the bosom of the church; monarchs expected victory and increase of dominion; and their subjects were easily persuaded to engage in the glorious cause! Yet army after army was destroyed; and though some brilliant victories served to exhibit the soldiers of Christendom as heroes of a valorous age, and the holy city of Jerusalem was more than once under their dominion, the Christian empire on the continent of Asia was eventually overthrown, and the dominion of the Mamelukes and Sultans established. But by means of these joint enterprises, the European nations became more connected with each other; feudal tyranny was weakened; a commercial intercourse took place throughout Europe, which greatly augmented the wealth of the cities; the human mind expanded; and a number of arts and sciences, till then unknown by the western nations, was introduced.

CRU'RAL, in anatomy, an epithet given to the artery which conveys the blood to the crura, or legs, and to the vein by which this blood returns towards the heart.

CRUSTA'CEA, or CRUSTA'CEOUS FISH, are those covered with shells, consisting of several jointed pieces or scales, as crabs, lobsters, &c. These are generally softer than the shells of the testaceous fish, which consist of a single piece, and commonly thicker and stronger than the former, such as those of the oyster, scallop, cockle, &c. The *crustacea* consist almost entirely of the three tribes, viz. *cancer*, *oniscus*, and *monoculus*.

CRYSTALOGY, that part of zoology which treats of crustaceous animals, arranging them in orders, tribes, and families, and describing their forms and habits.

CRU'YSHAGE, a fish of the shark kind, having a triangular head and mouth.

CRYOLITE, in mineralogy, a fluato of soda and alumine, of a white or yellowish gray colour, occurring in masses of a foliated structure. It is found in Greenland.

CRYOPH'OBUS, an instrument for showing the relation between evaporation at low temperatures and the production of cold.

CRYPT, a subterranean chapel or oratory; or a vault under a church for the interment of bodies.

CRYPTOGAMIA, the 24th class of plants in the Linnæan system; comprehending those whose fructification is concealed or inconspicuous, as ferns, mosses, liverworts, and mushrooms.

CRYPTOGRAPHY, the art of writing in cipher, or secret characters.

CRYPTOLOGY, secret or enigmatical language.

CRYSTAL, a species of stone of the quartz kind, belonging to the siliceous class. When no accidental circumstance has interrupted the crystallization (for it must once have been in a soft state), it is always of an hexagonal or six-sided angular form, pointed at both ends. This description of crystal is commonly termed *rock crystal*.—CRYSTAL, in chemistry and mineralogy, an inorganic body, which has assumed the form of a regular solid, terminated by a certain number of plane and smooth surfaces; or a salt which assumes a regular and solid form, on the gradual cooling of the solution.—*Crystal Glass*, a factitious crystal, more perfect in its composition and manufacture than common glass. It is frequently cut; and vases, lustres, and other ornaments are made of it.—*Iceland Crystal*, a variety of calcareous spar, or crystallized carbonate of lime, brought from Iceland, which is remarkable for its double refraction.

CRYSTALINE, transparent and pure, resembling crystal.—*Crystalline Heavens*, in ancient astronomy, two spheres imagined between the primum mobile and the firmament, in the Ptolemaic system.—*Crystalline Humour*, (of the eye), a very white, transparent, firm substance, adapted like a glass lens, to converge rays of light situated behind the iris, in the vitreous humour of the eye.

CRYSTALITE, in mineralogy, a name given to whinstone, cooled slowly after fusion.

CRYSTALIZA'TION, the act or process of reducing any salt into a regular form by dissolving it in a menstruum, and allowing it to cool until it shoots into the bodies called crystals. This process is the effect of refrigeration, or evaporation.

CRYSTALOGRAPHY, the doctrine or science of crystallization, teaching the principles of the process, the forms which crystals assume, &c.

CUBATURE, in geometry, the finding exactly the solid or cubic contents of a body.

CUBE, in geometry, a regular solid body, consisting of six square and equal sides, and containing equal angles. The solidity of

FROM THE HERMIT WAS THE IMMEDIATE CAUSE OF THE FIRST CRUSADE, HE DESCRIBING TO POPE URBAN THE STATE OF THE CHRISTIANS IN PALESTINE.

THERE IS A GREAT VARIETY IN THE FORM OF CRYSTALLIZED SALTS, AND EACH SALT PRESERVES ITS OWN PECULIAR FORM AND CHARACTER.

[CUC]

The Scientific and Literary Treasury ;

[CUL]

FROM THE OBSERVATIONS WHICH HAVE BEEN MADE, IT IS BELIEVED THAT THE CUCKOO MIGRATES FROM EUROPE TO THE COASTS OF AFRICA.

any cube is found by multiplying the superficial area of one of the sides by the height—*Cubic Number*, in arithmetic, that which is produced by the multiplication of a square number by its root, thus, 64 is a cube number, and arises by multiplying 16, the square of 4, by the root 4.—*'Cube Root*, the side of a cube number, thus 3 is the cube root or side of 27.

CUBER, in botany, the fruit of the *Piper Scutebæ*. It is less than pepper, good for strengthening the stomach, and aromatic.

CUBIC, or CUBICAL, having the form of a cube, or that may be contained within a cube. Thus, a *cubic foot* of water is the water that may be contained within six equal sides, each a foot square.

CUBIT, an ancient measure, equal to the length of a man's arm, from the elbow to the tip of the middle finger. Among different nations the length of the cubit differed. The English was 18 inches, the Roman rather less, and the cubit of the Scriptures is supposed to have been 22 inches.

CUBITANS, in anatomy, an epithet for two muscles of the wrist, one of which, called the *externus*, serves to extend the wrist, and the other, the *internus*, to bend it.

CUBITUS, in anatomy, a bone of the arm, reaching from the elbow to the wrist. The cubitus, for the sake of the more easy and varied motion, is composed of a binary number of bones, called the *cubitus*, or *ulna*, and the *radius*. The situation of the ulna is interior, its length is greater than that of the radius, and has a motion of flexion and extension. The epithet *cubital* is accordingly used, as, the *cubital nerve*, artery, or muscle.

CUCKOO SPITTLE, a white froth or spume very common on many plants in the spring, which forms the nidus of a sort of cicada.

CUCUBALUS, a genus of plants, class 10 *Dicandria*, order 3 *Tripgyna*. The species are mostly perennials, and consists of the various campions.

CUCULUS, or CUCKOO, a genus of birds belonging to the order *Pica*. They lay their eggs in the nests of other birds, chiefly in that of the hedge sparrow, from which the young cuckoos turn out the young sparrows. The cuckoo arrives in Britain about the middle of April, and departs in the first week of July. To this shortness of the period of residence, joined with the numerous progeny which nature has destined it to yield, ornithologists attribute the motive for this singular arrangement in the economy of nature, for by means of this resource, cuckoo's eggs are laid in an abundance that could not be effected if the bird was to sit herself.

CUCUMBER, the name of a plant and its fruit, of the genus *Cucumis*. The flower is yellow and bell shaped, and the stalks trail on the ground, or climb by their creepers. The fruit is cold, watery, and by many thought unwholesome.

CUCUMIS, a genus of plants, class 31

Monoecia, order 10 *Syngenesia*. This genus comprehends all animals with herbaceous scandent stems, as the gourd, cucumber, and melon.

CUCURBIT, a chemical vessel in the shape of a gourd. It is used in distillation, and with its head and cover, constitutes the alembic.

CUCURBITACEÆ, one of Linneus's natural orders of plants, comprehending those which resemble the gourd, as the cucumber, melon, pumpkin, &c.—The epithet *cucurbitaceus* is accordingly given to any fruit resembling a gourd.

CUD, the food which ruminating animals chew over again, from whence, to *chew the cud*, signifies, to ponder, think, or ruminate upon a thing.

CUIDY, in large ships, a place lying between the captain lieutenant's cabin, and the quarter-deck, under the poop. It is divided into partitions for the master and other officers. Also, a sort of cabin or cook room, in the fore-part or near the stern of a lighter, or barge of burden.

CUE, the last words of a speech, which a player, who is to answer, catches and regards as an intimation to begin. Also, a hint given to them of what and when he is to speak.

CUIRASS, a piece of defensive armour, made of iron plate, well hardened, and covering the body from the neck to the girdle.

—*Cuirassiers*, heavy cavalry armed with a cuirass. In former times cuirasses were very common, but appear to have been disused in England about the reign of Charles II. The lance having, of late years, again been introduced, the cuirass has been revived among the European cavalry.

CUL DE LAMP, in architecture, a term used for several decorations, in vaults and ceilings.

CULDEES, in church history, an order of priests, formerly inhabiting Scotland and Ireland. Being remarkable for the religious exercises of preaching and praying, they were called, by way of eminence, *cultores Dei*. After having exercised a great influence throughout the country, they are said to have been overthrown by the increase of the papal power, and the institution of monasteries, more congenial to the aspiring views of the see of Rome.

CULLUS, in Roman antiquity, the largest measure of capacity for liquids, containing forty urnæ, equal to 180 gallons.

CULEX, in entomology, a genus of two-winged flies, the mouth of which are tubular, but exceedingly slender and filiform. Under this genus are comprehended the gnats and humble bees.

CULPA, in antiquity, that part of the funeral pile in which the banquet was consumed.—*Culina*, a burial-ground for the poor.

CULLIAGE, a barbarous and immoral practice, whereby the lords of manors anciently assumed a right to the first night of their vassals' brides.

CULM, in botany, the stalk or stem of corn or grasses, usually jointed and hollow.

ANIMALS THAT RUMINATE, OR CHEW THE CUD, CAN PERFORM THAT OPERATION BY THE VOLUNTARY POWER OF THE GASTROCAECUM.

—Also, a species of fossil coal, found in small masses, difficult to be ignited, and burning with little flame, but producing an unpleasant smell.

CULMIFEROUS, in botany, an epithet for such plants as have a smooth jointed stalk, usually hollow, and at each joint wrapped about with single, narrow, sharp-pointed leaves, and their seeds contained in chaffy husks, as wheat, rye, barley, &c.

CULMINATION, in astronomy, the passing of any heavenly body over the meridian, or its greatest altitude for the day. Hence *culmination* is used, metaphorically, for the condition of any person or thing arrived at the most brilliant or important point of its progress.

CULMINÆÆ, the 26th of the Linnæan natural order of plants, consisting of the grasses.

CULPRIT, in law, a word applied in court to one who is indicted for a criminal offence.

CULTIVATION, in a general sense, the art and practice of tilling and preparing land for crops; but it means also the study, care, and practice necessary to the cultivation of our talents and the improvement of our minds.

CULVERIN, a long slender piece of ordnance, serving to carry a ball to a great distance.

CULVERTAILED, in ship-building, the fastening one timber into another by a dove-tailed joint.

CUMANA, in botany, an Indian tree resembling the mulberry, both in its appearance and fruit; the latter of which has a medical use.

CUMBULU, in botany, a high tree growing in Malabar, the root of which is said to be useful as a decoction in certain febrile diseases.

CUMERUM, in antiquity, a large covered basket, used at weddings for carrying the household stuff, &c. belonging to the bride.

CUMINUM, a genus of plants, class 5 *Pentandria*, order 2 *Digynia*. The only species is the *Cuminum cyminum*, an annual.

CUMMIN-SEED, a long, slender seed, of a rough texture, unctuous when bruised, of a strong smell, and a pungent taste.

CUMULUS, a large cloud, flat at the base, and rounded in its upper parts.

CUNEUS, the wedge, in mechanics.

—*Cuneus*, in antiquity, a company of infantry, drawn up in form of a wedge, the better to break through the enemy's ranks. Also, the seats and benches on which the spectators sat in a theatre, which were narrow near the stage, and broad behind.—*Cuneus*, in natural history, a kind of fossil mussel-shells, with one side much longer than the other, and found in vast numbers in many parts of the kingdom.

CUNEIFORM, an appellation given to whatever resembles a wedge; as, in botany, a cuneiform leaf.

CUPBEARER, an officer of the king's

household, who was formerly an attendant at a feast.

CUPÆL, a shallow chemical vessel made of earth, ashes, or burnt bones, in which assay-masters try metals. It retains them while in a metallic state, but when changed by fire into a fluid scoria, it absorbs them.

CUPOLA, in architecture, a roof or vault rising in a circular form, otherwise called the *tholus* or *dome*. The ancients constructed their cupolas of stone; the moderns, of timber, covered with lead or copper. The finest cupola, ancient or modern, is that of the Pantheon at Rome. Among some of the handsomest modern cupolas, is that on the Bank of England, St. Peter's at Rome, the Hotel des Invalides at Paris, and St. Paul's, London.

CUPPING, in surgery, the operation of applying the cupping-glass with scarification, for the purpose of drawing away blood or humours.—*Cupping glass*, a glass vessel like a cup, to be applied to the skin before and after scarification, for drawing blood.

CUPREOUS, resembling copper, or partaking of its qualities.

CUPRESSUS, in botany, a genus of trees, of which the most beautiful species is the horizontal cypress, which is the common timber in some parts of the Levant, and is said to resist the worm, the moth, and putrefaction. The Athenians used to bury their dead in coffins of cypress, and the mummy chests brought with those bodies out of Egypt are made of cypress wood.

CUPRIFEROUS, producing or affording copper; as, *cupriferous silver*.

CURATE, an officiating, but unbeneficed clergyman, who performs the duty of a church, and receives a salary from the incumbent of the living.

CURATOR, among civilians, a person regularly appointed to manage the affairs of minors, or persons mad, deaf, dumb, &c. There are also curators for the estate of debtors, and of persons dying without heirs.—Among the Romans, a trustee of the affairs and interests of a person emancipated or interdicted.

CURCULIO, in entomology, a genus of insects, which infest granaries and live upon the grain.

CURCUMA, in botany, an Indian plant called Turmeric.—A genus of plants in the Linnæan system, class 1 *Monandria*, order 1 *Monogynia*.

CURFEW, a law introduced from Normandy into England by William the Conqueror, that all people should put out their fire and lights at the ringing of a bell, at eight o'clock. The word is derived from the French *courre-feu*.

CURIA, in Roman antiquity, a certain division, or portion of a tribe. Romulus divided the people into thirty *curiæ*, or wards; and there were ten in every tribe, that each might keep the ceremonies of their feasts and sacrifices in the temple, or holy place, appointed for every curia. The priest of the curia was called *curio*.

EVERY CHEROKEE THAT OFFICIATES IN A CHURCH; WHETHER HE BE THE INCUMBENT OR A SUBSTITUTE, IN THE LITURGY IS CALLED A CURATE.

[CUR]

The Scientific and Literary Treasury ;

[CUR]

—CURIA, in law, signifies generally a court, but it was taken particularly for the assemblies of bishops, peers, &c. of the realm, called *collegia curia*, *curia publica*, &c.

CURLEW, an aquatic fowl, of the genus *Scopolas*, and the grallae order. It is of an ash colour diversified with black; frequents the sea-shore in winter, and in summer retires to the mountains. There is also another bird so called, which is larger than a partridge, and frequents the corn-fields in Spain.

CUR'RANT, the fruit of a well-known shrub belonging to the genus *Ribes*. There are many varieties, red, white, and black. A small kind of dried grape, imported from the Levant, is also called by the same name.

CURRENCY, in commerce, bank-notes or other paper-money issued by authority, and which are continually passing current for coin.

CURRENTS, in navigation, certain settings of the stream, by which ships are compelled to alter their course, and submit to the motion impressed upon them by the current. The causes of currents are very numerous. The waters may be put in motion by an internal impulse; by a difference of heat and saltness; by the inequality of evaporation in different latitudes; and by the change in the pressure at different points of the surface of the ocean. The existence of cold strata, which have been met with at great depths in low latitudes, prove the existence of a low current, which runs from the pole to the equator. It proves likewise, that saline substances are distributed in the ocean, in a manner not to destroy the effect produced by different temperatures.—It is well known also that there are different currents of air.

CURRYING, the art of dressing skins after they are tanned, for the purposes of the shoemaker, coach and harness-maker, &c., by giving them the necessary smoothness, lustre, colour, and suppleness. The person working at, or carrying on this business, is called a *currier*.

CURSITOR, a clerk belonging to the court of chancery, whose business it is to make out original writs.

CURTAIN, in a general sense, a cloth hanging round a bed, or at a window, which may be contracted, spread, or drawn aside at pleasure. Also, a cloth-hanging used in theatres, to conceal the stage from the spectators.—In fortification, the *curtain* is that part of the rampart which is between the flanks of two bastions, bordered with a parapet, behind which the soldiers stand to fire on the covered way and into the moat.

CURTATION, in astronomy, the interval between a planet's distance from the sun and the curtate distance. The *curtate distance* is the distance of a planet from the sun to that point, where a perpendicular let fall from the planet meets with the ecliptic.

CURULE CHAIR, in Roman antiquity, a chair, or stool, adorned with ivory, wherein the chief magistrates of Rome had

a right to sit. The curule magistrates were the sediles, the praetors, censors, and consuls. This chair was placed in a kind of chariot, whence it had its name.

CURVATURE of a line, is the peculiar manner of its bending or flexure, by which it becomes a curve of such and such peculiar properties.

CURVET, in horsemanship, a particular leap of a horse, when he raises both his fore legs at once, equally advanced, and as his fore legs are falling, he raises his hind legs, so that all his legs are from the ground at once.

CUSP, in geometry, the point or corner formed by two parts of a curve meeting, and there terminating.—In astronomy, a term for the horns of the moon.

CUSPIDATE, or CUSPIDATED, a term in botany, for a leaf, &c. having a sharp end, like the point of a spear, or terminating in a bristly point.

CUSTARD-APPLE, in botany, a species of *Annona*, growing in the West Indies, whose fruit is of the size of a tennis ball, of an orange colour, containing a yellowish pulp of the consistence of custard.

CUSTOM, in law, long established practice or usage, which constitutes the unwritten law, and long consent to which gives it authority.

CUSTOMS, in political economy, the duties, toll, tribute, or tariff, payable to the king upon merchandize exported and imported, and which form a branch of the perpetual taxes.

CUSTOS ROTULORUM, the keeper of the rolls and records of the sessions of the peace, and also of the commission of the peace itself. He is usually a nobleman, and always a justice of the peace, of the quorum in the county where he is appointed.—*Custos Brevium*, the principal clerk belonging to the Common-pleas.—*Custos oculi*, in surgery, an instrument for preserving the eye in some operations.

CUTANEOUS, an epithet for whatever belongs to or affects the skin; as, a *cutaneous eruption*, &c.

CUTICLE, in anatomy, the scarf-skin, a thin membrane closely lying upon the skin or *cutis*, of which it seems a part, and to which it adheres very firmly.

CUTIS, in anatomy, the *derma*, or inner skin, which lies under the cuticle: it is full of pores, nerves, fibres, lymphatic ducts, &c. and is called the *cutis vera*, or true skin, in distinction from the cuticle.

CUTLASS, a broad curving sword, used by seamen in boarding, &c.

CUTLERY, a term applied to all cutting instruments made of steel. Although in a general sense it comprises all those articles denominated edge-tools, it is more particularly confined to the manufacture of knives, scissors, razors, surgical instruments, and swords. Those articles which require the edge to possess great tenacity, at the same time that superior hardness is not required, are made from sheer-steel. The finer kinds of cutlery are made from steel which has been in a state of fusion, and which is

CUSTOMS (FORMERLY CALLED DUTIES OF TONNAGE AND PORTDUTY) APPEAR TO HAVE EXISTED IN ENGLAND EVEN BEFORE THE NORMAN CONQUEST.

THE MOST MINUTE INSTRUMENTS ARE GENERALLY MADE OF STEEL ON ACCOUNT OF ITS HARDNESS AND EXTRAORDINARY DUCTILITY.

CYA]

A New Dictionary of the Belles Lettres.

[CYL

SEE DIPPING A RAZOR IN HOT WATER, THE TEMPERATURE OF IT IS RAISED, AND THE FINENESS OF THE EDGE THEREBY INCREASED.

termed cast-steel, no other kinds being susceptible of a fine polish. Razors are made of cast steel, the edge of a razor requiring the combined advantages of great hardness and tenacity. After the razor blade is forged, it is hardened by gradually heating it to a bright red heat, and plunging it into cold water. It is tempered by heating it afterwards till a brightened part appears of a straw colour. The manufacture of penknives is divided into three departments; the first is the forging of the blades, the spring, and the iron scales; the second, the grinding and polishing of the blades; and the third, the handling, which consists in fitting up all the parts, and finishing the knife. The blades are made of the best cast steel, and hardened and tempered to about the same degree with that of razors. But the beauty and elegance of polished steel is not displayed to more advantage than in the manufacture of the finer kinds of scissars.—Damascus was anciently famed for its razors, sabres, and swords; the latter especially, which possessed all the advantages of flexibility, elasticity, and hardness; while they presented a beautiful wavy appearance called the water. They are said to have been made from the interlacing of very minute wires of steel and iron welded together in alternate wormings, and the waving caused by quenching the blade in a solution of common alum. Various other cities and countries have also been famous at different periods for the manufacture of good cutlery; as London, Salisbury, and Sheffield, at the present time are, for admirable penknives and surgical instruments.

CUTTER, a boat attached to a vessel of war, which is rowed with six oars, and is employed in carrying light stores, passengers, &c.—Also, a vessel with one mast and a straight running bowsprit, which may be run in upon deck.

CUTTLE-FISH, in ichthyology, the *Sepia*, a genus of Mollusca. They have small arms, with serrated cups, by which they lay fast hold of anything; they have also two tentacula longer than the arms. When pursued they emit a black fluid that darkens the water, by which means they escape. This fluid is said to form an ingredient in India ink, and from that circumstance it is sometimes called the *ink-fish*. The back bone is converted into pounce.

CUT-WATER, the fore part of a ship's prow, which cuts the water.—Also, a name for the *Ringcops*, or razor-bill, a species of water fowl.

CYANITE, in mineralogy, an argillaceous stone, of a blue or greenish gray colour.

CYANOGEN, carburetted azote, or the blue compound of carbon and azotic gas.

CYATHIFORM, in the form of a cup or drinking-glass, a little widened at the top.

CYATHUS, in Roman antiquity, a liquid measure, containing four *tipulas*, or half a pint.—Also, a cup, which the Romans used to fill and drink from as many times

as there were letters in the name of their patron or mistress.

CYCLAMEN, in botany, a genus of plants, class 5 *Pentandria*, order 1 *Monogynia*. The species are tuberous; as, the *Cyclamen corum*, or sow-bread, &c.

CYCLAS, in botany, a genus of plants, class 10 *Decandria*, order 1 *Monogynia*. The species are trees, natives of the Caribbee islands.

CYCLE, in chronology, a certain period or series of numbers, which regularly proceed from the first to the last, and then return again to the first, and so circulate perpetually.—*Cycle of the Sun, or solar cycle*, a period of 28 years, in which the Sunday or Dominical letter recurs in the same order.—*Cycle of the Moon, or lunar cycle*, a period of 19 years, when the new and full moon recur on the same days of the month.—*Cycle of indiction*, a period of fifteen years, in use among the Romans, commencing from the third year before Christ. This cycle has no connection with the celestial motions; but was instituted, according to Baronius, by Constantine.

CYCLOGRAPH, an instrument used for describing the arcs of circles.

CYCLOID, a geometrical curve generated by the rotation of a circle along a line.—*Cycloidal*, the space contained between the curve, or crooked line, and the subtense of the figure.

CYCLOMETRY, a term sometimes used for the mensuration of circles.

CYCLOPÆDIA, the circle or compass of the arts and sciences; a common title for a book of this kind.

CYCLOPIC, savage and gigantic; pertaining to those monsters in fabulous history, who are represented as having assisted Vulcan in forging the thunderbolts of Jove.

CYGNET, in ornithology, a young swan.

—In heraldry, a term when swans are colored about the neck with an open crown, to which a chain is affixed.

CYGNUS, the SWAN, in ornithology, a well known water fowl, ranked among the *anas* kind.—*Cygnus*, in astronomy, a constellation of the northern hemisphere.

CYLINDER, in geometry, a solid body, supposed to be generated by the rotation of a parallelogram round one of its sides; or a long circular body of uniform diameter. If the generating parallelogram be rectangular, the cylinder it produces will be a right cylinder, that is, it will have its axis perpendicular to its base. If the parallelogram be a rhombus, or rhomboides, the cylinder will be oblique or scalenous.—*Cylinder*, in gunnery, the whole hollow length of a great gun; the bore.

CYLINDROID, a solid body, approaching to the figure of a cylinder, but differing in some respects, as having the bases elliptical, but parallel and equal.

CYLINDRUS, in natural history, a genus of shell-fish, the shell of which is simple, without a hinge, formed of one continued piece, and of a figure approaching to that of a cylinder. Its animal inhabitant is called *limax*.

ACCORDING TO THE TABLE OF MYTHOLOGY, THE CYCLOPS FORGER WERE VOLCANOS, AND THE ROARING WITHIN THEM THE SOUND OF THEIR HAMMERS.

[CYN]

The Scientific and Literary Treasury ;

[CZA]

CYMATIUM CYMA, or **SI MA**, in architecture a member or moulding of the cornice, the profile of which is waving, that is concave at the top and convex at the bottom. When the concave part of the moulding projects beyond the convex part, the *cymatium* is denominated a *sima recta* but when the convex part forms the greatest projection it is a *sima recessa*.

CYMBAL a musical instrument used by the ancients, hollow and made of brass, supposed to be somewhat like a kettle drum. The modern *cymbals* used in military bands consist of two concave metal plates which are occasionally struck together and flourished above the head of the player.

CYMBARIA in botany, a genus of plants class 14 *Didymia* order 2 *Angiosperma*, so called from its boat shaped fruit. The whole plant is hoary and is distinguished from all others by its toothed calyx.

CYME literally a sprout or shoot also a sort of flowering where the florets do not all rise from the same point.

CYTOPHANE a mineral called also *Chrysoe yl*. Its colour is green of different shades and in hardness it ranks next to the sapphire.

CYMOSE the 63rd of the natural orders of Linnæus comprehending such plants as are disposed in the form of a cyme.

CYNANCHI among physicians an inflammation of the larynx. It is of several kinds and comprehends the quinsy, croup and malignant sore throat.

CYNANCHUM in botany a genus of plants which are all shrubs or under shrubs. The principal species are *Cynanchum vineale* *Euphorbia* *Spoyium* &c.

CYNANTHROPUS in medicine the disease occasioned by the bite of a mad dog wherein the patient avoids the light and dreads the water.

CYNIC a man of a surly or snarling temper a misanthrope. — The *Cynics* were a sect of ancient philosophers who valued themselves upon their contempt of riches and state arts, sciences, and amusements.

CYNIPS the Gall fly, a genus of insects of which there are 50 species chiefly found in the oak. The most beautiful gall is the production of the *Cynips quercus gemma* who piercing the terminal bud of the tree deposits its egg in the interior and thereby, with the hatching and progressive growth of the larva converts it from a healthy bud into a fine dark green gall leaved like a rose bud beginning to blow, about an inch in diameter, and held to the branch by a pedicle.

CYNOCEPHALUS in zoology, a sort of ape with a head like a dog.

CYNODONTES, in anatomy dog teeth of which there are two in each jaw one on each side betwixt the fore teeth and the grinders.

CYNOGLOSSUM, in botany Hound's tongue, a genus of plants, class 5 *Pentandria*, order 1 *Monogynia*.

CYNORRHODON, in botany, the dog rose also the flower of the red lily.

CYNOREXIA, in medicine, a canine appetite.

CYNOSURE, in astronomy, a constellation near the north pole, consisting of seven stars, four of which are disposed like the four wheels of a chariot and three lengthwise, like the beam hence called the chariot or Charles's wain.

CYNOSURUS, in botany a genus of plants class 3 *Triandria*, order 2 *Digynia*, natural order *Gramina* or *Grasses*. The species are mostly perennials.

CYPARISSE in antiquity fiery meteors, or atmospheric phenomena appearing in the night.

CYPHONISM, in Grecian antiquity a punishment inflicted upon criminals by fastening a collar of wood round their necks by which their heads were kept bowed down.

CYPRESS TREE [see *CUPRESSUS*] the most remarkable are the *Semperverus* or common cypress the evergreen American cypress or white cedar and the *Davichia* or deciduous American cypress.

CYPRINUS in ichthyology a genus of fishes including the carp barbel gudgeon tench gold fish chub and several other fresh water fish.

CYRLENAICS a sect of ancient philosophers so called from their founder Aristippus of Cyrene a disciple of Socrates. The great principle of their doctrine was that the supreme good (felicity) in this life is pleasure.

CYST a bag which contains morbid matter in animal bodies. — *Cystic oryde* a peculiar substance supposed to be generated in the kidneys.

CYSTICUS in medicine inflammation in the bladder. According to Cullen a genus of diseases in the class *Ulcera* order *Phlegmona*.

CYSTIDES in medicine, encysted tumours or such as have their substance included in a membrane.

CYSTOCLE in surgery a hernia or rupture formed by the protrusion of the urinary bladder.

CYSTOTOMY, the practice of opening encysted tumours for the discharge of morbid matter.

CYTHARUS in ichthyology, a sea fish of the turbot kind.

CYTISUS in botany the Laburnum or Bean Trefoil tree. — Also a genus of plants class 17 *Diadelphia*, order 4 *Decandria* the species of which are shrubs.

CYTHENA in antiquity a magnificent sort of banqueting house among the Greeks so called from Cyricus a city famous for its sumptuous buildings.

CZAR the title assumed by the emperors of Russia. The first that bore this title was Basil the son of Basilides under whom the Russian power began to appear about 1470. The word is of old Slavonic origin and is nearly equivalent to *king*.

CZARINA, the title of the empress of Russia.

THE SIMPLICITY OF LIFE ADOPTED BY THE CYNICS, DEGENERATED INTO CARELESSNESS, AND BROUGHT THEM DOWN TO THE LEVEL OF MERE SAVAGES

THE CYPRESS LOVES THE MOST GLOOMY SWAMPS AND ITS BRANCHES ARE GENERALLY SPY COVERED WITH EMBLE PESTHOONS OF LONG MOSS

[DAC]

A New Dictionary of the Belles Lettres.

[DAG]

D

D, the fourth letter in the alphabet, is a dental articulation, having a kind of middle sound between the *t* and *th*, its sound being formed by a stronger impulse of the tongue to the upper part of the mouth, than is necessary in the pronunciation of the *t*. D, as a numeral, denotes 500, as an abbreviation it stands for Doctor, Dominus, &c., as MD, Doctor of Medicine, DD, Doctor of Divinity, AD, Anno Domini. As a sign, it is one of the Dominical or Sunday letters, and in Music, it is the nominal of the second note in the natural diatonic scale of C.

DA ALDER, a Dutch silver coin, of the value of a guilder and a half, or about 2s 7d.

DAB, a small flat fish of the genus *Pleuronectes*, it is thinner and less than the flounder, and of a dark brown colour.

DA CAPO, in music, an Italian phrase signifying that the first part of the tune is to be repeated from the beginning. It is also used as a call or acclamation to the musical performer at concerts, &c., to repeat the air or piece which has just been finished.

DACE, a river fish of the carp kind, it is longer and more slender than the roach.

DACRYLOLIS, in medicine, a species of insanity, in which the maniac laughs and weeps at the same time.

DACTYLIC, an epithet for verses which end with a dactyl instead of a spondee.

DACTYL, a foot in Latin and Greek poetry, consisting of a long syllable followed by two short ones, as *dominus, carmine*. When combined with the foot called a spondee, consisting of two long syllables, it forms a line of hexameter, or six feet poetry, in which the dactyls and spondees are tactfully intermingled.

DACTYL, in antiquity, a name attributed to the first priests of the goddess Cybele, who were particularly called *Dactyls Idaei*, because she was principally honoured on mount Ida in Phrygia.

DACTYLIOMANCY, a kind of divination among the Greeks and Romans, which was performed by suspending a ring by a thread over a table, the edge of which was marked with the letters of the alphabet. As the ring, after its vibration ceased, happened to hang over certain letters, these joined together gave the answer.

DACTYLIOTHECA, a collection of engraved gems.

DACTYLIS, a genus of plants in the Linnæan system, class 3 *Triandria*, order 2 *Digynia*. Natural order of Grasses — *Dactylis* is also the botanic name for the date grass.

DACTYLOLOGY, or DACTYLOLOGY, the art of communicating ideas or thoughts by the fingers, or the art of numbering on the fingers.

DAC TYLOS, the shortest measure among the Greeks, being the fourth part of a palm.

DA DO, the die, or that part in the middle of the pedestal of a column between its base and cornice. It is also the name of the lower part of a wall.

DAIDOCK, in botany, the heart of a tree thoroughly decayed.

DADUCHI, priests of Ceres, who at the feasts and sacrifices of that goddess, ran about the temple with lighted torches, delivering them from hand to hand, till they had passed through the whole company.

DADALA, two festivals in Boeotia. One was held by the Plataeans in a large grove, where they exposed to the air pieces of boiled flesh, and observing on what trees the crows alighted, that came to feed upon them, they cut them down and formed them into statues called *Dadala*. The other festival, which was much more solemn, was observed in different parts of Boeotia once in sixty years, when they carried about the statue of a female, called *Dadala*, and every city and every man of fortune offered a bull to Jupiter, and an ox or heifer to Juno, the poorer people providing sheep. These, with wine and incense, were laid upon the altar, and, together with twelve statues which were piled thereon, were set on fire and wholly consumed.

D LEMONOMANIA, in the medical writings of the ancients, denoted a madness which was supposed to arise from demoniacal influence.

DAF IODIL, in botany, a species of the Narcissus.

DAGUERREOTYPE Under the head "PHOTOGRAPHIC DRAWING," will be found some account of that singular invention, and as the art, now in its infancy, is attracting great attention, and much rivalry appears to exist between the inventors, we think it not amiss to insert the following account of M. Daguerre's process, as we find it — "Mr St Croix, who has but recently arrived from Paris, has taken up his residence at No 7, Piccadilly, where, on Friday last, he made some very interesting experiments with his new apparatus for transmitting and securing the shadows of real objects on plates of silvered copper. This invention has made a good deal of noise at Paris, and the exhibition of the process by which the results are obtained was hailed by the scientific men of this country with great delight. We can say that the experiments were completely successful, and surpassed the expectations of those who witnessed them. Most persons are acquainted with the manner in which photographic impressions are taken, we shall not, therefore, again describe it, but shall say that the Daguerrotic impressions are

THE ART OF DACTYLOLOGY IS USUALLY TAUGHT, AND WITH GREAT SUCCESS, IN INSTITUTIONS FOR THE EDUCATION OF THE DEAF AND DUMB.

THE NAME OF "DADALA" IS GIVEN TO FULL-LENGTH FIGURES, OR IMAGES, WITH THE FEET PLACED IN AN ADVANCING POSTURE.

[DAG]

[DAM]

A PECULIAR ORB OF SILVER WAS DISCOVERED IN 1866, CALLED "ARGENT CORNE," WHICH BECAME BLACK ON EXPOSURE TO THE LIGHT.

infinitely beyond them. The Daguerrotypic drawings, or prints, or impressions, for we hardly know by which term to call them, are produced by the box or machine used in the exhibition of the camera obscura. The rays of light are collected into a focus, and brought to bear upon the substance upon which the desired representation is to be secured. In photogenic impressions this subject is prepared paper. In Daguerrotypic impressions it is a thin plate of copper, covered with a very thin lamina of steel, made to adhere to it by what is called technically 'dry rolling,' or compression. The surface of the silver is polished as bright as a mirror, and before being used the plate is heated to a slight degree, by a lamp, containing spirits of wine, being placed beneath it. This heating causes a voltaic action on the metals. The plate after cooling is rubbed with a preparation of sulphur, and polished very finely by pounce, triturated to an impalpable powder. The plate is then placed in a sort of box closely shut up, in which it undergoes a sort of fumigation from the vapour of iodine, during which operation, in length about twenty minutes, the room is darkened, and all rays of light carefully excluded. The plate being judged sufficiently prepared, is placed in the machine of the camera obscura, and retained there about the space of twenty minutes, at the expiration of which time on being removed, it presents no vestige of a picture, but appears bright, clear, and colourless. In this state it is placed in a box, having on one side a glass through which it may be seen. The box is fumigated with the vapour of mercury, to a heat of eighty-five degrees of the centigrade thermometer, commencing at forty-five degrees. After remaining in this box about ten or twelve minutes, the outline of a picture is perceivable through the glass; the details gradually develop themselves, and by twenty minutes a very beautiful representation is produced, in which there is a slight, certainly a slight, but yet obvious tint of colour. This representation is most accurate, and minute in every respect, and is an extraordinary miniature view of the large objects in actual existence. The plate is then washed with a slight chemical acid, and the process is perfected. The view taken on Friday was from the window of the residence of M. St. Croix; it was the south-western crescent of Regent-street; nothing could be more accurate. This invention has no quackery or secret whatever about it; we have described it as it appeared to us, but we have unavoidably omitted some of the details of the solutions applied to the plate; the whole operation requires little more than an hour. The plates employed were of French manufacture, and vastly inferior to what are made in England—they were what are called by the manufacturers 'puckered.' The invention will be of great use to engravers, as an engraving can at once be made on the plate, by passing the graver over the lines of the impression. It

will be of great use to tourists and travellers in taking views of ancient buildings, ruins, &c., as the whole process is merely mechanical, and can be gone through without any chance of failure, by a person wholly ignorant of drawing, or the art of design."

DAHLIA, the name of a genus of plants belonging to the natural order (*Compositæ*), or compound flowers. It is a native of South America, but has of late years become common in our gardens; and is highly ornamental in the autumnal season, when other flowers are scarce. The root is perennial, composed of fascicles of tubes; the stem is straight, branching, and often upwards of six feet in height; the flowers are solitary, at the extremity of long branches, and by cultivation have been doubled, and made to assume a variety of colours. It is reproduced from the seed, or by the division of the roots, which is the most approved mode; and it requires frequent watering. In autumn the roots should be taken up, covered with dry sand, and kept out of the reach of the frost during the winter. The roots furnish the Mexicans with a wholesome article of food, though the taste is by no means pleasant.

DAIRY, a building appropriated to the purpose of preserving and managing milk, making butter, cheese, &c. Temperature in a dairy is of the first importance; for if too much heat be admitted, the milk will quickly become sour; and if too cold an atmosphere prevails, neither butter nor cheese making can be carried on with any success. Dairy farms, in general, consist chiefly of meadow and pasture, with only a small portion of the land under tillage; but it has of late years been proved that stall-feeding, with green crops, is most important in the management of cows; for in this way they can be kept in milk through the whole winter season.

DALIA, a genus of plants, class 10 *Dicandria*, order 1 *Monogynia*. The species are all deciduous shrubs.

DALRY, in botany, a plant of the genus *Bellia*, of several varieties.

DAGON, an idol of the Philistines, of the human shape upwards, and resembling a fish downwards, with a finny tail.

DAKER-HEN, a fowl of the gallinæ-cus kind, somewhat resembling a partridge or quail. Some say it is the same as the land rail.

DAMAGE-FEASANT, in law, is when one person's beasts gets into another's ground, without licence of the owner or occupier of the ground, and do damage by feeding, or otherwise, to the grass, corn, wood, &c. in which case the party injured may distrain or impound them.

DAMAGES, in law, the estimated equivalent for an injury sustained; or that which is given or adjudged by a jury to the plaintiff in an action, to repair his loss.

DAMASCENE (pronounced *dam'son*), a fruit tree, bearing a small plum, of an oval shape; the *Prunus Damascena*.

DAMASK, a silk stuff with a raised pat-

THE GREATEST DAIRY FARMS IN ENGLAND ARE IN CHESHIRE, GLOUCESTERSHIRE, ESSEX, CAMBRIDGE, SUFFOLK, DORSET, AND SOMERSET.

[DAM]

A New Dictionary of the Belles Lettres.

[DAR

tern, consisting of figures and flowers originally from Damascus. Though at first it was made only of silk, other materials are now used, as, for example, damask tablecloth.—*Damask-steel*, is a fine kind of steel from the Levant, used for sword and cut-throat blades.

DAMASKEEN'ING, the art of engraving on and inlaying iron or steel with gold or silver wire.

DAME, formerly a title of honour to a woman. It is now seldom otherwise applied than to a mistress of a family in the humbler walks of life.

DAME-WORT, or DAME'S VIOLET, in botany, a plant of the genus *Hebe*, called also queen's gilly flower, or rocket.

DAMNIFY, in law, to cause hurt or damage to, as, to *damnify* a man in his goods or estate.

DAMP'S, noxious steams and exhalations, frequently found in mines, coal pits, wells, and other subterraneous places, and which are deleterious or fatal to animal life. These damps are usually the carbonic acid gas, vulgarly called *hoke-damp*, which instantly suffocates, or some inflammable gas, called *fire-damp*. The fire damp, which prevails almost exclusively in coal-mines, is a mixture of light carburetted hydrogen and atmospheric air, which explodes with tremendous violence whenever it comes in contact with flame. The injuries which formerly occurred so frequently, both to the machinery and to the lives of the miners, arising from the fire-damp, are now almost completely obviated by the invention of Sir Humphry Davy's safety-lamp, which consists of a cylinder of wire gauze, about four inches in diameter and one foot in length, having a double top, securely fastened by doubling over to a brass rim, which screws on to the lamp itself below. When the lamp is lighted, it affords the miner all the light he requires, and renders him perfectly secure, even though entirely enveloped with the explosive mixture, which, with an ordinary light would immediately prove fatal.

DAMP'ERS, in music, certain parts in the internal construction of the psaltery, which are covered with soft leather in order to deaden the vibration, and are acted on by a pedal.

DAMSEL (from the French *demoiselle*), a name anciently given to young ladies of noble or gentle extraction. The word is, however, now seldom used, except jocularly or in poetry.—*Damozel*, or *damoiseau*, the masculine of the same word, appears to have been applied to young men of rank, thus we read of *damzel Pepin*, *damzel Louis le Gros*, *damzel Richard*, prince of Wales. From the sons of kings this appellation first passed to those of great lords or barons, and afterwards to those of gentlemen, who were not yet knights, but such is the change which language undergoes, that at the present day it is only used (and then rarely) when speaking of young unmarried women. It occurs frequently in the Scriptures, and in poetry.

DANCING, a lively brisk exercise, or

agreeable motion of the body, adjusted by art to the measures or tune of instruments. Dancing has been practised by all nations civilized and barbarous, by some held in esteem, by others in contempt. It has also often been made an act of religion, thus David danced before the ark, to honour God, and express his excess of joy for its return into Zion, and among the pagans it made a part of the worship paid to the gods, it being usual to dance round the altars and statues. As an exercise, or amusement, dancing is nothing more than a methodized set instinctive in the human frame. To teach dancing, is to teach the activity of the body to display itself in a manner regulated by the principles of grace, or in imitation of steps and postures which others have used with approbation. By its mechanical effects on the body, it inspires the mind with cheerfulness, while the music which accompanies it has effects upon the body as well as upon the mind.

DANCETTE, in heraldry, is when the outline of any bordure or ordinary is very largely indented.

DANDY, (from *dandispratt*, a little urchin, or probably from the French *dandin*, a mimic), a male of the human species, whose foppishness in dress and manners renders him a bitter satire on "the human form divine."

DANE-ELT, an annual tax formerly laid on the English nation, for maintaining forces to oppose the Danes, or to furnish tribute to procure peace with them. It was first imposed as a continual yearly tax upon the whole nation, under king Ethelred. It was levied by William I. and II. but was released by Henry the First, and finally abolished by Stephen.

DANGERIA, in our old law, a payment of money anciently made by the forest tenants to their lords, that they might have leave to plough and sow in the time of pannage or mast feeding.

DAOURITE, a mineral called also *rubellite*, resembling sapphire, and of a reddish hue.

DAPHNE, in botany, a genus of plants, class 8 *Octandria*, order 1 *Monogynia*. The species are all shrubs, as *Daphne mezereum*, *Daphne laureola*, &c.

DAPHNEPHORIA, in antiquity, a novel festival celebrated by the Boeotians in honour of Apollo, to whom boughs of laurel were offered.

DAPHNIN, in chemistry, the bitter principle of the *Daphne Alpinia*, discovered by Vauquelin. It consists of hard crystals, which are of a grayish colour and transparent.

DAPPLED, variegated with spots of different colours, as, a *dapple bay* or *dapple-gray* horse.

DARAPTI, in logic, an arbitrary term expressing the first mood of the third figure of syllogisms, where the first two propositions are universal affirmatives, and the last a particular affirmative.

DARIC, in antiquity, a Persian gold coin, said to have been struck by Darius, and supposed to have been equal to 25s. sterling.

THE EFFECT OF THE SAFETY-LAMP IN MINES IS SUPPOSED TO DEPEND ON THE COOLING AGENCY OF THE WIRE GAUZE.

THE NATIONAL DANCES OF THE PEASantry IN MANY COUNTRIES, ARE EXPRESSIVE OF JOYOUS FEELING, AND ARE OFTEN STRIKINGLY CHARACTERISTIC.

[DAY]

The Scientific and Literary Treasury;

[DEA]

DATA, among mathematicians, a term used for such things and quantities as are given or known, in order to find other things therefrom, that are unknown. Euclid uses the word for such spaces, lines, and angles, as are of a given magnitude, or to which we can assign others equal.

DATE, that part of a writing or letter which expresses the day of the month and year.—*Date*, in law, is the description of the day, month, or year of our Lord; with the year of the reign of the king, in which a deed or other writing was executed.—An *ante-date* is a date prior to the real time when the instrument was signed. A *post-date* is that posterior to the real time.

DATE-TREE, in botany, the *Phoenix dactylifera*, a species of palm which flourishes in North Africa and Western Asia, growing fifty, sixty, and sometimes one hundred feet high; distinguishing the landscape of those countries, and affording the inhabitants food, clothing, &c. The fruit is pulpy, firm, sweet, and esculent; and in it is enclosed a hard kernel.

DATHOLITE, in mineralogy, the borate of lime, of which there are two sub-species, the common and the botryoidal.

DATISI, in logic, an arbitrary term for a mode of syllogisms in the third figure, wherein the major proposition is a universal affirmative, and the minor and conclusion are particular affirmatives.

DATIVE, in grammar, the third of the Greek and Latin nouns.

DATU'RA, in chemistry, a vegetable alkali obtained from *Datura stramonium*.

—Also, in botany, a genus of plants, class 5 *Pentandria*, order 1 *Monogynia*.

DAU'CUS, the CARROT, a well-known vegetable. Also, a genus of plants, class 6 *Pentandria*, order 2 *Digynia*: the species are biennials or annuals.

DAU'PHIN, the title of the eldest son of the king of France. It is said that, in 1349, Humbert II., the last of the princes of Dauphiny, having no issue, gave his dominions to the crown of France, upon condition that the king's eldest son should be styled the Dauphin.

DAVID'S DAY, (St.) the 1st of March, kept by the Welsh in honour of St. David, bishop of Miney, in Wales; who at the head of their forces obtained a signal victory over the Saxons. It is the invariable custom of the Welsh to wear leeks in their hats on this day.

DAWN, the commencement of the day, when the twilight appears.

DAY, according to the most natural and obvious sense of the word, signifies that part of the twenty-four hours when it is light; or the space of time between the rising and the setting of the sun; the time which elapses from its setting to its rising again being considered the night. The word day is often taken in a larger sense, so as to include the night also; or to denote the time of a whole apparent revolution of the sun round the earth. The day is also distinguished into *civil* and *astronomical*. The civil day is a space of twenty-four hours,

reckoned from sunset to sunset, or from sunrise to sunrise, which is different in different parts of the globe. The astronomical day is the space of twenty-four hours, reckoned from twelve o'clock at noon to the noon of the next day.—The *nautilical day* ends at the instant the astronomical day begins; so that nautilical time in days of the month, is always twenty-four hours in advance of astronomical time, and the civil day is midway between both.—The Babylonians began the day at sun-rising; the Jews at sun-setting; the Egyptians at midnight, as do several nations in modern times, the British, French, Spanish, American, &c.—*Days of grace*, in commerce, a customary number of days allowed for the payment of a bill after it becomes due. Three days of grace are allowed in Great Britain and America. In other countries the time allowed is much longer, but the merchants there very rarely avail themselves of the time.

DAY-FLY, in entomology, the *Ephemera* of Linnaeus; an insect, so called from the shortness of its existence, which rarely exceeds a day.

DAY-LILY, in botany, the *Hemerocallis* of Linnaeus; a plant so called because the beauty of its flower seldom lasts longer than one day.

DAY-COAL, a name given by miners to the upper stratum of coal.

DAY-WRIT, or **DAY-RULE**, in law, a rule or order in court permitting a prisoner in the Queen's Bench to go beyond the bounds of the prison for one day.

DAZE, in mineralogy, a kind of glittering stones, found in tin and lead mines.

DEACON, the lowest of the three orders of clergy (deacons, priests, and bishops) in the English church. The word is sometimes used in the New Testament for any one that ministers in the service of God; in which sense, bishops and presbyters are styled deacons. but, in its restrained sense, it is taken for the third order of the clergy. In the church of England, the form of ordaining a deacon declares that it is his office to assist in the distribution of the holy communion; in which, agreeably to the practice of the ancient church, he is confined to the administration of the wine to the communicants. A deacon is not capable of any ecclesiastical promotion; yet he may be chaplain to a family, curate to a beneficed clergyman, or lecturer to a parish church.—In the Romish church, the deacon's office is to incense the officiating priest, to incense the choir, to put the mitre on the bishop's head at the pontifical mass, and to assist at the communion.—In Presbyterian and Independent places of worship, the deacons distribute the bread and wine to the communicants.—In Scotland, an overseer of the poor, or the master of an incorporated company, is styled a *deacon*.

DEACONESS, a female deacon in the primitive church. This office appears as ancient as the apostolical age; for St. Paul calls Phoebe a servant of the church of

IN SOME COUNTRIES, THE STONES OF DATES ARE GROUND TO MAKE OIL, AND THE PASTE OR CAKE IS GIVEN AS FOOD TO CATTLE.

OUR NAMES OF THE PARTS OF THE WEEK WERE INTRODUCED BY THE SAXONS, WHO DERIVED THEM FROM THE SCANDINAVIAN MYTHOLOGY.

[DRE]

THE BEYVELONT DE L'EPRE DEVOTED HIS FORLIFE AND HIS LIVE TO THE GRATUITOUS INSTRUCTION OF THE DEAF AND DUMB.

Cenchrea. One part of their office was to assist the minister at the baptizing of women, to undress them for immersion, and to dress them again, that the whole ceremony might be performed with all the decency becoming so sacred an action.

DEAD LANGUAGE, a language which is no longer spoken or in common use by a people, and known only in writings, as the Hebrew, Greek, and Latin.

DEAD-LIGHTS, strong wooden ports, made to suit the cabin windows, in which they are fixed, to prevent the water from entering the ship in storm.

DEAD-EYES, in sea-language, a kind of blocks with many holes in them, whereby the shrouds are fastened to the chains.

DEAD-RECKONING, in navigation, the difference between the place of a ship by the log and astronomical observation, owing to currents &c.

DEAD WATER, the eddy water closing in with a ship's stern as she passes through the water.

DEAD-WORKS, the parts of a ship which are above the surface of the water, when she is balanced for a voyage.

DEAFNESS, or the want of the sense of hearing, generally arises either from an obstruction or depression of the auditory nerve; or from some collection of matter in the cavities of the inner ear, or from the auditory passage being stopped up by hardened excrements, or lastly, from some excrescence, or swelling of the glands, or some foreign body introduced. It occurs in every degree, from that which merely impairs the accuracy of the ear in distinguishing faint sounds, to that state in which there is no more sensation in this organ than in any other, and sound is felt in almost every other part of the body, as a mere vibration. Deafness, in every degree, affects the distinctness of articulation, and if it is so great that the person can no longer distinguish between articulate sounds, he is incapable of acquiring speech in the ordinary manner, and becomes dumb in consequence of his deafness. Much has been done since the beginning of the present century to alleviate this dire misfortune by the establishment of institutions for the instruction of the deaf and dumb. "It appears," says a writer in the *Conversations Lexicon*, "that there are now eighty-one establishments for deaf mutes in Europe, of which Spain has one, Portugal one, Italy six, Switzerland four, Baden four, Wurtemberg three, Bavaria one, Prussia eight, the rest of Germany ten, Denmark two, Sweden one, Russia one, Holland four, Great Britain ten, and France twenty-six."

DEAL, fir-planks of different thicknesses, brought from the Baltic, and much used in carpentry.

DEAN, a dignitary of the church of England, next to a bishop, and head of the chapter, in a cathedral or council.—*Dean and Chapter*, are the bishop's council to assist him with their advice in the affairs of religion, and in the temporal concerns of his see.

DEATH, a total and permanent cessation of all the vital functions, when the organs have not only ceased to act, but have lost the susceptibility of renewed action. "Men," says Lord Bacon, "fear death, as children fear the dark, and as that natural fear in children is increased by frightful tales, so is the other. Groans, convulsions, weeping friends, and the like, show death terrible; yet there is no passion so weak but conquers the fear of it, and therefore death is not such a terrible enemy, revenge triumphs over death, love slights it, dread of shame prefers it, grief flies to it, and fear anticipates it." A happy life is, indeed, desirable; for life is, but death is not. To talk of death, is to give a name to nothing. To part with life, is to part with that of which we can never regret the loss. The alarms most prevalent among mankind seem to arise from two considerations, viz. the supposed corporeal suffering attending it, and the state that is to succeed it. With respect to the supposed corporeal suffering, it may be observed, that death is a mere passive extinction of the vital fire, unattended with any exertion of the animal functions, and therefore wholly free from pain. The agonies and sufferings incident to sickness or wounds, are the agonies and sufferings of life, not of death, they are the struggles of the body to live, not to die; efforts of the machine to overcome the obstacles by which its functions are impeded. But when the moment of dissolution arrives, all sense of suffering is subdued by an instantaneous stoppage of life, or by a languid insensible fainting.—In law, there is a natural death and a civil death *natural*, where actual death takes place, *civil*, where a person is not actually dead, but adjudged so by law, as by banishment, alijuration of the realm, &c.

DEATH-WATCH, a little insect, which inhabits old wooden furniture, and is famous for striking with its head against paper or some other material, and thereby making a ticking noise, like the beat of a watch, which by ignorant and superstitious people is supposed to be a presage of death. This insect is a small beetle, 5 luths of an inch long, of a dark brown colour, spotted, having transparent wings under the vagina, or hard case, belonging to the beetle tribe, a large cap or helmet on its head, and two antennae proceeding from beneath the eyes, and doing the office of proboscides. It is now pretty well ascertained that this ticking is merely the mode of call which the male insect makes for its mate.

DEBATE, oral contention by argument and reasoning, or a controversy between parties of different opinions, professedly for elucidating the truth.—*Debates in Parliament*, the published report of arguments for and against a measure, in either house of parliament.

DEBENTURE, a term used at the custom-house for a certificate signed by an officer of the customs, which entitles a merchant exporting goods to the receipt of a bounty, or a drawback of duties.—It

THE SYSTEM OF DE L'EPRE WAS MATERIALLY IMPROVED BY RICARD, HIS PUPIL AND SUCCESSOR IN THE PARIS INSTITUTION.

[DEC]

The Scientific and Literary Treasury ;

[DEC]

also denotes a sort of bill drawn upon the government.

DEBIT, a term used in book-keeping to express the left hand page of the ledger, to which all articles are carried that are charged to an account.

DEBOUCH, in military language, to issue or march out of a narrow place, or from denles.

DEBRIS (pron *debre'*) ruins or rubbish, applied particularly to the fragments of rocks.—The word *debris* is also used by the French to express the remains or wreck of an army that has been routed.

DEBOUCHEMENT, a French term for the marching of an army from a narrow place into one that is more open.

DEBT, in law, that which is due from one person to another, whether it be money, goods, or services.—In law, used elliptically for an action to recover a debt.—In scripture, sin, that which renders liable to punishment, as, "forgive us our debts."

National Debt, the engagement entered into by a government to repay at a future period money advanced by individuals for public service, or to pay the lenders an equivalent annuity.

DECACHORD, or DECACHORDON, a musical instrument of ten strings.

DECAGON, in geometry, a plane figure with ten sides and ten angles.

DECAGRAM, a French weight of ten grams, or 154 grains, 41 decimals.

DECAGYN, in botany, a plant having ten pistils.

DECALITHRON, in geometry, a figure or body having ten sides.

DECALITER, a French measure of capacity, containing ten liters, or 610,28 cubic inches.

DECALOGUE, the ten commandments or precepts delivered by God to Moses, at Mount Sinai, originally engraved on two tables of stone.—The Jews, by way of excellence, call these commandments The Ten Words, whence they afterwards received the name of *decalogue*.

DECAMERON, a work containing the actions or conversations of ten days.—Boccaccio's *Decameron* consists of one hundred tales related in ten days.

DECAMETER, a French measure of length, consisting of ten meters, and equal to 393 English inches, and 71 decimals.

DECAPHYLLLOUS, in botany, an epithet for plants having ten leaves.

DECASTICK, a poem consisting of ten lines.

DECASTYLE, in architecture, a building with an ordinance of ten columns in front.

DECEMENTATE, having ten points or teeth.

DECEMLOCULAR, in botany, having ten cells for seeds.

DECEMBER, the last month of the modern year, consisting of thirty one days, when the sun enters the tropic of Capricorn, and makes the winter solstice. It was so called from being the tenth month in the Roman year, which began with March.

DECEMVIRI, ten magistrates elected by the Roman people, and invested with the power of administering the laws of the twelve tables, which were compiled at the time of their creation. The *decemviri* were introduced by the popular power to counteract the privileges of the patricians, but then misbehaviour caused the same power to procure their abolishment in the third year of their *decemvirate*.

DECANDRIA, the tenth class of the Linnaean system of plants, containing six classes, *Monogynia*, *Digynia*, *Trigynia*, *Tetragynia*, *Pentagynia*, and *Decagynia*, with ten stamens.

DECENNARY, in law, a titling consisting of ten freeholders and their families. Ten of these *decennaries* constituted a *hundred*, the origin of which is ascribed to Alfred.

DECEM PRIMI, or DECEM PRIMIPES, in Roman antiquity, the ten chief men or senators of every city or borough.

DECIDENCE, in medicine a decay or tendency to any disease.

DECIDUOUS, an epithet chiefly used in botany, as, *deciduous leaves*, those which fall in autumn, in distinction to those of evergreens. The calyx or cup of a flower is also said to be *deciduous* when it falls, or decays, along with the flower petals, while on the contrary, it is called *permanent* when it remains after these are fallen.

DECIGRAM, a French weight of one-tenth of a gram.

DECILITER, a French measure of capacity, equal to one-tenth of a liter.

DECIMETER, a French measure of length, equal to the tenth part of a meter.

DECIMAL ARITHMETIC, a kind of calculation in which no other fractions are used than tenths, hundredths, &c. which are consequently called *decimal fractions*, and afford great facilities in calculation.

DECIMATION, a punishment inflicted by the Romans on such soldiers as quitted their post, or behaved themselves ill in the field. The names of all the guilty were put into an urn or helmet, from which a tenth part only were drawn, whose lot it was to suffer death.

DECK, the planked floor of a ship from stem to stern. Small vessels have only one deck, larger ships have two or three decks. Thus, speaking of the size of a large ship, we say, she is a *two-decker*, or a *three-decker*.

DECKED, in heraldry, a term applied to an eagle, or other birds, when their feathers are trimmed at the edges with a small line of another colour.

DECLAMATION, the act of speaking to a public audience with energy and grace, and may be either a discourse addressed to the reason or to the passions. Among the Greeks, declamation was the art of speaking indifferently on all subjects, and on all sides of a question. With us it is more especially applied to the speeches of students in colleges, practised for exercises in oratory. The term is, however, often used contemptuously, to denote a noisy harangue.

FOR EVERY CREDITOR THERE MUST BE A DEBTOR, AND FOR ALL ORIENTATIONS EXPENDITURE, THERE MUST BE EQUIVALENT PRIVATION.

IF THE DIVISIONS OF MONEY AND MEASURES BE IN A DECIMAL RATIO, THE RATE OF CALCULATION IS VERY GREATLY INCREASED.

[DEC]

A New Dictionary of the Belles Lettres.

[DEC]

as mere declamation, by which is meant, that a very strong appeal to the passions may be wholly deficient in basis, and may gain the assent of the feelings without offering a single argument that is worthy of the understanding.

DECLARATION, in law, that part of the process or pleadings in which a statement of the plaintiff's complaint against the defendant is set forth—*Declaration of war*, a public proclamation made by a herald at arms to the subjects of a state, declaring them to be at war with some foreign power, and forbidding all and every one to aid or assist the common enemy at their peril.

DECLENSION, in grammar, the inflection of cases to which nouns are subject. Also, the act of going through these inflections.

DECLINATION, in astronomy, is the distance of any star or point of the heavens from the equator, either north or south. When the sun is in the equinoctial, he has no declination, and enlightens half the globe from pole to pole. As he increases in north declination, he gradually shines farther over the north pole, and leaves the south pole in darkness, and *vice versa*. The sun's greatest declination, north or south, is 23 degrees and a half—*Declination of the compass*, is the variation of the needle from the true meridian of a place.

DECLINATORY PLEA, in law, a plea before trial or conviction, intended to show that the party was not liable to the penalty of the law, or was specially exempted from the jurisdiction of the court.

DECORTION, a medicinal liquor, made by extracting the soluble and efficacious part of many drugs, particularly of barks, woods, seeds, roots, &c.

DECOLLATIO, in surgery, the loss of a part of the skull, from *decollé*, to behead.

DECOLLATION, the act of beheading, a term frequently used in the phrase "decollation of St John the Baptist."

DECOMPOUND, in botany, an epithet for a leaf, an umbel, and a flower. A decomposed leaf is one which has its primary leaf so divided that each part forms a compound leaf. A decomposed flower (*flos decompositus*), is one which contains within a common calyx smaller calyxes.

DECOMPOSITION, in chemistry, the act of separating the constituent parts of a substance. It differs from mechanical division, as the latter effects no change in the properties of the body divided, whereas the parts chemically decomposed have properties very different from those of the substance itself.

DECOMUM, in architecture, the sustainability of a building, and of its parts and ornaments, to their respective places and uses.

DECOY, in a general sense, any lure that deceives and misleads. Also, a sea term, for a stratagem employed by ships of war, to draw any vessel of inferior force into an incautious pursuit, until she comes within gun shot. Decoying is also performed to elude the chase of a ship of su-

perior force in a dark night; and this is done by committing to the sea a lighted cask of pitch, which will burn for a considerable time, and misguide the enemy. As soon as the cask is lowered, the ship changes her course, and thus, if at any tolerable distance from the foe, escapes with facility—*Decoy*, among sportsmen, a place for catching wild fowl—*Decoy-duck* a wild duck trained to decoy others into the decoy or place where they may be caught.

DECREMENTS, in physics, the small parts by which a variable and decreasing quantity becomes less and less—*Decrement equal of life*, is a term in the doctrines of annuities, signifying that out of a certain number of lives there should be an equal number decrease within a given period of years.

DECRÉE, the order of an authoritative power. In England, the sentence of the judges in the civil courts, and in chancery, is called a decree. In theology, the predetermined purpose of God, whose plan of operations is, like himself, unchangeable.

DECREET, in the Scotch law, a final decree of judgment of the lords of session, from which an appeal only lies to parliament.

DECREPITATION, in chemistry, a term applied to the cracking noise of salts when exposed to heat, by which they are quickly split. It takes place in those salts that have little water of crystallization, the increased temperature converting that small quantity into vapour, by which the crystals are suddenly burst. Common salt affords a good example of decrepitation, and when used as a flux should be previously decrepitated.

DECRESCENDO in music, the term for gradually decreasing or weakening the sound, as opposed to *crescendo*.

DECRESCENT, in heraldry, a term denoting the state of the moon when she declines from the full to her last quarter, when the horns are turned to the sinister side of the escutcheon.

DECRETALE, a letter from the pope, determining some point or question in ecclesiastical polity. The *decretals* form the second part of the canon law.

DECEMBENT, in botany, an epithet for a flower having its stamens and pistils bending down to the lower side of it.

DECEMBRITURE, in astrology, the scheme or aspect of the heavens, by which the prognostics of recovery or death are discovered.

DECURRENT, an epithet for a leaf, which adheres immediately to the stalk of a plant, without any pedicle, and which has its lower part extended along the branch.

DECURIO, in Roman antiquity, a company of ten men under one officer or leader, who was called a *decurion*, their cavalry being divided into centuries, and the centuries subdivided into ten *decuria* each.

DECURIONES MUNIPALES, a court of judges or counsellors representing the Roman senate in the free towns and provinces.

A DECOY FOR WILD FOWL IS GENERALLY MADE WHERE THERE IS A LARGE FORD, OR PIECE OF WATER, SURROUNDED WITH WOOD.

IN THE OLD GERMAN EMPIRE, THE RESOLUTIONS OF THE EMPEROR, DECLINED TO THE RESAYS OF THE EMPIRE, WERE CALLED DECREES.

DED]

The Scientific and Literary Treasury ;

[DEF

DECUSSATION, a term in geometry, optics and anatomy, signifying the crossing of any two lines, rays, or nerves, when they meet in a point, and then go on separately from one another.

DECUSSATE, or **DECUSSATED**, in botany, an epithet for such leaves and branches as grow in pairs which alternately cross each other at right angles, or in a regular manner.—In rhetoric, a *decussated* period is one that consists of two rising and two falling clauses, placed in alternate opposition to each other.

DEDALOUS, a botanical term applied to leaves of a delicate texture, whose margin is marked by various windings and turnings.

DEDICATION, the act of consecrating, or solemnly devoting, any person or thing, to the service of God, and the purposes of religion.—*Feast of Dedication*, an anniversary festival among the Jews, in memory of Judas Maccabæus, who repaired and dedicated anew the temple and altar, which had been plundered and profaned by Antiochus Epiphanes. It was observed on the twenty-fifth of Chisleu, and continued eight days.

DEDUCTOR, a client amongst the Romans, who called upon his patron at his lodgings in the morning, waited upon him from thence to the forum and attended him upon all public occasions.

DEED, in law, a written contract, sealed and delivered. It must be written before the sealing and delivery, otherwise it is no deed, and after it is once formally executed by the parties, nothing can be added or interlined, and, therefore, a deed be sealed and delivered with a blank left for the sum, which the obligee fills up after sealing and delivery, this will make the deed void. Every deed must be founded upon good and sufficient consideration, not upon an usurious contract, nor upon fraud or collusion, either to deceive *bona fide* purchasers, or just and lawful creditors, any of which considerations will vacate the deed. It takes effect only from the day of delivery and, therefore, if a deed have no date, or a date impossible, the delivery will in all cases ascertain the date of it. The delivery of a deed may be alleged at any time after the deed, but unless it be sealed and regularly delivered, it is no deed. And lastly, it must be properly witnessed or attested, which, however, is necessary rather for preserving the evidence, than as intrinsically essential to the validity of the instrument.

DEFACTO, in law, something actually in fact, or existing, in contradistinction to *de jure*, where a thing is only so in justice, but not in fact, as a king *de facto* is a person that is in actual possession of a crown, but has no legal right to the same, and a king *de jure* is the person who has a just right to the crown, though he is not in possession of it.

DEFAMATION, the malicious uttering of falsehood with a view to injure another's reputation. Defamatory words written and published constitute a *libel*.

DEFAULT, in law, a non-appearance in court without assigning sufficient cause.

—*Defaulter*, one who fails to account for public money entrusted to his care.

DEFEASANCE, in law, a condition relating to a deed, which being performed, the deed is *defeated* and rendered void. A *defeasance*, or a bond, or a recognizance, or a judgment recovered, is a condition which, when performed, *defeats* it.

DEFECTION, the act of separating from lees or dregs.

DEFENCE in law, the reply which the defendant makes after the declaration is produced.—In military affairs, any work that covers or defends the opposite posts, as flanks, parapets, &c.

DEFENDANT, in law, the party that is summoned into court, and *defends*, denies, or opposes the demand or charge, and maintains his own right. It is applied whether the person defends, or admits the claim and suffers a default.

DEFILE, a narrow way, or pass, through which a company of soldiers can march only in file.

DEFINITION, the determining the nature of things by words, or a brief description of a thing by its properties. It is generally effected by adding to a generic word the essential and peculiar qualities or circumstances of the thing to be defined, but a strictly accurate definition cannot always be given, and the most simple things are generally the least capable of definition, from the difficulty of finding terms more simple and intelligible than the one to be defined.

DEFINITIVE, a term applied to whatever terminates a process, question, &c. in opposition to provisional and interlocutory.—In grammar, a word used to define or limit the extent of the signification of an appellative or common noun.

DEFLAGRATION, rapid combustion, or the act of burning two or more substances together, as charcoal and nitre.

DEFLATION, the turning anything out of its due course, as the tendency of a ship out of her due course by reason of currents, &c.—*Deflection of the rays of light*, in optics, a property (called by Newton *refraction*) distinct from reflection and refraction, being made perpendicularly towards the opaque body.

DEFLEXUS, in botany, an epithet for a leaf when bowed or bent down like an arch.

DEFLORATUS, in botany, an epithet for a flower which has discharged its pollen.

DEFLUVIUM, in botany, a disease in trees whereby they lose their bark.—*Defluvium capillorum*, in medicine, a preternatural falling off of the hair.

DEILYXION, in surgery, the falling or flowing of humours from a superior to an inferior part of the body, as a defluxion from the nose or head in catarrh.

DETOLIAION, the shedding of leaves, a term technically applied to the autumnal season, when the leaves of trees and shrubs are shed.

THE FORMAL PARTS OF A DEED ARE THE PREMISES, THE COVENANTS, AND THE CONCLUSION WHICH MENTIONS THE EXECUTION AND DATE.

TO MARCH BEFORE ANY ONE WITH A NARROW FRONT, THAT IS "EN COLONNE," OR BE FILED, IS ALSO CALLED "DEFILING."

[DEI]

A New Dictionary of the Belles Lettres.

[DEL]

THE FRENCH DIVIDE THE CIRCLE INTO 400 DEGREES. EACH DEGREE CONTAINING 100 MINUTES, EACH MINUTE 100 SECONDS, &c.

DEFORCEMENT, in law, the holding of lands or tenements to which another person has a right. In Scotland, it denotes a restraining of an officer in the execution of law.

DEGRADATION, in ecclesiastical affairs, the depriving a person of his dignity and degree; as the degradation of a clergyman by depriving him of holy orders.—In military affairs, the depriving an officer of his commission.—In painting, a lessening and obscuring of the appearance of distant objects in a landscape, that they may appear as they would do to an eye placed at a distance.

DEGRADED, in heraldry, an epithet in blazoning for a cross that has steps at each end.

DEGREE, in geometry, a division of a circle, including the 360th part of its circumference every circle is supposed to be divided into three hundred and sixty parts, called degrees, and each degree divided into sixty other parts, called minutes, each of these minutes being again divided into sixty seconds, and each second into thirds, and each third into fourths, and so on.—*Degree*, in algebra, a term applied to equations, to distinguish the highest power of the unknown quantity.—*Degree*, in genealogy, an interval of relationship between persons more or less nearly allied.—The division, space, or interval, marked on a mathematical or other instrument, as, on a thermometer or barometer.

DEGREE, in universities, a mark of distinction conferred on the students or members thereof as a testimony of their proficiency in arts or sciences, and entitling them to certain privileges. This is usually evinced by a diploma. The first degree is that of *Bachelor of Arts*, the second, that of *Master of Arts*. Honorary degrees are those of *Doctor of Divinity*, *Doctor of Laws*, &c. Physicians also receive the degree of *Doctor of Medicine*.

DEGREES of comparison, in grammar, the inflections of adjectives which express different degrees of the same quality, as, *good, better, best*.

DEHISCENCE, and **DEHISCENT**, in botany, terms given to the opening of the capsules of a plant.

DEICIDE, a term only used for the condemnation and execution of the Saviour of the world, by Pontius Pilate and the Jews.

DEIFICATION, the act of deifying, or enrolling among the heathen deities.

DEIPNOSOPHIST, one of an ancient sect of philosophers who were famous for their learned conversation at meals.

DEISTS, in the modern sense of the word, are those persons who acknowledge the existence of one God, but disbelieve in revealed religion. Taking the denomination in the most extensive signification, a learned theologian has thus divided deists into four classes. 1. Such as pretend to believe the existence of an eternal, infinite, independent, intelligent Being, and who teach that this supreme Being made the world, though they fancy he does not at all concern himself in the management of it. 2. Those who be-

lieve not only the being, but also the providence of God with respect to the natural world, but who not allowing any difference between moral good and evil, deny that God takes any notice of the morally good or evil actions of men, these things depending, as they imagine, on the arbitrary constitutions of human laws. 3. Those who having right apprehensions concerning the natural attributes of God, and his all-governing providence, and some notion of his moral perfections also, yet being prejudiced against the notion of the immortality of the human soul, believe that men perish entirely at death, and that one generation shall perpetually succeed another, without any future restoration or renovation of things. 4. Such as believe the existence of a supreme Being, together with his providence in the government of the world, as also the obligations of natural religion, but so far only, as these things are discoverable by the light of nature alone, without believing any divine revelation.

DEI JUDICIUM, the old Saxon trial by ordeal, so called because it was supposed to be an appeal to God.

DEITY, the nature and essence of the Supreme Being, a term frequently used in a synonymous sense with God.—Also, a fabulous god or goddess, as, Jupiter, Juno, Apollo, &c.

DELACRYMATION, a prternatural discharge of watery humours from the eyes.

DEL CREDERE, a term in commerce expressive of a guarantee given by factors, who for an additional premium warrant the solvency of the parties to whom they sell goods upon credit.

DELEGATE, a commissioner of appeal appointed by the king to hear appeal causes from the ecclesiastical court.—In the United States of America, a person elected or appointed to represent a state or district in the congress.

DELLTARIOUS, an epithet for drugs or any substances of a destructive or poisonous quality.

DELLF, a kind of potter's ware, originally made at Delft in Holland, it is covered with an enamel or white glazing, in imitation of porcelain.

DELIQUESCENCE, in chemistry, spontaneous liquifaction in the air, a term applied to certain saline bodies that have become moist or liquid, by means of the water which they absorb from the atmosphere, in consequence of their great attraction to moisture.

DELIQTUM, a state in which the ideas of a person are wild and irregular, or do not correspond with the truth, or with external objects. Or it may be defined symptomatic derangement, or that which is dependant on some other disease, in distinction from idiopathic derangement or *mania*.

DELIVERY, a part of oratory, referring to the management of the voice; as, he has a good or graceful *delivery*.

DELPHIC, or **DELPHIAN**, relating

THE DIFFERENCE OF THE LONGITUDE OF TWO PLACES IS DETERMINED BY THE DIFFERENCE OF THE HOUR AT THE SAME POINT OF TIME.

[DEM]

The Scientific and Literary Treasury ;

[DEM]

to Delphi, and to the celebrated oracle there.

DELPHINITE, a mineral called also *rustacite*.

DELPHINIUM, in botany, *LARKSPUR*, a genus of plants, class 12 *Polyandria*, order 3 *Trigynia*.

DELPHINUS, a genus of animals, class *Mammalia*, order *Cete*, consisting of the dolphin, the porpoise, and the sword grampus. The dolphin is described by the ancients as the swiftest of all animals either by land or sea, and, according to Aristotle, so agile in leaping, that it would clear ships.

Delphinus, in astronomy, is a constellation in the northern hemisphere, for among the fictions of the ancient poets, is one which states that the dolphin was translated to the celestial regions by Neptune.

DELTOID, in anatomy, a thick triangular muscle of the arm, being one of the three elevators—Also, a term for any thing having three angles, of which the terminal one is much further from the base than the lateral ones.

DELUGE, an inundation or overflowing of the earth, either wholly or in part, by water—We have several deluges recorded in history, as that of *Ogyges*, which overflowed almost all Africa, and that of *Deucalion*, which drowned all *Thessaly*, in Greece but the most memorable was that called the universal deluge, or *Noah's flood*, from which only *Noah* and those with him in the ark, escaped. This flood makes one of the most considerable epochs in chronology. Its history is given by *Moses* in the book of *Genesis*, ch. vi & vii and its time is fixed to the year from the creation 1656. From this flood, the state of the world is divided into "diluvian" and "anti diluvian."

DEMAIN, or **DEMI SNE**, in law, a manor house and the lands therunto belonging, which the lord of the manor and his ancestors have time out of mind kept in their own occupation. It denotes also all the parts of any manor not in the hands of freeholders, and is frequently used for a distinction between those lands that the lord has in his own hands, or in the hands of his lessee demised at a rack rent, or such other land appertaining to the manor, which belongs to free or copyholders.

DEMACOGUE, any factious orator who acquires great influence with the populace, whom he flatters, cajoles, or leads into danger, as best suits his purpose.

DEMANDANT, in law, the pursuer in real actions, in distinction from the plaintiff.

DEMARCATIION, LINE OF, every line drawn for determining a border, which is not to be passed by foreign powers, or by such as are at war with each other.

DEMI, a half fellow at *Magdalen College*, Oxford—Also, a term in composition, signifying half, as, *demigod*, a hero who was enrolled among the gods.

DEMI-CADENCE, in music, an imperfect cadence, or one that falls on any other than the key note.

DEMI CROSS, an instrument for taking the altitude of the sun and stars.

DEMI CULVERIN, a piece of ordnance, the least of which is ten feet long, and carries a ball of nine pounds weight.

DEMI-GORGE, in fortification, that part of the polygon which remains after the flank is raised, and goes from the curtain to the angle of the polygon.

DEMI-QUAVER, a note in music, of half the length of the quaver.

DEMI VOLT, one of the seven artificial motions of a horse, in which he raises his fore legs in a particular manner.

DEMI SE, in law, is applied to an estate either in fee, for term of life or years, though most usually the latter.—The death of a king, or a queen regnant, is termed the demise of the crown, by which is implied a transfer of the royal authority or kingdom to a successor—*Demise and re demise*, a conveyance where there are mutual leases made from one to another of the same land, or something out of it.

DEMOCRACY, a form of government, in which the supreme power is lodged in the hands of the people collectively, or in which the people exercise the powers of legislation.

DEMON, or **DAEMON**, a name used by the ancients for certain supernatural beings, whose existence they supposed. They were spirits or geni who appeared to men, either to do them service or to hurt them. The Platonists distinguish between gods, demons, and heroes, the demons being those since called angels. *Socrates* and *Tasso* spoke in very distant ages, of being each attended by a demon or familiar. In *Tasso*, this pretension has been retired to an hypochondriacal state of mind, in *Socrates*, the matter has given rise to much speculation. From the manner, however, in which the philosopher is said to have described his demon, there seems good reason to be here that he spoke figuratively of his natural conscience or intellect "it directed him how to act in every important occasion of life, and restrained him from imprudence of conduct." The demons of the New Testament were supposed to be spiritual beings which vexed and tormented men. And in general, the word, in modern use, signifies an evil spirit or genius, which influences the conduct or directs the fortunes of mankind.

DEMONIAC, a human being whose volition and other mental faculties are overpowered, restrained, or disturbed, in their regular operation, by an evil spirit.—In church history, the term *Demoniac* is given to a branch of the Anabaptists, whose distinguishing tenet is, that at the end of the world the devil will be saved.

DEMONOCRACY, the power or government of demons.

DEMONOLGY, a treatise on demons or evil spirits. Demonology in our Saviour's time was no inconsiderable part of philosophy. Thus the Greeks imputed madness sometimes to the agitation and agency of Furies, and sometimes to the influence of Diana or the moon. The Romans thought

THE ALTERNATE DEPOSITS OF TERRESTRIAL AND MARINE PRODUCTIONS ON THE EARTH, AND THE EFFECT OF REPEATED DELUGES.

THE DELPHIC ORACLE SERVING TO REGULATE AND UPHOLD THE POLITICAL, CIVIL, AND RELIGIOUS RELATIONS OF A-NCIENT GREECE.

[DEM]

A New Dictionary of the Belles Lettres.

[DEN

insanity was caused by Ceres or the Larvæ; and amongst the Jews, "to have a devil" and "to be mad," were synonymous terms. Everything, in short, which affected either the body or the mind, in an extraordinary manner, every disagreeable phenomenon, which they could not otherwise account for, was by the Jews supposed to be the work of the devil. What gives still more strength to the opinion is, that what one evangelist calls *demoniacal possession*, is by another mentioned simply as a disease. Besides most, if not all the disorders which are ascribed to in-dwelling demons in the gospel history, are, so far as we are enabled to judge from the description of them there, disorders which existed in the world long before, and are accounted for upon natural principles. The disciples and apostles themselves might perhaps believe these disorders to be real demoniacal possessions, and our Saviour might suffer them to remain in so harmless an error, for he came not to teach speculative philosophy, but to make men holy and happy.

DEMONSTRATION, a proof of a proposition founded on axioms and intermediate proof, called *a priori* when the effect is proved from the cause, and *a posteriori* when the cause is proved from the effect. It has been remarked, that the knowledge acquired by demonstration, though certain, is not so clear and evident as intuitive knowledge. In every step that reason makes in demonstrative knowledge, there is an intuitive knowledge of that agreement or disagreement it seeks with the next in intermediate idea, which it uses as a proof, for if it were not so, that yet would need a proof, since without the perception of such agreement or disagreement, there is no knowledge produced.

DEMONSTRATOR, in anatomy, one who exhibits the parts when dissected.

DEMULCENTS, any medicines which lessen acrimony, or the effects of stimulus on the solids, as gums and other mucilaginous substances.

DEMUR, in law, to stop at any point in the pleadings, and rest or abide on that point in law for a decision of the cause.

DEMURRAGE, in commerce, an allowance made to the master of a ship by the merchants, for staying in a port longer than the time first appointed.

DEMURRER, in law, a pause or stop put to any action upon some point of difficulty which must be determined by the court before any further proceeding can be had in the suit. A demurrer confesses the fact or facts to be true, but denies the sufficiency of the facts in point of law to support the claim or defence. Demurrers are either *general*, where no particular cause is shown, or *special*, where the causes of demurrer are set forth.

DEMY, in heraldry, an epithet for any charge that is borne, half, as a demy-lion, or half lion.

DEMY, the name of paper of a particular size, of which great quantities are used for printing books on.

DENARIUS, in Roman antiquity, the chief silver coin among the Romans, worth 8d. As a weight, it was the seventh part of a Roman ounce.—*Denarius Dei*, God's Penny, or earnest money given and received by the parties to contracts. It was so called because in ancient times it was given to the church or to the poor.

DEN DRACHATE, in mineralogy, arborescent agate, or agate containing the figures of shrubs or parts of plants.

DENDRITE a stone or mineral on which are the figures of shrubs or trees. Hence the epithets *dead-tree* and *dendroid*.

DENDROIT, a fossil which has some resemblance in form to the branch of a tree.

DENDROLITE, a petrified fossil shrub, plant, or part of a plant.

DENDROLOGIA, a discourse on, or the natural history of, trees.

DENDROMETER, an instrument to measure the height and diameter of trees.

DENDROPHORIA, in antiquity, the carrying of boughs or branches of trees, a religious ceremony so called, because certain priests called from thence *dendrophori*, or tree-bearers, marched in procession, carrying the branches of trees in their hands in honour of Bacchus, Cybele, Sylvanus, or any other god.

DENIZEN, an alien who is made a subject by royal letters patent, holding a middle state between an alien and a natural born subject. He may purchase and possess lands, and enjoy any office or dignity, yet it is a sort of naturalization for a stranger, when naturalized, may inherit lands by descent, which a denizen cannot do. If a denizen purchase lands, his issue that are born afterward may inherit them, but those he had before shall not, and as a denizen may purchase, so he may take lands by devise.

DENOMINATOR, in arithmetic, the parts into which a whole is divided, the number of which is expressed by the numerator of a fraction, but in decimals, the denominator is understood to contain as many ciphers as there are terms in the numerator, and is not written.

DENOUMENT, a French word, by modern custom nearly anglicized, signifying the development or winding up of any event.

DENSE, in botany, an epithet for a pampel having an abundance of flowers very close.

DENSITY, closeness of constituent parts, that property in bodies by which they contain a certain quantity of matter under a certain bulk or magnitude. It is directly opposed to *rarity*. A body is said to have double and triple the density of another body, when, being equal, the quantity of matter is in one double or triple the quantity of matter in the other.

DENTAGRA, a surgeon's instrument, or forceps for extracting teeth.

DENTALIS LAPIS, in medicine, the tartareous matter which adheres to the teeth, and becomes as hard as the bone itself.

THE RELIGION OF MOABITES, OR DOCTRINE OF THE TEN-LEAGUE, IS LOOKED UPON AS A CHIEF SOURCE OF DEMONOLOGY.

IT IS BELIEVED THAT THE JEWS, AT THE TIME OF THE BABYLONISH CAPTIVITY, PRINCIPALLY DERIVED THEIR NOTIONS OF DEMONOLOGY.

[DEP]

The Scientific and Literary Treasury;

[DEN]

DEN'TAL, an articulation or letter formed by placing the end of the tongue against the upper teeth, or nearer the roof of the mouth, as in *d* and *t*.

DENTALIUM, in ichthyology, a genus of shell-fish, the shell consisting of one tubulous straight valve, open at both ends.

DENTALITE, a fossil shell of the genus *Dentalium*.

DENTATE, or **DENTATED**, in botany, an epithet for a root that consists of a concatenation of joints, resembling a necklace, or for a leaf having points like teeth on the margin.

DENTATO SIN'UATE, having points like teeth with hollows about the edge.

DENTICULATE, in botany, having small teeth or notches, as a denticulate leaf, calyx, or seed.

DENTICULATION, the state of being set with small teeth, like a saw.

DENTIFRICE, any powder or other substance used for cleaning the teeth.

DENTIL, in architecture, an ornament in cornices bearing some resemblance to teeth, used particularly in the Corinthian and Ionic orders.

DENTOID, having the form of teeth.

DENTES SAPIEN'TIÆ, or **Wisdom Teeth**, a term applied to the two most backward double teeth, so called because they come when persons are arrived at years of maturity.

DENUDATION, in geology, the act of washing away the surface of the earth by a flood.

DEOBSTRENT, any medicine which removes obstructions and opens the natural passages of the fluids of the body.

DEODAND, a personal chattel which has been the immediate occasion of the death of a rational creature, and for that reason is *given to God*, that is, forfeited to the king, to be applied to pious uses.

DEOXYDATE, or **DIOXYDIZE**, in chemistry, to deprive of oxygen, or reduce from the state of an oxide.

DEPARTMENT, either a division of territory, as the *departements* of France, or a distinct class of official duties allotted to a particular person.

DEPHLOGISTICATED AIR, a term applied by Dr Priestley, and others, to what is now called *oxygen gas*, when he first discovered it. It was denominated by Scheele, who discovered it about the same period, *vital air*.

DEPLOY, the spreading of troops; a military term.

DEPONENT, in law, one who gives written testimony under oath to interrogatories exhibited in the court of Chancery.

DEPORTATION, a sort of banishment among the Romans, to some island or other place which was allotted to a criminal for the place of his abode, with a prohibition not to leave it, on pain of death.

DEPOSIT, among civilians, something that is committed to the custody of a person, to be kept without any reward, and to be returned again on demand.

DEPOSITION, in law, the testimony

given in court by a witness, upon oath.

Deposition, the settlement of substances dissolved in fluids; as, banks are sometimes called *depositions* of alluvial matter.

Also, the act of dethroning a king, or divesting any one in authority of his power and dignity.

DEPOT, a French word for a store or magazine for depositing goods or merchandise.

DEPRESSION, of the sun, or a star, in astronomy, is its distance at any time below the horizon, measured by an arc of the vertical circle.

Depression of the pole, a phenomenon which arises from the spherical figure of the earth, thus, when a person sails or travels towards the equator he is said to depress the pole, because as many degrees as he approaches nearer the equator, so many degrees will the pole be nearer the horizon.

Depression of an equation, in algebra, the reducing an equation to lower degrees, as a biquadratic to a cubic equation, or a cubic to a quadratic.

DEPRESSORIUM, a surgical instrument used for depressing the *dura mater* after the operation of trepanning.

DEPRESSOR, in anatomy, a name applied to several muscles, because they depress the parts to which they are attached.

DEPRESSUS, in botany, an epithet for the leaves of succulent plants which are hollow or depressed in the middle.

DEPRIVATION, an ecclesiastical censure by which a clergyman is deprived of his dignity.

DI PURATION, the act of purifying or freeing fluids from heterogeneous matter. This is done either by decantation, when the feculent matter is deposited in the bottom of the vessel, by boiling and skimming, by filtration, or by clarification.

DEPUTATI, in antiquity, persons who attended the army for the purpose of carrying away the wounded from the field of battle and waiting on them. The armourers were also sometimes called *deputati*.

DEPUTY, in a general sense, signifies a person appointed or elected to act for another, or who is sent upon some business by a community.—In law, a *deputy* is one who exercises an office in another's right, and, properly, the misdeemeanor of such deputies shall cause the person he represents to lose his office.—By a *deputation* is generally understood, the person or persons authorized and sent to transact business for others, either with a special commission and authority, or with general powers.

DERELICTS, in law, such goods as are wilfully relinquished by the owner. It also signifies a thing forsaken, or cast away by the sea: thus, lands which the sea has suddenly left are called *derelict lands*, and vessels forsaken at sea are called *derelict ships*.

DERIVATIVE, in grammar, any word derived (i. e. taking its origin) from another, called its *primitive*, as *manhood* from *man*, &c.

IN ALL INDICEMENTS FOR HOMICIDE, THE INSTRUMENT THAT IMMEDIATELY CAUSED THE DEATH, AS WELL AS ITS VALUE, IS SPECIFIED.

THOUGH BY HOMICIDE A FINE IS INCURRED TO THE KING, NO FORFEITURE CAN BE CLAIMED UNLESS A DEADLY WEAPON BE AWARDED BY A JURY.

[DES]

A New Dictionary of the Belles Lettres.

[DES]

DEROGATION, the act of annulling, revoking, or destroying the value and effect of anything, or of restraining its operation; as, an act of parliament is passed in *derogation* of the king's prerogative.

DEROGATORY CLAUSE, in a person's will, is a sentence or secret character inserted by the testator, of which he reserves the knowledge to himself, with a condition that no will he may make hereafter shall be valid unless this clause is inserted word for word. This is done as a precaution to guard against later wills being extorted by violence or otherwise improperly obtained.

DERVISE, or **DERVIS**, a name given to various Mahometan priests or monks. Many of the dervises travel over the whole of the Eastern world, entertaining the people wherever they come with agreeable relations of the curiosities and wonders they have met with. There are dervises in Egypt, who live with their families, and exercise their trades, of which kind are the dancing dervises at Damascus. They are distinguished among themselves by the different forms and colours of their habits; those of Persia wear blue; the solitary and wanderers wear only rags of different colours; others carry on their heads a plume, made of the feathers of a cock; and those of Egypt wear an octagonal badge of a greenish white alabaster at their girdles, and a high stiff cap without anything round it. They generally profess extreme poverty, and lead an ascetic life.

DERMESTES, in entomology, a genus of hemipterous insects, whose larva devour dead bodies, skins, leather, &c. They are of a lengthened oval shape, and are exceedingly destructive in museums and libraries.

DESCENSION, in astronomy, an arch of the equator which descends or acts with any sign or point in the zodiac. Descension is either *right* or *oblique*, according as it takes place in a right or oblique sphere.

—The epithet *descending* is also in frequent use in astronomy; as *descending degrees*, *descending latitude*, &c. And by *descensional difference* is understood, the difference between the right and oblique descension of any planetary body.

DESCENT, in a general sense, is the tendency of a body from a higher to a lower place; thus all bodies, unless otherwise determined by a force superior to their gravity, descend towards the centre of the earth.—In law, it means transmission by inheritance; which is either *lineal* or *collateral*. Descent is *lineal*, when it proceeds directly from the grandfather to the father, from the father to the son, and from the son to the grandson; *collateral*, when it does not proceed in a direct line, but from a man to his brother, nephew, or other collateral representative.—*Descent*, in genealogy, the order of succession of descendants in a line or family; or their distance from a common progenitor. Also, a term in heraldry, to express coming down; "as a lion in descent," i. e. a lion with his heels upwards, as though in the act of leaping down from an eminence.

DESCRIPTION, in literature, such a vivid, strong, and beautiful representation of any thing, as shall give the reader a distinct view and satisfactory notion of it.

DESECRATION, a word denoting the very opposite of *consecration*, being the act of divesting any thing of a sacred purpose or use to which it has been devoted.

DESERT, a large uninhabited tract of land, or extent of country, entirely barren. In this sense, some are sandy deserts, as those of Arabia, Lybia, and Zaara: others are stony, as the desert of Pharan, in Arabia Petrea. "The Desert," absolutely so called, is that part of Arabia south of the Holyland, where the children of Israel wandered forty years. But the term desert may be, and often is, applied to an uninhabited country, covered with wood or overrun with vegetation incapable of affording sustenance to man.

DESERTER, a soldier who quits his regiment without leave; or a sailor who clandestinely leaves his ship. In seaman's language to desert is called "to run."

DESHABILLE, (Fr.) an undress.

DESHACHE, in French heraldry, a term for a beast whose limbs are separated from the body, but still remain on the escutcheon, with only a small separation from their natural places.

DESICCANT, or **DESICCATIVE**, any medicine or application that has the property of exhausting moisture from, or drying up, a sore.

DESIDERATUM, any perfection or improvement not possessed, but which, being much wanted, is therefore desirable.—This word is frequently applied without the necessary precision. Something which one seeks, though perhaps it may not be strictly desirable to attain—or something which appears excellent, but which has not yet been proved so—is pronounced "a desideratum." Thus, for instance, if we were prematurely to assert, that "this book is a desideratum in the present state of our elementary literature," it would not merely be a proof of our vanity, but a misapplication of the word; but if public approbation and extensive patronage should follow its appearance, we might then use it with great propriety.

DESIGN, in a general sense, the plan, order, representation, or construction of a building, &c., by an outline or general view of it. The word *design*, in painting, is used for the first draught of a large work, with an intention to be executed and finished in a more elaborate manner. Its essential requisites are correctness, good taste, elegance, character, diversity, expression, and perspective.—In music, it denotes the disposition of every part, and the general order of the whole.

DESIPIENTIA, in medicine, a defect of reason, or asymptomatic frenzy.

DESI'RE, a wish to possess some gratification or source of happiness which is supposed to be obtainable. It may be either spiritual, intellectual, or sensual; but when directed merely to sensual enjoy-

THE SAMUEL, OR SIMOON OF THE DESERT, OCCASIONS INSTANT DEATH TO EVERY MAN AND BEAST HAPPENING TO FACE IT.

IN ORDER TO AVOID THE SIMOON OF THE DESERT, TRAVELLERS, IF THEY HAVE TIME, PROSTRATE THEMSELVES TILL IT HAS PASSED.

[DIA

THE ESSENCE OF A "DEVICE" CONSISTS IN METAPHORICAL SIMILITUDE BETWEEN THE THINGS REPRESENTING AND REPRESENTED.

ment, it differs little from animal appetite.

DESMOLOGY, that branch of anatomy which treats of the ligaments and sinews.

DES POTISM, a form of government where the monarch rules by his sole and uncontrolled authority.

DESPOUILLE, in heraldry, the whole case, skin, or slough of a beast, with the head, feet, tail, &c., so that being filled and stuffed, it looks like the entire animal.

DESPUMATION, a term for clarifying a liquor, by skimming off its froth or excrementitious matter.

DESQUAMATION, in anatomy, an exfoliation of bone, also the separation of the cuticle in small scales.

DESDATION, in medicine, a profuse and inordinate sweating, succeeded by an eruption of pustules, called heat pimple.

DESUETUDE, the cessation of use, or discontinuance of any practice.

DESULPHURATION, in chemistry, the act or operation of depriving of sulphur.

DETACHMENT, a body of troops selected or drawn out from several regiments or companies, on some special service or expedition. Also, a number of ships, taken from a fleet, and sent on a separate service.

DETLINTS, in clock work, are those stops, which, by being lifted up or let down, lock or unlock the clock in striking.

DETERGENTS, or **DETERGIVES**, medicines which have the power to remove viscid humours, or cleanse the skin of impurities.

DETERMINATION, in physics, the tendency of a body in any particular direction.

DETERRATION, the uncovering of any thing buried or hidden in the earth.

DEFAUNE, in law, a writ or action that lies against a person who has goods or other things delivered to him to keep, and who afterwards *defaunes*, or refuses to deliver them up.

DETONATION, or **DETONIZATION**, an explosion, or sudden report made by the percussion and inflammation of certain combustible substances. — *Detonating Powder*, a composition of charcoal, sulphur, and oxy-muriate of potash, which may be inflamed by the heat generated by percussion.

DETRITUS, in geology, a mass of substances detached or worn off from solid bodies by attrition, as, diluvial detritus, or the strata which is supposed to have been washed from primitive mountains at the time of the deluge.

DEUTERONOMY, one of the sacred books of the Old Testament, or the fifth book of the Pentateuch. It is so called, because this last part of the work of Moses comprehends a recapitulation of the law he had before delivered to the Israelites himself.

DEUTEROCANONICAL, in theology, a term applied to certain books of Scripture which were added to the canon after the rest, either because they were not written till after the canon was compiled, or in con-

sequence of some controversy in regard to their canonicity.

DLUTOXYD, in chemistry, a substance oxidized in the second degree.

DEVAPORATION, the change of vapour into water, as in the generation of rain.

DEVISE, in law, is the disposition of real estate by will, being distinguished from a bequest of personal estate, that being termed a *legacy*. The person to whom a devise is made is called *devisee*.

DEVICE, in painting, an emblem or representation of any thing, with a motto subjoined or otherwise introduced. In heraldry, a name common to all figures, ciphers, characters, rebuses, mottoes, &c. which by their allusions to the names of persons, families, &c. denotes their qualities, nobility, or the like. Badges, impresses, and devices, were greatly in vogue in England, from the reign of Edward I to that of Elizabeth, when they began to be disused.

DEVIL, the chief of the apostate angels, Satan, the Tempter of the human race.

DEW, the moisture which is first exhaled from the earth by the sun, and afterwards deposited on the earth in gentle drops during the night, particularly after a hot day, for the heat of the sun having converted all the liquid matter on the earth's surface into aqueous gas, the atmosphere is, in a manner, completely saturated with it.

DEWLAP, the loose skin that hangs from the throat of an ox, cow, &c.

DEW WORM, in entomology, the *Lumbricus terrestris* of Linnæus, an insect often found in decayed wood, as well as in the earth, and which is very destructive to plants.

DEXTER, the right, or on the right hand or side, as the *deexter point*, in heraldry, by which is meant the right hand side of the escutcheon.

DEY, the title of the supreme governor in Algiers, Tunis, and the other Barbary states.

DIABETES, in medicine, an excessive and morbid discharge of urine.

DIACHALASIS, in medicine, a relaxation of the suture of the cranium.

DIACHRESTIA, medicines applied to the fauces, palate, &c. for the abstraction of phlegm.

DIAPHYLLON, in medicine, an emollient digestive plaster.

DIACUSTICS, the science of refracted sounds, called also *diaphonics*.

DIACUSTIC CURVE, in mathematics, a kind of curve caused by the refraction of rays in a particular direction, so as to form a given ratio with lines which meet them.

DIA'CRIL, in Grecian antiquity, an appellation given to a faction at Athens, who favoured oligarchy, in opposition to the *pedæi*, who were for a pure democratic government.

DIA'CRINIS, in medicine, the act of distinguishing diseases one from another by their symptoms.

THE DROPS WHICH ARE OFTEN SEEN HANGING ON LEAVES AT SUNRISE, ARE NOT PRODUCED BY DEW, BUT ARE CONDENSED TRANSPIRATION.

[DIA]

A New Dictionary of the Belles Lettres.

[DIA]

THE DIAMOND AND CHARCOAL ARE SIMILAR SUBSTANCES IN THEIR CHEMICAL NATURE, AND DIFFER ONLY IN THEIR TEXTURE.

DIADELPHIA, in the Linnæan system of botany, a class of plants, the 17th in order, comprehending all those with papilionaceous and hermaphrodite flowers, and leguminous seed-vessels. The distinguishing characteristic of this class is, that the stamens adhere together, forming two dissimilar bodies or filaments, the one standing above the pistil, and the other surrounding it.

DI'ADEM, anciently, a head band or fillet worn by kings as a badge of royalty. It was made of silk, thread, or wool, tied round the temples and forehead, the ends being tied behind, and let fall on the neck. In modern usage, the mark of royalty, worn on the head—*Diadem*, in heraldry, is applied to certain circles, or rims, serving to enclose the crowns of sovereign princes. In figurative language, the word *diadem* denotes empire or supreme power.

DIÆ'RESIS, in surgery, an operation serving to divide and separate a part when its continuity is a hindrance to the cure.—*Diæresis*, in grammar, the division of one syllable into two, which is usually denoted by two dots over a letter, as in *aulai* for *aule*.

DIADROM, the time in which the vibration of a pendulum is performed.

DIAGNOSTICS, in medicine, a term given to those signs which indicate the state of a disease, its nature and cause, the symptoms by which it is known or distinguished from others. When the diagnostics are common to several diseases, they are called *adjunct*, when they always attend a particular disease, the word *pathognomonic* is used.—The term *diagnostic signs* is also used in botany, as the signs or characters by which plants are distinguished.

DIAGONAL, in geometry, a right line drawn across a quadrilateral figure from one angle to another, by some called the diameter of the figure.

DI'AGRAPH, a geometrical delineation, for the purpose of demonstrating the properties of any figure, as a square, triangle, &c.

DI'AL, or **SUN' DIAL**, an instrument for measuring time by means of the shadow of the sun, being a plate, or plain surface, on which lines are drawn in such a manner, that the shadow of a wire, or the upper edge of another plane, erected perpendicularly on the former, may show the true time of the day. The edge of the plane, which shows the time, is called the *stile*, the line on which this plane is erected, is the *substile*, and the angle included between the substile and stile, is called the *elevation* or height of the stile. Sun-dials are differently denominated according to their different situation, and the figure of the surfaces upon which they are described, as horizontal, vertical, equinoctial, polar, direct, erect, declining, inclining, reclining, cylindrical, mural, parallel, &c.

DI'ALLECT, the form or idiom of a language, peculiar to a province or any particular part of a country. A dialect is, in fact, the branch of a parent language, with

such alterations as time or accident may have introduced among descendants of the same stock, living in separate or remote situations. The dialects of Greece were admitted to form a part of their language, as the Attic, Ionic, Pæotic, Eolic, and Doric dialects, which were used either separate y or intermixed.

DIALECTICS, that branch of logic which teaches the art of reasoning.

DIALLAGÉ, a mineral of a lamellar or foliated structure.

DIALLING SPHERE, an instrument made of brass, with several semi-circles sliding over each other upon a moveable horizon, serving to shew the nature of spherical triangles, as well as to give the true idea of drawing dials on all sorts of planes.

DIALOGISM, in rhetoric, is used for the soliloquy of persons deliberating with themselves. It is also, in a more extensive sense, taken for discourse in general, whether held by a person alone, or in company with others.

DIALOGUE, a verbal or written discourse between two or more persons.

DIALYSIS, a mark or character, consisting of two points placed over one of two vowels, as *maûic*, to separate the diphthong, and show that they must be sounded distinctly.—In rhetoric, *dialysis* is a figure of speech in which several words are placed together, without the aid of a conjunction, as *venit, iudicet*—In medicine, *dialysis* is a term denoting great relaxation or weakness of the limbs.

DIAMETER, in geometry, a right line passing through the centre of a circle, or other curvilinear figure, and terminated at each side by the circumference. It thus divides the circle into two equal parts and is the greatest chord: hence we have a method of describing a semicircle upon any line, assuming its middle point for the centre. The diameter of a circle is to the circumference, as 7 to 22. The square of the diameter multiplied by 7/64, is the area. The cube of the diameter multiplied by 5236, is the solid contents of a sphere.

DIAMOND, the most valuable and the hardest of gems. When pure, it is perfectly clear and pellucid, and is eminently distinguished from all other substances, by its vivid splendour, and the brightness of its reflections. Though found of different shapes, and sometimes accidentally tinged with several colours, yet it ever carries the same distinguishing characters. Diamonds are generally very small, but a few large ones have been found, for which incredible prices have been given. The largest ever known belonged to the king of Portugal, it weighed 1640 carats, and was valued, although uncut, at 224,000,000 sterling; the one in the sceptre of the emperor of Russia weighs 779 carats, and is valued at upwards of 1,000,000, but was bought by the empress Catharine for about 135,000*l*. The Pitt diamond, which at that time was one of the largest, weighed 136 carats, and cost Louis XIV. 130,000*l*. The places

WHEN DUG OUT OF THE EARTH, DIAMONDS HAVE NO BRILLIANT, BUT ARE COVERED WITH AN EARTHY CRUST.

[DIA]

A New Dictionary of the Belles Lettres.

[DIA]

A DIAMOND IS SAID TO BE OF THE FIRST WATER, BECAUSE IT IS PERFECTLY TRANSPARENT, AND FREE FROM THE SLIGHTEST IMPURITY.

whence diamonds are brought are the island of Borneo, and the kingdoms of Visapour, Golconda, Bengal, in the East Indies, and the Brazil, in the West Indies. These gems consist of pure carbon, with a specific gravity of 3.5 and the hardest tools making no impression on them, they are cut and ground by the powder of their own substance. In the experiments of modern chemists, the diamond has been reduced to ashes by the power both of the furnace and the burning glass.—*Rough Diamond*, is the stone as it comes from the mines—*Rose Diamond*, is one which is quite flat underneath, with its upper part cut in numerous little lines, usually triangles, the uppermost of which terminate in a point.—*Pable Diamond*, is that which has a large square face at top, encompassed with four lesser—*Brilliant Diamond*, is that which is cut in facets both at top and bottom, and whose table or principal face is flat.—*Diamonds* are valuable for many purposes. Their powder is the best for the lapidary and gem engraver, and more economical than any other material for cutting, engraving, and polishing hard stones. Glaziers use them for cutting their glass, their diamond being set in a steel socket, and attached to a small wooden handle. It is very remarkable, that only the point of a natural crystal can be used, cut or split diamonds scratch, but the glass will not break along the scratch, as it does when a natural crystal is used. The diamond has also of late years become an article of great value to engravers, particularly in drawing or ruling lines, which are afterwards to be deepened by aqua fortis, for which steel points, called etching needles, were formerly used.

DIAMOND BEETLE, a beautiful insect, so called from the marks on its wings, which appear as brilliant as gems.

DIAM EARBOR, silver and quicksilver dissolved in nitric acid, the crystallizations resembling a tree.

DIANDRIA, the second class of the Linnæan system of plants, containing three orders, *Monogynia*, *Digynia*, and *Trigynia*, with two stamens.

DIANE, in rhetoric, a figure of speech by which a correct interpretation is given to a subject suitable to the occasion.

DIANTHUS, in botany, the *Pink*, a genus of plants, class 10 *Dicandria*, order 2 *Digynia*.

DIAPASON, in music, a musical interval, by which most authors, who have written upon the theory of music, use to express the octave of the Greeks. The diapason is the first and most perfect of the concords, if considered simply, it is but one harmonical interval, though, if considered diatonically, by tones and semitones, it contains seven degrees, viz. the three greater tones, two lesser tones, and two greater semitones.—*Diapason*, the fundamental or standard scale by which musical instruments are made.

DIAPENTE, in music, a fifth, an interval making the second of the concords,

and with the diatessaron, an octave.—In medicine, a composition of five ingredients.

DIAPER, a kind of figured linen cloth, much used for towels or napkins.

DIAPHRAGM, in anatomy, a large muscular membrane or skin placed transversely in the trunk, and dividing the thorax from the abdomen.

DIAPHANOUS, an appellation given to all transparent bodies, or such as transmit the rays of light.

DIAPHORA, in rhetoric, a figure of speech, in which a word, when repeated, is taken in a different sense from what it was at first understood.

DIAPHORESIS, in medicine, augmented perspiration.

DIAPHORETICS, medicines which promote perspiration. *Diaphoretics* differ from *sudorifics*, the former only increase the insensible perspiration, the latter excite the sensible discharge called *sweat*.

DIAPORISIS, in rhetoric, a figure of oratory, expressive of the speaker's doubt or hesitation as to the manner in which he should proceed in his discourse, the subjects he has to treat of being all equally important.

DIARRHEA, a disorder which consists in a frequent and copious discharge of a bilious humour from the intestines.

DIARTHROSIS, in anatomy, a kind of articulation, or juncture of the bones, in which there is an evident motion.

DIARY, a register of daily occurrences and observations, or an account of what passes in the course of a day.

DIASCHISM, in music, the difference between the comma and chromatic diesis, commonly called the lesser comma.

DIASIA, in Grecian antiquity, a festival kept at Athens in honour of Jupiter the *Propitious*.

DIASPORE, a mineral of a pearly gray colour, and intuitable.

DIASTALTIC, an epithet given by the Greeks to certain intervals in music, as the major third, major sixth, and major seventh.

DIATANIS, a term used by ancient physicians for a distension of the muscles, or separation of the fibres.

DIATEMA, in rhetoric, a modulation of the tones of the voice, by marking with precision the intervals between its elevation and depression.—In music, a space or interval.

DIASTOLE, among physicians, a dilatation of the heart, auricles, and arteries, it stands opposed to *astole*, or contraction of the same parts.—*Diastole*, in grammar, a figure of prosody, by which a syllable naturally short is made long.

DIASTYLE, an edifice in which three diameters of a column are allowed for the intercolumniations.

DIASYMBOS, in rhetoric, a kind of hyperbole, being an exaggeration of something low and ridiculous, ironical praise.

DIATESARON, in music, a concord or harmonic interval composed of a greater tone, a lesser tone, and one greater semitone. Its proportion is as 4 to 3, and it is

THE GREAT PYRAMID OF EGYPT, COMPOSED OF GRAVITE, IS FIVE HUNDRED FEET HIGH, AND STANDS ON ELEVEN ACRES OF GROUND.

[DIE]

The Scientific and Literary Treasury;

[DIE]

called a perfect fourth.—In theology, the four Gospels.

DIATONIC, an epithet given to music, as it proceeds by tones and semi tones, both ascending and descending. Thus we say, a *diatonic series*, a *diatonic interval*, *diatonic melody* or harmony.

DIATRIBE, a continued disputation or controversial discourse.

DIATRITOS, in medicine, a term given to three days' abstinence enjoined by physicians of the Methodic sect upon their patients.

DYCAST, in ancient Greece, an officer answering nearly to our jurymen.

DICE, cubical pieces of bone or ivory, dotted on their face from one to six; and used for gambling purposes. They are said to be of great antiquity, and to have been invented by Palamedes at the siege of Troy, for the amusement of the officers and soldiers. Dice pay a very heavy duty to government, and cannot legally be imported.

DICHOTOMOUS, in botany, an epithet for a stem, &c. regularly dividing by pairs from top to bottom.—*Dichotomous-corymb*, composed of corymbs, in which the pedicles divide and subdivide by pairs.

DICHOTOMY, in astronomy, that phase or appearance of the moon, when she is bisected, or shows just half her disk. In this situation the moon is said to be in her quadrature.

DICOTYLEDON, in botany, a plant whose seeds divide into two lobes in germinating. Hence the epithet *dicotyledonous*.

DICTATOR, in ancient Rome, a magistrate created in times of exigence and distress, and invested with unlimited power. He had authority to raise or disband troops, and to make war or peace, and that without the consent either of the senate or people. The ordinary duration of his office was only for six months, during which time all other magistracies ceased, the tribuneship excepted. Whenever he appeared in public, he was attended by twenty-four lictors, or double the number allowed a consul. Extensive, however, as his power was, he was nevertheless under some restrictions: he could not, for instance, spend the public moneys, arbitrarily leave Italy, or enter the city on horseback. The choice of dictator was not, as in the case of other magistrates, decided by the popular voice, but one of the consuls appointed him by command of the senate. A dictator was also sometimes named for holding the *comitia* for the election of consuls, and for the celebration of public games. For the space of four hundred years this office was regarded with veneration, till Sylla and Caesar, by becoming perpetual dictators, converted it into an engine of tyranny, and rendered the very name odious.

DICTIONARY, in its first and most obvious sense, signifies a vocabulary, or alphabetical arrangement of the words in a language, with their definitions. But now, that the various branches of science have become so much extended, the term is also

applied to an alphabetical collection of the terms of any art or science, with such explanations or remarks as the writer may deem necessary for their elucidation.

DIDACTIC, containing didacticisms, precepts, or rules, intended to instruct.

DIDACTIC POETRY, that species of metrical composition which has instruction for its primary object. But though its ostensible aim is to impart instruction in the garb of verse, it may and often does attain an animated and elevated character, mingling the flights of poetic genius with natural descriptions and moral axioms, and thereby captivating the senses, while it amends the heart.

DIDACTYLOUS, in zoology, an epithet for having two toes.

DIDECAHEDRAL, in crystallography, having the form of a dodecahedron (or twelve sided) prism, with pentahedral (or five-sided) summits.

DIDODECAHEDRAL, in crystallography, having the form of a dodecahedron (twelve sided) prism, with hexahedral (six-sided) summits.

DIDRACHMA, a piece of money, the fourth of an ounce of silver.

DIDYNAMIA, the 14th class of the Linnæan system of plants, containing two orders, *Gymnospermia* and *Angiospermia*, with two long and two short stamens.—To this genus belong balm, germander, lavender, thyme, betony, mint, basil, fennel, &c.

DIE, a stamp used in coining, by which a piece of prepared metal is impressed with due force. Coins are generally completed by one blow of the coining press, and at the Royal Mint these processes are so contrived by machinery, that they shall strike, upon an average, sixty blows in a minute. Metals are usually in very high relief, and the effect is produced by a succession of blows.

DIES, (days) in law, are distinguished into *Dies juridici*, days on which the courts sit for the administration of justice, *Dies non* (juridici), days on which no pleas are held in any court of justice, and *Dies fasti*, a day, or time of respite, given by the court to the defendant in a cause.—*Dies caniculares*, in astronomy, the dog days.—*Dies critici*, in medicine, days in which some diseases are supposed to arrive at a crisis.—Among the Romans, days were distinguished in a variety of ways, the most important of which were *Dies nefasti* or *Dies etati*, days devoted to religious purposes, on which it was unlawful to do any public business, *Dies fasti*, similar to the *Dies juridici* of modern times, and *Dies feriati*, like our *Dies non juridici*, when the courts were shut.

DIE SIS, the mark \sharp , called also a double dagger, and used as a mark for reference.—*Diesis*, in music, the division of a tone less than a semi-tone, or an interval consisting of a less or imperfect semi tone.

DIEÏT, food regulated by the rules of medicine. It appears that the best way

"DIATONIC" IS APPLIED TO ORDINARY MUSIC, CONTAINING ONLY THE TWO GREATER AND LESSER TONES, AND THE GREATER SEVENTH.

THE DICTATOR WAS NAMED BY THE CONSUL, IN THE NIGHT, VIVA VOCE, AND HIS ELECTION WAS CONFIRMED BY THE AUGURES.

[DII]

A New Dictionary of the Welles Letters.

[DIG]

HERBIVOROUS ANIMALS MASTICATE AND DIGEST THEIR FOOD WELL, BECAUSE THEY GRIND IT BY MOVING THE LOWER JAW FROM SIDE TO SIDE.

to preserve health, is to live upon plain simple foods, lightly seasoned, and in a quantity agreeable to the age, strength of the stomach, sex, constitution, and chiefly to what nature has by experience been found to require. Generally, indeed, hunger shews the best time of eating, as thirst does of drinking, but it either be indulged to excess, our health and spirits will both suffer. In summer, when the spirits and fluid parts are apt to evaporate, the diet should be moist, cooling, and easy of digestion, to repair the loss with the greater speed, but in winter, the stomach will admit of more solid and heating aliments. The golden rule, however, seems to be, to use great moderation both in eating and drinking, and it is indisputable that early habits of self-command, in the regulation of the appetite, are of paramount importance to all who would enjoy good health and attain a vigorous old age — *Diet*, in German politics, a convention of princes, electors, ecclesiastical dignitaries, and representatives of free cities, to deliberate on the affairs of the empire.

DIET DRINK, drink prepared with medicinal ingredients. The decoction of sarsaparilla and mezereum, and the Lisbon diet-drink, are the most common and most esteemed.

DIETETICS, the science or philosophy of diets, or that which teaches us to adapt particular foods to particular organs of digestion, or to particular states of the same organ, so that the greatest possible portion of nutriment may be extracted from a given quantity of nutritive matter.

DIET ET MON DROIT (French, signifying *God and my right*), the motto of the royal arms of England, first assumed by king Richard I to intimate that he did not hold his empire in vassalage of any mortal. It was afterwards taken up by Edward the Third, and was continued, without interruption, to the time of William III who used the motto *je maintiens* *dray*, though the former was still retained upon the great seal. After him queen Anne used the motto *semper eadem*, which had been before used by queen Elizabeth but since Anne's time, *Dieu et mon droit* has continued to be the royal motto.

DIEU ET MON ACTE, a maxim in law, that the act of God shall not be a prejudice to any man.

DIEXAHE'DRIA, in natural history, a genus of pellicul and crystaliform spars, composed of two pyramids, joined base to base, without any intermediate column; the diekahedra are dodecahedral, or composed of two hexangular pyramids.

DIFARREATION, in Roman antiquity, a ceremony whereby the divorce of the priests was solemnized; or the dissolving of marriage contracted by cohabitation.

DIFERENCE, in logic, an essential attribute belonging to any species that is not found in the genus, being the idea that defines the species — *Difference*, in arithmetic, the remainder, when one number has been subtracted from another — *Diffe-*

rences, in heraldry, certain additions to a coat of arms, serving to distinguish one family from another, or to show how distinct a younger branch is from the elder or principal branch.

DIGEST, in law literature, a collection of the decisions of the Roman lawyers, properly digested, or arranged under distinct heads, by order of the emperor Justinian.

DIGESTION, that process in the animal body, or action of the stomach, by which food is converted into chyme, before it passes into the intestines, and is there separated by the chyle into nutritive and excrementitious parts, effected chiefly by the solvent power of the gastric juice — In chemistry, the operation of exposing bodies to a gentle heat, to prepare them for some action on each other, or the slow action of a solvent on any substance. By this process, essences, elixirs, and tinctures are made.

DIGESTIVE, in medicine, any preparation which increases the tone of the stomach, and aids digestion — In surgery, an application which ripens an ulcer or wound, or disposes it to suppurate.

DIFFORM, in botany, an epithet for leaves or flowers, which do not correspond in size or proportion.

DIGASTRIC, an epithet given to a muscle of the lower jaw.

DIGESTER, a chemical vessel or instrument to prevent the loss of heat by evaporation.

DIGIT, in astronomy, the twelfth part of the diameter of the sun or moon — a term used to express the quantity and magnitude of an eclipse. Thus an eclipse is said to be of six digits, when six of these parts are hid — *Digits*, or *Monades*, in arithmetic, signify any one of the ten numerals, 1, 2, 3, 4, 5, 6, 7, 8, 9, 0 — *Digit* is also a measure taken from the breadth of the finger; the word being derived from *digitus*, a finger, thus indicating the humble means originally employed in computations. It is properly three quarters of an inch.

DIGITALIS, or **FOXGLOVE**, in botany, a genus of plants, which are for the most part herbaceous, with a root that is either biennial or perennial. The stalk rises two or three feet high, and bears spikes of brown or purple flowers. The purple foxglove is a native of England, and is much used in medicine, it having the remarkable property of diminishing the strength and frequency of the pulse.

DIGITATE, or **DIGITATED**, in botany, an epithet for a leaf which branches into several distinct leaflets, like fingers; or when a simple, undivided petiole connects several leaflets at the end of it.

DIGLIPH, in architecture, a kind of imperfect triglyph, console, or the like, with two channels or engravings, either circular or angular.

DIGITALINE, a powerful poison, derived from the *digitalis purpurea*, or foxglove, the properties of which it possesses in a very concentrated state. It is a brown coloured substance, deliquescent, and extremely bitter.

DIGESTION, CIRCULATION, AND RESPIRATION, ARE CALLED ORGANS OF INVOLUNTARY MOTION, BECAUSE THEY GO ON WITHOUT INTERMISSION.

A New Dictionary of the Belles Lettres.

[DIO]

DIGNITARY, in the canon law, an ecclesiastic who holds a dignity, or a benefice which gives him some pre-eminence over mere priests and canons; as a bishop, dean, arch-deacon, prebendary, &c.

DIGNITY. This word, in a general sense, signifies a nobleness or elevation of mind; and is opposed to *meanness* and *vile*, the true dignity of human nature being based on moral rectitude and religious veneration. In a more extended sense, it means, elevation of deportment; and also an elevated office, civil or ecclesiastical.—In astrology, the term *dignity* is used to denote an advantage which a planet has on account of its being in some particular place of the zodiac, or in a particular station with respect to other planets.

DIGRAPHS, a union of two vowels, of which one only is pronounced, as in *bread*. It is essentially different from a diphthong, which consists of two vowels also, but produces a sound which neither of the vowels have separately.

DIGRESSION, in rhetoric or literary composition, that passage, or narration, which deviates from the main subject, but which may have some relation to it, or be useful by way of illustration.

DIGYNIA, in botany, an order in the Linnæan system, consisting of plants that have two pistils.

DIOXAHEDRAL, in crystallography, having the form of a hexahedral prism with trihedral summits.

DILAPIDATION, in law, the ruin or damage which accrues to a house in consequence of neglect.

DILATATION, in surgery and anatomy, signifies the widening the orifice of a wound, or the distension of a vessel.

DILEMMA, in logic, an argument which cannot be denied in any way without involving the party denying in contradictions; or a position involving double choice, each presenting difficulties. A dilemma is usually described, as though it always proved the absurdity, inconvenience, or unreasonableness of some opinion or practice, and this is the most usual design of it. But it is plain, that it may be used to prove the truth or advantage of any thing proposed: as, "In heaven we shall either have desires, or not: if we have no desires, then we have full satisfaction: if we have desires, they shall be satisfied as fast as they arise: therefore, in heaven we shall be completely satisfied." This sort of argument may be composed of three or more members, and may be called *trilemma*. It is also called *syllogismus cornutus*, a horned syllogism; its horns being so disposed, that if you avoid the one, you run against the other.

DILETTANTE, one who delights in promoting science of the fine arts.

DILUVIUM, in geology, strata of sand, loam, gravel, &c. apparently accumulated by water, and supposed to have been caused by the deluge.

DIMENSION, the measure or compass of a thing. A line has one dimension, or length; a superficies two, namely length and breadth;

and a solid three, namely length, breadth and thickness. The word is generally used in the plural, and denotes the whole space occupied by a body, or its size and capacity; as, the *dimensions* of a room, ship, &c.

DIKE, or **DYKE**, a mound of earth, stones, or other materials, intended to prevent low land from being inundated by the sea, &c., as the dikes of Holland.

DIMINUTION, in architecture, a contraction of the upper part of a column, by which its diameter is made less than that of the lower part. It generally commences from one third of the height of the column.

—*Diminution*, in rhetoric, the exaggerating what you have to say by an expression that seems to diminish it.—In music, the imitation of or reply to a subject in notes of half the length or value of those of the subject itself.

DIMINUTIVE, in grammar, a word or termination which lessens the meaning of the original word; as, *rivulet*, a small river; *manikin*, a little man.

DIMISSORY, dismissing to another jurisdiction.—A *letter dimissory*, is one given by a bishop to a candidate for holy orders, having a title in his diocese, directed to some other bishop, and giving leave for the bearer to be ordained by him.

DIMITY, a kind of white cotton cloth, ribbed or figured. It was originally imported from India, but is now manufactured in Lancashire, and various other parts of Britain.

DIOCESAN, a bishop who has charge of a particular diocese.

DIOCESE, or **DIOCESS**, the district or circuit of a bishop's jurisdiction. The name diocese began first to be used in the fourth century, when the exterior polity of the church began to be formed upon the model of the Roman empire. England, in regard to its ecclesiastical state, is divided into two provinces, viz. Canterbury and York, and each province into subordinate dioceses; the province of Canterbury contains twenty-one dioceses, and that of York three. These are divided into archdeaconries, which are subdivided into rural deaneries and parishes.

DIOCCOUS, in botany, an epithet for a capsule consisting of two cohering grains or cells, with one seed in each.

DIOCTAHEDRIA, in crystallography, a genus of pellucid and crystalliform spars, composed of two octangular pyramids, joined base to base, without any intermediate column.

D'ODON, in ichthyology, the sun-fish; a genus of fishes of a singular form, appearing like the fore part of the body of a deep fish amputated in the middle.

DIOECIA, in botany, a class in the Linnæan system, comprehending such plants as have no hermaphrodite flowers, but the males and females on distinct individuals, as the poplar, aspen, amber tree, willow, oxier, &c. The epithet for plants of this kind is *dioecous*.

D'OMEDE, in ornithology, a web-footed, aquatic fowl, about the size of a common domestic hen.

DILATION, IN PHYSICS, IS A MOTION OF THE PARTS OF A BODY, BY WHICH IT IS SO EXPANDED AS TO OCCUPY GREATER SPACE.

A PLACEMAN'S SOLILOQUY: "A STRONG 'DILEMMA' IN A DESPERATE CASE! TO ACT WITH INFAMY, OR QUIT MY PLACE."

[DIP]

The Scientific and Literary Treasury ;

[DIP]

DIONYSIACA, a name given by the Grecians to all theatrical entertainments or diversions of the stage, because play-houses were sacred to Bacchus and Venus, the deities of sport and pleasure.

DIOPSIDE, a rare mineral, of a pale green colour, occurring in prismatic crystals, and regarded as a variety of *augite*.

DIOPTRICS, the science of refractive vision, or that part of optics which considers the different refractions of light in passing through different mediums, as air, water, glass, &c. It demonstrates the different directions in which the rays of light move, according as they are broken on plane or curved substances, and the principles deduced from these observations determine the nature of the various lenses, explain the manner in which the light is refracted in the human eye, and teach the manner of seeing through lenses, and the composition of them, consequently the theory of telescopes, magnifying glasses, &c. By its aid, therefore, the eye has been enabled to reach objects previously unknown, and thus to obtain immense advantages in pursuing the science of astronomy.

DIORAMA, the name of a building erected in the Regent's Park, London, in which a novel and very beautiful mode of depicting scenery is exhibited, also the name given to the method of delineating it. "The advantage which this mode of representing the face of nature possesses over any other yet invented is, that it causes the light to play at will all over the picture, so that the spectator can hardly help imagining himself placed on the very spot, when he perceives the rays of the sun now lighting up one range of mountains, now another, and beholds them peeping out from behind masses of clouds, which gradually become overcast as if with rain, and then the lowering effect giving way in its turn to bright gleams of sunshine—which enlighten the bosoms of the distant lakes, glitter upon the purling brooks, and then die away behind the darker skirts of the surrounding woods and thickets. All this is produced by a mode of uniting transparent painting to the usual opaque method, and causing the daylight to fall upon the picture, both from before and behind. At the same time, while by means of coloured transparent blinds, suspended both above and behind the picture, and which are put in motion by means of machinery, the rays of light can be intercepted and made to fall at pleasure in graduated tints upon every part of the picture in succession." The Diorama contains two pictures of these one only is seen at a time, and the scene is changed by causing the saloon containing the spectators to revolve on its axis. The number and colour of the moveable blinds must be determined by the judgment and skill of the artist. Each picture occupies several thousand square feet of canvas, and a succession of novelties are always in preparation to gratify the lovers of scenic exhibitions.

DIOSCOREA, in botany, a genus of

plants, class 22 *Dioecia*, order 6 *Heandria*. The species are perennials, there is no corolla in either the male or female flowers, and the fruit is a compressed large capsule, of a triangular form, containing three valves, and divided into three cells.

DIOSCURIA, in antiquity, a festival observed by the Spartans in honour of Castor and Pollux.

DIOSPYROS, in botany, a genus of plants, class 23 *Polygamia dioecia*, order 2 *Octandria monogynia*. The species are trees, varieties of the plum.

DIP, the depression of a magnet below the horizontal plane.—In geology, the *dip* of a *stratum* is its greatest inclination to the horizon, or that on a line perpendicular to its direction or course.

DIPETALOUS, in botany, an epithet for a corolla having two petals only.

DIPHTHONG, the union of two vowels pronounced in one syllable. The sound is not simple, but so blended as to be considered as forming but one syllable, as *noise, bound, joint, &c.*

DIPHYLOUS, in botany, an epithet for a calyx, &c. having two leaves.

DIPLOE, in anatomy, the medullary substance, or porous part between the laminae or plates of the skull.

DIPLOMA, a written document conferring some power, privilege, or honour, viz. an instrument or licence given by colleges, societies, &c. to a clergyman to exercise the ministerial function, or to a physician to practise the profession, &c. after passing examination, or admitting him to a degree.—In chemistry, "to boil in diploma," is to put the vessel which contains the ingredients into a second vessel, to which the fire is applied.

DIPLOMACY, the customs, privileges, and practice of public business by ambassadors, envoys, and other representatives of princes and states at foreign courts. It has been truly observed, that in times not very distant, it was sufficient to entertain a royal master by the gossip of a capital, the intrigues of ladies and gentlemen of the bed chamber, and the cabals of rival ministers. Now, the political correspondent of a cabinet is compelled to enquire into the working of the complex machinery of modern society, to observe constantly the pulse of the whole body politic, to keep in view the moral and physical resources of nations, to defend the rights of his country, on the grounds of law and reason, to give information to the minister, from whom he holds his instructions, and to enable his government to profit by the intelligence he imparts, not only in the management of its foreign concerns, but likewise of its internal resources. To be a perfect diplomatist, in fact, in the present state of the world, a man should be well acquainted with the municipal laws of different countries, versed in the sciences, from which industry and arts derive their splendour and a state its strength, and equal to any of the tasks to which those with whom he is brought into contact might put his learning and saga-

THE ANCIENTS TRAINED DISTINCTLY OF DIRECT AND REFLECTED VISION, BUT OF REFRACTED VISION THEY KNEW VERY LITTLE.

MR. DOLOYD'S DISCOVERY OF ACROMATIC GLASSES HAS BEEN OF GREAT IMPORTANCE IN THAT BRANCH OF OPTICS CALLED DIOPTRICS.

[DIP]

[DIS]

THE FRENCH DIRECTORY WAS FORMED BY THE CONVENTION IN 1795, AND OVERTURNED BY THE SUCCESSFUL ARMY OF BUONAPARTE.

city.—It was one part of the business of the congress assembled at Vienna, in 1814, to regulate the degrees of rank to which the various *diplomatic agents* were entitled viz 3 ambassadors, 2 *envoys extraordinaires* and ministers plenipotentiary 3 ministers resident, 4 *chefs d'affaires*, 5 secretaries of legation and *attaches*. Ministers at a court are denominated a *diplomatic body*.

DIPLOMATICS, the science of diplomacy, or of ancient writing, literary and public documents, decrees, charters, &c., having for its object the deciphering of old writings and ascertaining their authenticity, &c.

DIPLOPIA, in medicine, a disease in the eye, which causes the person to see an object double or treble.

DIPLOI, in surgery, an epithet for wounds which have two orifices.

DIP PING, among miners, signifies the interruption, or breaking off of the veins of ore, an accident often attended with much trouble, before the ore can again be discovered.

DIP PING NEEDLE, a magnetic needle so duly poised about an horizontal axis, that, besides its direction towards the pole, it will always point to a determined degree below the horizon. In the equatorial regions, the needle takes a horizontal position but as we recede from the equator, towards either pole, it dips or inclines one end to the earth, the north end as we proceed towards the north, and the south end as we proceed southward.

DIPSAULUS, in botany, contains four species, of which the *diapycus fullonum*, or cultivated teasel, is reared in great quantities in the west of England, for raising the nap upon woollen cloths, by means of crooked awns upon the heads. For this purpose they are fixed on the circumference of a large broad wheel, which turns round while the cloth is held against them.

DIPTERA, in entomology, the sixth order of insects in the Linnæan system, comprehending those which have two wings with balancers, as gnats, flies, &c.

DIPTYCHA, or DIPTYCH, in Roman antiquity, a public register of the names of the consuls and other magistrates. Among the early Christians, they were tablets, on one of which were written the names of the deceased, and on the other those of the living patriarchs, bishops, &c. or those who had done any service to the church.

DIPUS, in zoology, the jerboa, a genus of mammalia, containing four species. The *Dipus agatta*, or Egyptian jerboa, is about the size of a rat, and was known to the ancients by the name of the two footed mouse. It is found in various parts of Africa, and in the eastern provinces of Siberia. In its posture and motions it resembles a bird. It inhabits subterranean apartments, in which it reposes during the day, choosing the night for its excursions and for obtaining its food.

DIPYRRE, a mineral occurring in minute prisms. Before the blow-pipe it melts with

ebullition, and its powder on hot coals phosphoresces with a feeble light.

DIRADIATION, in medicine, an invigoration of the muscles by the animal spirits.

DIRÆ, in the Roman divination, signifies any unusual accidents or uncommon appearances, as sneezing, stumbling, strange voices, apparitions, spilling salt or wine upon the table or upon one's clothes, melting wolves, hares, foxes, &c.

DIRLCT, in law, an epithet for the line of ascendants and descendants in genealogical succession.—*Direct*, in astronomy, is when a planet moves forward in the zodiac according to the natural order and succession of the signs, in distinction from the *retrograde*.—In optics, a *direct ray* is one which is carried from a point of the invisible object directly to the eye, without being turned out of its rectilinear direction by any intervening body.

DIRECTION, LINE or, in mechanics, the line of motion which any natural body observes, according to the force impressed upon it.—*Angle of direction*, the angle comprehended between the lines of direction of two conspiring powers.—*Direction said*, in printing, the word which is sometimes put at the bottom of a page, and which begins the next page.

DIRECTOR, a person appointed to transact the affairs of a public company, as the *director* of a bank, assurance office, &c.—*Director* in surgery, a grooved probe to direct the edge of the knife or scissors in opening sinuses or fistule, &c. that by this means the subjacent nerve and tendons may remain unharmed.

DIRECTORY, a book containing an alphabetical list of the inhabitants of a town, with their places of abode. Also, a book containing directions for public worship, or religious services.—In France, the term *Directory* was given to six officers, to whom the executive authority was committed by the constitution of the year 3 of the republic. The seven ministers of state were immediately under, and were appointed and removed by the directory.

DIRGL, a song or tune intended to express grief, sorrow, and mourning.

DIS, a prefix or inseparable preposition, which generally has the force of a privative and negative, as *disarm*, *disallow*, *disoblige*. In some cases, however, it denotes separation, as in *distribute*, *disconnect*.

DISABILITY, in law, an incapacity in a man to inherit or take a benefit which otherwise he might have done, which may happen by the act of any ancestor, by the act of the party himself, by the act of the law, and by the act of God.—*Disability* differs from *inability*, in denoting deprivation of ability, whereas *inability* denotes destitution of ability, either by deprivation or otherwise.

DISAFFECTION, in a political sense, signifies disloyalty, not merely alienation of affection, but positive dislike and enmity.

DISAFFOREST, to strip of forest laws and their oppressive privileges.

THE DIRECTORY UNDER THE FRENCH CONVENTION, WHICH WAS ESTABLISHED IN 1644, PROHIBITED THE LITURGE AND CHURCH MUSIC.

The Scientific and Literary Treasury ;

[DIS]

"A YOUNG DISCIPLE SHOULD BEHAVE SO WELL, AS TO GAIN THE AFFECTION AND THE EAR OF HIS INSTRUCTOR."—DR. WATTS.

DISAGGREGATION, the act or operation of separating an aggregate body into its component parts.

DISC, or **DISK**, the body and face of the sun, moon, or a planet, as it appears to us on the earth, or the body and face of the earth, as it would appear to a spectator in the moon.—In optics, the magnitude of a telescope glass, or the width of its aperture.—**Disc**, in botany, an aggregate of florets forming, as it were, a plane surface, or the middle plain part of a radiated compound flower, as in the marigold or daisy.

DISCHARGE, a word of various significations. Applied to *fire arms*, it means an explosion, to *fluids*, a flowing, issuing, or throwing out, as water from a spring or spout. It also denotes a *dismissal* from office or service, a *release* from debt, obligation, or imprisonment, and the *performance* of any office, trust, or duty.

DISCHARGING ROD, an instrument used in electrical experiments, formed of metal wire with balls at the end, a joint in the middle, and a glass handle.

DISCIPLE, one who learns anything from another, thus the followers of any teacher, philosopher, &c. are called disciples. In the more common acceptation, among Christians, the disciples denote those who were the immediate followers and attendants on Christ, of whom there were seventy or seventy-two, but the word is also correctly applied to all Christians, as they profess to learn and receive his doctrines and precepts. The words *disciple* and *apostle* are often synonymously used in the gospel history, but sometimes the apostles are distinguished from disciples as persons selected out of the number of disciples, to be the principal ministers of his religion.

DISCIPLINARIAN, one who is well versed in military and naval tactics and manoeuvres, and who exacts a strict observance of them from those under his command.

DISCIPLINE, subjection to laws, rules, order, and regulations, either in a moral, ecclesiastical, or military sense. It also denotes that chastisement or external mortification which some religious devotees inflict on themselves.

DISCLAIMER, in law, a plea containing an express or implied denial.

DISCORD, in music, a union of sounds which is unharmonious, grating, and disagreeable to the ear, or an interval whose extremes do not coalesce. It is opposed to *concord* and *harmony*. The second, fourth, and seventh, with their octaves, and, in general, all intervals, except those few which precisely terminate the concords, are called discords. There is, notwithstanding, what is termed the *harmony of discords*, wherein the discords are made use of as the solid and substantial part of the harmony, for by a proper interposition of a discord, the succeeding concords receive an additional grace.

DISCOUNT, in commerce, an allowance

made on a bill or any other debt not yet become due, in consideration of immediate payment, or any deduction from the customary price. The discounts at banking establishments are usually the amount of legal interest paid by the borrower, and deducted from the sum borrowed, at the commencement of the credit. Five per cent, or 100 shillings per cent per annum, is one shilling, or twice pence, per pound, for twelve months, or one penny per pound per month. This is the usual method, but still it is inaccurate. The true discount for any given sum for any given time, is such a sum as will in that time amount to the interest of the sum to be discounted; the proper discount therefore to be received for the immediate advance of 100*l*. due twelve months hence is not 5*l*, but 4*l* 15*s* 2*d*., for this sum will, at the end of the year, amount to 5*l*, which is what the 100*l*. would have produced.

DISCOVERY, in a general sense, that which is discovered, found out, or revealed, as, the discovery of America by Columbus, or the properties of the magnet were an important discovery.—**Discovery**, in law, the disclosing or revealing anything by a defendant in his answer to a bill filed against him in a court of equity.

DISCRETIVE, in logic, an epithet applied to a proposition expressing some distinction, opposition, or variety by means of *but, though, yet, &c.* as, men change their dresses, *but* not their inclinations.

DISCUMBLING, the act of leaning at meals, according to the manner of the ancients.

DISCUS, in antiquity, a quoad made of stone, iron, or copper, five or six fingers broad and more than a foot long, inclining to an oval figure, which they hurled in the manner of a bowl, to a vast distance, by the help of a leathern thong tied round the person's hand who threw it, and put through a hole in the middle.

DISCUTSIVE, in medicine, having the power to discuss or disperse tumours or coagulated matter.

DISCUTIENT, a medicine or application which disperses any coagulated fluid or tumour.

DISLANE, any state of a living body in which the natural functions of the organs are interrupted or disturbed either by defective or preternatural action. A disease may affect the whole body, or a particular limb or part of the body, and such partial affection of the body is called a *local* or *topical* disease.

DISEMBOWING, a term applied to rivers which discharge the muck into the sea.

DISFRANCHISE, to deprive of chartered rights and immunities, or to deprive of some franchise, as the right of voting in elections, &c.

DISINFECTIION, in medicine, purification from infected matter.

DISINTEGRATION, in chemistry, the act of separating *integral* parts of a substance, as distinguished from decomposition or the separation of *constituent* parts.

THE DISINTEGRATION OF ROCKS, AND THE DECOMPOSITION OF VEGETABLES AND ANIMALS, PRESERVE THE EQUILITY AND NECESSARY VARIETY OF SOIL.

[DIS]

A New Dictionary of the Belles Lettres.

[DIS]

DISJUNCTIVE, in grammar, an epithet for conjunctions, which unite sentences, but separate the sense, as *but, nor, &c.*—A *disjunctive proposition*, in logic, is one in which the parts are opposed to each other by means of disjunctives; as, "it is either day or night."—A *disjunctive syllogism*, is, when the major proposition is disjunctive; as, "the earth moves in a circle, or an ellipsis; but it does not move in a circle, therefore it moves in an ellipsis."

DISLOCATION, in geology, the displacement of parts of rocks, or portions of strata, from the situations which they originally occupied.

DISMEMBERED, in heraldry, an epithet for birds that have neither feet nor legs; and also to lions and other animals whose members are separated.

DISMOUNTING, in the military art, the act of unhorsing. Thus to dismount the *cavalry*, is to make them alight.—To *dismount cannon*, is to remove artillery from their carriages; or to break the carriages or wheels, so as to render the guns useless.

DISORDER, in the medical art, generally denotes any slight disease, but it may also mean a serious interruption of the functions of the animal economy.—It has likewise a very extended signification for confusion or irregularity; as, "the troops were thrown into disorder;" "the papers are lying about in sad disorder."

DISOXYDATE, in chemistry, to reduce from the state of an oxide, by disengaging oxygen from a mineral or other substance. Hence we have *disoxydation* and *disoxygenation*, for the act of separating oxygen from any substance containing it.

DISPATCHES, in politics, a packet of letters sent by a public officer on some affair of state or public business.

DISPENSATION, in ecclesiastical affairs, the granting of a license, or the license itself, to do what is forbidden by laws or canons, or to omit something which is commanded. Also, a system of principles and rites enjoined, as the *Mosaic dispensation*, that is, the Levitical law and rights, the *Gospel dispensation*, or scheme of human redemption by Jesus Christ.

DISPENSATORY, or *PHARMACOPŒIA*, an authorized volume containing directions for compounding medicines.

DISPERMOUS, in botany, an epithet for plants which contain only two seeds.

DISPERSION, in optics, the separation of the different coloured rays, in refraction, arising from their different refrangibilities.—In medicine, the removing of inflammation from a part, and restoring it to its healthy state.

DISPLAYED, in heraldry, is understood of the position of an eagle, or any other bird, when it is erect, with its wings expanded or spread forth.

DISPLUME, to deprive of plumage; and, figuratively, to strip off badges of honour, or degrade from rank and office.

DISPOSITION, a word of extensive application, very generally signifying method, distribution, arrangement, or inclination.

Thus we speak of the *disposition* of the several parts of an edifice; the *disposition* of the infantry and cavalry in an army; the judicious *disposition* of a person's effects; a *disposition* in plants to grow upwards; a *disposition* in animal bodies to putrefaction; a person's *disposition* to undertake particular work, &c.

DISPUTATION, in the schools, a contest, either by words or writing, on some point of learning for a degree, prize, or for an exercise. Also a verbal controversy respecting the truth of some fact, opinion, or argument; as, Paul *disputed* with the Jews in the synagogue.

DISQUALIFICATION, that which incapacitates in law; implying a previous qualification, which has been forfeited; and not merely the want of qualification.

DISQUISITION, formal or systematic examination into the circumstances of any affair, in order to discourse about it, and so arrive at the truth.

DISRUPTION, in geology, a term applied to the violent separation of rocks or a stratum of earth, as by an earthquake.

DISSECTION, the dividing an animal body into its substantial parts, for the purpose of examining its structures and uses. Le Gendre observes, that the dissection of a human body, even dead, was held a sacrilege till the time of Francis I.; and that he has seen a consultation held by the divines of Salamanca, at the request of Charles V. to settle the question whether or not it were lawful in point of conscience to dissect a human body for the purposes of anatomical science.

DISSEISIN, or *DISSEIZIN*, in law, an illegal seizure of a person's lands, tenements, or other incorporeal rights. The person dispossessed is called the *disseisor*, and the person dispossessed, the *disseised*.

DISSENTER, one who separates from the service and worship of any established church. In England, therefore, the word is particularly applied to those who do not conform to the rites and service of its church as by law established. The principles on which Dissenters separate from the church of England, are, the right of private judgment, and liberty of conscience. They maintain that Christ, and he alone, is the head of the church, and that they bow to no authority, in matters of religion, but that which proceeds from him.

DISSIPATION, in physics, the insensible loss or waste of the minute parts of a body, which fly off, by which means the body is diminished, or consumed.—The common acceptance of the word denotes an irregular, careless, and vicious course of life.

DISSOLVENT, in chemistry, a menstruum, or any thing which has the power of melting, or converting a solid substance into a fluid; as, water is a *dissolvent* of salts.—In medicine, a *solvent*, or any remedy supposed capable of dissolving calculi or other concretions in the body.

DISSONANCE, in music, unharmonious or discordant sounds.

"THE POSITION OF ROCKS, OFTEN LEAVING OR PROSTRATE, SHOWS THAT THEY HAD SOME DISLOCATION FROM THEIR NATURAL SITE."—BURNET.

"THERE ARE MANY OPINIONS IN WHICH MULTITUDES OF MEN DISSENT FROM US, WHO ARE AS GOOD AND WISE AS OURSELVES."—ADDISON.

[DIS]

The Scientific and Literary Treasury ;

[DIS]

DISTANT OBJECTS IN A PROSPECT APPEAR BLUE, OWING TO THEIR BEING TINTED BY THE DREFPING RAYS OF THE ATMOSPHERE.

DISSYL LABLE, in grammar, a word consisting of two syllables only ; as, *king-dom, virtue.*

DISSOLUTION, the separation of a body into its elementary principles, or a cessation of the powers by which it was held together. We speak of the *dissolution* of animal bodies, when the parts separate by putrefaction, and of the reduction of a substance into its smallest parts, by a solvent or menstruum. We also say, the *dissolution* of the world, when we refer to its final destruction, and the *dissolution* of government, when it can no longer hold together.

DISTAFF, the staff of a spinning wheel, to which a bunch of flax is tied, and from which the thread is drawn.

DISTANCE, in astronomy is either apparent, real, or relative. *Apparent distances* are such as are judged of by the eye, *relative distances* are deduced from the theory of gravity and *real distances*, from the parallel, relative distances, &c.

Line of Distance, in perspective, a right line drawn from the eye to the principal point, the point of distance being a point in the horizontal line at such a distance from the principal point, as is that of the eye from the same — **Distance**, as applied to the turf, is a length of 240 yards from the winning post of a race-course precisely at which spot is fixed a post corresponding with others, but having a gallery capable of holding three or four persons, which is called the *distance post*. In this gallery as well as in that of the winning post, before the horses start each heat, a person is stationed holding a crimson flag, during the time the horses are running, each flag is suspended from the front of the gallery to which it belongs, and inclined forward as a horse passes either post. If there happen to be any horse which has not come up to the distance-post, before the first horse in that heat has reached the winning post, such horse is said to be "distanced," and is thereby disqualified for running any more during that race.

DISTEMPER, in the veterinary art, a disease incident to dogs, horses, and other domestic animals. — In painting, the mixing of colours with something besides oil and water. When colours are mixed with size, whites of eggs, &c. but not with oil, it is said to be done in *distemper*.

DISTICH, a couplet, or couple of verses in poetry, making complete sense.

DISTILLATION, the operation of extracting spirit from a substance, by drawing out its humid, spirituous, oleaginous, or saline parts, by means of heat, these parts being first resolved into a gas or vapour, and then recondensed into a fluid, by means of an alembic or still. In the preparations of the original compound, and in the management of the results, consists the art of a distiller. As an introduction to an elaborate practical treatise under this head, in Dr. Ure's Dictionary of Arts, &c. are the following pertinent remarks — "In

the commercial language of this country, *distillation* means the manufacture of intoxicating spirits; under which are comprehended the four processes, of *mashing* the vegetable materials, *cooling* the worts, *exciting* the vinous fermentation, and *separating* by a peculiar vessel called a *still*, the alcohol combined with more or less water. This art of evoking the fiery demon of drunkenness from his attempered state in wine and beer, was unknown to the ancient Greeks and Romans. It seems to have been invented by the barbarians of the north of Europe, as a solace to their cold and humid clime, and was first made known to the southern nations in the writings of Arnoldus de Villa Nova, and his pupil, Raymond Lully of Majorca, who declares this admirable essence of wine to be an emanation of the Divinity, an element newly revealed to man, but hid from antiquity, because the human race were then too young to need this beverage, destined to revive the energies of modern decrepitude. He further imagined that the discovery of this *aqua vite*, as it was called, indicated the approaching consummation of all things—the end of this world. However much he erred as to the value of this remarkable essence, he truly predicted its vast influence upon humanity, since to both civilized and savage nations it has realized greater ills than were threatened in the fabled box of Pandora.—The article concludes with the following astounding statement respecting the consumption of whiskey — "In the year 1831, 13,000,000 gallons of spirits were made in the United Kingdom, equivalent to the consumption of 1,500,000 quarters of grain, and for that year and the four preceding years, there were imported annually 2,000,000 of quarters of foreign barley.—In 1832, 20,774,521 gallons paid excise duty. In 1833, 23,397,806. In 1836, 27,137,000, of which 11,000,000 were Irish. We may add to the last quantity, three millions of gallons at least on the score of smuggling, in licensed and illicit distilleries, making 30 millions to be the frightful amount of whiskey consumed by the British people, independent of other intoxicating liquors."

DISTRESS, in law, the *distraint* or seizing upon a person's goods for the payment of rent or taxes, &c.

DISTRIBUTION, the act of dividing or separating, as, the distribution of property among children, or the distribution of plants into genera and species — In logic, the distinguishing a whole into its several constituent parts.—In medicine, the circulation of the chyle with the blood — In architecture, the dividing and disposing of the several parts of a building, according to some plan, or to the rules of the art — In printing, the taking a form asunder, so as to separate the types, and place each letter in its proper cell or box in the cases —

Distributive Justice, implies, that justice is so administered by a judge, as to give every man his due — *Distributive*, in grammar, words which serve to distribute things

OWING TO THE SPHERICAL FORM OF THE EARTH, A MAN STANDING ON LEVEL GROUND CAN SEE ONLY ABOUT THREE MILES DISTANT.

[DIV]

A New Dictionary of the Belles Lettres.

[DIV]

into their several orders, as each, either, every, &c.

DISTINCTION, in a general sense, means the act of separating or distinguishing. It also denotes elevation of rank or character. Thus we say, of men who hold a high rank by birth or office, as well as of those who are eminent for their talents, services, or moral worth, that they are persons of *distinction*.—*Metaphysical Distinction* is the non-agreement of being, whereby *this* entity is not *that*, or one thing is not another.—*Distinction*, or *distinguo*, is also used, in the schools, as an expedient to evade an argument, or to clear up and unfold an ambiguous proposition, which may be true in one sense, and false in another: thus they say, "the respondent was hard pressed, but he disengaged himself by a *distinguo*."

DISTRICT, a word applicable to any portion of land or country, or to any part of a city or town, which is defined by law or agreement. A governor, a prefect, or a judge may have his *district*; or states and provinces may be divided into *districts* for public meetings, the exercise of elective rights, &c.—*District*, in law, that circuit or territory within which a man may be forced to make his appearance.

DISTRING'AN, in law, a writ commanding the sheriff, or other officer, to distrain a person for debt, or for his appearance at a certain day.

DITHYRAMBUS, a sort of hymn anciently sung in honour of Bacchus, full of transport and poetical rage. A poem written with wildness. The *dithyrambic poetry* was very bold and irregular, for the poets not only took the liberty to coin new words for the purpose, but made double and compound words, which contributed very much to the wild magnificence of this kind of composition.

DITONE, in music, an interval comprehending two tones. The proportion of the sounds that form the ditone is 4 : 5, and that of the semi-ditone, 5 : 6.

DITRIHEDRIA, in mineralogy, a genus of spars with six sides or planes; being formed of two trigonal pyramids joined base to base, without an intermediate column.

DITTANDEIL, or *PAPPUS-WORT*, in botany, *Lepidium*, a genus of plants of many species. The common dittander has a hot biting taste, and is sometimes used in lieu of pepper.

DITTANY (white), in botany, an aromatic plant of the genus *Ditamnus*. Its leaves are covered with a white down, and when fresh they yield an essential oil. Bastard dittany is a species of *Marrubium*.

DITTO, contracted into *Do*, in books of accounts, is from the Italian *detto*, and signifies "the aforesaid." It is used to avoid repetition.

DIURETICS, medicines which have the power to promote or increase the discharge of urine.

DIVAN', a council-chamber, or court in which justice is administered, in the eastern nations, particularly among the Turks.

There are two sorts of divans, that of the grand seignior, called the council of state, which consists of seven of the principal officers of the empire; and that of the grand vizir, composed of six other vizirs or counsellors of state, the chancellor, and secretaries of state for the distribution of justice.—The word *divan*, in Turkey, also denotes a kind of stage, which is found in all the halls of the palaces, as well as in the apartments of private persons. It is covered with costly tapestry, and a number of embroidered cushions leaning against the wall; and on it the master of the house reclines when he receives visitors. From this, a kind of sofa has obtained the name of divan.

DIVARICATE, in botany, an epithet for a branch which spreads out wide, or forms an obtuse angle with the stem. It is also applied to peduncles and petioles.

DIVERGENT, or *Diverging lines*, in geometry, are those which constantly recede from each other.—*Divergent rays*, in optics, those rays which, going from a point of the visible object, are dispersed, and continually depart one from another, in proportion as they are removed from the object: in which sense it is opposed to *convergent*. Concave glasses render the rays divergent, and convex ones convergent.—*Diverging series*, in mathematics, a series the terms of which always become larger the farther they are continued.

DIVERSION, in military tactics, an attack on an enemy, by making a movement towards a point that is weak and undefended, in order to draw his forces off from continuing operations in another quarter.

DIVIDEND, the part or proportion of profits which the members of a society, or public company, receive at stated periods, according to the share they possess in the capital or common stock of the concern. The term is applied also to the annual interest paid by government on various public debts. In this sense, the order by which stockholders receive their interest is called a *dividend warrant*, and the portions of interest unreceived are denominated *unclaimed dividends*. It also signifies the sum a creditor receives from a bankrupt's estate.—*Dividend*, in arithmetic, the number to be divided into equal parts.

DIVING, the art of descending under water to a considerable depth, and remaining there for a length of time, as occasion may require. The practice of diving is resorted to for the recovery of things that are sunk, &c.—The most remarkable diver was Nicolo Peace, who, according to the account given by Kircher, was able to spend five days together in the waves, without any other provisions than the fish which he caught and ate raw. He would swim from Sicily to Calabria, carrying letters from the king. At length he met his fate in exploring the depths of Charybdis, at the instance of the king: who, after he had once succeeded in fetching up a golden cup that had been thrown in, ordered him to repeat the experiment.

DIVAN, WITH THE ARABS, PERSIANS, AND TURKS, IS USED TO DENOTE A COMPLETE COLLECTION OF LYRIC POEMS, CALLED GAZELLES.

THE ROMANS HAD NO OTHER WAY OF DRIVING HANNIBAL OUT OF ITALY, BUT BY MAKING A "DIVERSION" IN ATTACKING CANTHARE.

[DIV]

The Scientific and Literary Treasury ;

[DIV]

DIVING-BELLS ARE RESTRICTED IN THEIR DESCENT TO ABOUT TWELVE FATHOMS, THE HEAVY AND DENSITY OF THE AIR BECOMING INSUPPORTABLE.

DIVING-BELL, a mechanical contrivance by which persons may descend below the water and remain for some time without inconvenience. It is most commonly made in the form of a truncated cone, the smallest end being closed, and the large one open, and is used for the recovery of property that is sunk in wrecks. Of late years it has also been much employed to assist in laying the foundations of buildings under water. To illustrate the principle of this machine, take a glass tumbler, and plunge it into water with the mouth downwards, you will find that very little water will rise into the tumbler, which will be evident if you lay a piece of cork upon the surface of the water, for its upper side will be perfectly dry, the air which was in the tumbler having prevented the entrance of the water. But, as air is compressible, it could not entirely exclude the water, which by its pressure condensed the air a little.—Within these few years an ingenious diving apparatus has been invented by Mr. Deane, and successfully employed on many occasions. In fact, at the very time we are preparing this article, it would appear to be in use for the purpose of recovering the guns, &c. belonging to the wreck of the Royal George, at Spithead. In this apparatus the head of the diver is covered by a helmet of thin sheet copper, large enough to admit of the easy motion of the head, and capable of containing from six to eight gallons of air. The helmet comes pretty far down on the breast and back, and has in front three eye holes, covered with glass, protected by brass wires. The copper helmet is attached to a waterproof canvas jacket by means of rivets, so tightly fixed that no water can be introduced to the body of the diver. The junction of the helmet and jacket is stuffed, so that it may clasp the shoulders of the diver firmly. A leather belt passes round the neck, to which are attached two weights, one before and the other behind, each weighing about 40 lbs., in order that the diver may descend with facility, but in case of any accident occurring when he is at the bottom, the belt is fastened with a buckle in front, which he can instantly unfasten, and rise to the surface after the dropping of the weights. The diver is supported with fresh air by means of a flexible waterproof pipe, which enters the back of the helmet, and communicates with an air pump wrought above in the vessel from which the diver descends. From the back part of the helmet there is likewise led an education pipe, to allow the escape of the breathed air. In order that the diver may give notice to the attendants at the top, when he requires a hook, tackle, bucket, or any difference in the supply of fresh air, he is furnished with a signal line, which passes under his right arm. The diver descends from the side of the vessel either by means of a rope or wooden ladder loaded at the lower end, (but more frequently by the former). When he descends to the bottom, the rope is let down, so that it becomes

slack, to prevent the motion of the vessel from obstructing him, and he carries a line in his hand, that he may, when necessary, return to the rope. In order that the diver may be as comfortable as possible under water, he puts on two suits of flannel, above which he has a complete dress of Mackintosh's waterproof cloth, which entirely covers his body, the only apertures being at the neck and wrists. The diver is thus enabled to remain several hours at a time under water, all the while perfectly dry, his motion being rendered quite steady by heavy weights attached to his shoes.—Our readers, perhaps, will not think it an inappropriate conclusion to this article, if we transcribe an account of the method adopted by Colonel Pauley, the engineer now employed in removing the wreck of the Royal George. "On Monday, Sept. 23d, 1849, a cylinder, containing 2320 lbs of powder, having been lowered, was placed in a situation which the divers supposed would be effectual on the most compact portions of the wreck. The operation being completed, the vessel in which the voltaic battery was placed, was drawn off to the distance of 500 feet, which is the length of the connecting wires, and instantaneously on the circuit being completed the explosion took place, with very remarkable effects. At first the surface of the sea was violently agitated by a sort of tremulous motion, which threw it into small irregular waves, a few inches only in height. This lasted three or four seconds, when a huge dome of water made its appearance, of a conical or rather beehive shape. At first it appeared to rise slowly, but rapidly increased in height and size, till it reached the altitude of 4 or 30 feet, in a tolerably compact mass, it then fell down, and produced a series of rings, which spread in all directions, the first, or outer one, having the aspect of a wave several feet in height, curled and broke, as if it had been driven towards the shore. Neither the shock nor the sound was so great as had been expected by those who witnessed the former explosions, where the quantity of powder was only 45 lbs., but the effect produced on the water at the surface, considering that the depth was 90 feet, was truly astonishing. By this experiment, Colonel Pauley has established the practicability of applying the voltaic battery to submarine purposes, and the certainty of exploding a charge at any depth of water. The effect on the wreck will not be fully ascertained till the present spring tides are over, and the long periods of slack water at the neaps enable the divers to remain upwards of an hour under water. Two large guns and a quantity of timber, however, have been recovered since the explosion, and landed at the dock yard, and the gallant Colonel now feels convinced that this obstruction to the anchorage at Spithead, which has remained 67 years, will ultimately be removed." We are enabled to add, that repeated submarine explosions were subsequently made with similar success.

A DIVING-BELL OF AN IMPROVED PRINCIPLE, WAS CONSTRUCTED IN 1812, BY THE LATE MR. REYNOLDS, AND EMPLOYED IN RANGFATE HARBOUR.

[DIV]

A New Dictionary of the Belles Lettres.

[DIV]

DIVINATION, the pretended art of foretelling future events, or such as cannot be obtained by ordinary or natural means. The Israelites were always very fond of divination, magic, and interpretation of dreams. It was to cure them of this foolish propensity, that Moses promised them, from God, that the spirit of real prophecy should not depart from amongst them, forbade them to consult diviners, astrologers, &c., under very severe penalties, and ordered those to be stoned who pretended to have familiar spirits, or the spirit of divination.—The ancient heathen philosophers divided divination into two kinds, *natural* and *artificial*. Natural divination was supposed to be effected by a kind of inspiration or divine affluus, artificial divination was effected by certain rites, experiments, or observations, which we have explained under their respective heads. All the ancient Asiatic tribes had modes of divination the Egyptians and Greeks had their oracles, and, with the Romans, divination and witchcraft were brought into a kind of system, and constituted part of their religion. In truth, there has hardly been a nation discovered, which had advanced beyond the lowest barbarism, that did not practise some kinds of divination, and even in the ages in which reason has most prevailed over feeling, the belief in the power of foreseeing future events has been entertained. At the present day, enlightened as the world is by science, the desire of prying into futurity keeps alive many modes of prognosticating future events, nor is the practice, we believe, entirely confined to the ignorant and superstitious.

DIVINITY, a term applied to the Deity or Supreme Being. It also denotes theology, the science which unfolds the character of God, his laws and moral government, the duties of man, and the way of salvation.

DIVISIBILITY, that property by which the particles of matter in all bodies are capable of separation, or division from one another. As it is evident that body is extended, so it is no less evident that it is divisible; for since no two particles of matter can exist in the same place, it follows that they are really distinct from each other, which is all that is meant by being divisible. In this sense the least conceivable particle must still be divisible, since it will consist of parts which will be really distinct. Thus far extension may be divided into an unlimited number of parts, but with respect to the limits of the divisibility we are still in the dark. We can, indeed, divide certain bodies into surprisingly fine and numerous particles, and the works of nature offer many fluids and solids of wonderful tenuity, but both our efforts, and those naturally small objects, advance a very short way towards infinity. Ignorant of the intimate nature of matter, we cannot assert whether it may be capable of infinite division, or whether it ultimately consists of particles of a certain size. The atoms which produce light, and still enable

us to discriminate their actions in varied colours; those which produce odours; those of the gaseous elements; and those of magnetic phenomena, &c. baffle description, and leave us in a state of indescribable astonishment. The actual subdivision of bodies has, in many cases, been carried to a prodigious extent. The trituration and levigation of powders, and the perennial abrasion and waste of the surface of solid bodies, occasion a disintegration of particles, almost exceeding the powers of computation. The solutions of certain saline bodies, and of other coloured substances, exhibit a prodigious subdivision and dissemination of matter. A single grain of the sulphate of copper, or blue vitriol, will communicate a fine azure tint to five gallons of water. In this case the copper must be attenuated at least ten million times, yet each drop of the liquid may contain as many coloured particles, distinguishable by our unassisted vision. A still finer portion of cochineal, dissolved in deliquate potash, will strike a bright purple colour through an equal mass of water. Animated matter likewise exhibits, in many instances, a wonderful subdivision. The milt of a cod fish, when it begins to putrify, has been computed to contain a billion of perfect insects; so that thousands of these living creatures could be lifted on the point of a needle. But the infusory animalcules display, in their structure and functions, the most transcendent attenuation of matter. Of the *monas gelatinosa*, discovered in ditch water, milious appear in the field of a microscope, playing, like the sunbeams, in a single drop of liquid, yet each animalcule must consist of parts connected with each other, with vessels, with fluids, and with organs necessary for its motions, &c. How inconceivably small must these organs be! and yet they are, unquestionably, composed of other parts still smaller, and still farther removed from the perception of our senses.

DIVISION, the act of dividing or separating any entire bodies into parts.—*Division*, in arithmetic, one of the four fundamental rules, by which we find how often a less number, called the *divisor*, is contained in a greater, called the *dividend*, the number of times which the divisor is contained in the dividend being termed the *quotient*.—*Division*, in music, the dividing the interval of an octave into a number of less intervals. The fourth and fifth divide the octave perfectly, though differently. When the fifth is below, and serves as a bass to the fourth, the division is called *harmonic*, but when the fourth is below, it is called *arithmetical*.—*Division*, among logicians, is the explication of a complex idea, by enumerating the simple ideas whereof it is composed.—In rhetoric, it is the arrangement of a discourse under several heads.—A part of an army, as a brigade, a squadron, or platoon.—A part of a fleet, or a select number of ships under a commander, and distinguished by a particular flag or standard.

A SPIDER'S LIME IS SIX TIMES FIFTEEN THOUSAND PARTS OF AN INCH IN DIAMETER.

THE FIBRE OF THE COARSEST WOOL IS ABOUT THE 500TH PART OF AN INCH IN DIAMETER, AND THE FINEST ONLY THE 1500TH PART.

[DIV]

The Scientific and Literary Treasury ;

[1000]

DIVO RCF, a separation, by law, of husband and wife, and is either a divorce *a vinculo matrimonii* that is, a complete dissolution of the marriage bonds, whereby the parties become as entirely disconnected as those who have not been joined in wedlock or a divorce *a mensa et thoro* (from bed and board), whereby the parties are legally separated, but not unmarried. Divorces *a vinculo* are decreed by the ecclesiastical courts in England for prior contract too near an affinity, or consanguinity and other causes, existing at the time of the marriage but not for any subsequent cause. For any cause whatever, arising after the marriage the ecclesiastical courts can only decree *div a mensa et thoro*, which does not leave either of the parties to marry again.

DIURETIC medicines which promote the urinary discharge.

DJURNAL ARCH, in astronomy, the arch or number of degrees that the sun, moon or stars describe between their rising and setting. — *The diurnal motion of a planet* is so many degrees and minutes as any planet moves in twenty-four hours.

DOCLMACY, or the **DOCLMATIC ART**, the art of assaying metals or separating them from foreign matters, and determining the nature and quantity of metallic substance contained in any ore or mineral. The metal is rarely found in a pure state and when combined with non-metallic substances, its distinctive characters are so altered, that it often requires much skill and experience to recognize its nature, or to decide if it can be smelted with advantage. The assayer, therefore triturates it to an impalpable powder and then subjects it to the decomposing action of powerful chemical reagents. Sometimes with the aid of alkalies or salts appropriate to its nature he employs the dry way by himself alone at others the solvent power of acids are made to effect what he alone is incapable of effecting the usual preliminary test however is the blow pipe.

DOCLMATA in Greek antiquity a probation of the magistrates and persons employed in public business at Athens. It was performed publicly in the forum where they were obliged to give account of themselves and their past life before certain judges.

DOCKS By the word dock was formerly understood a ship or cove used for the purpose of building or repairing a vessel. When furnished with flood gates to prevent the influx of the tide it required it was called a *dry dock* and when, having no flood gates, the vessel could only be cleaned or repaired during the period in which the tide left her accessible it was called a *wet dock*. Both these docks are still used, but the name of *drying or building dock* is now more generally given to what we have termed *dry dock* which latter term is applied to those docks or basins left dry by the tide, while the appellation *ship* is confined to the narrow inlet for building or repairing unprotected

by gates. Most seaport towns are provided with graving docks for the repairing of ships, but it is only in the British islands that the system has been carried to any extent of forming large basins or floating docks, furnished with flood gates for the reception of shipping to load and unload, wherein the vessel remains safe at the quay side. That these floating docks were a great desideratum, and have contributed much towards our commercial prosperity no one can doubt who considers the inconvenience, danger, and delay caused by loading and unloading vessels in a tide river or in a harbour not entirely landlocked. Mr. McCulloch observes that 'notwithstanding the obvious utility of wet docks and the vast trade of the metropolis there was no establishment of this sort on the Thames till nearly a century after a wet dock had been constructed at Liverpool. The inconvenience arising from the crowded state of the river, at the periods when fleets of merchantmen were accustomed to arrive, the insufficient accommodation afforded by the legal quays and sufferance wharfs the necessity under which many ships were placed of unloading in the river into lighters, and the insecurity and loss of property thence arising, had been long felt as almost intolerable grievances, but so powerful was the opposition to any change, made by the private wharfingers and others interested in the support of the existing order of things that it was not till 1791 that a plan was projected for making wet docks for the port of London and six years more elapsed before the act for the construction of the West India Docks was passed. To give the reader an idea of the extent of these docks and their commercial importance it will be sufficient to state that the docks with their basins and the locks which connect them with the river present an area of 64 acres of ground excavated for the reception and moorage of vessels. The total superficies including that of the quays and warehouses, is 140 acres. It can admit at the same time 204 vessels in the import, and 19 in the export dock forming a total of 120,000 tons. Upon the quays under the sheds and in the warehouses there have been deposited, at the same time, 149,661 casks of sugar, 431,748 bags of coffee, 11,154 pipes of rum and Madeira wine 14,021 logs of mahogany 130 tons of logwood and a variety of other articles. There are also the East India Docks, the London Docks and St. Katharine's Docks, each of which though inferior in size to the West India Docks are magnificent works. Forty years ago nearly the whole of the vessels that entered the port of London were obliged to remain moored in the open stream of the Thames.'

DOCKET, in law signifies a brief in writing. The rolls of judgment, when brought into the court of common pleas, are entered on the docket of that term and afterwards kept docket books, wherein they enter judgments.

WHEN A MINA YIELDS NINE METAL, ON ITS OXIDE, NO FURTHER PROCESS BEYOND THAT OF PICKING AND ELISING IS NECESSARY.

THE TWENTY TWO DOCKS OF LIVERPOOL COVER 111 ACRES, AND THE QUAY SPACES AROUND THEM ARE EIGHT MILES. THEY COST ABOVE TWO MILLIONS.

[DOD]

A New Dictionary of the Belles Lettres.

[DOG]

THE DOG IS THE NATURAL ALLY OF MAN, AND THE ONLY ANIMAL WHICH HAS FOLLOWED HIM THROUGH EVERY REGION OF THE EARTH.

DOCK-YARDS, an arsenal containing all sorts of naval stores, and timber for ship-building. In England, the royal dock-yards are at Chatham, Portsmouth, Plymouth, Deptford, Woolwich, and Sheerness, where her Majesty's ships and vessels of war are generally moored during peace, and such as want repairing are taken into the docks and refitted.

DOCTOR, a person who has passed all the degrees of a faculty, and is empowered to practise and teach it; or, according to modern usage, one who has received the highest degree in a faculty. The title of *doctor* originated at the same time with the establishment of universities; and is either conferred publicly, with certain ceremonies, or by diploma.

DOCTRINAIRES, a party in the French chamber of deputies, on the second restoration of the Bourbons, who would neither rank themselves among the friends of absolute power, nor among the defenders of the revolution. They opposed the ultra royalists, and took a middle course, avowing themselves the supporters of a constitutional monarchy.

DOCTRINE, a principle or position in any science, that is laid on as true by an instructor therein. Thus, the *doctrines* of the Gospel are the principles or truths taught by Christ and his Apostles. But any tenet or opinion is a doctrine; therefore doctrines may be either true or false.

DOCUMENT, any official or authoritative paper, containing written instructions, or evidence.

DOUYER, in botany, a parasitical plant of the genus *Cuscuta*. It attaches itself to hops, flax, nettles, &c., and as it decays at the root, is nourished by the plant that supports it by means of little vesicles which adhere to the stalk.

DODECAGYN'IAN, in botany, an epithet for plants having twelve pistils.

DODECATEM'ORY, in astronomy, a term sometimes applied to each of the twelve signs of the zodiac.

DODO, in ornithology, the *Didus*, a genus of fowls of the gallinaceous order. The hooded *dodo* is larger than a swan, with a strong hooked bill, and the head appearing as if covered with a hood. The solitary *dodo* is a very large fowl, sometimes weighing between 40 and 50 lbs.

DODECAGON, a regular polygon of 12 equal sides and angles.

DODECAHEDRON, in geometry, a solid bounded by twelve equal and equilateral pentagons.

DODECANDRIA, the 12th class of the Linnæan system of botany, comprehending those plants which have flowers with twelve stamens and upwards, as far as nineteen inclusive, as dyer's weed, pansy, houseleek, &c. The essential character is, that the stamens, however numerous, are inserted into the receptacle.

DODON'IAN, in antiquity, an epithet given to Jupiter, because he was worshipped in a temple built in the forest of Dodona, where was the most celebrated,

and, it is said, the most ancient oracle in Greece.

DOG, (*Canis familiaris*), an animal well known for his attachment to mankind, his incorruptible fidelity, and his inexhaustible diligence, ardour, and affection. But when we thus describe this faithful animal, we mean those only which man has domesticated. In his wild state the dog is a beast of prey, of the wolf kind, clearing the earth of carrion, and living in friendship with the vulture. By Mahometans and Hindoos the dog is regarded as impure, and neither will touch one without an ablution; they are therefore unappropriated, and prowl about the towns and villages, devouring the offal, and thus performing the office of scavengers. Tamed and educated by man, the numerous good qualities of dogs have claimed and received the tribute of universal praise. Their sensibility is extreme; witness their susceptibility of the slightest rebuke, and restless anxiety to be restored to favour. Uninfluenced by changes of time and place, these animals seem to remember only the benefits they may have received, and, instead of showing resentment, will lick the hand from which they have received the severest chastisement. The skill of several species in the chase, where they act as the purveyors of man; their domestic habits; their kindness to children; in a word, their general congeniality with man himself, have, in all ages, recommended them to his use and care.

When we attempt to trace the source or origin of the species, it will be found that the changes and varieties, which the influence of domestication and the intermixture of races have produced, are so multifarious and interminable as to baffle all research. Pennant is of opinion, that the original stock of dogs in the old world is derived from the jackall; that from their tamed offspring, casually crossed with the wolf, the fox, and the hyena, have arisen the numberless forms and sizes of the canine race. Buffon, on the contrary, considers the shepherd's dog as the parent stock whence all the species of the canine race have sprung; and that naturalist corroborates his idea by observing that they appear originally disposed, independently of education or habit, to take care of herds. Zoologists reckon twenty-three canine species, among which are included the wolf, the hyena, the jackall, and the fox. The varieties of dogs are almost without end. Of the faithful dog, alone, there are thirty-five varieties, and numerous sub-varieties. The mastiff, peculiar to England, is called the *English dog*. Among many nations dogs form an important article of food. In China, the Society Islands, &c., young puppies are considered a great delicacy; and we learn from the writings of Hippocrates, that in his day the flesh of a grown dog was esteemed wholesome and nourishing.

DOGBANE, in botany, the *Hyoscyamus Androsæmifolium* of Linnæus, a perennial North American plant, the root of which is intensely bitter and nauseous, and is em-

DOGS PUT OUT THEIR TONGUES WHEN HOT, BECAUSE THEY HAVE NO OTHER MEANS OF INCREASING THE EVAPORATION FROM THEIR BODIES.

[DED]

The Scientific and Literary Treasury ;

[DEF]

played in the form of a powder for the same purposes as *aprecuanha*.

DOG DAYS the period between the 24th of July and the 24th of August, so called because the dog star (*Sirius*) during this period rises with the sun, and the heat which is usually most oppressive at this season was formerly ascribed to the conjunction of this star with the solar luminary.

DOG FISH in ichthyology the popular name of several of the genus *dogfish* or shark. In their general character they differ but little from the other sub genera of their generic family so well known for their voracious habits. Although dogfishes are seldom if ever injurious to man they commit great ravages in the fisheries by their voracity. The flesh of all the species is hard dry and unpalatable requiring to be well soaked before it is eaten, but a considerable quantity of oil is obtained from the liver.

DOG-GEREL an epithet given to a kind of loose irregular burlesque poetry like that of *Stodibras*.

DOG-WOOD in botany (*Cornus Florida*) a small tree growing in America the wood of which is white hard and of a fine texture much used by cabinet makers for inlaying &c and considered little inferior to box. Its bark possesses properties very similar to the Peruvian bark and is often used as a substitute for it.

DOGE formerly the title of the chief magistrate in the republics of Venice and Genoa. The dignity was elective in both places at Venice it continued for life, at Genoa, only for two years. His power became by degrees very limited.

DOGGER the name of a two masted Dutch fishing vessel. In some of our old statutes we meet with *dogger men* denoting the fishermen whose vessels were of this description.

DOGMA a principle maxim tenet or settled opinion particularly with regard to matters of faith and philosophy, as the *dogmas* of the church, the *dogmas* of *Aristotle*.

DOGMATISTS a sect of ancient physicians of which Hippocrates was the first. They are also called *logics* or *logicians* from their using the rules of logic on professional subjects. They laid down definitions and divisions reducing diseases to certain genera and those genera to species and furnishing remedies for them all supposing principles drawing conclusions, and applying those principles and conclusions to the particular diseases under consideration.

DOG STAR, or SIRIUS a star of the greatest magnitude in the constellation *Canis*.

DOIT the ancient Scottish penny piece twelve of which were equal to a penny sterling. Two of them were equal to the *botle* six to the *baubee*, and eight to the *achesson*.

DOLE in our ancient customs signified a part or portion of a meadow, where some

veral persons had shares. It now means a distribution or dealing of alms, or a liberal gift made to the people or to some charitable institution.

DOLMAN a kind of long cassock worn by the Turks hanging down to the feet with narrow sleeves buttoned at the wrist.

DOLIUM the name of a genus of shells called by some *conchoglossa*. The *dolium* is a simple shell without any hinge formed of one continuous piece which makes a body of a figure approaching to round distended and as it were inflated. The animal inhabiting it is a *limax*.

DOLLAR a silver coin of Spain and of the United States of the value of 4s 6d sterling or 100 cents. In Germany the name *dollar* is given to several coins of different values.

DOLOMITE in mineralogy a variety of magnesian carbonate of lime so called from the French geologist Dolomieu. It occurs under considerably diversified aspects constituting beds of very great extent and abounding in the Apennines the Tyrol Switzerland and Tuscany. It is of various shades of white and both in Europe and America it is frequently employed as marble.

DOI PHIN (*dolphin*) in ichthyology a genus of cetaceous fish. But that to which seamen give this name is the *Coryphæna hippuride* of Linnaeus. The colour is a silvery white with yellowish spots. It has a roundish snout and tapering body with a fin running along the back from the head to the tail. Few fish are more agile or swim with greater velocity.

DOMESDAY or DOOMS DAY BOOK a book recorded made by order of William the Conqueror which now remains in the exchequer and consists of two volumes a large folio and a quarto the former contains a survey of all the lands in most of the counties in England and the latter comprehends some counties that were not then surveyed. The Book of Domesday was begun by five justices assigned for that purpose in each county in the year 1081 and finished in 1086. It was of such authority that the Conqueror himself submitted in some cases wherein he was concerned to be determined by it. Camden calls it the Tax book of king William and it was further called *Magna Rolla*. There is likewise a third Domesday book made by command of the Conqueror and also a fourth being an abridgment of the other books.

DOMP in architecture a spherical roof or cupola raised over the middle of a building. Some of the greatest architects both in this country and Italy have given their particular attention to this branch of building.—The dome of St Pauls by Sir Christopher Wren is considered as a masterpiece.

DOMINICAL LETTER in chronology is that letter of the alphabet which points out in the calendar the days throughout

146. PENON ASSIGNED FOR THE SURVEY TAKEN BY WILLIAM THE CONQUEROR, WAS THAT EVERY MAN SHOULD BE SATISFIED IN HIS OWN MIND.

DOMESDAY BOOK IS KEPT IN THE CHANCERY HOUSE AT WESTMINSTER WHERE IT MAY BE CONSULTED ON PAYING A FEE OF 6s 8d TO THE PROPER OFFICERS.

[DOU

THE DOMINICANS WERE THE PRINCIPAL COUNSELLORS BY WHOSE ADVICE LEO X. WAS DETERMINED TO THE CONDEMNATION OF LUTHER.

the year, thence also called *Sunday letter*, or *Dies Domini*. The dominical letter may be found universally, for any year of any century, thus: Divide the centuries by 4, and take twice what remains from 6; then add the remainder to the odd years, above the even centuries, and their 4th. Divide their sum by 7, and the remainder taken from 7, will leave the number answering to the letter required.

DOMINICANS, called also *Predicants*, or *Preaching Friars*, an order of monks, founded by St. Dominic, a native of Spain, in 1215. The design of their institution was, to preach the gospel, convert heretics, defend the faith, and propagate Christianity. They embraced the rule of St. Augustine, to which they added statutes and constitutions, which had formerly been observed either by the Carthusians or Præmonstratenses. The principal articles enjoined perpetual silence, abstinence from flesh at all times, wearing of woollen, rigorous poverty, and several other austerities. In France they were called *Jacobins*, because the first convent in Paris was in the *Rue St. Jacques*. The *Dominican Nuns*, who were established at the same time, follow similar rules.—A third establishment of St. Dominic was the military order of Christ, originally composed of knights and noblemen, whose duty it was to wage war against heretics. After the death of the founder, this became the order of the penitence of St. Dominic, for both sexes, and constituted the third order of Dominicans. These became extremely influential; and numbered among their fraternity some of the most distinguished scholars, such as Albertus Magnus and Thomas Aquinas. In course of time they were superseded in the schools and courts by the Jesuits; and the order at present flourishes only in Spain, Portugal, Sicily, and South America.

DOMICILIARY, pertaining to an abode or residence. Hence, a *domiciliary visit* signifies a visit to a private dwelling, particularly for the purpose of searching it, under authority.

DOMINANT, in a general sense, predominant or governing; as the *dominant party* or *faction*.—In music, the dominant or *separable chord* is that which is practised on the dominant of the tone, and which introduces a perfect cadence. Every perfect major chord becomes a dominant chord, as soon as the *seventh minor* is added to it.

DOMIFYING, in astrology, a term, now nearly obsolete, for the dividing or distributing the heavens into twelve houses, in order to erect a theme, or horoscope, by means of six great circles, called circles of position.

DOMINION, (*dominium*), in the civil law, signifies the power to use or dispose of a thing as we please.—*Dominium plenum*, is when the property is united with the possession.—*Dominium nudum*, when there is the property without the possession. *Dominium* is again divided into that which is acquired by the law of nations, and that which is acquired by the civil law. The

former can never be got without possession, the latter may. *Directum Dominium*, is the right alone of dominion. *Dominium utile*, the profit redounding from it. Thus the wife retains the *dominium directum* of her jointure, and the *dominium utile* passes to her husband.—In a general sense, *Dominion* signifies either sovereign authority, or territory within the limits of the authority of a prince or state; as, the British *dominions*.

DOMINO, a masquerade dress, worn by gentlemen and ladies, consisting of a long silk mantle, with a cap and wide sleeves. It was formerly a dress worn by priests in the winter, which, reaching no lower than the shoulders, served to protect the face and head from the weather.—*Dominoes*, a game played by two or four persons, with twenty-eight pieces of ivory, called cards, and variously dotted after the manner of dice.

DOMINUS, in the civil law, signifies one who possesses anything by right of purchase, gift, loan, legacy, inheritance, payment, contract, or sentence.—*Dominus*, in the feudal law, one who grants a part of his estate in fee to be enjoyed by another.

DOMO REPARANDO, a writ which lies for a person against his neighbour, whose house he fears will fall to the damage of his own.

DON, a title of honour in Spain, answering to Dom., or Dominus Lord.

DONATION, in law, the act or contract by which a person transfers to another either the property or the use of something, as a free gift. In order to be valid, it supposes a capacity both in the donor and donee, and requires consent, acceptance, and delivery.

DONATISTS, a sect of Christians in Africa, who took the name from their founder Donatus. They held that there's was the only pure church, and that baptism and ordination, unless by their church, were invalid. The Donatists made themselves formidable, when swarms of fanatical peasants, inflamed by their doctrines, in 348, under the name of *Circumcelliones*, attacked the imperial army, and for thirteen years after desolated Mauritania with pillage and murder. Martyrdom was eagerly sought by them, and they voluntarily gave themselves up to the catholics, to be executed. This sect was finally extinguished when the country was conquered by the Saracens.

DONATIVE, in the canon law, a benefice given by the patron to a priest, without presentation to the ordinary, and without institution or induction.—*Donative*, among the Romans, was properly a gift made to the soldiers, as *congrarius* was that made to the people.

DONJON, in fortification, signifies a strong tower, or redoubt, into which the garrison of an ancient fortress might retreat, in case of necessity, and capitulate with greater advantage.

DORIC, an epithet for any thing belonging to the Dorians, an ancient people of Greece. The *Doric dialect* was broad

THERE HAVE BEEN THREE POPES OF THE DOMINICAN ORDER, 60 CARDINALS, 150 ARCHBISHOPS, AND 800 BISHOPS, BESIDES OTHER DIGNITARIES.

[DOR]

The Scientific and Literary Treasury ;

[DOV]

and rough, yet there was something venerable and dignified in its antique style, for which reason it was often made use of in solemn odes, &c.—The *Doric order* of architecture is the second of the five orders, being that between the Tuscan and Ionic. It is distinguished for simplicity and strength and is used in the gates of cities and citadels, on the outside of churches, and other situations where embellishment is unnecessary or inappropriate.—The *Doric mode*, in music, was the first of the authentic modes of the ancients, and grave rather than gay.

DORMER, or **DORMENT**, in architecture, a window made in the roof of a building.

DORMANT, an epithet expressive of a state of inaction or sleep. Hence we speak of *dormant* animals, or such as remain several months in the year apparently lifeless, or, at least, in utter inactivity. The period of long sleep generally begins when the food of the animal grows scarce, and inactivity spreads over the vegetable kingdom. Instinct at this time impels the animals to seek a safe place for their period of rest. The bat hides itself in dark caves, or in walls of decayed buildings, the hedgehog envelops himself in leaves, and generally conceals himself in fern brakes, and the marmot buries himself in the ground. In this period we observe in the animals, first a decrease of animal heat, and secondly, that they breathe much slower and more uninterruptedly than at other times. The digestion is also much diminished, the stomach and intestines are usually empty, and even if the animals are awakened, they do not manifest symptoms of appetite, except in heated rooms. The causes of the dormant state of animals have generally been sought in a peculiar construction of the organs, but the immediate cause producing this torpidity, is mostly, it not entirely, the cold. Frogs, serpents, and lizards, kept in artificial cold, may remain for years in this state, hence they have been sometimes found enclosed in stones, in which they have been perhaps for centuries. The other lower animals, as snails, insects, &c., are also subject to a similar torpidity. A state of partial torpor takes place in the case of the common bear, the badger, and the racoon. The bear begins to be drowsy in November, when he is particularly fat, and retires into his den, which he has lined with moss, and where he but rarely awakes in winter.—*Dormant*, in heraldry, is used for the posture of a lion, or any other beast lying along in a sleeping attitude, with the head on the fore paws, by which it is distinguished from the *couchant*, where, though the beast be lying, yet he holds up his head.—*Dormant* (or *sleeping*) partner, one who takes no share in the active business of a partnership, but is entitled to a share of the profits, and subject to a share of the losses. To be of any use such a partner ought to have sufficient capital to assist the concern in an emergency, or when circumstances seem to warrant it.

DORMOUSE, in zoology, a genus of mammiferous quadrupeds, of the order *Glucos*. During the rigour of winter they retire to their bed of moss or dry leaves, made in a hollow tree or under shrubs, and rolling themselves up, fall into a torpid or lethargic state, which lasts, with little interruption, throughout that cheerless season. Sometimes they experience a short revival in a warm, sunny day, when they take a little food, and then relapse into their former condition.

DORNOCK, a kind of figured linen, of stout fabric, manufactured for coarse table cloths. It derives its name from a town in Scotland, where it was first made.

DORSAL, an epithet for what belongs or relates to the back, as the dorsal fins of fishes.

DORSIFEROUS, in botany, a term for plants of the capillary kind, without stalks, and which bear their seeds on the back of their leaves.

DORYPHORI, in antiquity, an appellation given to the life guard men of the Roman emperors.

DOSE, the quantity of any medicine prescribed by the physician to be taken by the patient at one time.—*Dose*, in chemistry, the quantity of any substance which is added to any solution, in order to produce any chemical effect.

DOS SIL, in surgery, a pledget or piece of lint made into a cylindrical form.

DOTAGE, the childishness and imbecility of old age.

DOTTEREL, the name of different species of fowls, of the genus *Charadrius*, and the grallie order as the Alexandrine dotterel, the ringed dotterel, &c.

DOUBLE ENTENTE (*French*), a term applied to a word of two different meanings.—*Double entente*, any phrase which has a covert as well as an obvious meaning.

DOUBLET, among lapidaries, a counterfeit stone composed of two pieces of crystal, with a colour between them, so that they have the same appearance as if the whole substance were coloured.

DOUBLING a cape, is to sail round or pass beyond it, so that the point of land shall separate the ship from her former situation, or lie between her and any distant observer.

DOI BLOON, a Spanish coin of the value of two pistoles, or 31 6s sterling.

DOUBT, uncertainty of mind, or the act of withholding our assent from any proposition, on suspicion that we are not thoroughly apprised of the merits or from not being able peremptorily to decide between the reasons for and against it.

DOI (EUR), a present or bribe for the acquirement of any desired object.

DOI (INE), (*French*), in architecture, a moulding concave above and convex below, serving as a cymatium to a delicate cornice.

DOVE, in ornithology (a wild pigeon, a species of *Columba*), of which there are three sorts, namely the *ring dove*, the largest of the pigeon tribe, so wild that it cannot be domesticated, the *stock-dove*, that is mis-

MANY BIRDS, WHICH WERE SUPPOSED TO RETREAT INTO HOLDS AND THE DORMANT ANIMALS AND INSECTS IN WINTER, ARE NOW KNOWN TO MIGRATE.

MANY VEGETABLES DRIVE THE WINTER DO NOT SEEM TO RESPIRE, BUT TO SLEEP LIKE THE DORMANT ANIMALS AND INSECTS IN WINTER.

[DRA]

A New Dictionary of the Belles Lettres.

[DRA]

gratory: and the *turtle-dove*, a shy and retired bird living in the woods.

DOVE-TAIL, in carpentry, the manner of fastening boards together by letting one piece into another, in the form of a dove's tail spread, or wedge reversed; which is the strongest of all jointings.

DOW'AGER, in law, properly a widow who enjoys a dower; particularly applied as a title to the widows of princes and nobility. The widow of a king is a *queen-dowager*.

DOWER, in law, the portion which a widow has of her husband's lands, to enjoy during her life.

DOWN, the softest and most delicate feathers of birds, particularly of geese, ducks, and swans, growing on the neck and part of the breast. The eider duck yields the best kind.—Also the fine feathery substance by which seeds are conveyed to a distance by the wind; as in the dandelion and thistle.

DOWNS, banks or elevations of sand, which the sea gathers and forms along its shore, and which serve it as a barrier. The term is also applied to tracts of naked land on which sheep usually graze.—*The Downs* is a famous roadstead on the coast of Kent, between the North and South Foreland, where both the outward and homeward bound ships frequently make some stay, and squadrons of men of war rendezvous in time of war. It affords excellent anchorage, and is defended by the castles of Deal, Dover, and Sandwich, as well as by the Goodwin Sands.

DOW'RY, the money or fortune which the wife brings her husband in marriage: it is otherwise called *maritagium*, marriage-goods, and differs from dower.—*Dowry* is also used, in a monastic sense, for a sum of money given with a female upon entering her in some religious order.

DOXOLOG'Y, in Christian worship, a hymn in praise of the Almighty. There is the greater and lesser doxology; the angelic hymn, "Glory be to God on high," &c. is the *greater* doxology; the *lesser*, "Glory be to the Father, and to the Son," &c.

DRACHM, a Grecian coin of the value of seven pence three farthings.—*Drachm* is also a weight, containing sixty grains, or the eighth part of an ounce. It is often written *dram*.

DRA'CO, in astronomy, a constellation in the northern hemisphere.

DRA'CO VOLANS, a meteor in cold marshy countries, consisting of phosphuretted or carburtted hydrogen, which, in certain excitements and combinations, becomes luminous.—There is, likewise, a "*draco volans*," an insect, found in Africa and India, and distinguished from the lizard tribe, merely by having a broad, lateral membrane, strengthened by radii or bony processes: it wanders about trees, and is able, by means of the membrane, to spring from bough to bough, and support itself for a few moments in the air; it feeds on insects. It is a harmless and inoffensive animal, and in its very limited power of flying resembles the flying squirrel or the bat.

DRACUN'CULUS, in botany, a species of *Arum*, a plant with a long stalk, spotted like the belly of a serpent.—In medicine, *Dracunculi* are small long worms, which breed in the muscular parts of the arms and legs, and are called *Guinea worms*, being common among the natives of Guinea.

DRAFT, in commerce, a bill drawn by one person upon another for a sum of money.—In military affairs, the selecting or detaching of soldiers from an army, or from a military post. Also, the act of drawing men to serve in the militia.

DRAG, a machine consisting of a sharp square frame of iron, encircled with a net, and commonly used to rake the mud off from the platform or bottom of the docks, or to clean rivers.

DRAG-NET, a net to be drawn on the bottom of a pond or river for taking fish.

DRAG'OMAN, an interpreter in the East, whose office it is to interpret for the European ambassadors at the Ottoman court.

DRAG'ON, a kind of winged serpent, much celebrated in the romances of the middle ages.—In Scripture, *dragon* seems sometimes to signify a large marine fish or serpent, and sometimes a venomous land serpent.

DRAG'ONET, a fish with a slender round body, coloured with yellow, blue, and white. It breathes and ejects water through two orifices at the top of the head, like the cetaceous tribe.

DRAG'ON-FLY, the *Libella*, a particularly ravenous insect, with four extended wings. There are many species, with a great variety of colours; and they hover over stagnant waters.

DRAGONNE'E, in heraldry, the term for a lion or other beast, where the upper half resembles a lion, &c., but the other half goes off like the hinder part of a dragon.

DRAGON'S-BLOOD, a resinous juice obtained by incision from several plants, found between the tropics. It comes from the East Indies, in small flat cakes or round balls, or in oval drops wrapped in leaves, and knotted like a chaplet. It is opaque, of a deep reddish brown, brittle, and has a smooth and shining conchoidal fracture. Its taste is slightly astringent; and when burnt, it emits an odour somewhat like benzoin. It is used chiefly for tingeing spirit and turpentine varnishes, for preparing gold lacquer, and for staining marble, to which it gives a red tinge. It was formerly in high repute as a medicine, but at present is very little used.

DRAGON'S HEAD, in botany, the *Dracoccephalum*, a genus of plants, of many species, most of them herbaceous.—*Dragon's Head and Tail*, the name given by astrologers to the points of the ecliptic plane crossed by the moon in its orbits; to the former of which they ascribe good fortune, and to the latter, bad.

DRAGOON, a kind of light horseman, of French origin, trained to fight either in or out of the line, in a body or singly, chiefly on horseback, but, if necessary, on foot also. Experience proving that they did not

THE IDEA OF THE DRAGON IS DISTINGUISHED IN CHIVALRIC HISTORIES, ORIGINATED FROM ERRONEOUS ACCOUNTS OF THE CROCODILE.

THE ANIMAL WHICH GAVE RISE TO MANY OF THE FABLES RESPECTING DRAGONS, IS PROBABLY NO OTHER THAN THE GREAT BOA CONSTRUCTOR.

The Scientific and Literary Treasury ;

[DRA]

answer the end designed, they were hardly ever used in infantry service, and now form a useful kind of cavalry, mounted on horses too heavy for the hussars, and too light for the cuirassiers.

DRAINING, in agriculture, a method of improving the soil by withdrawing the water from it. Where the land is composed of such soils as are liable to admit and retain the excesses of moisture, they are exposed to much injury and inconvenience from the retention and stagnation of water: they consequently require artificial means to drain and render them capable of affording good crops. To effect this there are various modes, adapted to the peculiar nature of the land, its situation, &c., the true knowledge of which forms an important feature in the business of a practical agriculturist, and will well repay his care. By a judicious system of *under-draining*, large tracts of land, apparently worthless, have been brought into a state of high cultivation; nay, we have ourselves been informed, by a large landed proprietor, whose estates are situated on the northern borders of Gloucestershire, and who has paid the most sedulous attention to this practice, that the time is not very remote when some of his own land, now worth forty shillings per acre, was let for five!

DRAMA, the name of all compositions adapted to recitation and action on the stage, whether tragedy, comedy, opera, or farce; in which are displayed, for instruction and amusement, all the passions, feelings, errors, and virtues, of the human race in real life. The elements of the dramatic art are found among all nations; and every people which has made progress in civilization, has, at the same time, shewn some taste for it. The drama, says Vossius, owes its rise to the days of festivity; for in ancient times, it was usual for men, when they gathered in the fruits of the earth, to meet together that they might sacrifice to the deity, and unbend their minds from the fatigues of the harvest. Hence arose two sorts of poetry, the one grave, in praise of the gods, the other jocose and full of lampoons directed against each other. From the former arose tragedy; from the latter, satire, comedy, and buffoonery. The Europeans are indebted for the drama, as for so many other productions of civilization, to the Romans, whose acquisitions in civilization were in part preserved, and in part revived by the Italians; but the dramatic genius—who has surpassed all ancient and modern writers, in universality of conception and knowledge of human nature, appeared in the person of our own unrivalled Shakespeare. In the beginning of the middle ages, when everything noble was buried under the deluge of barbarism, the dramatic art was lost, or existed only among the lower classes of the people, in plays improvised at certain festivals; for instance, at the carnival. These were attacked as heathenish, immoral, and indecent exhibitions; but the favour which they enjoyed

among the people, and the spirit of the times, induced the clergy to encourage theatrical exhibitions of subjects from sacred history. It is impossible to ascertain the exact period when theatrical amusements were first introduced into England; but they are mentioned as having existed very early by William Fitz-Stephen, a monk of Canterbury, in his *Descriptio nobilissimæ civitatis Londonæ*, written soon after the year 1170. "London, instead of common interludes belonging to the theatre, has plays of a more holy subject; representations of those miracles which the holy confessors wrought, or of the sufferings wherein the glorious constancy of the martyrs did appear." These representations being mentioned as neither new nor uncommon, we may reasonably conclude them to be of a date still more ancient; and they continued a long time after to be the only subjects for the drama. These *Mysteries*, as they were at that time denominated, were followed by a species of the drama, styled *Moralities*, in which the senses, passions, affections, virtues, and vices, were personified, and constituted the characters: these being of a moral turn, and contrived to entertain as well as instruct, soon exhibited some dawning of poetry, with occasional attempts at wit and humour, which naturally introduced *comedy*; the earliest English piece, meriting that title, is *Gammer Gurton's Needle*, written by Dr. Stoll; performed at Christ's college, Cambridge, and printed in 1551.—The moral influence of dramatic representations on the manners of a people is far greater than may generally be supposed; and in our opinion there is no class of persons more deserving of public esteem than those censors of histrionic performances, who sit in judgment on them, and conscientiously award their praise or censure. Both dramatists and managers who endeavour to exalt the character of the stage, cannot be too highly commended or rewarded; while such as ignobly study to gratify a depraved taste, are fit objects for the severest reprobation.

DRAMATIS PERSONÆ, the characters represented in a drama.

DRASTICS, medicines which operate speedily and effectually.

DRAPEY, in sculpture and painting, the representation of the clothing of human figures; also hangings, tapestry, curtains, and most other things that are not flesh or landscape.

DRAUGHT, in architecture, the delineation of any intended building, &c.—In navigation, the depth of water necessary to float a vessel; or the depth to which a ship sinks when laden; as, a ship of ten feet draught.—*Draughts*, an amusing game played on a chequered board, like the chess-board.—*Draught hooks*, the iron hooks fixed on the cheeks of a cannon-carriage, used in drawing the gun backwards and forwards.—*Draught-horse*, a horse used in drawing carts, &c., as distinguished from a saddle-horse.

THE FIRST PATENT FOR A THEATRE WAS GRANTED TO ELLIENOR FOR DEURY-LANE, THE NEXT TO DAVENANT FOR LINCOLN'S INN FIELDS.

THE GREATEST STAIN ON OUR DRAMA IS THE PRACTICE OF ADMITTING WOMEN OF LOOSE CHARACTER—AS DISCUSSED AS IF IT WERE IMMORAL.

[DRE]

A New Dictionary of the Belles Lettres.

[DRO

THE CRUDE IDEAS WHICH DISTURB US IN OUR SLEEP, AND WHICH WE CALL DREAMS, GIVE RISE TO MUCH SUPERSTITIOUS FOLLY.

DRAWBACK, in commerce, a term used to signify the remitting or paying back of the duties previously paid on a commodity, on its being exported; so that it may be sold in a foreign market on the same terms as if it had not been taxed at all. By this device, therefore, merchants are enabled to export commodities loaded at home with heavy duties, and to sell them abroad on the same terms as those fetched from countries where they are not taxed.—In a popular sense, *drawback* signifies any loss of advantage, or deduction from profit.

DRAW, a word used in a variety of situations, and in some of very opposite meanings, but in most of its uses it retains some shade of its original sense—to pull, to move forward by the application of force, or to extend in length. It expresses an action gradual or continuous, and leisurely, yet not requiring the toil and difficulty which its kindred word *drag* implies.

DRAW'ER and **DRAW'EE**, in commerce, the drawer is he who draws a bill of exchange or an order for the payment of money; and the *drawee*, the person on whom it is drawn.

DRAWING, the art of representing the appearances of objects upon a flat surface, by means of an outline which describes their form and shadow, situation, distance, &c. [See **PAINTING**, **PERSPECTIVE**, &c.]

DRAWING-ROOM, a room appropriated for the reception of company at court; or to which, in common cases, parties withdraw after dinner. Also, the company assembled at court to pay their respects to the sovereign.

DREAM, a series of thoughts which occupy the mind of a sleeping person, and which therefore are not under the command of reason. According to Wolfius, every dream takes its rise from some sensation, and is continued by the succession of phantasms in the mind. He observes, that though it be certain, *a priori*, from the nature of the imagination, that dreams must begin by some sensation, yet that it is not easy to confirm this by experience; it being often difficult to distinguish those slight sensations, which give rise to dreams, from phantasms or objects of imagination. It has often been argued, that the state of the soul in sleep is one of the most powerful proofs of her immortality and excellence. Sleep is justly observed to be the image of death, and this temporary death, we see, does not destroy the power of thinking; the soul, indeed, seems to be deprived of the nobler faculties, but that is only caused by the still subsisting union between her and the sleeping body, which clogs and renders her less active and powerful. Her higher faculties are impeded by the indisposition of the bodily organs, and suspended by her union with them whilst they are in a dead and torpid state, and rise in perfection and vigour according as her material fetters less encumber her. Be the cause of dreams whatever it may, or the impressions which they leave on the mind ever so powerful, they never ought to create superstitious

anxiety and solicitude, nor be converted into presages and predictions at variance with the dictates of cool reason and sober judgment.

DREDG'ING, the process of catching oysters, by the removing or dragging mud with dredges, &c.—*Dredging-machine*, an engine used to take up mud or gravel from the bottom of rivers, docks, &c.

DREGS, the feculent sediment of liquors. Also waste or worthless matter; hence, figuratively, the most vile and despicable characters; as, the *dregs* of society.

DRESS, clothes worn as the covering or ornament of the body; and generally, though not always, applied to elegant attire.—*To dress*, is a military term for arranging the men in line.

DRIFT, a heap of any matter driven together; as, a drift of snow or sand.—*Drift*, in mining, a passage cut out under the earth, betwixt shaft and shaft, or turn and turn.—*Drift*, in navigation, the angle which the line of a ship's motion makes with the nearest meridian, when she drives with her side to the waves, and is not governed by the helm.—*Drift-sail*, a sail used under water, veered out right a-head by sheets, as other sails are. It serves to keep the ship's head right upon the sea in a storm, and to hinder her driving too fast in a current.—A boat is also said to *drift*, or go a *drift*, when it floats on the water without any one to row or steer it.

DRILL, in mechanics, a small instrument for making such holes as punches will not conveniently serve for. Drills are of various sizes, and are chiefly used by smiths and turners.—*To drill*, in a military sense, to teach and train raw soldiers to their duty, by frequent exercise.—*Drilling*, in husbandry, a mode of putting seed into the ground by a machine called a *drill plough*, which makes channels in the ground and lets the seed into them, so that it comes up in rows at regular distances from each other.

DROMEDARY. [See **CAMEL**.]

DRONE, the male of the honey bee. It is larger than the working bee, but less than the queen bee. The drone makes no honey; and after living a few weeks, they are killed or driven from the hive.

DROP, a small portion of any fluid in a spherical form; as, a drop of water, a drop of laudanum, &c.—The part of a gallows which sustains a criminal before he is executed, and which suddenly *drops* after the fatal cord is attached to him.—*To drop astern*, in seaman's language, is to slacken the velocity of a vessel to let another pass her.

DROP'SY, in medicine, an unnatural collection of watery humour, either throughout the whole body, or in some part of it, as the cavity of the abdomen. It occurs most frequently in persons who are debilitated by disease. The dropsy takes different names according to the part affected; as *ascites*, or dropsy of the abdomen, *hydrocephalus*, or water in the head, &c.

DRO'SERA, in botany, a genus of plants,

A NEW AND REALLY CURIOUS ART, CALLED "PHOTOGENIC DRAWING," CAME INTO NOTICE DURING THE YEAR 1839.

[DRU]

The Scientific and Literary Treasury ;

[DRY]

THE DRUIDS HAD A COMMON SUPERIOR, WHO WAS ELECTED FROM THEIR OWN NUMBER, AND WHO ENJOYED HIS DIGNITY FOR LIFE.

class 5 *Pentandria*, order 5 *Pentagynia*, they are herbaceous and of small size, and very singular in their structure. The leaves are furnished with glandulous hairs on the upper surface, and fringed round the edge: these hairs have each a small globule of pellucid liquor like dew, continuing even in the hottest part of the day, and in the full-est exposure to the sun. Hence the English name "the sun-dew." The *Drosera acutis* has a sessile flower in the bosom of the root leaves. These plants have the property of entrapping small insects within their folded leaves.

DROSOMETER, an instrument for ascertaining the quantity of dew which falls. It consists of a balance, one end of which is furnished with a plate to receive the dew, the other containing a weight protected from it.

DROVE, a number of animals collected together, and driven is one body. When merely collected, we say a herd of cattle, or a flock of sheep; but a *drove* is a herd or flock *driven*. He who drives them is called a *drover*.

DROWNING, the extinction of the vital powers, caused by immersion in a liquid. If a man, unable to swim, falls into the water, he instinctively makes every exertion to escape from it; for a time he struggles, but at last becomes exhausted, and sinks. The methods of treatment recommended by the London Humane Society for the recovery of persons in a state of suspended animation ought to be kept in every house, and known to every individual; and in all cases, medical assistance should be immediately sent for. In the mean time, avoid all rough usage, and attend to the following *cautions*: never hold the body up by the feet; nor roll the body on casks; nor rub the body with salts or spirits; nor inject tobacco-smoke or infusion of tobacco; but convey the body carefully, with the head and shoulders supported in a raised position, to the nearest house: strip the body, and rub it dry; then wrap it in hot blankets, and place it in a warm bed, in a warm chamber; put bladders or bottles of hot water, or heated bricks, to the pit of the stomach and the soles of the feet, and foment the body with hot flannels; but, if possible, immerse the body in a warm bath, as hot as the hand can bear without pain, as this is preferable to the other means of restoring warmth. Do not, however, suspend the use of the other means at the same time. These observations are recommended in the absence of a medical practitioner. He, perhaps, will see it necessary to employ electricity, injections, &c. The treatment recommended by the society is to be *persevered* in three or four hours; for it is a very erroneous opinion, that persons are irrecoverable because life does not soon make its appearance.

DRUG, a general name for substances used in medicine, sold by the druggist, and compounded by apothecaries, &c. It is also applied to dyeing materials.—In commerce, any article lying on hand, or

become unsaleable, is called a *drug*.—A *mortal* or *deadly drug*, is poison.

DRUG'GET, a coarse woollen fabric, used for covering carpets, and sometimes as an article of clothing by females of the poorer classes.

DRUIDS, the priests or ministers of the ancient Britons and Gauls, resembling, in many respects, the bramins of India. The Druids were chosen out of the best families; and were held, both by the honours of their birth and their office, in the greatest veneration. They are said to have understood astrology, geometry, natural history, politics, and geography; they had the administration of all sacred things; were the interpreters of religion, and the judges of all affairs; and, according to Cæsar, they believed in the immortality of the soul, and its transmigration through different bodies.

DRUM, a military musical instrument in form of a cylinder, hollow within, and covered at the ends with vellum, which is stretched or slackened at pleasure by the means of small cords and sliding knots. It is beat upon with sticks. Some drums are made of brass, but they are commonly of wood. There are several beats of the drum, as the *chamade*, *reveille*, *retreat*, &c.—*Drum of the ear*, the hollow part of the ear, behind the membrane of the *tympanum*; which latter is a tense membrane, closing the external passage of the ear, and receiving the vibrations of the air.

DRUNKENNESS, intoxication. Physically considered, it consists of a preternatural compression of the brain, and a decomposition of its fibres, occasioned by the fumes or spirituous parts of liquors; so that the drunkard's reason is disordered, and he reels or staggers in walking. Drunkenness appears in different shapes, in different constitutions: some it makes gay, some sullen, and some furious. Hobbes makes voluntary drunkenness a breach of the law of nature, which directs us to preserve the use of our reason. Paley calls it "a social festive vice;" and says, "the drinker collects his circle; the circle naturally spreads; of those who are drawn within it, many become the corrupters and centres of sets and circles of their own; every one countenancing, and perhaps emulating the rest, till a whole neighbourhood be infected from the contagion of a single example." Drunkenness is punishable by fine and imprisonment, and in law is no excuse for any crime committed during the paroxysm.

DRUPE, in botany, a pulpy fruit, containing a nut or stone, with a kernel like the plum, cherry, apricot, &c. Hence the epithet *drupaceous*, for fruit consisting of drupes.

DRUSE, in mining, a cavity in a rock, having its interior surface studded with crystals, or filled with water.

DRY'ADS, in the heathen theology, a sort of deities or nymphs, which the ancients thought inhabited groves and woods. They differed from the *Hamadryads*, these latter being attached to some particular tree with

DURING THE ROMAN DOMINATION IN BRITAIN THEY PERSECUTED THE DRUIDS, OWING TO THEIR GREAT INFLUENCE OVER THE PEOPLE.

[DUC]

A New Dictionary of the Belles Lettres.

[DUK]

which they were born, and with which they died, whereas the *Dryads* were goddesses of trees and woods in general.

DRY ITE, in geology, fragments of petrified or fossil wood in which the structure of the wood is recognised.

DRY ROT, a fungus which grows in timber, decomposes its fibres, and produces rapid decay. *Dry rot* is so called by architects in contradistinction only to the more usual circumstances of decay to which wood is liable: such a designation however does not appear the most eligible, as it is now sufficiently ascertained to arise only from moisture. The dry rot, then, consists in a more or less rapid decomposition of the substance of the wood from moisture deposited on it by condensation to the action of which it is more disposed in certain situations than in others, and this moisture operates more quickly on wood which most abounds with the saccharine, or fermentible principle of the sap. There are a great number of causes for this species of decay: some buildings have it from the locality of their situations, others from the nature of the material employed, and some from a too rapid finishing. When it takes place from situation, viz damp walls near the earth's surface, it is generally, if not universally, occasioned by the percolation of water from the higher adjoining grounds, which thus intercepted in its current attempts to follow the general hydrostatic law of elevating itself by the syphon line, to a height equal to that from whence it had its origin. When the cause arises from the state of the material, or from the too rapid finishing, or indeed any other stimulus, the effectual remedy is to char, or carbonize the surface of the wood. Many persons have written on this subject, and the nostrums proposed are as numerous as their authors: but no means of checking the evil can be depended upon, except that of removing the corrupted and contagious matter, and admitting a free circulation of air.

DUALISTIC, an epithet derived from the *dual* number in Greek. The *dualistic* system of Anaxagoras and Plato taught that there are two principles in nature, one active, the other passive.

DUAL, in grammar, that number which is used, in some languages, to designate two things, whilst the plural exists to express many.

DUALISM, the philosophical exposition of the nature of things by the adoption of two dissimilar primitive principles, not derived from each other.—In theology, *dualism* is the doctrine of those who maintain that only certain elected persons are capable of admission to eternal happiness, and that all the rest will be subject to eternal condemnation.

DU CAT, a foreign coin of different values, and which are either of silver or gold. The silver ducat is generally of the value of 4s 6d sterling, and the gold ducat of twice that value.

DUCATOON, a silver coin, struck chiefly in Italy, value about 4s. 8d. sterling, but

the gold ducatoon of Holland is worth twenty shillings.

DUCK'S TE CUM, (*bring with thee*), in law, a writ commanding a person to appear on a certain day in the court of Chancery, and to bring with him some writings, evidences, or other things, which the court would view.

DUCTILITY, the property of some metals, as gold, silver, copper, &c which renders them capable of being extended by hammering or drawing, without breaking. Thus a single grain of gold may be beat into an extent of several square feet, and yet the leaf remain so compact, as not to transmit the rays of light, and Dr Halley found that a small cube of gold, whose side is the 1 100th part of an inch only, contains 2,433,000 visible parts. M Reaumur shews that in the common way of drawing gold wire, a cylinder of silver 22 inches long and one and a half inch in diameter is stretched to 1,163,520 feet, or is 644,692 times longer than before, which amounts to about 97 leagues. To wind this thread on silk, for use, it is first flattened, in doing which it stretches at least one seventh further, so that the 22 inches are now 111 leagues, but in the flattening, instead of one seventh, it could be stretched one-fourth, which would bring it to 120 leagues!

DUCT, in medicine, any vessel or tube in the animal body, by which the blood, chyle, lymph, &c are carried from one part to another. Also, the vessels of plants in which the sap is conveyed.

DUCHY, the territory or dominions of a duke.

DUCKWEED, or **DUCK'S MEAT**, a plant growing in ditches and stagnant waters, and serving as food for ducks and geese.

DUL, that which one contracts to pay or perform to another, that which law or justice requires to be paid or done. Also, that which office, rank, station, or established rules of right or decorum, require to be given or performed.

DUEL, in law, was originally a combat between two persons for the trial of the truth, but is now a premeditated battle between two persons on some private quarrel, in which, if death ensue, both the principal and the seconds are guilty of murder.—An unpremeditated sudden fight is a *rencontre*.

DUENNA, an old woman who is kept to guard a younger.

DUET, or **DUETTO**, in music, a song or air in two parts.

DUKE, a sovereign prince in Germany, and the highest title of honour in England next to the Prince of Wales. His consort is called a *duchess*.—In England, among the Saxons, the commanders of armies, &c were called dukes, *duces*, without any addition, till Edward III made his son, the Black Prince, duke of Cornwall, after whom there were more made in the same manner, the title descending to their posterity. Duke, at present, is a mere title of dignity, without giving any domain, terri-

THE PARASITICAL VEGETABLE WHICH OCCASIONS THE DRY ROT IN SHIPS IS A LEATHER LICE FUNGUS, CALLED XYLSTROMA CIGANTURUM.

tory, or jurisdiction over the place from whence the title is taken

DULOC RACY a government in which slaves and the lowest order of the people have the power

DUMOSY the 43d Linnæan natural order of plants containing shrubs and bushes as the elder &c

DULCIFIED SPIRITS a term formerly applied to the distilled ethers as, the *dulcified spirits of nitre and vitriol*

DULCIMER a musical instrument played by striking brass wires with little sticks

DUMB The most general if not the sole cause of dumbness is the want of the sense of hearing; and nothing is more fallacious than the idea that the want of speech is owing to the want of mental capacity. The necessity of communication and the want of words obliges him who is dumb to observe and imitate the actions and expressions which accompany various states of mind and of feeling to indicate objects by their appearance and use and to describe the actions of persons by direct imitation or pantomimic expression. Hence what has been called the natural sign language has been adopted by instructors of the deaf and dumb in order to express all the ideas we convey by articulate sounds.

This language in its elements is to be found among all nations and has ever been the medium of communication between voyagers and the natives of newly discovered countries. The more lively nations of Europe belonging to the Celtic race, the French, Italians &c make great use of it in connexion with words and sometimes even without them. The more phlegmatic people of the Teutonic race in England and Germany are so little disposed to it that they regard it as a species of affectation or buffoonery in their southern neighbours. The method of instructing the deaf and dumb which has been most successfully employed in this country consists in teaching the pupil the relation between the names of objects and the objects themselves, the analysis of words into letters of the alphabet and the particular gesture which he is to attach to each word as its distinctive sign—showing to him also the meaning of collective words as distinguished from those denoting individual objects or parts of objects. It is out of our power to enter into details in this place but those readers who seek further information will find it in a book published in 1809 on the Instruction of the Deaf and Dumb by Dr Watson who had the management of the asylum for this purpose which was established in London in 1792. [See also the article *DEAFNESS*]

DUN of a colour partaking of a dull brown and black—*To dun* to press for the payment of money by repeatedly calling for it. Hence an importunate creditor is called a *dun*.

DUNAGE in commercial navigation loose wood laid in the bottom and against the sides of the ship's hold, in order to

prevent the cargo from being injured in the event of her becoming leaky

DUNNING a particular method of curing cod fish practised off the coast of New Hampshire in North America. It is thus described—the cod are taken in deep water, split and stack salted then laid in a pile for two or three months, in a dark store covered for the greatest part of the time with salt hay or clover grass, and pressed with some weight. In April or May they are opened and piled again as close as possible in the same dark store till July or August when they are fit for use.

DUODECIMALS in arithmetic, are numbers proceeding in a proportion of twelves in the same way as decimals proceed in a proportion of tens. This rule is used by workmen and artificers in computing the contents of their work. Duodecimals are usually taken in feet inches, and parts—*Duodenary Arithmetic* is that in which the local value of the figures increases in a twelvefold proportion.

DUODECIMO having or consisting of twelve leaves to a sheet or a book in which a sheet is folded into twelve leaves.

DUODENUM in anatomy, the first of the small intestines.

DUPLION a double cocoon formed by two or more silk worms.

DUPLICATE among mathematicians an epithet applied to a ratio where the antecedent term is double the consequent or where the exponent of the ratio is 2 thus the ratio of 8 to 4 is a duplicate ratio—*Sub duplicate ratio* is just the reverse of the former, or as 1 to 2. Such is 4 to 8 or 6 to 12.

DUPLICATE a copy or transcript—*Duplicate proportion or ratio* is the proportion of the square of one number to the square of another.

DUPPLICATION in anatomy the fold of a membrane or vessel.

DUPPLICATION the act of dissembling one's real opinions for the purpose of concealing them and misleading persons in the conversation and intercourse of life.

DURAMATER in anatomy the membrane which lies between the bones of the skull and the parts of the brain, and also dividing it into two parts.

DURESS in law is restraint or compulsion as where a person is wrongfully imprisoned or restrained of his liberty contrary to law or is threatened to be killed, wounded or beaten till he executes a bond or other writing. Any bond deed or other obligation obtained by duress, will be void in law and in an action brought on the execution of any such deed the party may plead that it was brought by duress.

DURAN in law. During as *durante brevis placit* during pleasure *durante minor aetate* during minority *durante vita*, during life.

DURRA a sort of millet cultivated in North Africa.

DUSK a middle degree between light and darkness as twilight, or the *dusk* of the evening. Hence the words *ducky, dusky news*, &c.

THE FIRST WORK EVER PRINTED FOR THE INSTRUCTION OF THE DEAF AND DUMB WAS WRITTEN BY JOHN ROBERT, A SPANARD, IN 1820

THE CELEBRATED DWARF, JEFFERY HUDSON, WAS 3 FEET 9 INCHES IN HEIGHT, BUT THE POLISH COUNT SOROWLSKI WAS ONLY 2 FEET 4 INCHES

[DYE]

A New Dictionary of the Belles Lettres.

[DYS]

IN DYING, ALUM IS MUCH USED, BECAUSE IT CLEANSER AND OPENS THE PORES ON THE SURFACE OF THE CLOTH, AND FIXES THE COLOUR

DUTY, in commerce, any tax or excise, a sum of money required by government to be paid on the importation, exportation, or consumption of goods.—In a military sense, the business of a soldier or mariner on guard.—In its universal application, *duty* includes any natural, moral, or legal obligation, as, it is the *duty* of every citizen of a state to pay obedience to its laws, obedience, respect, and kindness are the *duties* which children owe their parents.

DUUM VIRI, in Roman antiquity, a general appellation given to magistrates, commissioners, and officers, where two were joined together in the same function. The office, dignity, or government of two men thus associated, was called a *duumvirate*.

—*Duumviri capitales*, were the judges in criminal causes from their sentence it was lawful to appeal to the people, who only had the power of condemning a citizen to death.—*Duumviri municipales*, were two magistrates in some cities of the empire, answering to what the consuls were at Rome, they were chosen out of the body of the *decuriones*, their office usually lasted five years, upon which account they were frequently termed *quinquennales magistratus*.

—*Duumviri navales*, were the commissaries of the fleet. The duty of their office consisted in giving orders for the fitting of ships, and giving their commissions to the marine officers, &c.—*Duumviri sacrorum*, were magistrates created by Tarquinius Superbus, for the performance of the sacrifice, and keeping of the sibyl's books. They were chosen from among the patricians, and held their office for life; they were exempted from serving in the wars, and from the offices imposed on the other citizens, and without then the oracles of the sibyls could not be consulted.

DWARF, in general, an appellation given to things greatly inferior in size to that which is usual in their several kinds: thus there are dwarfs of the human species, dwarf trees, &c. The Romans were so passionately fond of dwarfs, that they often used artificial methods to prevent the growth of boys designed for dwarfs, by inclosing them in boxes, or by the use of tight bandages.

DYEING, the art of impregnating and giving a lasting colour to silks, cloths and other substances, whereby their beauty is much improved, and their value enhanced. Dyeing, properly so called, is a chemical process, and in order that it may succeed, it is necessary that the colouring matters should be dissolved in some fluid and that their attraction to that fluid should be less than that to the stuff. The essential circumstances in dyeing are to ascertain the affinities of the colouring substance, first, to the solvents, secondly, to those substances which modify its colour, increase its brilliancy, and strengthen its union with stuff, thirdly, to the different agents which may change the colour, and principally to air and light. In dyeing, the term *mordant* is applied to those substances which serve as intermedia between the colouring parti-

cles and the stuff to be dyed, either for the purpose of facilitating, or of modifying their combination, and by their means colours are varied, brightened, made to strike, and rendered more durable. The principal substances employed as mordants are aluminous salts, lime, metallic oxides, some astringent substances and animal matters. The three simple colours in dyeing are red, yellow, and blue, all other colours are compounded of these. The ancient Egyptians cultivated the art of dyeing with some degree of scientific precision, but Tyre was the nation of antiquity that made it the staple of its commerce, and there is little doubt that purple the sacred symbol of royal and sacerdotal dignity, was a colour discovered in that city, and that it contributed to its opulence and grandeur. The moderns have obtained from the new world several dye drugs unknown to the ancients, such as cochineal, Brazil wood, logwood, annatto, &c., but the vast superiority of our dyes over those of former times, must be ascribed principally to the employment of pure alum and solution of tin as mordants, substances which give to our common dye stuffs remarkable depth, durability and lustre.

DYNAMETER, an instrument for determining the magnifying power of telescopes.

DYNAMOMETER, an instrument for measuring the relative strength of men and other animals.

DYS CRASY, in medicine, an ill habit or vitiated state of the humours.

DYS ENTERI, in medicine, a disease in which the excrements consist chiefly of blood, mucus, and other morbid matter, accompanied with griping of the bowels, &c.

DYS ODILE, a species of coal of a greenish or yellowish gray colour, in masses composed of thin layers. Its odour when burning is very fetid.

DYS ORLXY, in medicine, a bad or depraved appetite.

DYNAMICS, the science of moving powers, particularly of the motion of bodies mutually acting on one another, investigates the laws which govern complicated phenomena as the motions of the heavenly bodies, oscillating bodies, revolving bodies, &c. under all circumstances.

DY NASTY, a race or series of princes who have reigned successively in any kingdom as the *dynasties* of Egypt or Persia.

DYTIS CUS, in entomology, a genus of insects of the coleopterous order.

DYSPEPSIA, or **DYSPEPSI**, in medicine, difficulty of digestion. Hence those who are afflicted with indigestion are termed *dyspeptic* persons. The disorder of the digestive function is the most frequent and prevailing of the ailments that afflict man in the civilized state, all classes and all ages suffer from its attacks. But the increased prevalence of dyspepsia or indigestion, in modern times, arises from the more frequent injury done to the stomach and its functions, directly, by the habits of luxurious

THE SUBSTANCES OF ARSENIC, LEAD, COPPER, ANTIMONY, &c. ARE USED WITH ADVANTAGE IN DYING VARIOUS KINDS OF STUFFS.

[EAR

indulgence, which have been exceedingly extended; and indirectly, by the multiplication of intellectual and moral agitations, from the extension of the commercial and financial operations of society, the greater activity and employment of the intellectual faculties, and the augmentation of political, social, and individual reverses.

DYSPHONY, in medicine, a difficulty of speaking, occasioned by an ill disposition of the organs of speech.

DYSPNŒA, in medicine, a difficulty of breathing.

DYSURŶ, in medicine, difficulty in discharging the urine, attended with pain and a sensation of heat.

E

E, the fifth letter in the alphabet, and the second vowel, has different pronunciations in most languages. The French have their *e* open, *e* masculine, and *e* feminine or mute. In English there are three kinds of *e*: open, as in *year*, *bear*; long, as in *here*, *mere*, *me*; and short, as in *wet*, *kept*, &c. As a final letter it is generally quiescent: but it serves to lengthen the sound of the preceding vowel, as in *mane*, *cane*, *thine*, which without the final *e* would be pronounced *man*, *can*, *thin*. In many other words the final *e* is silent, as in *examine*, *definite*, &c. As a numeral, **E** stands for 250. In sea-charts, **E** stands for East: **E** by **N**, and **E** by **S**. East by North, and East by South.

EAGLE, a rapacious fowl, of the genus *Falco*, is called, on account of his great strength and the rapidity and elevation of his flight, the king of birds. There are several species; as the sea-eagle, or ossifrage, which feeds on fish; the golden eagle, three feet long, with wings extending above seven feet, which devours fawns, lambs, kids, &c.; the cinereous eagle, common in the mountains of Europe; the crying or plaintive eagle, of Siberia and Asia; and also the bald or white-headed eagle, which preys on flesh and fish. The talons and bills of all the species are strong and terrible; their sight is keen and distant and they live to a great age.—*Eagle*, in heraldry, one of the most noble bearings in armoury, and, according to the learned in that science, ought to be given to none but such as greatly excel in courage and magnanimity.—Among the ancients, the eagle was held sacred to Jupiter, and placed on his sceptre, as the carrier of the lightning, and thereby expressive of superior dominion. In this sense he is used as the emblem and symbol of nations, princes, and armies. As the standard of an army, the eagle was first used by the Persians. Among the Romans, it was either of gold or silver, borne singly on the point of a staff, till the time of Constantine, when the empire being divided into the eastern and western, the eagle was afterwards represented with two heads. During the sway of Napoleon, the French took for their standard an eagle with his wings folded; and an eagle standing with outspread wings, is the military em-

blem of the United States of America.—The eagle is also the badge of several orders, as the black eagle and the red eagle of Prussia, the white eagle of Poland, &c.

EAGLET, a diminutive of eagle, properly signifying a young eagle.—In heraldry, when there are several eagles on the same escutcheon, they are termed eaglets.

EAGLE-STONE, in mineralogy, an argillaceous oxide of iron, varying in size from that of a walnut to a man's head; of a spherical or oval shape; having a rough surface, and being essentially composed of concentric layers. In the centre is generally a kernel or nucleus, sometimes moveable, and always differing from the exterior in colour and density. The ancients gave them the name of eagle-stones, from an idea that the eagle carried them to her nest to facilitate the laying of her eggs.

EAR, the organ of hearing; a cartilaginous substance attached to the head for conveying undulations of air to the nerves and brain. The external cartilage collects the sound into the *concha*, at the bottom of which is the *tympanum*, like the skin of a drum, and beneath the tympanum is a cavity, terminated by a tube called the *Eustachian tube*; and further on are several winding passages filled with a watery fluid, in which the nerves are situated.—*Ear*, in music, denotes that internal sense by which we perceive and judge of harmony, and distinguish musical sounds.—*Ear*, among gardeners, a name given to the leaves that first appear from the seed which differ considerably from other leaves.

EARING, in seamen's language, a small rope employed to fasten the upper corner of a sail to its yard.

EARL, a title of British nobility, between a marquis and a viscount; now the third degree of rank. William the Conqueror first made this title hereditary, giving it in fee to his nobles, and allotting them for the support of their state the third penny out of the sheriff's court, issuing out of all pleas of the shire whence they had their title. At present the title is accompanied by no territory, private or judicial rights, but confers nobility, and an hereditary seat in the House of Lords. In official instruments, they are called by the king, "trusty and well-beloved cousins," an ap-

WHEN EAGLES TAKE FLIGHT, THEY SPRING PERPENDICULARLY UPWARDS, WITH THEIR WINGS STEADILY FIXED (FOR THE SUN.

pellation as ancient as the reign of Henry IV. For some time after the Norman conquest they were called *counts*, and their wives to the present day are styled *countesses*.—The *Earl's coronet* has no flowers raised above the circle, like that of a duke and a marquis, but only points rising, and a pearl on each of them.

EARL MARSHAL OF ENGLAND, a great officer who had anciently several courts under his jurisdiction, as the court of chivalry, and the court of honour. Under him is also the herald's office, or college of arms. He has some pre-eminence in the Marshalsea court, where he may sit in judgment against those who offend within the verge of the king's court. This office is of great antiquity in England, and has been for several ages hereditary in the family of the Howards.

EARN'EST, in commercial law, money advanced by the buyer of goods, to bind the seller to the performance of a verbal bargain.

EARRING, an ornament worn at the ear, by means of a ring passing through the lobe, with a pendant of diamonds or pearls, &c. attached.

EARTH, in astronomy and geography, one of the primary planets, being the terraqueous globe which we inhabit. In remote antiquity, the earth was regarded as a flat, circular body, floating on the water: but the great distances which men were able to travel soon refuted this limited idea as an optical illusion; and the spherical form of the earth was consequently ascertained. According to the Ptolemaic system it was supposed to be immovable in the centre of the universe; but according to that of Copernicus it moves from west to east, so as to occasion the succession of day and night, and also annually round the sun, so as to cause the different seasons. By some of the ancients its form was supposed to be like that of an oblong cylinder; by others, of the form of a drum; and by others, a plane surface. Succeeding ages have, however, demonstrated it to be nearly spherical; and among other considerations for this theory, the following are given:

1. All the appearances of the heavens, both at land and at sea, are the same as they would be if the earth were a globe.
2. In eclipses of the moon, which are caused by the shadow of the earth falling upon the moon, this shadow is always circular, and a body can be no other than a globe, which in all situations casts a circular shadow.
3. Several navigators have sailed quite round the globe, steering their course directly south and west till they came to the Magellanic sea, and from thence to the north and west, till they returned to their port from the east; and all the phenomena which should naturally arise from the earth's rotundity, happened to them. How, indeed, could the earth appear, from every possible position, as a surface bounded by the firmament, if it were not a sphere encircled by it? How else could the horizon grow wider and wider, the higher our

position? Or how could the fact be explained, that we see the tops of towers and mountains, at a distance, before the bases become visible? It is true, the surface of the earth is not an exact geometrical globe, but then the inequalities are so inconsiderable, that the highest mountain bears no greater proportion to the bulk of the earth, than a grain of dust does to a common globe. The figure of the earth then was reckoned by mathematicians and geographers as perfectly spherical, excepting the small inequalities in its surface, of mountains and valleys, till it engaged the attention of Sir Isaac Newton and Mr. Huygens, who demonstrated from the laws of hydrostatics, and the revolution of the earth about its axis, that its figure was not a true sphere, but an oblate spheroid flattened towards the poles. Various measurements have since put this beyond all doubt.

—*Size of the Earth.* Not only the figure of the earth has been ascertained, but its *magnitude*; and it is found that its diameter is equal to 7,958 miles in length: circumference 25,000: superficies 198,944,206 square miles: solidity 26,393,000,000 cubic miles. It is also imagined that the unexplored portions of the earth and seas contain 160,522,026 square miles, and the inhabited part of the earth is equal to 38,422,180, in the following proportions, viz. in Europe, 4,456,065; in Asia, 10,968,423; in Africa, 9,654,817; America, 14,142,875.—The *exterior surface* of the earth consists of granite and primary mountains, which slope beneath the general surface; while that surface consists of rocks and strata of later formation, or of mixed soil and ruins of rocks, which appear to have been often displaced by the sea; the great accumulation of which, in the southern hemisphere, leads to a supposition that the sea alternately preponderate in each hemisphere. The *interior* of the earth is entirely unknown to us, as the depth to which we have been able to penetrate is nothing in comparison with its diameter: it is useless therefore to speculate on the various hypotheses regarding its formation.—*Motion of the Earth.* The earth has a triple motion.

1. A diurnal motion round its own axis, from west to east, in 24 hours, which occasions the perpetual succession of days and nights.
2. An annual motion round the sun in a year, which produces the different seasons, and the lengthening and shortening of days.
3. That motion by which the poles of the world revolve about the poles of the ecliptic, and occasion what is commonly called the precession of the equinoxes, or more properly, the retrogression of the earth's nodes.—The theory of the motion of the earth has become memorable in the history of the human mind, showing, as it does, a marked ability in man to resist the impressions produced by appearances, and to believe the contrary of that which had been believed and taught for many centuries. The invention of the telescope, by means of which the rotation of Jupiter was soon observed, but still more

Newton's discovery of universal gravity, and of the nature of the celestial motions, established the theory of the earth's motion, and, in modern times, no man of intelligence any longer doubts it.

EARTHENWARE, or POTTERY. Under the head "CHINA WARE" will be found such observations as would be perfectly applicable here we therefore beg to refer to it. We shall, however, devote a few sentences to the state of its manufacture in this country, particularly as regards its rise and present importance in the district called the Potteries in Staffordshire. The Potteries comprise a number of villages, with a population amounting to above 60,000, by far the greater proportion of which is engaged in the manufacture, and it is believed that when Mr Wedgwood began his discoveries and brought forward his improvements there in 1760, the population was scarcely one third of that number. The best clay from which the Staffordshire ware is made, comes from Dorsetshire, and a second quality from Devonshire. It is composed of about 24 parts of alumine, and 76 of silica, with some other ingredients in very small proportions. This clay is very refractory in high heats, a property which, joined to its whiteness when burned, renders it peculiarly valuable for pottery. It is also the basis of all the yellow biscuit ware called "cream colour," and in general of what is called the "printing body," as also for the semi vitrified porcelain of Wedgwood's invention, and of the tender porcelain. It is estimated that the value of the different sorts of earthenware produced at the Potteries may amount to 1,600,000*l* a year, and that the earthenware produced at Worcester, Derby, and other parts of the country, may amount to about 700,000*l*, making the whole value of the manufacture 2,300,000*l* a year. It has with great truth been said, that there is scarcely any manufacture which is so interesting to contemplate in its gradual improvement and extension as that of earthenware, presenting, as it does, so beautiful a union of science and art, in furnishing us with the comforts and ornaments of civilized life. Formed from substances originally of no value, the fabrication has induced labour of such various classes, and created skill of such various degrees, that nearly the whole value of the annual produce may be considered an addition made to the mass of national wealth.

EARTH QUAKE, a concussion or vibration of the ground, usually preceded by a rattling sound in the air, or by a subterraneous rumbling noise, and sometimes accompanied by rents, and by shaking of the surface, so as to swallow up towns and tracts of country. At one time it is hardly perceptible, at another, it is so violent, that it not only demolishes the works of art, but changes the appearance of the ground itself. Sometimes the surface of the ground remains unbroken, sometimes it bursts open into clefts and chasms, and then occasionally appears the phenomenon

of the eruption of gases, and also of flames, with the ejection of water, mud, and stones, as in volcanic eruptions. Volcanoes are, indeed, only so many spiracles serving for the discharge of this subterranean fire, when it is thus assembled, and where there happens to be such a structure and conformation of the interior parts of the earth, that the fire may pass freely and without impediment from the caverns therein, it gathers into these spiracles, and then readily and easily gets out from time to time without shaking or disturbing the earth but where a communication is wanting, or the passages are not sufficiently large and open, so that it cannot come at these spiracles, without first forcing and removing all obstacles, it heaves up and shakes the earth, till it makes its way to the mouth of the volcano, where it rushes forth, sometimes in flames of vast volume and velocity. Earthquakes are sometimes confined to a narrow space, which is properly the effect of the reaction of the fire, and they shake the earth just as the explosion of a powder-magazine causes a sensible concussion at the distance of several leagues. These observations furnish grounds for the conclusion that earthquakes cannot proceed from extrinsic causes, but arise from certain powers operating within the circumference or crust of the earth. The subterranean, thunder like noises, the shaking, raising, and bursting asunder of the earth, the emission of fire and flames, and the ejection of mineral substances, all occur, occasionally, in earthquakes as well as in volcanic eruptions, even when at a distance from active volcanoes. All the observations, in fact, that have been made, tend to prove, that earthquakes and volcanic eruptions are effects of the same chemical process (so to speak), which must have its seat at a great depth beneath the earth's surface.

EARTH ING, in agriculture and gardening, signifies the covering of shrubs and plants, as vines, celery, &c with earth.

EARTH NUT, a kind of plant, the pods or nuts of which ripen under ground. The nuts yield a quantity of oil.

EARTH WORM, a worm bred under ground, being the common species of the worm.

EARTHS, in a popular sense, may be considered those solid bodies composing the mineral strata, which are incombustible, colourless, not convertible into metals by all the ordinary methods of reduction, or, when reduced by scientific experiments, possessing but an evanescent metallic existence. But, to describe *earths* according to the rules of chemical science, we should say, that they are tasteless, odourless, unflammable substances, occurring in intimate union with each other, and with various acids and metallic oxides. Under these circumstances, they constitute by far the greatest part of the strata, gravel, and soil, forming the mountains, plains, and valleys of our globe. Their number is ten, and their names are *silex*, *alumina*, *magne-*

EARTHQUAKES ARE GENERALLY MOST SEVERE IN NON-VOLCANIC COUNTRIES, THOUGH THEY MOST FREQUENTLY OCCUR WHERE VOLCANOES EXIST.

THE ROCKS IN WHICH METALLIC VEINS ARE SITUATED, DO NOT, ON ANALYSIS, CONTAIN A PARTICLE OF THE METAL THEY ENCLOSE.

A New Dictionary of the Belles Lettres.

[KAS]

sia, lime, barytes, strontites, zircon, glucine, yttria, and thorina; the properties of which we have noticed in their several places. The earths were regarded as simple bodies until the brilliant researches of Sir H. Davy proved them to be compounds of oxygen with peculiar bases.

EAR' TRUMPET, an instrument used by persons partially deaf, to strengthen the sensation of sound, by collecting and conducting it through a funnel-shaped tube to the seat of the sense of hearing.

EAR'WIG, in entomology, the *Forficula auricularia*, an insect with sheath wings, which was formerly imagined to creep into the ear, but this idea does not appear to be borne out by the fact. If, however, such should happen, a piece of an apple applied to the orifice is said to entice the insect, and thus relieve the sufferer; or where this fails, a few drops of sweet oil will destroy the life of the earwig, which must then be carefully extracted with a proper instrument.

EASEL, a wooden frame on which a painter sets the cloth, &c. to be painted.

Easel-pieces, such pieces as are painted on easels, in distinction to those painted on ceilings, &c.

EASEMENT, in law, a privilege or convenience which one man has of another, whether by charter or prescription, without profit; such as a way through his lands, &c.

EASING, in sea language, the slackening a rope, &c.; thus, to ease the bow-line or sheet, is to let them go slack; to ease the helm, is to let the ship go more before the wind, or more larboard.

EAST, one of the four cardinal points of the world; being that point of the horizon where the sun is seen to rise when in the equator.—The word *east* is indefinitely used when we speak of countries which lie eastward of us, as Persia, India, China, &c.—In Christian churches, which are generally built east and west, the chancel stands at the east end, with an emblematic reference to Christ, who is called the Sun of Righteousness and the Day spring.

EASTER, a solemn festival observed among Christians, in commemoration of Christ's resurrection. The Greeks and Latins call it *pascha*; a Hebrew word, applied to the Jewish feast of the passover, to which the Christian festival of Easter corresponds. Thus, St. Paul says (1 Cor. v. 7.), "For even Christ our passover is sacrificed for us." This feast was fixed by the council of Nice, in the year 325, to be held on the Sunday which falls upon or immediately after the full moon which happens next after the twenty-first of March; and as such it stands in the rubric of the church of England.—The English name *Easter*, and the German *Ostern*, are supposed to be derived from the name of the feast of the Teutonic goddess *Ostera*, celebrated by the ancient Saxons early in the spring, and for which, as in many other instances, the first missionaries wisely substituted the Christian festival.

EASTERLING, a coin struck by Rich-

ard II., which is supposed to have given rise to the name of sterling, as applied to English money.

EASTER-OFFERINGS, or **EASTER-DUES**, small sums of money paid to the parochial clergyman by the parishioners.

EAST-INDIA COMPANY,—"the Governor and Company of Merchants of London trading to the East Indies,"—the most celebrated commercial association either of ancient or modern times, which has extended its sway over the whole of the Mogul empire,—was incorporated about the 42nd of queen Elizabeth, A.D. 1600, and empowered to trade to countries to the eastward of the Cape of Good Hope, exclusive of all others. A variety of causes had been long operating in favour of such an incorporation. Several very valuable East India ships had been taken from the Portuguese and Spaniards by the English fleets, and awakened the cupidity of our merchants to the obtaining a share in a traffic which promised such great advantages. At length, in 1598, an armament fitted out for the East Indies by Sir Walter Raleigh, and commanded by Sir John Borroughs, fell in, near the Azores, with the largest of all the Portuguese carracks, a ship of 1600 tons burden, carrying 700 men and 36 brass cannon; and, after an obstinate conflict, carried her into Dartmouth. She was the largest vessel that had been seen in England; and her cargo, consisting of gold, spices, calicoes, silks, pearls, drugs, porcelain, ivory, &c., excited the ardour of the English to engage in so opulent a commerce. About the year 1698, application being made to parliament by private merchants, for laying this trade open, an act passed empowering every subject of England, upon raising a sum of money, for the supply of the government, to trade to those parts. A great subscription was accordingly raised, and the subscribers were styled the *New East-India Company*; but the old establishment being in possession of all the forts on the coast of India, the new one found it its interest to unite; and both, trading with one joint stock, have ever since been known under one name, viz. *The United East-India Company*. Many and severe have been the contests between the advocates of a free trade to India, and the friends of the "incorporated company;" but at length the long-supported monopoly of that powerful body yielded to the act 3 and 4 Will. 4. c. 85., for continuing the charter till 1854, which, in fact, has put a limit to the Company's commercial character, by enacting that its trade to China was to cease on the 22nd of April, 1834, and that the Company was, as soon as possible after that date, to dispose of their stocks on hand, and close their commercial business. The functions of the East-India Company are now, therefore, wholly political. She is to continue to govern India, with the concurrence and under the supervision of the Board of Control, till the 30th of April, 1854.—"The territorial revenues at the disposal of the

THE CONCERNS OF THE EAST INDIA COMPANY ARE GOVERNED BY TWENTY-FOUR DIRECTORS IN COMMITTEE, SIX OF WHOM GO OUT EVERY APRIL.

THE NATIVE ARMY OF THE EAST INDIA COMPANY, DISCIPLINED IN EUROPEAN TACTICS, IS ABOUT 150,000 CAVALRY AND INFANTRY.

IN THE TIME OF THE ANGLO SAXONS, THERE WAS NO DISTINCTION BETWEEN THE CIVIL TRIBUNALS AND THE ECCLESIASTICAL JURISDICTION.

East-India Company (says Mr McCulloch) have, for a lengthened period, equalled those of the most powerful monarchies. At present they are greater than those of either Russia or Austria, being inferior only to those of Great Britain and France! Still, however, the Company's financial situation is the very reverse of prosperous. Vast as their revenue has been, their expenditure appears, in most instances, to have been still larger, and at this moment their debts exceed 60,000,000! " Let us now take a glimpse of it as it existed in the days of imperial Rome. In the age of Nero, the East India trade was carried on by the river Nile, the merchandize proceeded in caravans to the Red Sea, where it was embarked for the Indian Ocean. The specie annually carried from Rome, upon this account, according to Pliny's computation, amounted to about 300,000! sterling, and the usual return, which arrived in December and January, yielded, in clear gain, a hundred for one!

EAU DE COLOGNE, a far famed fragrant liquid, resorted to by the votaries of fashion, in this and many other countries, as a panacea against ailments of every kind, and it consequently forms an expensive companion of the toilet. It is nothing more or less than alcohol highly aromatized, but the ingredients are numerous, and should be compounded with great nicety.

EAU DE LUCE, a volatile preparation, made of white soap dissolved in alcohol, and the solution mixed with the spirit of sal ammonia.

EAVES, the edges of the roof of a house, which overhang the wall, for the purpose of throwing off the water.

EAVES DROPPER, one who skulks under the eaves of houses, for the purpose of listening to what passes within.

EBB, the retirement or reflux of the tide.

EBONY, a hard, heavy, durable, black wood, which admits of a fine polish. It is the wood of the *Diospyros ebenus*, or eben tree, which grows in India, Madagascar, Ceylon, and the Mauritius. It is wrought into toys, and used for mosaic and inlaid work.

EBOULEMENT, in fortification, the crumbling or falling away of a wall or rampart.

EBRACTEATE, in botany, without a bractee or floral leaf.

EBULLITION, either the operation of boiling, or the effervescence which arises from the mixture of an acid and alkaline liquor.

ECAU DATE, in botany, an epithet for plants which have no tail or spur.

EC BASIS, in rhetoric, those parts of the proemium in which the orator treats of things according to their events or consequences.

EC BOLE, in rhetoric, a digression whereby the speaker introduces some other person speaking in his own words.

EC CE HOMMO, (Latin), "Behold the man!" a pointing which represents our Saviour, with a crown of thorns on his

head, given up to the people by Pilate. The title of it is taken from Pilate's exclamation, John xix 5.

ECCLN'TRIC, in geometry, a term applied to circles and spheres which have not the same centre, and consequently are not parallel.—It also denotes a deviation from usual practice or established forms, as *eccentric conduct*—*Eccentric circle*, in astronomy, the circle that circumscribes the elliptical orbit of the planet.

ECCENTRI CITY, in astronomy, the distance between the sun and the centre of the eccentric.

ECCHYMOISIS, in medicine, an appearance of livid spots on the skin occasioned by an extravasation of the blood from a vein between the flesh and skin.

ECCLES'ANS, an epithet formerly given to those who stood up for the spiritual authority of the church in opposition to the civil power.

ECCLESIASTES, a canonical book of the Old Testament, the design of which is to show the vanity of all sublunary things. The generality of commentators believe this book to be the produce of Solomon's repentance, after having experienced all the follies and pleasures of life.

ECCLESIASTIC, a person in orders, one who is consecrated to the service of the church and the ministry of religion.

ECCLESIASTICUS, an apocryphal book of Scripture, so called from its being read in the church, (*ecclesia*) as a book of piety and instruction, but not of infallible authority. The author of this book was a Jew, called Jesus the son of Sirach. The Greeks call it the wisdom of the son of Sirach.

ECOPROTIC in medicine, a mild cathartic. Any medical preparations having the quality of promoting gentle alvine discharges are so called.

ECHOLON, a term in military tactics borrowed from the French, signifying the position of an army with one division more advanced than another, somewhat like the steps of a ladder. A battalion, regiment, &c. marches *en echelon*, if the divisions of which it is composed do not march in one line but on parallel lines. The divisions are not exactly behind each other, but each is to the right or left of the one preceding, so as to give the whole the appearance of a stairway. This order is used if the commander wishes to bring one part of a mass into action, and to reserve the other. The word *literally* means a ladder or stairway.

ECHINATE, or **ECHINATID**, a term given to whatever is prickly or like the hedgehog, having sharp points, bristled.—In botany, an epithet for the seeds of plants that are rough and prickly, also for the pericarp of some plants.

ECHINITE, a fossil called *centronia*, frequently found in chalk pits, a calcareous petrification of the echinus or sea hedgehog.

ECHINOFS, or (globe thistle, in botany, a genus of plants, class 19 *Syngetes*, or der 5 *Polygama aggregata*, the flower of which is compound, consisting of a great

- THE NORMAN CONQUEST, WILLIAM I. IN THE INSTANCE OF THE CURE, SEPARATED THE ECCLESIASTICAL FROM THE CIVIL TRIBUNALS.

[ECH]

A New Dictionary of the Belles Lettres.

[ECL]

number of floscules or small flowers, divided into several acute segments.

ECHNOPHORA, in botany, a genus of the *pentandria-digynia* class of plants, the corolla of which consists of five unequal petaloid petals.

ECHINUS, in ichthyology, a shell-fish set with prickles or spines; a genus of *Mollusca*. The *Echinus esculentus*, or edible sea-egg, is common on the coast of Europe, and is esteemed as an article of food. There are several species of the echinus, which have an orbicular, oval, or globular body, covered with spines. By means of these spines the animals change their position, and move from place to place. They are said to retreat to deep water on the approach of a storm, and preserve themselves from injury by attaching themselves to submarine bodies.—With botanists, a prickly head or top of a plant.—In architecture, a member or ornament near the bottom of the Ionic, Corinthian, and Composite capitals; so named from its roughness.

ECHIUUM, or Viper's-bugloss, in botany, a genus of plants, class 5 *Pentandria*, order 1 *Monogynia*. The species are shrubs: the flower consists of a single petal, the tube being very short, and the limb erect, growing gradually wider at the extremity, where it is divided into five unequal segments.

ECHO, a sound reflected or reverberated from some hard surface, and thence returned or repeated to the ear. As the undulatory motion of the air, which constitutes sound, is propagated in all directions from the sounding body, it will frequently happen that the air, in performing its vibrations, will impinge against various objects, which will reflect it back, and so cause new vibrations the contrary way: now if the objects are so situated as to reflect a sufficient number of vibrations back, viz. such as proceed different ways, to the same place, the second will be there repeated, and is called an echo; and the greater the distance of the object is, the longer will be the time before the repetition is heard: and when the sound, in its progress, meets with objects at different distances, sufficient to produce an echo, the same sound will be repeated several times successively, according to the different distances of these objects from the sounding body, which makes what is called a *repeated echo*. Echoes are not, however, caused by a mere repulsion of the sonorous particles of air, for then every hard substance would produce an echo; but it is supposed to require a certain degree of concavity in the repelling body, which collects several diverging lines of sound, and concentrates them in the place where the echo is audible, or, at least, reflects them in parallel lines, without weakening the sound, as a concave mirror collects in a focus the diverging rays of light, or sometimes sends them back parallel. The celebrated echo at Woodstock, in Oxfordshire, repeats the same sound fifty times. But the most singular echo we have ever heard of is that near Rosneath, a few miles from

Glasgow. If a person placed at a proper distance from this echo plays eight or ten notes of a tune with a trumpet, they are correctly repeated by the echo, but a third lower; after a short pause, another repetition is heard, in a lower tone; and then, after another interval, a third repetition follows in a still lower tone.—As the reflection of sound depends on the same laws as those which regulate the reflection of light, on which the science of catoptrics depends, the doctrine of echoes is sometimes called the *catoptrics of sound*: the place of the sounding body is called the *phonic* centre, and the reflecting place or object, the *phonocampic* centre.—Echo, in architecture, any vault or arch constructed so as to produce an artificial echo. These are generally of a parabolic or elliptic form: of this kind is the whispering-gallery in St. Paul's cathedral.—*Echo*, in poetry, a sort of verse which returns the sound of the last syllable, the elegance of which consists in giving a new sense to the last words.

ECHOMETER, among musicians, a kind of scale or rule, serving to measure the duration and length of sounds, and to find their intervals and ratios.

ECLAIRCISSEMENT, the clearing up of any thing not before understood.

ECLAMPISIS, in medical science, scintillations or flashings of light which dart from the eyes; a symptom of epilepsy.

ECLAT, (French), a burst of applause; renown or approbation following some action or event.

ECLGNM, a medicine made by the incorporation of oil with syrups.

ECLECTICS, those philosophers who, without attaching themselves to any particular sect, select whatever appears to them the best and most rational from each.—The *Eclectics* were a sect of Greek philosophers who endeavoured to mould the doctrines of Pythagoras and Plato, and blend them with the theology of the Egyptians, and the tenets of Zoroaster. They borrowed many of the principal truths of Christianity from the catechetical school of Alexandria, and blending these with the mysticism of Pythagoras, the errors of Plato, and the superstition of Egypt, they hoped to reconcile the Christians and Pagans to the same opinions.

ECLIPSE, in astronomy, an interception or obscuration of the light of the sun, moon, or other luminary, by the interposition of another heavenly body between it and our sight. An eclipse of the sun is caused by the intervention of the moon, which totally or partially hides the sun's disc; an eclipse of the moon is occasioned by the shadow of the earth, which falls on it and obscures it in whole or in part, but does not entirely conceal it. In endeavouring to understand the true nature of eclipses, the mind must figure to itself the body of the sun, irradiating the earth on one side of its globe, which, being a solid body, intercepts the rays, and therefore projects a long shadow from its opposite side: now, when the moon happens to

IS A REAL ECHO, THE FIRST SOUND IS FROM NEAR SURFACES; THE SECOND, OR REPEATED ECHO, FROM SURFACES AT A DISTANCE.

THE DARK OR CENTRAL PART OF THE MOON'S SHADOW, IS CALLED THE "UMBRA;" THE LIGHTER PART IS CALLED THE "PENUMBRA."

[ECP]

The Scientific and Literary Treasury ;

[EDI]

POLITICAL ECONOMY HAS BEEN SO MISUNDERSTOOD BY DABBLERS IN THE SCIENCE, THAT IT HAS GIVEN RISE TO THE WILDEST THEORIES.

come in a line with this shadow, it falls upon her, and she is eclipsed. An eclipse of the moon is *partial*, when only a part of its disc is within the shadow of the earth ; it is *total*, when all its disc is within the shadow ; and it is *central*, when the centre of the earth's shadow falls upon the centre of the moon's disc. As the moon is actually deprived of her light during an eclipse, every inhabitant upon the face of the earth, who sees the moon, sees the eclipse. An eclipse of the sun, as we have said, happens when the moon, passing between the sun and the earth, intercepts the sun's light ; and the sun can only be eclipsed at the new moon, or when the moon, at its conjunction, is in or near one of its nodes. An eclipse of the sun begins on the western side of his disc, and ends on the eastern ; and an eclipse of the moon begins on the eastern side of her disc, and ends on the western.—The ancient Greeks and Romans had frightful ideas of eclipses, supposing them presages of the most dismal events. At Rome it was not allowed to speak publicly of any natural causes of eclipses.

ECLIPTA, a genus of plants, class 19 *Syngenesia*, order 2 *Polygamia-superflua*. The species are all annuals.

ECLIPTIC, in astronomy, the sun's path ; or, a great circle of the celestial sphere, supposed to be drawn through the middle of the zodiac ; or it may be defined, that circle of stars in the heavens, through which the earth would appear to move, if it were seen from the sun. The axis of the earth is, however, not perpendicular to the plane or level of the ecliptic, but declines from the perpendicular 23 degs. 28 min., which position it maintains throughout the orbit, causing the variations in the length of the day, and the four seasons.—*Ecliptic*, in geography, a great circle on the terrestrial globe, not only answering to, but falling within the plane of the celestial ecliptic.

ECLIOGUE, in poetry, a pastoral composition, in which shepherds are introduced conversing with each other, as the *eclogues* of Virgil. It is also used to denote any little elegant composition, written in a simple natural style and manner.

ECONOMY, the frugal expenditure of money, with the prudent management of all the means by which property is saved or accumulated. It also means, a judicious application of time and labour. In a more extended sense, it denotes the regulation and disposition of the affairs of a state or nation, which is called *political economy*. And it is likewise applied to the regular operations of nature in the generation, nutrition, and preservation of animals or plants ; as, *animal economy*, *vegetable economy*.

ECPHONESIS, in rhetoric, a figure of speech used by an orator to give utterance to the warmth of his feelings.

ECPHRACTIC, in medicine, that which has the property of dissolving or attenuating viscid matter and of removing obstructions.

ECPHYSE'SIS, in medicine, a quick breathing.

ECPIESMA, in medicine, a fracture of the cranium when the bones press inwardly on the membranes of the brain.

ECPLEX'IS, in medicine, that state of motionless stupor in which a person appears to lie when in a trance.

ECRITH'MUS, in medicine, a term applied to pulses which are entirely out of order.

ECSTASY, that state of the mind in which the functions of the senses are either suspended or transported with raptures, by the contemplation of some extraordinary object.—In medicine, a species of catalepsy, when the person remembers, after the paroxysm is over, the ideas he had during the fit.

ECSTATICI, a sort of diviners amongst the Greeks, who for a considerable time lay in trances, deprived of all sense and motion, but when they returned to their former state, gave strange accounts of what they had seen and heard during their absence from the body.

ECTROPIUM, in surgery, is when the eye-lids are inverted, or retracted, so as to show their internal or red surface, and cannot sufficiently cover the eye. Sometimes this is a simple or original disorder, and sometimes only a symptom, or consequence of another, as an inflammation, tumour, &c.

ECTYPE, a word sometimes used by antiquarians, signifying an impression of a medal, seal, or ring, or a figured copy of an inscription or other ancient monument.

EDDY, a current of water running in a contrary direction to the main stream.—*Eddy-tide*, or *Eddy-water*, the water which runs back contrary to the tide ; or that which falls back on the rudder of a ship under sail, called *dead-water*.—*Eddy-wind*, the wind returned or beat back by any obstruction.

ED'ELITE, in mineralogy, a siliceous stone of a light gray colour.

EDEM'ATOUS, or **EDEM'ATOUS**, in medicine, an epithet denoting a white, soft, and insensible tumour.

EDGE, in a general sense, denotes the side or border of any thing ; but is more particularly used for the sharp side of some weapon, instrument, or tool ; as the *edge* of a sword, razor, &c.

EDGINGS, in gardening, the series of small but durable plants, set round the edges or borders of flower-beds, &c. ; as, an *edging* of box.

EDICT, an order issued by a prince to his subjects, as a rule or law requiring obedience. In Roman history we frequently meet with the edicts of the emperors and the edicts of the praetors, containing notices to the people in what manner they intended to execute the laws.—*Edictum perpetuum* was a collection of all the laws which had been yearly published by the praetors in their edicts. It was so called because it was intended to continue in

THE ROMAN PRÆTORS RETAINED THEIR PRIVILEGE OF ISSUING EDICTS, TILL ALL LEGISLATIVE POWER FELL INTO THE HANDS OF THE EMPERORS.

A New Dictionary of the Belles Lettres.

[EDU]

for ever, and serve as a guide and rule in the administration of justice throughout the empire.

EDITION, one impression of any book, or the whole number of copies published at once; as the twelfth *edition*.

EDITOR, a person who revises, corrects, and prepares a book for publication; or who furnishes the most important matter, and superintends the literary arrangement of a newspaper, &c.—That which pertains to an *Editor* is termed *editorial*; and his duty is called *editorship*.

EDUCATION. This word has a most comprehensive signification, embracing subjects pregnant with interest to every civilized being; yet we may safely affirm, that nothing within the range of human intellect is more imperfectly understood, or gives rise to so much senseless disputation. Nothing, in fact, is more shackled by prejudices, more perverted by fanciful theorists, or more abused by the unblushing effrontery of ignorant and artful empirics, than **Education**. By the magic power of this all-absorbing topic, the pseudo-politician essays to reach the envied pinnacle of popularity; it serves the restless demagogue as an alibi for his sedition; while notorious charlatans, whose projected "systems" of instruction are as rife as they are ridiculous, diligently ply with crafty bubble-mongers, till some amorphous scheme for plundering the credulous public appears, under the specious device of National Education!—It is not too much, then, to assume, that according as this intellectual nutriment is administered, it becomes the germ of happiness, or misery, to the human race; and hence arises our regret to see it so basely prostituted.—In the ordinary sense of the word, it embraces all that series of instruction and discipline, in literature, in arts, and in science, by which the understanding is enlarged, and the manners and habits of youth formed for society. But there is a still more important feature in education—one which involves a higher duty—the duty of imbuing the youthful mind with sound principles in religion, morals, and obedience to the laws. Without these, social virtue ceases to exist, patriotism degenerates into factious discontent, and the path of life is ever after beset with thorns and briars. Were we satisfied that it was in our power to write such an essay on education as the theme deserves, a niche in this volume would not afford sufficient space for us to do the subject justice; but, independently of this, we are not ashamed to confess that it infinitely transcends our utmost ability. We will, however, embrace the present opportunity of quoting a few detached passages from the writings of Dr. Vicesimus Knox, a man whose profound erudition and varied acquirements peculiarly fitted him for the office of a Mentor. "There are, he observes, two kinds of education; one of them confined, the other enlarged; one which only tends to qualify for a particular sphere of action, for a profession, or an official employment; the other, which

endeavours to improve the powers of the understanding for their own sake; for the sake of exalting the endowments of human nature, and rendering it capable of sublime and refined contemplation. It constitutes a broad and a strong basis, on which any kind of superstructure may afterwards be raised. It furnishes a power of finding satisfactory amusement for those hours of solitude, which every man must sometimes know, in the busiest walks of life; and it constitutes one of the best supports of old age, as well as the most graceful ornaments of manhood. Even in the commercial department it is greatly desirable; for besides that it gives a grace to the man in the active stage of life, and in the midst of his negotiations, it enables him to enjoy his retreat with elegance, when his industry has accumulated an ample fortune. * * * I most anxiously wish that a due attention may be paid to my exhortations, when I recommend great and exemplary diligence. All that is excellent in learning depends upon it. And how can the time of a boy, or young man be better employed? It cannot be more pleasantly: for I am sure that industry, by presenting a succession of various objects, and by precluding the listlessness of inaction, renders life at all stages of it agreeable, and particularly so in the restless season of youth. It cannot be more innocently, for learning has a connection with virtue; and he whose time is fully engaged, will escape many vices and much misery. It cannot be more usefully; for he who furnishes his mind with ideas, and strengthens his faculties, is preparing himself to become a valuable member of society, whatever place in it he may obtain. * * *

The truth is, that polite learning is found by experience to be friendly to all that is amiable and laudable in social intercourse: friendly to morality. It has a secret, but powerful, influence in softening and meliorating the disposition. True and correct taste directly tends to retrain the extravagances of passion, by regulating that nurse of passion, a disordered imagination. Indeed, however highly I estimate knowledge, and however I admire the works of a fine fancy; yet I will not cease to inculcate on the minds of studious youth, that goodness of heart is superior to intellectual excellence, and the possession of innocence more to be desired than taste. At the same time I cannot help feeling and expressing an ardent wish, that those amiable qualities may always be combined, and that the noblest of all sublimary objects may more frequently be produced, an accomplished man! a character, perfectly polite, yet neither vain, affected, nor superficial; elegantly and deeply learned, yet neither sceptical nor pedantic; that a graceful manner and a pleasing address may be the result; not of artifice but of a sincere and a benevolent heart; and that all the lovely and valuable qualities, whether exterior or internal, may operate in augmenting the general sum of human happiness, while they advance the dignity, and

THE ENQUIRER OF A CHILD OUGHT TO BE ANSWERED READILY; FOR BY THAT MEANS HE WILL OFTEN BE EXCITED TO THE PURSUIT OF KNOWLEDGE.

NEVER START WITH THE CREDULITY OF CHILDREN, BY ANSWERING THEIR INNOCENT QUESTIONS IN A LUDICIOUS, UNSATISFACTORY, OR DECEITFUL MANNER.

[EDU]

The Scientific and Literary Treasury ;

increase the satisfactions, of the individual. * * * It is no wonder that visionary writers on education are greatly admired, though their directions can seldom be pursued. Innovation is indeed found to be so agreeable to the human mind, and is received by the unexperienced and injudicious with such avidity, that it becomes expedient to stand up in defence of those established practices, which, besides that they were originally reasonable, have been countenanced and supported by the uniform decisions of long experience. * * *

I am the rather induced to defend that discipline which lays the foundation of improvement in ancient learning, because I think, and am not singular in the opinion, that not only the taste, but the religion, the virtue, and, I will add, the liberties of our countrymen, greatly depend upon its continuance. True patriotism and true valour originate from that enlargement of mind, which the well-regulated study of philosophy, poetry, and history, tends to produce, and if we can recal the ancient discipline, we may perhaps recal the generous spirit of ancient virtue. * * *

With the foregoing extracts we might very properly conclude, but we are tempted to proceed, and we trust that the sound and wholesome remarks, which we thus glean, will make ample amends for the unusual length to which this article is extended. "When I turn my attention to my own country," says the venerable author, "I am willing to indulge the pleasing idea, that I see something in the national character of Englishmen, similar to the spirit of an ancient Roman. Of the Roman, a gravity and a dignity were the striking features. I mean not the disgusting severity of a puritanical exterior, but that respectable appearance, which naturally results from sentiments uniformly great, a gravity unalloyed to dullness, a dignity unconnected with opulence. My opinion of this flattering resemblance is not the effect of an unphilosophical predilection, or fortuitously adopted. It is suggested by observation, and confirmed by a review of the annals of the English. It is conformed by their public conduct, ever generous, spirited, humane, by their private lives, sedate, contemplative, independent, by their writings, solid, nervous, and breathing a spirit of freedom and philanthropy, which almost rescues human nature from the imputation of degeneracy." * * *

In another place he says, "I am not one of those who would promote the most distant tendency to despotism, but I would promote order and tranquillity, the most valuable ends of civilization. And I will assert, that when the persons of the rulers, in any department of the state, are rendered contemptible, the reverence necessary to restrain the vulgar is removed, and it is not wonderful that the consequences are riot and rebellion! Look into the senate of an empire in extent, connections, resources, and glories unrivalled. I will not be personal, though personality, in the present

age, is the readiest method to excite popular attention. I will say nothing of the dissipated youth, the virulent rancour, the petulant abuse, the infidel principles, or the debauched morals, of any one senator the senatorial rank should consecrate the persons who possess it." * * * And again, alluding to our religious institutions, he says, "If you have courage enough publicly to avow a primitive zeal for the cause of Protestantism, or for many of these virtuous sentiments and wholesome practices of our good old English forefathers, immediately some travelled gentleman steps forth, and ironically exclaims, How narrow-minded, how illiberal, how unphilosophical, in these enlightened times, such antiquated ideas! Universal libertinism restrained only by political compliance with what every prater terms vulgar prejudice, forms the wisdom of these large minded, liberal, and philosophical gentlemen." * * *

But how is this levity to be shunned, and the national character restored? Adversity is a severe remedy for political disease, and not to be wished for till every lenient method has failed. A radical cure may be effected, by restoring vigour to the proper modes of education. Let the mind be early habituated to something solid for the employment of its energies; let it be supplied with food which will nourish and add strength and agility, not with such as only bloats, or overloads with morbid matter. Let the uncorrupted bosom of ingenuous youth imbibe the spirit, the virtue, the elevation of sentiment, and the rational love of liberty, which exalted the polished ancients to all that is great and glorious in this sublunary scene." * * * Then, having apostrophised the all engrossing topics of public life, he exclaims, "I will not derogate from the glory of arms, or the merit of political conflicts, but I will say, that he effects a durable and substantial good to society, who successfully labours in adding to the personal merit of a rising generation. He sows the seeds of excellence, which may spring up in a happy soil to aggrandise a kingdom, and of virtues, which may in future ages bless and exalt human nature." Another experienced writer in speaking of legislative interference, appositely says, "a little consideration will convince the man of a thinking mind, that the prescriptions of civil authority universally act as barriers to the improvement of the arts. The language of these prescriptions is, 'hitherto shalt thou go, but no farther.'" It is, however, the business of education not to cramp but to guide the intellect. Its province extends to the inculcating of those fundamental principles upon which the structure of science is said to be built, the finishing of the structure ought to be left in a great measure to individual discretion. To the attainment of truth, freedom of inquiry is absolutely essential. A man may as well attempt to penetrate the mazes of an entangled wood in fetters, as to investigate the vast variety of intellectual subjects, with a mind trammelled by the imperative deci-

[EFF]

THE EFFERVESCENT QUALITY OF MANY MINERAL WATERS IS OCCASIONED BY THE CARBONIC ACID WHICH THEY CONTAIN.

sions of human institutions. And to the reducing of the general mind to this degrading predicament, do the prescriptions of civil authority in matters of literature usually tend. They lead to the fostering of prejudice, and to the perpetuation of error. They necessarily keep a nation stationary in the march of intellect, and repress that expansion of thought which is the parent of excellence. To a certain degree they may be productive of decided and powerful effects, but the uniformity of habit and character which they are calculated to produce, rather tends to lower man to the level of brutal instinct, than to raise him higher in the scale of the intelligent creation.—In conclusion, we beg to offer the following extract on the *education of females*. "In the estimation of reason, a lovely woman cannot be rendered less lovely, by the high cultivation of her talents, and many examples may be quoted to prove, that intellectual attainments are so far from being inconsistent with feminine graces, that they confer upon them additional attractions. In the mean time, let not domestic accomplishments be despised. On the contrary, let them be cultivated with the most diligent attention. But why should any portion of the field of knowledge be interdicted to any rational creature, who has an opportunity and who entertains a wish to enter it? and why should females be debarred from a source of elegant amusement, and of useful instruction peculiarly adapted to their domestic habits? The conduct of learned females is watched with an evil eye their foibles are magnified, their errors are exaggerated, and whatever faults they commit, are laid to the account of literature, with the candour and good sense evinced by the self-complacent ignorant, who, on seeing a man executed for forgery, exclaimed, "such are the consequences of reading and writing!" When we consider what influence the female sex have in directing the early ideas of man, and also upon the habits of his future life, it is surely desirable that they should be endowed with every species of knowledge conveniently within their reach, which may turn that influence to good."—*Education in Greece and Rome*. The education of youth was strictly attended to both amongst the Greeks and Romans. Their minds and bodies were improved at the same time, their minds by every necessary branch of knowledge and learning, and their bodies by the manly exercises of the Campus Martius, or private contests and trials of skill, agility, and strength. It was the chief aim of the Romans, as well as Grecians, to make them shine in the senate and in the field, at the forum and the public games.—Oratory was an object which they kept constantly in view, and whatever was their destination, they endeavoured to acquire the arts of elocution and a habit of fluent reasoning. Lacedæmon trained her hardy sons to despise danger, endure fatigue, and seem insensible of pain—to maintain their honour unstained, to love their country, and hold

in contempt riches, and all that train of enervating pleasures which are the companions of affluence.—So far all this was meritorious in a high degree, but how circumscribed must the space have been which was then allowed for intellectual exertion, when the whole world of science was a *terra incognita*.

EDULCORATION, in chemistry, the act of separating, purifying, or freeing any substance from the saline particles with which it may be impregnated, or those that may be left adhering to it after any operation.

EEL, in ichthyology, a genus of fishes belonging to the order *Apodes*, of which the common species are very long lived, viviparous, prolific, and torpid in winter, living on insects, worms, and eggs of other fish. In some respects eels resemble reptiles, particularly in their manner of moving by a serpentine winding of the body, and they often creep upon land, and wander about at night in search of snails and other food.

EEL-POUT, a species of *Gadus*, somewhat resembling an eel, but shorter. It is sometimes called *mustela fluvialis*.

EEL-SPEAR, a forked instrument with three or four jagged teeth, used for catching eels.

EFFECT, the consequence of a cause, sometimes simple and visible, sometimes complicated and invisible, but always simultaneous with the cause.—The word *effects* signify personal or movable goods.

EFFECTIVE, in military language, an epithet for a body of men that are fit for service. As 20,000 *effective* men.

EFFEMINACY, that weakness, delicacy, and indulgence in womanish pleasures which are characteristic of the female sex, but which in men are deemed a reproach.

EFFETE, barren. An animal becomes *effete* by losing the power of conception. the earth may be rendered so by drought, or by exhaustion of fertility.

EFFERVESCENT, in a general sense, signifies a slight degree of ebullition in liquids exposed to a due degree of heat; but chemists apply it to that commotion excited in various fluids, either by the mixture of fluids with others of a different nature, or by mixing them with salts or powders of various kinds, as the effervescence of a carbonate with nitric acid.

EFFICIENT, producing the effect intended. The *efficient cause* is that which produces; the *final cause* is that for which it is produced.

EFFLORESCENCE, in chemistry, the spontaneous formation of small white threads, resembling the sublimated matter called flowers, on the surface of certain substances. this is sometimes called a *saline vegetation*. An efflorescence is also often seen on salt butter, or on walls formed with plaster. The word is likewise applied to the conversion of any body into a dry powder, or white dust, as in sulphate and carbonate of soda.

INSECTS ATTACH THEIR EGGS ON VARIOUS SUBSTANCES, WHICH, WHEN THEY ARE HATCHED, THE YOUNG ARE DESTINED TO FEED UPON.

[ELÆ]

The Scientific and Literary Treasury ;

[ELD]

EFFLUVIA, the small particles perpetually flowing out of mixed bodies in the form of vapours, which are sometimes visible, as in the case of smoke or steam, and sometimes not perceptible, as the noxious exhalations from putrefying animal or vegetable substances. Malignant effluvia are assigned, by physicians, as the cause of the plague and other contagious diseases.

EFT, in zoology, *Lacertus vulgaris*, the common lizard, called also, in several parts of the kingdom, the newt, or evel.

EFFUSION, in surgery, the escape of any fluid out of the vessel, or viscus naturally containing it, also the natural secretion of fluids.

EGG, a body formed in the females of fowls, &c., containing an embryo, or germ of the same species, under a cortical surface or shell, which shell becomes more brittle by being exposed to a dry heat. It is lined everywhere with a very thin membrane, which dividing at, or very near, the obtuse end of the egg, forms a small bag where only air is contained. In new laid eggs, this follicle appears very little, but becomes larger when the egg is kept. Within this are contained the *albumen*, or white, and the *vitellus*, or yolk. The animal in the egg is first nourished by the albumen, and when this is consumed, by the vitellus, as with milk.—Most insects are oviparous.—The eggs of fish and some other animals are united by a viscid substance, and called *spawn*.—The quantity of eggs consumed in England appears almost incredible. Independently of the home produce, which is immense, the number of eggs annually imported from France, and other parts of the continent, is upon an average about 65 millions.

EGG PLANT, in botany, the *Solanum melongena* of Linneus, so called because the fruit is like an egg.

EG LANTINE, in botany, the *Rosa rubiginosa*, or sweet briar.

EGRET, in ornithology, a bird of the heron kind, of which there are two, the *great* and the *little* egret.

ELDER-DOWN, the soft feathers of the *elder duck*, which are much esteemed.—*Elder-ducks* build their nests among precipitous rocks, and the female lines them with fine feathers plucked from her breast. This being collected, forms the *elder-down*.

EJECTMENT, in law, a writ or action which lies for the recovery of possession of land from which the owner has been ejected, and for trial of title. Ejection may be brought by the lessor against the lessee for rent in arrear, or for holding over his term, also by the lessee for years, who has been ejected before the expiration of his term.

EKEBERGITE, a mineral supposed to be a variety of *scapolite*.

ELABORATE, an epithet expressive of great care, diligence, &c., used in the execution of any performance.

ELÆAGNUS, or Dutch-myrtle, in botany, a genus of trees, belonging to the *tetrandria-monogynia* class, the characters of which are, that it has no flower-pals,

and the fruit is an oval, obtuse, and smooth drupe, including an oblong kernel or nut.

ELÆOCARPUS, in botany, a genus of the *polyandria-monogynia* class of trees, the calyx of which is a five leaved perianthium; the corolla consists of five jagged torn petals, of the length of the cup, the fruit is a roundish drupe, and the seed a crisp spherical nucleus.

ELÆOM ELI, a gum which drops from the olive trees in Syria. It is thicker than honey, and of an oily nature.

ELA OLITE, called also *fellstein*, a mineral more or less translucent, of a greasy appearance, having a crystalline structure, and varying in its colour from greenish blue to flesh red.

ELASTICITY, or **ELASTIC FORCE**, that inherent property of bodies by which they restore themselves to their former figure, after any external pressure or tension, very observable in a bent bow, steel springs, and the like. A *perfectly elastic* body, is that which restores itself with the same force wherewith it was bent, or depressed; those which do not restore themselves with exactly the same force, being called *imperfectly elastic* bodies. The air is *elastic*; vapours are elastic, and when the force compressing them is removed, they instantly expand or dilate, and recover their former state. Elasticity, indeed, seems to vary, according to the different densities of bodies, for the more metals are hammered, the more elastic they become.

ELA TLER, in entomology, a genus of four winged flies of the order *coleoptera*, the body of which is oblong, and the antennae setaceous, and when the insect is laid on its back, it leaps with great agility.

ELATERIUM, a substance deposited from the very acid juice of the *Momordica elaterium*, or wild cucumber. It is in thin cakes, of a greenish colour and bitter taste, and is a powerful cathartic.

EL ATIN, the active principle of the elaterium, from which the latter is supposed to derive its cathartic power.

ELBOW, in anatomy, the juncture of the *cubitus* and *radius*, or the outer angle made by the flexure or bend of the arm.—*Elbow*, in architecture, a term used for an obtuse angle of a wall, building, road, &c., which divides it from its right line.

ELDER, a person advanced in life, and who, on account of his age and experience, is selected to fill some important office. In Jewish history, the *elders* were persons the most considerable for age, experience, and wisdom. Of this sort were the seventy men whom Moses associated to himself in the government of his people. Such also were those who afterwards held the first rank in the synagogue, as presidents. In the first Christian churches, *elders* were persons who enjoyed offices or ecclesiastical functions, and the word includes apostles, pastors, presbyters, bishops, or overseers. Hence the first councils of the Christians were called *presbyteria*, or councils of *elders*. In the modern presbyterian churches, *elders* are officers

THE EGGS OF BIRDS WHICH NESTLE IN HOLES, AS WOODPECKERS, ROBINS, SWALLOWS, &c. ARE OF A SHINING WHITE COLOUR.

THE EGGS OF STARBINGS, FLY-CATCHERS, REDDIE-SPARROWS, &c. ARE CHARACTERIZED BY A PALE GREEN OR PALE BLUE COLOUR.

[ELE]

A New Dictionary of the Belles Lettres.

[ELE]

who with the ministers and deacons, compose the sessions of the kirk, and have authority to inspect and regulate matters of religion and discipline.

ELDER, a tree or genus of trees, the *Sambucus*, of several species. Some bear black, some white, and others red berries. The stem and branches contain a soft pith.

ELEATIC, an epithet given to a certain sect of philosophers, so called from Elea, a town of the Lucani, where most of its celebrated teachers were born.

ELECAMPANE, in botany, the *Ixxia*, a genus of plants, of many species. The common elecampane has a perennial, thick, branching root, which is used in medicine as a sudorific and expectorant.

ELECT, in theology, among Calvinists, a term for those whom they believe God has chosen, or predestinated to be saved.

—**Elect**, in matters of polity, signifies chosen, but not inaugurated. Thus the lord mayor of London, before his predecessor's mayoralty is expired, is called the lord mayor elect.

ELECTION, the act of choosing a person to fill an office or employment, by any manifestation of preference; and is applicable to the choice of members of the legislature, which takes place within every seven years; to the choice of parish officers, annually; and to the admission of members into societies. Sometimes it is practised by show of hands; sometimes by ballot, and at others, by every elector giving his vote separately, with an oath in regard to his right and integrity.—**Election** is also the state of a person who is left to his own free will, to take or do one thing or another, which he pleases.—**Election**, in theology, divine choice, by which persons, according to the calvinistic creed, are distinguished as objects for salvation by the special grace of God, without reference to their good or bad deeds.

ELECTIVE, dependent on choice, as an elective monarchy; opposed to hereditary.

ELECTORATE, the dignity or territory of an elector in the German empire.

ELECTOR, in law, any one who has the right of giving his vote at an election, particularly at an election of a member of parliament.—**Elector**, in political history, the title of such German princes as formerly had a voice in the election of the emperor of Germany.

ELECTRIC, a term for any substance capable of exhibiting the phenomena of electricity, either by friction or otherwise, and of resisting the passage of it from one body to another. Hence an *electric* is called a non-conductor.—**Electric Fluid**, a fine rare fluid, supposed to issue from and surround electrical bodies.

ELECTRICITY, the operation of an extremely subtle fluid, in general invisible; but which appears to be diffused through most bodies; is remarkable for the rapidity of its motion, and discovers itself to be one of the principal agents in nature. The name is derived from *electrum*, (amber,) a

substance the attractive power of which was observed at least six hundred years before the Christian era: electricity, however, scarcely became a distinct object in science before the commencement of the seventeenth century, when a book, containing accounts of several electrical experiments, was written by Dr. William Gilbert; and it is only since the year 1745, when the *Leyden phial* was discovered, that it has advanced with any considerable rapidity. From that time, however, electricity became the general subject of conversation, and, as a science, it advanced with great rapidity under the auspices of Franklin, Priestley, and others. The earth, and all bodies with which we are acquainted, are supposed to contain a certain quantity of an exceedingly elastic invisible fluid, called the electric fluid. This certain quantity belonging to all bodies may be called their natural share; and which of itself, in its dormant state, produces no sensible effect; but as soon as the equilibrium is disturbed, and the surface of any substance becomes possessed of more than its natural share, it exhibits the phenomena of attraction and repulsion, and other remarkable effects are produced according to the quantity of excitation.—Bodies capable of accumulating and retaining the electric fluid are impervious to its power, and in proportion as they are capable of being excited, so are they less pervious; while, on the other hand, those which are more pervious are less capable of excitation. They are called *electrics*, or *non-conductors*, in distinction from those which are capable of receiving and transmitting electricity, and on that account called *conductors*. To the class of electrics belong resins, bitumens, glass, dry animal substances, feathers, paper, white sugar, oils, chocolate, &c. Substances of this description may be excited by friction, so as to exhibit the electric appearances of attracting and repelling light bodies, and emitting sparks or flashes of light, attended with a sharp snapping sound; and such is the rapidity of the electric fluid in motion, that no perceptible space of time is required for its passage to any known distance. It is now thoroughly ascertained that lightning is the rapid motion of vast masses of the electric matter, and thunder is the noise produced by the motion of lightning. Metallic points silently attract electricity from the bodies charged with it; hence the use of pointed conductors to secure buildings from the effects of lightning. The *aurora borealis*, or northern lights, are (as we have observed) the effects of the electric fluid passing through highly rarefied air. It is also well known, that earthquakes, whirlwinds, and water-spouts are generally accompanied with, and dependant upon electrical phenomena.—Among the numerous philosophic enquirers on this interesting subject, the nature of which is daily further illustrated by the experiments of scientific men, none have given it more attention, or have more systematically developed its causes and effects, than Professor

ELECTRIC CHARGES SENT THROUGH A CHAIN OR WIRE SHORTER IN, AND INCREASE ITS TENDENCY BY LATENT REFRACTION.

THE EFFECTS OF ELECTRICITY IN THUNDER-STORMS WERE FIRST EXPERIMENTALLY DEMONSTRATED BY DR. BENJAMIN FRANKLIN.

[P.L.F.]

The Scientific and Literary Treasury ;

[ELE]

THE CHEMICAL AGENCIES OF WATER AND AIR, ASSISTED BY ELECTRICITY, ARE OF IMMENSE IMPORTANCE IN THE ECONOMY OF NATURE.

Faraday, whose series of experiments, which were read before the Royal Society during the last year, are an honourable example of persevering industry in the cause of science. It is not within the scope of this work to enter at large into this or any other science, but we are desirous, when we cannot do more, to direct attention to the best sources of information, and to render honour where honour is due. We will therefore now discuss the article, by referring to the Proceedings of the Royal Society, and the Scientific and Literary Periodicals generally, for further details. But there is something so singular in the following account of an "electrical lady," authenticated by a respectable physician who communicated it to the editor of "Bulman's Journal," in which it recently appeared, that we insert it as a curiosity. He states, "that on the evening of Jan 28th, during a somewhat extraordinary display of northern lights, the person in question became so highly charged with electricity, as to give out vivid electrical sparks from the end of each finger to the face of each of the company present. This did not cease with the heavenly phenomenon, but continued for several months, during which time she was constantly charged, and giving off electrical sparks to every conductor she approached, so that she could not touch the stove, nor any metallic utensils, without first giving off an electrical spark, with the consequent twinge. The state most favourable to this phenomenon was an atmosphere of about 80 deg. Fahrenheit, moderate exercise, and social enjoyment. It disappeared in any atmospheric approach to zero, and under the debilitating effects of fear. When seated by the stove, reading, with her feet upon the fender, she gave out sparks at the rate of three or four a minute, and under the most favourable circumstances, a spark that could be seen, heard, or felt, passed every second. She could charge others in the same way, when insulated, who could then give sparks to others. To make it satisfactory that her dress did not produce it, it was changed to cotton and woollen, without altering the phenomenon. The lady is about thirty, of sedentary pursuits, and delicate state of health."

ELECTRICIAN, a person versed in electricity, and who has scientifically investigated its properties by observation and experiments.

ELECTRICAL MACHINE, an instrument or apparatus contrived for rubbing electrics and conductors together, and for collecting the electric fluid from surrounding bodies. There are various kinds, but the cylindrical machine is in most common use. This consists of a glass cylinder, fixed in such a manner that it may be turned with a winch, a cushion, supported by a glass pillar, and having a piece of silk which comes between it and the cylinder, and a tube, supported by a glass pillar, which is called the prime conductor, or simply the conductor.—*Electrical rubber*, a part of

the electrical apparatus, consisting of black oiled silk, which serves to aid the friction in the electrical machine.—*Electrical shock*, the sudden explosion between the opposite sides of a charged electric.

ELECTRICAL-LEEL, in ichthyology, the *Gymnotus electricus* of Linnaeus, a fish so called from its power of producing an electrical shock whenever it is touched. By this power it stupifies, and then seizes, such animals as venture to approach it.

The properties and habits of the electrical eel have lately more particularly come under the notice of scientific men, from the circumstance of one having been brought to this country from the Amazon river, and exhibited at the Gallery of Practical Science, London. "On October 22," says the *Athenaeum*, "Professor Faraday, in the presence of Professors Daniell, Owen, Wheatstone, and others, succeeded in obtaining from it the electric spark, and one of the party, who had the temerity to grasp the creature with both hands, had his curiosity satisfied with a shock, which, if he were before incredulous, must have most effectually removed all doubts as to the electric properties of the animal. The electricity appears to be of the most intense character, being communicated by simply immersing the hands in the vessel of water containing the eel. By one shock, not only was the needle of a galvanometer deflected, but chemical action and magnetic induction obtained."—This specimen of the *Gymnotus electricus* having been entrusted to the care of Mr T. Bradley, he has favoured the public with an interesting account of its habits, through the medium of the *Magazine of Natural History*, from which we learn, that when the eel is eager for food, it swallows it without giving it a shock, yet there is reason to believe that at the moment of seizing a fish, the eel discharges its electricity through the water, since a shock has been perceived by a person at that moment having his hands immersed in the tub in which the eel is kept. If the *Gymnotus* do not see the small fish, he appears to be aware of its presence, and seeks it, and during the motions of the two animals, if the fish happen to touch the eel, it generally receives a shock that paralyzes it, causing the victim to float, belly upwards, on the surface, till it is noticed by the eel, who instantly swallows it. According to the opinion of Dr Faraday, who has carefully examined the animal, its electric power is identical with common electricity, though more readily developed. And it has been further remarked, that whilst the hinder parts were negatively electrified, the head and neck were positively so, and a series of electric sparks, as well as an elevation of temperature, were elicited.

ELECTRO-CHEMISTRY, that science which treats of the agency of electricity and galvanism in effecting chemical changes.—A powerful electro-chemical battery has been executed by Mr E. M. Clarke, at the Gallery of Science, Lowther Arcade,

MELTED WAX, MOSBY, AND SURPRISE DISPLAY NO ELECTRICITY WHEN HOT, BUT MUCH WHEN COLD; AND WHEN HEATED, A SPARK SETS FIRE TO THEM.

[ELE]

A New Dictionary of the Belles Lettres.

[ELE]

London, by which the most surprising effects are produced. It rapidly fuses a copper rod, of a quarter of an inch in diameter; yet, notwithstanding such intense power, the experimenter holds the conducting wires in each hand, evidently without receiving any shocks from the battery.

ELECTRO-MAGNETISM, that branch of electric science which shews the agency of electricity and galvanism in communicating to certain substances magnetic properties. Thus we speak of *electro-magnetic* phenomena in the atmosphere, &c.

ELECTROMETER, an instrument for measuring the quantity or intensity of electricity, and determining its quality.

ELECTRO-MOTION, the motion or passing of electricity from one metal to another, by the attraction of one metal plate in contact with another. That which produces electro motion is called the *electro-motive power*.

ELECTROMOTOR, an apparatus so called by Volta, a mover of the electric fluid.

ELECTRO-NEGATIVE, repelled by bodies negatively electrified, and attracted by those positively electrified.—*Electro-positive*, attracted by bodies negatively electrified, or by the negative pole of the galvanic arrangement.

ELECTROPHOR, or **ELECTROPHORUS**, a kind of substitute for an electrical machine, consisting of two plates, one of which is a resinous electric and the other metallic. When the former is once excited by a peculiar application of the latter, the instrument will furnish electricity for a considerable time. It was invented by the celebrated professor Volta.

ELECTRUM, in mineralogy, an argenteous gold ore, of a pale brass yellow colour.—Also *Amber*, [which see].

ELECTUARY, in pharmacy, a form of medicine composed of powders, or other ingredients, incorporated with some conserve, syrup, &c.

ELEMOSYNARY, an epithet for whatever pertains to the use and management of charitable donations, whether intended for the relief of the poor or sick, or appropriated to education. A hospital founded by charity is an *elemosynary* institution for the sick, a college founded by donations is also *elemosynary*, and so is the corporation which is entrusted with the care of such institutions.

ELÉGANCE, in a general sense, is that which pleases by its symmetry, purity, or beauty, and is select, as distinguished from what is common.—In literature, *elegance of composition* consists in well chosen words and phrases, arranged in an appropriate and happy manner. It implies neatness, purity, and perspicuous arrangement, a style calculated to please a delicate taste, rather than to excite admiration or strong feeling.—In speaking, it includes propriety of diction and rich expressions with gracefulness of action.—In painting, it implies a certain manner which embellishes and heightens objects, as in Corre-

gio, where, notwithstanding all the defects as to justness of design, there is an elegance even in the manner of the design itself, as well as in the turn of the attitudes, &c.—In architecture, *elegance* consists in the due symmetry and distribution of the parts of an edifice, or in regular proportions and arrangement.—It is also applied to various works of art or nature remarkable for their beauty of form, &c.

ELÉGIT, in law, a writ of execution, which lies for a person who has recovered debt or damages, or upon a recognisance in any court, against a defendant that is not able in his goods to satisfy his creditors.

ELÉGY, a mournful and plaintive kind of poem. The principal writers of elegiac verse among the Latins, were Propertius, Ovid, and Tibullus, the chief writers of elegy among the Greeks, were Callimachus, Parthenius, and Euphron.

ELEMENT, in physiology, a term used to denote the original component parts of bodies, or those into which they are ultimately resolvable. In the ancient and still popular sense of the word, the elements are understood to be four in number, namely, fire, air, earth, and water; but by the researches of modern science it is fully demonstrated that earth is a compound of many earths, air, a compound of at least two gases, water, a compound of hydrogen and oxygen, and fire, only the extrication of light and heat during combustion. Modern chemistry has, in fact, determined that an element is merely the last result of chemical analysis, or that which cannot be decomposed by any means now employed.—*Elemente*, in a figurative sense, is used for the principles and foundations of any art or science, as "Euclid's Elements," &c.—*Elemente*, in divinity, the bread and wine prepared for the sacrament of the Lord's supper.

LEMI, a resin, of a strong aromatic odour and a hot spicy taste, which exudes from incisions made through the bark of the *Amvis elemifera*, a small tree or shrub of South America. The crystalline resin of elemi is called *elemine*, and is used in making lacquer.

ELEMENTARY, an epithet expressive of that which is uncompounded, or having only one principle or constituent part. It also denotes *rudimental*, or *initiatary*, as, an *elementary treatise*.

ELENCHUS, in logic, a sophism, or fallacious argument, which deceives the hearer under the appearance of truth.

EL PHANT, the largest, strongest, and most sagacious of all quadrupeds. The form of this animal is altogether awkward, the head is large, the eyes small, and the ears large and pendulous, the body is thick, and the back much arched, but the most singular part of the structure of the elephant is his trunk or proboscis, by which he conveys food and drink to his mouth. The eyes are small and the feet short, round, clumsy, and distinguishable only by the toes. The trunk is a cartilaginous and

THE CHARACTERISTIC OF TRUE ELEGY IS A CALM AND MEDITATIVE CONTEMPLATION OF GRIEF, NOT THE AGONY OF SUFFERING.

THE EMPLOYMENT OF THE ELEPHANT HAS BEEN DISCONTINUED IN MODERN WARFARE, HIS TERROR OF FIRE-ARMS RENDERING HIM UTTERLY USELESS.

[ELE]

The Scientific and Literary Treasury ;

[ELG]

THE ELEPHANT AND THE DOG ARE THE ONLY ANIMALS WHICH SEEM TO COMPREHEND WHAT WE MEAN BY OUR LOOKS

muscular tube, extending from the upper jaw, and is seven or eight feet long. It is of such strength as to be capable of breaking off large branches from trees whilst, at the same time it is endowed with such exquisite sensibility, that it can grasp the smallest object. The two large tusks are of a yellowish colour and extremely hard, the bony substance of these is called ivory. The disposition of the elephant is gentle and his manners social, hence they are seldom seen except in troops. In wandering from place to place the males who are furnished with the largest tusks, put themselves at the head and are the first to face every danger. In Abyssinia they are pursued by hunters on horseback in the following manner: two men, perfectly naked, mount the same horse, the hindmost is armed with a broadsword, the lower part of which is covered with cord and the remainder is exceedingly sharp. In this manner they pursue the elephants and having singled out one they irritate him to attack them when they ride up close to him and the armed man slips from the horse on the off side and whilst the elephant's attention is engaged with the horse he divides the tendons of his foot with a single blow and thus disables him, when he is dispatched by lances. The Hottentots in South Africa hunt and shoot them. They are oftener however taken alive in pitfalls or are driven into enclosures and when gradually brought into subjection by caresses and kind treatment they become the most gentle and obedient of all domestic animals. To keep an elephant in full vigour he requires daily about a hundred pounds of rice, either raw or boiled besides fresh burbage to cool him and about forty gallons of water as drink. —We learn in ancient history that elephants were first used in war by the Greeks in the time of Alexander the Great at least there is no mention of them before. They carried upon their backs large towers, containing from ten to thirty soldiers who threw missile weapons from thence upon the enemy being themselves secured within their wooden walls while the animals did great execution by terrifying tearing and trampling down both horses and men.

EL EPHANT BELILL in entomology a large species of *Scarabeus* or beetle found in South America. It is covered with a hard black shell is nearly four inches long and has a proboscis an inch and a quarter in length.

EL EPHANTIASIS a species of leprosy which derives its name from the skin being covered with incrustations like those of the elephant and the legs swelling to an immense size. It is a direful chronic disease, and regarded as contagious.

EL EPHANTIN in Roman antiquity an appellation given to the books wherein were registered the transactions of the senate and magistrates of Rome of the emperors or generals of armies and even of the provincial magistrates, the births and

classes of the people, and other things relating to the census. They were so called, perhaps as being made of ivory.

ELEVATION, in its primary sense, denotes exaltation, the act of raising from a lower place to a higher or figuratively, the act of exalting in rank as the *elevation* of a man to a throne. —In architecture an orthographic or upright draught of a building. —*Elevation* in astronomy, altitude the height of the equator pole, or stars &c., above the horizon. —In gunnery, the angle which the chase of a cannon or mortar makes with the plane of the horizon. —*Elevation of the Host* in the Romish church that part of the ceremony of the mass which consists in the priest raising the host above his head for the people to adore.

EL EVAFOR in anatomy, the name of several muscles which serve to raise the parts of the body to which they belong as the elevator of the external ear, the epiglottis &c.

ELLEVATORY in surgery, an instrument used in trepanning for raising depressed or fractured parts of the skull.

ELLUSINIA in Grecian antiquity, a solemn and mysterious festival in honour of *Ceres* kept every fourth year by the Celians and Philisians and every fifth year by the Athenians. Lacedaemonians Parrhasians and Cretans at Eleusis a borough of Attica. It was transferred from thence to Rome by the Emperor Adrian. The *Eleusinia* was the most celebrated and mysterious solemnity of any in Greece and often called by way of eminence *mysteria*. The mysteries were of two kinds the greater and the less the less were preparatory to the greater. They consisted of a solemn representation of what was supposed to pass in the regions of Elysium and Tartarus and their chief design was by sensible means to spread among the people a conviction of the immortality of the soul and of a future state of rewards and punishments. To reveal the secrets of the Eleusian mysteries was looked upon as a crime that would not fail to draw down the vengeance of heaven. The person who presided at these rites was called Hierophantas or the revealer of holy truths.

EL EUTHYRIA in Grecian antiquity, a festival celebrated at Plataea in memory of the defeat of Mardonius the general of Xerxes and in honour of those who gallantly sacrificed their lives for the liberty of their country. It was held every fifth year when prizes were contended for.

ELF a term now almost obsolete but formerly used to denote a fairy or hobgoblin an imaginary being the creature of ignorance superstition and craft.

ELF ARROWS a name given to fints in the shape of arrow heads vulgarly supposed to be shot by fairies. They are frequently met with in Great Britain and there is reason to believe they were weapons of offence among the ancient Britons.

ELGIN MARBLES, a collection of splendid basso relievo and fragments of

IN THE TALK OF AN ELEPHANT SAYS CUVIER, THERE ARE NEARLY FORTY THOUSAND MUSCLES, WHICH HAVE THE POWER OF DISTINCT MOTION

[ELM]

A New Dictionary of the Belles Lettres.

[E.L.O.]

statuary, which were brought from the Parthenon of Athens to England, in 1814, by Lord Elgin, (hence the name). They are now in the British Museum, having been purchased by government for 35,000*l*. They are unquestionably some of the finest remains of ancient art, and offer the richest field for study.

ELIMINATION, the ejection of superfluous matter from organized bodies.

ELIQUATION, in metallurgy, a separation of the different parts of mixed bodies, by the different degrees of fire required to melt them.

ELISION, in grammar, the cutting off or suppressing a vowel at the end of a word, for the sake of sound or measure, when the next word begins with a vowel; as, *th' exanguined field*.

ELIXIR, in medicine, a compound tincture, extracted from two or more ingredients.

ELK, a quadruped of the cervine genus. It is the largest of the deer kind, and is found in the northern regions of Europe, Asia, and America.

ELL, a measure of different length in different countries; but those mostly used in England are the English and Flemish ells; the former, three feet nine inches, or one yard and a quarter; and the latter only twenty-seven inches, or three-quarters of a yard.

ELLIP'SIS, in geometry, an oval, or curve line returning into itself, and produced from the section of a cone by a plane cutting both its sides, but not parallel to the base.—In grammar, a figure of syntax, by which one or more words are omitted, which the reader may supply; as, the horse I rode, for the horse *which* I rode.

—In rhetoric, a figure of speech whereby the orator, through excessive emotion, passes over many things, which, had he been cool, ought to have been mentioned.

ELLIPSOID, in geometry, an elliptical spheroid, being the solid generated by the revolution of an ellipse about either axis.

ELM, in botany, *Ulmus*, a forest tree of the first magnitude, the wood of which is very serviceable where it may be continually dry or wet, in extremes. Accordingly, it is proper for water-works, mills, pumps, aqueducts, and ship-planks beneath the water lines. It is also used for nares of wheels, handles for single saws, axle-trees, and the like. The elm is common in Great Britain, and lives to a great age. About twenty species are known, all inhabiting the temperate parts of the northern hemisphere.

ELMO'S FIRE, *St*; an appearance caused by fiery meteors in the atmosphere: it is often seen playing about the masts and rigging of ships.—In explanation of this curious phenomenon, we submit the following extract of a letter from W. Traill, Esq., Kirkwall, to Professor Traill, dated May 16, 1837, describing its appearance at Orkney. "On Sunday, Feb. 19, 1837, in a tremendous gale, my large boat sunk, and it was late on Tuesday night before we

could get her up and drawn to the shore, after which we had to wait till three o'clock next morning till the tide ebbed from her; she was during this time attached to the shore by an iron chain, about 30 fathoms long, which did not touch the water, when, to my astonishment, I beheld a sheet of blood-red flame, extending along the shore for about 30 fathoms broad and 100 fathoms long, commencing at the chain and stretching along the shore and sea in the direction of the shore, which was E.S.E., the wind being N.N.W. at the time. The flame remained about ten seconds, and occurred four times in about two minutes. Whilst I was wondering not a little, the boatmen who, to the number of 25 or 30, were sheltering themselves from the weather, came running down apparently alarmed, and asked me if I had ever seen anything like this before. I was about to reply, when I observed their eyes directed upwards, and found they were attracted by a most splendid appearance at the boat. The whole mast was illuminated, and from the iron spike at the summit, a flame of one foot long was pointed to the N.N.W., from which a thunder-cloud was rapidly coming. The cloud approached, which was accompanied by thunder and hail; the flame increased, and followed the course of the cloud till it was immediately above, when it arrived at the length of nearly three feet, after which it rapidly diminished, still pointing to the cloud, as it was borne rapidly on to S.S.E. The whole lasted about four minutes, and had a most splendid appearance."

ELOCUTION, in rhetoric, consists of elegance, composition, and dignity; the first comprehends the purity and perspicuity of a language, and is the foundation of elocution; the second ranges the words in proper order; and the last adds the ornaments of tropes and figures, to give strength and dignity to the whole. To which may be added, that there should be a certain musical cadence or intonation, to render it pleasing to the ear.

ELONGATION, in astronomy, the removal of a planet to the farthest distance it can be from the sun, as it appears to an observer on the earth. The term is chiefly used in speaking of Venus and Mercury, the arch of a great circle intercepted between either of these planets and the sun, being called the elongation of that planet from the sun.—*Elongation*, in surgery, an imperfect luxation, occasioned by the extension of the ligaments of a joint beyond its natural dimensions.

ELOPEMENT, in law, the voluntary departure of a wife from her husband to go and live with an adulterer. In common acceptance, the secret departure of any female with her lover, either to be married or to live together illicitly.

ELOPS, in ichthyology, a genus of fishes of the *Abdominal* order, having a smooth head, and a palate rough with teeth.

ELOQUENCE, the art or act of speak-

IF SAILORS OBSERVE TWO FLAMES IN ST. ELMO'S FIRE, THEY CONSIDER IT A GOOD OMEN; IF ONLY ONE, THEY REGARD IT AS BAD.

THE AMERICAN OR WHITE ELM FREQUENTLY REACHES THE HEIGHT OF 100 FEET, WITH A TRUNK FOUR OR FIVE FEET IN DIAMETER.

[EMA]

The Scientific and Literary Treasury ;

[EMB]

ing with grace, effect, and fluency, in which is comprehended a good elocution or utterance; correct, appropriate, and rich expressions, with animation, and suitable action. Cicero defines it, the art of speaking with copiousness and embellishment. Eloquence and rhetoric differ from each other, as the theory from the practice: rhetoric being the art which describes the rules of eloquence, and eloquence that art which uses them to advantage.

ELUL, the name of a Jewish month, answering to part of August.

ELUTRIATION, in metallurgy, the operation of pulverising a solid substance, mixing it with water, and pouring off the liquid, while the foul or extraneous substances are floating, or after the coarser particles have subsided, and while the finer parts are suspended in the liquor.

ELYMUS, in botany, a genus of the *Triandria digynia* class of plants, the calyx of which is a common involucre, consisting of four leaves, and containing several flowers in two spiculae: the particular corollae are composed of two valves: the seed is oblong.

ELYSTIUM, or ELYSIAN FIELDS, in heathen mythology, the supposed residence of the blessed after death. The poets describe this region as consisting of beautiful meadows alternated with pleasant groves; where a serene and cloudless sky was spread over them, and a soft, celestial light shed a magical brilliancy over every object. The heroes there renewed their favourite sports; danced to the sound of the lyre from which Orpheus drew the most enchanting tones, or wandered through the most odoriferous groves, where the warbling birds carolled forth their harmony by the side of refreshing fountains. There the earth teemed with plenteous fruits, and the verdure of spring was perpetual; while all cares, pains, and infirmities, were exchanged for the purest bliss.

ELYTRA, in entomology, a name for the wing-sheaths, or upper crustaceous membranes, which cover the wings of the insects of the beetle tribe.

EMANATION, the act of flowing or proceeding from some source or origin; or, the thing that proceeds from that action. Light is an *emanation* from the sun, wisdom, an *emanation* from God, &c.

EMANCIPATION, in the Roman law, the setting free a son from the subjection of his father. It differed from manumission, as the latter was the act of a master in favour of a slave, whereas emancipation put the son in a situation to manage his own affairs, and to marry without his father's consent, although a minor. The word *emancipation* was applied to the projects long entertained of redeeming the negroes from Christian slavery; and to the Catholic relief bill in England.

EMARGINATED, among botanists, an epithet for such leaves as have a little indenting on their summits; and accordingly as this indentation is terminated on each

side, they are said to be *obtusely* or *acutely* emarginated.

EMASCULATION, the act of depriving a male of those parts which characterize the sex. It also denotes unmanly weakness.

EMBALMING, the opening a dead body, taking out the intestines, and filling the place with odoriferous and desiccative drugs and spices, to prevent its putrefaction. The Egyptians have always been celebrated for their adherence to this practice, and the skill with which they performed it. With some variation, it is still one of the peculiar customs of that nation. It appears to have been a metaphysical notion, inculcated as of their religion, that the soul continued with the body. There naturally followed an affectionate desire to do every thing that living creatures can suppose acceptable to the dead. They were even desirous of having the dead bodies of their parents in their houses, and at their tables, and believed, as has been suggested, that their souls were present also; and it was essential to this gratification that those bodies should be preserved in the most perfect manner possible.—Modern chemistry has made us acquainted with many means of counteracting putrefaction, more simple and more effectual than the laborious processes of the ancients.

EMBARGO, in commerce, a prohibition of sailing, issued by authority on all shipping, either out of port, or into port. It is generally to restrain ships from leaving a port.

EM'BASSY, the public function or employment of a public minister, whether ambassador or envoy.

EM'BER WEEKS, four seasons in the year more particularly set apart for prayer and fasting, namely, the first week in Lent, the next after Whitsuntide, the fourteenth of September, and the thirteenth of December.—*Ember Days*, particular days of fasting and humiliation in the Ember weeks.

EM'BER-GOOSE, in ornithology, a fowl of the genus *Columbus*, and order of *Anseres*. It is of a dusky black colour, and inhabits the Orkney isles, Iceland, &c.

EMBERIZA, in ornithology, a genus of birds of the order of *Passeres*. They are chiefly known in English by the name of Bunting, except the Ortolan (*Emberiza hortulana*), which is esteemed a great delicacy for the table.

EMBEZZLEMENT, the act of fraudulently appropriating a thing to one's own use, which has been intrusted to one's care and management.

EM'BLEM, a kind of painted enigma, or certain figures painted or cut metaphorically, expressing some action, or instructing us in some moral truth.

EM'BLEMENTS, in law, a word used for the produce of land sown or planted by a tenant for life or years, whose estate is determined suddenly after the land is sown or planted, and before a harvest. In this case,

IN THEOLOGY, THE DOCTRINE OF "EMANATION" IS THAT WHICH REGARDS THE SON AND MOST SHORT AS EFFLUXES FROM THE DEITY.

IN MANY INSTANCES, BODIES NOT EMBALMED HAVE BEEN PRESERVED FROM DECAY FOR CENTURIES, MERELY BY THE EXCLUSION OF THE AIR.

[EME]

A New Dictionary of the Belles Lettres.

[+MI]

IN PLAIN'S TIME THE BEST EMERALDS CAME FROM SCYTHIA, AND IN ENCOMIUMS ON THEIR BEAUTY HE IS REALLY ELOQUENT

the tenant's executors shall have the *emblemments*. Sometimes it is used for any products that naturally arise from the ground.

EM BOLISM, in astronomical chronology, the insertions of days, months, or years, in an account of time, to produce regularity.

EM BONPOINT, (*French*), a moderate and agreeable fulness of figure.

EM BOSS ING, the forming or fashioning works in relieve, whether by raising, by carving, or by depression. It is, in short, a kind of sculpture, where the figures project from the plane whereon it is cut and according as the figures are more or less prominent, they are said to be in *alto, mezzo, or basso rilievo*. — *Embossing wood*, as in picture frames and other articles of ornamented cabinet work, is either produced by means of carving, or by casting the pattern in plaster of Paris, or other composition, and cementing it on the surface of the wood.

— *Embossing cloth*. Cotton, woollen cloth, silk, paper, and other fabrics, are embossed by the powerful pressure of revolving cylinders on which the required patterns are engraved. — The patent of an ingenious invention was taken out by Mr. T. Greig of Bury, Lancashire, in 1835, for both embossing and printing silk, cotton, &c., in one or more colours at one operation.

EM BRA SURE, in architecture, the enlargement made of the aperture of a door or window, on the inside of the wall. — In fortification, a hole or aperture in a parapet, through which cannon are pointed and discharged.

EM BROCA TION, in pharmacy, a lotion or combination of medicinal liquids, with which any diseased part is rubbed or fomented.

EM BROID ERY, figured work wrought on silk, cloth, stuffs, or muslins. The art of embroidery was invented in the east, probably by the Phrygians or Persians. At all events, it was introduced from Persia into Greece. — *Embroidering Machine*. Until of late embroidery work was entirely performed by hand, and was cultivated on account of its elegance, by ladies of rank, but since the invention of a most ingenious machine by M. Heilmann of Mulhouse, many of them have been set up in England, France, and Germany. One of these machines having 130 needles, will perform as much as fifteen expert hand embroiderers, and requires merely the labour of one grown up person and two assistant children.

EM BRY O, the first rudiments of the animal in the womb, before the several members are distinctly formed, after which it is called the *fœtus*.

EM BOUCHU RE, in music, the aperture of a flute or other wind instrument.

EM ENDA TION, an alteration made in the text of any book by verbal criticism. — In law, the correction of abuses.

EM'ERALD, a well known gem of a beautiful green colour, somewhat harder than quartz, which occurs in prisms with a regular hexagonal base, and ranks next in value to the oriental ruby and sapphire. It becomes

electric by friction, is often transparent, sometimes only translucent, and before the blow-pipe is fusible into a whitish enamel, or glass. The most intensely coloured and valuable emeralds are brought from Peru. — In heraldry, another name for *vert*, or the green tincture in coat armour.

EMER GENT, in astronomy, an epithet for a star at the moment it goes out of the sun's beams, so as to become visible. — In chronology, the year or epoch from which any computation of time is made.

EMER SION, in astronomy, the reappearance of the sun and moon after they have undergone an eclipse, also of a star that emerges from under the rays of the sun.

EM ERY, in mineralogy, a compact variety of *corundum*, very generally regarded as a sort of iron ore. It is of a blackish gray colour, and so very hard as to scratch topaz. It consists of alumina, silica, and iron, and is used in the form of a powder for polishing hard minerals and metals. The lapidaries cut ordinary gems on their wheels, by sprinkling them with the moistened powder of emery, but it will not cut the diamond.

EM ETIC, a medicine for emptying the stomach by vomiting.

EM K TINE, in medicine, a peculiar vegetable principle, obtained from the *ipeacacuanha* root, of whose emetic properties it is conceived to be the sole cause. In a dose of half a grain it acts as a powerful emetic, followed by sleep, and six grains produce violent vomiting, stupor and death.

EMICA TION, a flying off in small particles, as from heated iron or fermenting liquors.

EM IGRANT a person removing from his native country to reside in some foreign land.

EMIGRATION the removal of inhabitants from one country to another, for the purpose of permanent residence. Of late years, various causes have conspired to favour the practice of emigration from the shores of Britain to her distant colonies, and there appears to be every prospect that similar causes will exist for some length of time to come, but when we consider how much resolution is required to abandon for ever the home to which man is bound by the strongest ties of kindred and habit, to seek an uncertain fortune in a land of strangers, there is no reason to believe that large masses will ever emigrate without the most urgent motives. Prohibitions of emigration are unjust, as well as impolitic, and always prove, that a government which allows them, has an incorrect idea of its rights. British subjects, however are encouraged rather than restrained, and our surplus population find a wide field for the exercise of their talents and their spirit of enterprise in colonies which are daily rising into importance. Still we fear that many are led to leave their native country, and dwell in a "land of promise," who have no better information respecting their future prospects, than is to be derived from the flattering and deceptive pictures presented to them by the interested agents of colonial speculators.

AN EMERALD WITHOUT A FLAW IS SO RARE, THAT IT HAS PASSED INTO A PROVERB, AND IS IN ACCORDANCE VERY HIGHLY PRIZED.

[DED]

The Scientific and Literary Treasury ;

[DEF]

EM INENCE, an honorary title given to cardinals. They were called *illustrissimi* and *reverendissimi*, until the pontificate of Urban VIII.

EMIR, a title of dignity among the Saracens and Turks. It was at first given to the caliphs, but when they assumed the titles of Sultan, that of Emir remained to their children.

EMISSARY, a secret agent sent to ascertain the sentiments and designs of another, and to propagate opinions favourable to his employer.

EMIT, to send forth or give out. As boiling water emits steam, animal bodies emit perspirable matter, putrescent substances emit noxious exhalations.

EMOLLESCENCE, in metallurgy, that degree of softness in a fusible body which alters its shape.

EMOLIENTS, in medicine, such remedies as soften the aspect of the humours, and at the same time relax and supple the solids.

EMOTION, in a philosophical sense, an internal motion or agitation of the mind which passes away without desire. When desire follows, the motion or agitation becomes a *passion*.

EMPEROR, (*imperator*), among the ancient Romans, a title of honour conferred on a general who had been victorious. It now denotes a sovereign prince, or supreme ruler of an empire, as, the emperor of Russia.

EMPALEMENT, in botany, the calyx or flower cup of a plant.—In heraldry, a conjunction of coats of arms, pale wise.

EMPHASIS, in rhetoric, a particular stress of utterance or force of the voice and action, given to such parts or words of an oration, as the speaker intends to impress especially upon his audience.

EMPHYSEMA, in surgery, a puffy tumour, formed by the air insinuating itself between the skin and muscles, into the substance of the cellular or adipose membrane.

EMPIRE, the territory over which a government prevails, or the government or territory of an emperor. An empire is usually a territory of greater extent than a kingdom. Thus we say, the Russian empire, the Austrian empire, the sovereigns of which are denominated *emperors*. The British dominions are also called an empire, and since the union of Ireland, the parliament is denominated the *imperial* parliament.

EMPIS, in entomology, a genus of insects of the *Dipterous* order, having a mouth with an infected sucker and proboscis, antennae setaceous, and legs short.

EMPIRIC, one who, without a professional education or regard to the rules of science, makes experiments with medicines. Hence the word is used for a quack or charlatan of any kind.

EMPORIUM, a common resort of merchants for trade, particularly, a city or town of extensive commerce, or in which the commerce of an extensive country cen-

tres, or to which sellers and buyers resort from different countries.

EMPYLMA, in medicine, a disorder wherein purulent matter is contained in the thorax or breast, after an inflammation and suppuration of the lungs and pleura.

EMPLASTICS, an appellation given to medicines which constipate and shut up the pores of the body. Hence, *emplastic* means viscosous, or adhesive, like a plaster.

EMPYREUM, or **EMPYREAN**, a term used by divines for the highest heaven, where the blessed enjoy the beatific vision.

—Hence we have the word *empyreal*, as pertaining to that region of space which is refined beyond aerial substance, where only pure fire or light is supposed to exist.

EMPYREUMA, in chemistry, the peculiar smell produced from burnt oils, in distillations of animal and vegetable substances.

EMPYREUMATA, in medicine, the remains of a fever after the critical time of a disease.

EMULGENT, in a literal sense, milking or draining out. In anatomy, the *emulgent* or renal arteries are those which supply the kidneys with blood.

EMULSION, in medicine, any milk like mixture prepared by uniting oil and water, by means of another substance, saccharine or mucilaginous.

EMUNCTORY, in anatomy, a term for any part which serves to carry off the excrementitious parts of the blood and other humours, thus, the skin is the *emunctory* of the body, the nose the *emunctory* of the brain, &c.

EN'ALLAGE, a figure in grammar, where there is a change of one case or mood for another.

ENAMEL, a kind of coloured glass, principally formed by the combination of different metallic oxides, and used in enamelling and painting in enamel. Enamels have for their basis a pure crystal glass, or frit, ground up with a fine calx of lead and tin prepared for the purpose, with the addition usually of white salt of tartar. These ingredients baked together, are the matter of all enamels, and the colour is varied by adding other substances, and melting or incorporating them together in a furnace. Enamels are distinguished into transparent and opaque, in the former all the elements have experienced an equal degree of liquefaction, and are thus run into crystal glass, whilst in the others, some of the elements have resisted the action of heat more, so that their particles retain sufficient aggregation to prevent the transmission of light. They are used either in counterfeiting or imitating precious stones, in painting in enamel, or by enamellers, jewellers, and goldsmiths, in gold, silver, and other metals. This art is of so great antiquity, as to render it difficult, if not impossible, to trace to its origin. It was evidently practised by the Egyptians, from the remains that have been found on the ornamented envelopes of mummies. From Egypt it passed into Greece, and afterwards into Rome and its

BLACK ENAMELS ARE MADE WITH PRORIDE OF MANGANESE, OR PROTIDE OF IRON, TO WHICH A PORTION OF COBALT IS ADDED.

RED ENAMELS, VIZING WITH THE FINEST CARBINE, MAY BE OBTAINED FROM THE PURE OXYDE OF COPPER, IF PROPERLY PREPARED.

[ENC]

A New Dictionary of the Belles Lettres.

[ENC]

provinces, whence it was probably introduced into Great Britain, as various Roman antiquities have been dug up in different parts of the island, particularly in the barrows, in which enamels have formed portions of the ornaments.—*Painting in enamel, &c.* is performed on plates of gold or silver, but more commonly of copper, enamelled with the white enamel: the colours are melted in the fire, where they take a brightness and lustre like that of glass. This painting is prized for its peculiar brightness and vivacity, which is very permanent; the force of its colours not being effaced or sullied by time, as in other painting, and continuing always as fresh as when it came out of the workman's hands.

ENANTE'SIS, in anatomy, a meeting or near approach of the ascending and descending vessels.

ENANTIOSIS, a rhetorical figure, where that which is spoken negatively, is to be understood affirmatively.

ENARTHROSIS, in anatomy, that species of articulation which consists in the insertion of the round end of a bone in the cavity of another, forming a movable joint.

ENCAENIA, in antiquity, anniversary feasts to commemorate the completing or consecrating any new and public work, &c. In modern times, this term is used for any commemorative festival.

ENCAMPMENT, the act of pitching tents for the accommodation of an army in the open country.

ENCAUSTIC PAINTING, a peculiar mode of painting in wax, liquefied by fire, by which the colours acquire considerable hardness, brilliance, and durability. Ancient authors often mention this species of painting, but we have no ancient pictures of this description, and therefore the precise manner formerly adopted is not completely developed, though many moderns have closely investigated the subject, and described their processes. As the thing chiefly regarded in encaustic painting was the securing of permanence and durability, by the application of fire, the word *encausta* has been applied, in a very general sense, to other processes, in which both the material and the mode of applying the heat, are entirely different from what is conceived to have been the ancient materials and modes. The moderns have used the term for painting on porcelain, and work in enamel, and in the same way it was given to the painting on glass of the middle ages, such as is still seen in the windows of some Gothic churches. It has also been just as erroneously applied to works in metal, where gold and silver were inlaid, melted, or laid on, and of everything which was gilt or silvered by fire, which was called gold or silver encaustic.

ENCEINTE, in fortification, the wall or rampart which surrounds a place, sometimes composed of bastions or curtains. It is sometimes only flanked by round or square towers, which is called a Roman wall.—In law, a term for a state of pregnancy.

ENCEPH'ALI, in medicine, worms ge-

nerated in the head, where they cause such great pain as sometimes to occasion the loss of reason.

ENCHANTMENT, the use of magic arts and spells, or the invocation of demons, in order to produce wonderful or supernatural effects.

ENCHAS'ING, or **CHAS'ING**, the art of enriching and beautifying gold, silver, &c., by some design represented thereon, in low relieve. It is performed by punching, or driving out the metal, to form the figure, from within side, so as to stand out prominently from the plane or surface of the metal.

ENCHYRIDION, a manual or small volume.

ENCLAVE, in heraldry, denotes something let into another, especially when the piece, so let in, is square.

ENCLIT'IO, in grammar, a particle so closely united with any other word as to seem to be part of it, as *que*, in *virumque*.

ENCLOSING LAND, the parting off of common grounds into distinct possessions.

ENCORE, (French, pron. *onghore*), a word signifying *again*, used by the audience at theatres, and other places, when they call for a repetition of a particular song, &c.

ENCROACHMENT, in law, an unlawful intrusion or gaining upon the rights and possessions of another.

ENCYCLOPÆDIA, a general system of instruction or knowledge, embracing the principal facts in all branches of science and the arts, properly digested, and arranged in alphabetical order. A contemporary writer, speaking of the effects which the celebrated French *Encyclopedie* had in influencing public opinion, very truly observes, that "there is hardly an instance to be found in which the literati of a nation have obtained so extensive and powerful an influence on political sentiment as the French literati, and particularly the French encyclopedists. Their philosophy, too, was a fashionable philosophy, a philosophy for common life, favourable for wit and gaiety. Instead of proceeding with steady steps to the goal of truth, they hurried to and fro, with daring leaps, and imagined they had reached the mark, if they could maintain an opinion which contained something new and paradoxical. This mixture of philosophy with elegant literature became still more interesting on account of the opinions which men like Mahly, Condillac, Mercier, Raynal, Buffon, Helvetius, Diderot, and D'Alembert, advanced on the subjects of religion and civil government, for which a prohibition was laid on the further progress of the work. But the printers only, and not the authors, were punished, and the government was soon after obliged to permit the work to proceed, as it was too weak to prevent it. To the encyclopedists, who were connected with the highest circles at that time, is justly attributed a very important influence on the French revolution." Too true indeed it is, that "instead of proceeding with steady steps to the goal

The Scientific and Literary Treasury ;

[ENG]

of truth,' they flattered the prejudices and called into action the worst passions of mankind, spreading a moral pestilence over the whole civilised world, which is still insinuating itself, in countless channels, through every class of society.

ENCRATITES, in church history, a sect which appeared towards the end of the second century: they were called *encratites*, or *continentes*, because they abstained from marriage, and the use of wine and animal food.

ENDIVE, an herbaceous plant, a sort of succory, used as a salad: the *Chicorium endivia* of Linnaeus.

ENDORSEING, the writing one's name on the back of a bill of exchange or check: by which responsibility for its amount is incurred, if duly presented and not paid.

ENDOWMENT, in law, the act of giving or assuring a dower to a woman. Also, the assigning certain rents and revenues for the maintenance of a vicar, almshouses, &c.

The word endowment has also a more enlarged signification, implying any quality or faculty bestowed on man by the Creator.

ENEMA, in medicine, a clyster.

ENEMY, in a political sense, any one belonging to a nation with whom our own country is at war.—In law, it denotes an alien or foreigner, who in a public capacity, and with a hostile intention, invades any kingdom.

ENERGY, the internal or inherent power, virtue, or efficacy of a thing; as, Danger will rouse our dormant *energies* into action; the administration of the laws requires *energy* in the magistrate. It also signifies the momentum which any simple or compound body exhibits, by causes obvious or concealed.

ENERVATE, to deprive of nerve, force, or strength: as, idleness and luxury *enervate* both body and mind.

ENFEOFFMENT, in law, the act of giving the fee simple of an estate.

ENTILED, in heraldry, an epithet implying that the head of a man, beast, or any other charge, is placed on the blade of a sword.

ENFILADE, in military tactics, is used in speaking of trenches, or other places, which may be seen and scoured by the enemy's shot along the whole length of a line.

ENFRANCHISEMENT, in law, the incorporating a person into any society or body politic; to admit to the privileges of a freeman.

ENGAGEMENT, a word used in different senses. Any obligation by agreement or contract, is an *engagement* to perform, &c.; the conflict of armies or fleets is an *engagement*; and any occupation, or employment of the attention, as likewise called an *engagement*.

ENGINE, in mechanics, a compound machine, consisting of one or more mechanical powers, as of levers, pulleys, &c. in order to raise, cast, or sustain any weighty body; or to perform some mechanical operation in which force and velocity are ne-

cessary. [The different kinds of engines are described in their respective places. See Steam-engine, &c.]

ENGINEER. There are two kinds, military and civil. A *military engineer* is one who, by a perfect knowledge in mathematics, delineates upon paper, or marks upon the ground, forts, or other works proper for offence and defence. He should understand the art of fortification, so as to be able, not only to discover the defects of a place, but to find a remedy proper for them, as also how to attack as well as to defend. It is his business also to delineate the lines of circumvallation and contravallation, taking all the advantages of the ground; to mark out the trenches, places of arms, batteries, lodgements, &c.—*Civil engineers* are employed in delineating plans and superintending the construction of public works, as aqueducts, canals, bridges, rail-roads, &c.

ENGISCOPE, in mechanics, an instrument or kind of microscope, for viewing small bodies more distinctly.

ENGISOMA, in surgery, a fissure of the cranium. Also, a surgical instrument used in fractures of the cranium.

ENGLISH, (pron. *Inglish*), the language spoken by the people of England, and their descendants in India, North America, and the British colonies. The ancient language of Britain is generally allowed to have been the same with that of the Gauls; this island, in all probability, having been first peopled from Gallia, as both Cæsar and Tacitus prove by many strong and conclusive arguments. Julius Cæsar, sometime before the birth of our Saviour, made a descent upon Britain, though he may be said rather to have discovered than conquered it: but, about the year 45, in the time of Claudius, Aulus Plautius was sent over with some Roman forces, by whom two kings of the Britons, Codiguanus and Caractacus, were both signally defeated: whereupon a Roman colony was planted at Malden in Essex, and the southern parts of the island were reduced to the form of a Roman province. Britain was subsequently conquered as far north as the friths of Dumbarton and Edinburgh, by Agricola, in the time of Domitian; and a great number of the Britons, in the conquered part of the island retired to the western part, called Wales, where their language continued to be spoken without any foreign admixture. The greatest part of Britain being thus become a Roman province, the Roman legions, who resided in Britain for above two hundred years, undoubtedly disseminated the Latin tongue; and the people being afterwards governed by laws written in Latin, it must have necessarily followed that the language would undergo a considerable change. In fact, the British tongue continued, for some time, mixed with the provincial Latin; but at length, the declining state of the Roman empire rendered the aid of the Roman legions necessary at home, and on their abandoning the island, the Scots and Picts took the opportunity to attack and harass South Britain: upon

THE SARCATIC VOLTAIN OBSERVES, "THE ENGLISHMAN GAINS UPON US TWO HOURS A-DAY, BY SWALLOWING HALF OF ALL HIS WORDS."

THERE ARE A HUNDRED ENGLISHMEN WHO SPEAK FRENCH TOLEBASTY WELL, FOR ONE FRENCHMAN WHO CAN SPEAK GOOD ENGLISH.

[FRG]

THE ENGLISH LANGUAGE IS MORE REMARKABLE FOR ITS STRENGTH AND EXPRESSIVENESS, THAN DISTINGUISHED FOR GRACE AND BEAUTY.

which, Vortigen, the king, about the year 440, called the Saxons to his assistance, who, coming over with several of their neighbouring tribes, repulsed the Scots and Picts, and were rewarded for their services with the Isle of Thanet, and the whole county of Kent. Growing at length too powerful, and not being contented with their allotment, they dispossessed the inhabitants of all the country on the east side of the Severn; and thus the British language was in a great measure destroyed, and that of the Saxons introduced in lieu of it. What the Saxon tongue was long before the Conquest, viz. about the year 700, may be seen in the most ancient manuscript of that language, which is a gloss on the Evangelists, by bishop Eadfride, in which the three first articles of the Lord's prayer run thus: "Uren fader this arth in heofnas, sic gehalgod thin noma, so symeth thin ric. Sic thin willa sue in heofnas, and in eorþo, &c." In the beginning of the ninth century, the Danes invaded England, and getting a footing in the northern and eastern parts of the country, their power gradually increased, and in about two hundred years they became its sole masters. By this means the ancient English obtained a tincture of the Danish language: but their government, being of no long continuance, did not make so great an alteration in the Anglo-Saxon, as the next revolution, when the whole land, A.D. 1067, was subdued by William the Conqueror, duke of Normandy, in France: for the Normans, as a monument of their conquest, endeavoured to make their language as generally received as their commands: and thereby the English language became an entire medley. About the year 900, the Lord's prayer in the ancient Anglo-Saxon, read as follows: "Thu ure fader the eart on heofenum, si thin nama gehalgod; cume thin rice si thin willa on eorþan swa, swa on heofenum, &c." And, about the year 1160, pope Adrian, an Englishman, thus rendered it in rhyme:

"Ure fader in heaven rich,
Thy name be hayled ever lich,
Thou bring us thy michell blisse:
Als hit in heaven y doe,
Ever to yearth beene it also, &c."

It continued to undergo various mutations, till the year 1537, when the Lord's prayer was thus printed: "O oure father which arte in heven, halowed be thy name: let thy kingdome come, thy will be fulfilled as well in erth as it is in heven; geve us this daye in dayly bred, &c." Here, it may be observed, the diction is brought almost to the present standard, the chief variations being only in the orthography. By these instances, and many others that might be given, it appears, that the Anglo-Saxon language, which the Normans in a great measure despoiled and rendered obsolete, had its beauties, was significant and emphatical, and preferable to what they substituted for it. "Great, verily," says Camden, "was the glory of our tongue, before the Norman Conquest, in this, that the old

English could express, most aptly, all the conceptions of the mind in their own tongue, without borrowing from any." Of this he gives several examples. After the Conquest, it was ordained that all law proceedings should be in the Norman language; and hence the early records and reports of law cases came to be written in Norman. But neither royal authority, nor the influence of courts, could absolutely change the vernacular language. After an experiment of three hundred years, the law was repealed; and since that period, the English has been, for the most part, the official as well as the common language of the nation. Since the Norman invasion, the English has not suffered any shock from the intermixture of conquerors with the natives of England; but the language has undergone great alterations, by the disuse of a large portion of Saxon words, and the introduction of words from the Latin and Greek languages, with some French, Italian, and Spanish words. These words have, in some instances, been borrowed by authors directly from the Latin and Greek; but most of the Latin words have been received through the medium of the French and Italian. For terms in the sciences, authors have generally resorted to the Greek; and from this source, as discoveries in science demand new terms, the vocabulary of the English tongue is receiving continual augmentation. We have also a few words from the German and Swedish, mostly terms in mineralogy; and commerce has introduced new commodities of foreign growth or manufacture, with their foreign names, which now make a part of our language. It may then be stated, that the English is composed of, 1st, Saxon and Danish words of Teutonic and Gothic origin. 2nd, British or Welsh, which may be considered as of Celtic origin. 3rd, Norman, a mixture of French and Gothic. 4th, Latin. 5th, French. 6th, Greek. 7th, A few words directly from the Italian, Spanish, German, and other languages of the continent. 8th, A few foreign words, introduced by commerce, or by political or literary intercourse. Of these the Saxon words constitute our mother tongue. The Danish and Welsh also are primitive words, and may be considered as part of our vernacular language.

ENGRAVING, the art of producing, by the aid of an instrument called a graver, representations on hard surfaces of metal or wood, which, by means of ink and a printing-press, may be transferred to paper. For this purpose copper has generally been used, and is wrought or etched with a tool, and the lines completed with aqua fortis, or nitric acid. But latterly mixed metals, not subject to the corrosion of oil in printing, or steel, have been introduced: and engravings on wood have been revived with great effect, as may be seen in the "pictorial" editions of various works recently published. The art of engraving on copper was invented in Europe in the early part of the 15th century: but the Chinese

OUR LANGUAGE POSSESSING GREAT FLEXIBILITY, AND EMPRACING A VERY COPIOUS STOCK OF WORDS USED EXCLUSIVELY IN POETRY.

ENGRAVING ON WOOD IS SUPPOSED TO HAVE BEEN INVENTED AT FLANDERS IN 1422, AND REVIVED BY THE CELEBRATED ALBERT DÜRER IN 1511.

seem to have been acquainted with it long before.—The art of *etching* was discovered some time after that of engraving. It consists in giving the representation of any object on a metal plate, on which a ground has been previously laid, capable of resisting the action of acids. After the plate has been covered with a proper varnish or ground, the ground is scored or scratched by a needle or similar instrument, in the places where the etchings or engravings are intended to be, the plate is then covered with diluted nitric acid which corrodes or eats the metal where it is thus laid bare. This is called *biting* in the more distant and lighter places require the acid to be applied to them for a shorter time, and when it happens that any parts of the etching are wished darker, they can be accomplished by what is termed *re biting*.

ENHARMONIC, in music, an epithet applied to such species of composition as proceed on very small intervals, or smaller intervals than the diatonic and chromatic.

ENIGMA, a dark or ambiguous saying, in which the true meaning is concealed under obscure language.

ENNEAHEDRON, in natural history, a genus of columnar, crystalliform, and double pointed spars, composed of a trigonal column, terminated at each end by a trigonal pyramid.

ENNEANDRIA, the name of the ninth class in Linnæus's sexual system, consisting of plants which have hermaphrodite flowers, with nine stamens.

ENNEAPETALOUS, in botany, having nine petals or flower leaves.

ENNEATICAL DAYS, are every ninth day of a disease.—*Enneatical years*, are every ninth year of a person's life.

ENNI, (*French*) a word expressive of lassitude, or weariness arising from the want of employment.

ENS, among metaphysicians, denotes entity, being, or existence: thus the schools call *ens reale*, and *ens positum*, to distinguish it from their *ens rationis*, which exists only in the imagination.—*Ens*, among chemists, signifies the essence or virtue of any substance.

ENSIFORM, an epithet for that which resembles a sword, (*ensis*), as an *ensiform leaf*.

EN SIGN, the flag or banner under which soldiers are ranged, according to the different regiments to which they belong.

—*Ensign* is also the officer that carries the colours, being the lowest commissioned officer in a company of infantry.—*Naval ensign*, is a large banner hoisted on a staff, and carried over the poop or stern of a ship.

ENSATÆ, the sixth Linnæan natural order of plants, containing the lilaceous plants, as the saffron, &c.

ENSEMBLE, (*French*), a term used in the fine arts to denote the general effect of a whole work, without reference to the parts. The *ensemble* of a picture, for instance, may be satisfactory to the eye of the spectator, though the several parts may

not bear a critical analysis, or, in a drama, the characters may be well drawn, and yet it may be deficient in the *ensemble*, that is, as a whole.

ENTABLATURE, in architecture, the architrave, frieze, and cornice, at the top of a column, and which is over the capital, the horizontal continuous work which rests upon a row of columns.

ENTAIL, in law, an estate entailed, abridged and limited by certain conditions prescribed by the first donor. Estates tail are either *general* or *special*, and are always *lesser* estates than a fee simple.

To *entail*, is to settle the descent of lands and tenements, by gift to a man and to certain heirs specified, so that neither the donee nor any subsequent possessor can alienate or bequeath it.

ENTALIA, in natural history, shells or coverings for sea worms.

ENTE, in heraldry, an epithet signifying grafted or engrafted.

ENTERITIS, in medicine, inflammation of the intestines, a disorder always attended with considerable danger, and consequently requiring immediate attention.

ENTERONELLE, in surgery, a rupture of the intestines.

ENTEROLOGY, a treatise or discourse on the internal parts of the body.

ENTEROMPHALOS, an umbilical or navel rupture.

ENTERTAINMENT, the pleasure which the mind receives from any thing interesting, and which arrests the attention. Also, the hospitable reception of, and amusement we provide for, our guests.—In a dramatic sense, the *farc* or *pantomime* which follows a tragedy or comedy.

ENTHUSIASM, in a religious sense, implies a transport of the mind, whereby a person vainly fancies himself inspired with some revelation from heaven, or that his actions are governed by a divine impulse. Devotion, when it does not lie under the check of reason, is apt to degenerate into enthusiasm, and when once it fancies itself under the influence of a divine impulse, it is no wonder that it should slight human ordinances, and trust to the conceits of an overrunning imagination. But enthusiasm, in another sense, when under the controul of reason and experience, becomes a noble passion, that forms sublime ideas, and prompts to the ardent pursuit of laudable objects. Such is the enthusiasm of the poet, the orator, the painter, and the sculptor—such is the enthusiasm of the patriot, the hero, the philanthropist, and the truly devout Christian.

ENHYME, among logicians, denotes a syllogism, perfect in the mind, but imperfect in the expression.

ENTERTIE, or ENTIRETY, in law, the whole of a thing, in distinction from a moiety: thus a bond, damages, &c., are said to be *entire*, when they cannot be apportioned.

ENTOMOLITHUS, in mineralogy, an insect, or any part of one, changed into a fossil.

BY THE PRINCE ARMY, UNDER NAPOLEON, THE OLDEST AND MOST DISTINGUISHED SERGEANTS ACTED AS ENIGMAS, AND BORE THE COLOURS.

[ENT]

A New Dictionary of the Belles Lettres.

[ENT]

INSECTS ARE DESTITUTE OF VOICE AND HAVE NO DISTINCT HEART, AND INCUBATION IS NOT NECESSARY FOR HATCHING THEIR EGGS.

ENTOMOL'OGY, that branch of zoology which treats of the orders, genera, species, varieties, structure, and habits, of insects. Like all other organized bodies, insects are composed of fluids and solids. In the four superior classes of animals, viz mammals, birds, reptiles, and fishes, the bones form the most solid part, and occupy the interior part both of the trunk and limbs. This is reversed in insects, the exterior part is the most solid, serving at the same time both for skin and bones. Whether insects be endowed with any senses different from those of the superior animals, cannot easily be ascertained. It appears evident that they possess vision, hearing, smell, and touch, and there are few things, either in the vegetable or animal kingdom, which are not consumed by some of them. The general characters by which insects are distinguished are the following—they are furnished with several (six or more) feet, the muscles are affixed to the internal surface of the skin, which is a substance more or less strong, and sometimes very hard and horny, they do not breathe like larger animals, by lungs or gills situated in the upper part of the body, but by a sort of spiracles, distributed in a series or row on each side the whole length of the abdomen, these are supposed to communicate with a continued chain, as it were, of lungs, or something analogous to them, distributed throughout the whole length of the body, the head is furnished with a pair of what are termed antennae, or horns, which are extremely different in different tribes, and which, by their structure, &c form a leading character in the institution of the genera into which insects are divided. The sting, which is peculiar to insects of the bee tribe and some few others, is sometimes simple, having but one dart, and sometimes compound, having two darts. In bees and wasps the sting is retractile, that is, capable of being drawn in, but in other insects it is almost always hid in the body, or seldom thrust out. In some tribes of insects it exists in the males, in others in the females only, but seldom in both sexes. Writers on natural history formerly included snails, worms, and the smaller animals, or animalcules, in general, among insects: these are now more properly placed among the tribe *vermes*, or worm like animals. Insects have also been denominated bloodless animals, which modern discoveries have shown to be contrary to fact, some of them have been frequently viewed with the microscope, to exhibit in a striking manner the circulation of the blood. In *cimex lectularius*, for instance, the vibrations and contractions of the arteries may be distinctly observed. Most insects are oviparous, and as many of them cannot transport themselves easily, in quest of food, to places at a distance from one another, nature has furnished the perfect insects of many species with an instinct, which leads them to deposit their eggs in situations where the larvæ, as soon as hatched, may find that kind of food

which is best adapted to their nature. Most of the butterflies, though they flutter about, and collect the nectarous juice of a variety of flowers, as food for themselves, always deposit their eggs on or near to those vegetables which are destined by nature to become the food of their larvæ. The eggs of insects are of two sorts, the first membranaceous, like the eggs of the tortoise and the other reptiles, the other covered with a shell, like those of the birds. Their figure varies exceedingly, some are round, some elliptical, some lenticular, some cylindrical, some pyramidal, some flat, some square, but the round and oval are the most common. The life of insects varies as to its duration. Some, as bees and spiders, are supposed to live for a considerable time, but others will not live beyond a year, a day, or some hours, in their perfect state, although they will continue for some time in their larva state.—In 1735, the system of Linnæus was published, it consisted at first of four orders, which he afterwards increased to seven, classing them according to their wings, viz. 1, *Coleoptera*, or such as have shells that cover the wings, as the beetle tribe. 2, *Hemiptera*, or half winged insects, as the locust, grasshopper, &c. 3, *Lepidoptera*, or scaly winged insects, as the butterfly and the moth. 4, *Neuroptera*, or nerve-winged or fibre winged insects, as the dragon fly, trout fly, &c. 5, *Hymenoptera*, or insects with four wings and a sting, as the bee, wasp, hornet, white ant, &c. 6, *Diptera*, or two winged insects, as the gnat, common fly, mosquito, &c. 7, *Aptera*, or insects without wings, as the spider, flea, lobster, &c.—Cuvier's later classification is much more extensive.—Insects afford nourishment to a great number of the superior animals, many of the fishes, reptiles, and birds, draw the principal part of their sustenance from that source, nay, some of them form part of the food of man. Besides, by consuming decayed animal and vegetable matter, which, if left to undergo the putrefactive process on the surface of the ground, might taint the atmosphere with pestilential vapours, preserve the air pure for the respiration of man and other animals. On the other hand, the injuries they inflict upon us are extensive and complicated, and the remedies which we attempt are often aggravations of the evil, because they are directed by an ignorance of the economy of nature. There are beetles which deposit their larvæ in trees, in such formidable numbers, that whole forests perish beyond the power of remedy. At one place in South Carolina, at least 9000 trees in every 100, upon a tract of 2000 acres, were swept away by a small black winged bug. Wilson, the American ornithologist, speaking of the labours of the ivory billed woodpecker, says, "Would it be believed that the larvæ of an insect, or fly, no larger than a grain of rice, should, silently, and in one season, destroy some thousand acres of pine trees, many of them two or three feet in diameter, and 150 feet

HIPPOCRATES WROTE UPON INSECTS ABOUT 500 YEARS BEFORE THE CHRISTIAN ERA. ARISTOTLE AND PLINY ALSO MADE THEM THEIR STUDY.

ENVY]

The Scientific and Literary Treasury;

[EPA

REPAINTERS ORIGINATED IN THE TIME OF LOUIS XII FROM THE RIBAND BY WHICH THE SWORD BELT WAS KEPT FAST ON THE SHOULDER.

high? In some places the whole woods, as far as you can see around you, are dead, stripped of the bark, their wintry looking arms and bare trunks bleaching in the sun, and tumbling in ruins before every blast' The corn weevil, which extracts the flour from grain leaving the husk behind, will destroy the contents of the largest storerooms in a very short period. The wire worm and turnip fly are dreaded by every farmer. The ravages of the locust present a frightful example of the formidable collective power of the insect race, and the white ants of tropical countries sweep away whole villages with as much certainty as a fire or an inundation.

ENTRELLES, (*French*) small plates, or dainties, set between the principal dishes at table.—In music the inferior and lesser movements inserted in a composition between those of more importance.

ENTRELPAH, in horsemanship a short broken pace, nearly resembling an amble.

ENTREPOT (*French*) a warehouse or magazine for the deposit of goods.

ENTRICHOMIA, in anatomy the outer extremity or claw of the eyelid.

ENTROCHITE, a kind of fossil, usually about an inch long and made up of round joints which when separated, are called *trochites*. They are situated from the centre to the outside, have a cavity in the middle, and seem to be composed of the same substance as the fossil shells of the echin.

ENTRY, in law the act of taking possession of lands.—In commerce the act of setting down in an account book the particulars of trade as make an *entry* of that sale, debt or credit. Bookkeeping, is performed either by *single* or *double entry*.

ENTRY, at the custom house, the exhibition or depositing of a ship's papers in the hands of the proper officers and obtaining permission to land the goods.

ENUCLEATE, to open as a nucleus to clear from knots or lumps; hence, to explain or clear from obscurity.

ENULON, in anatomy, the internal flesh of the gums or that part of them which is within the mouth.

ENUMERATION, an account of several things, in which mention is made of every particular article.—*Enumeration*, in rhetoric, is that part of a peroration in which the orator recapitulates the principal points or heads of the discourse or argument.

ENURETIS, in medicine an involuntary flow or incontinency of urine.

ENURNEY, in heraldry an epithet for a bordure charged with wild beasts.

ENVELOPE, the cover that encloses a letter or note.—In fortification, a small rampart of earth, with a parapet.

ENVIRONNE, in heraldry, signifies surrounded with other things: thus they say, a lion *environné* with so many bezants.

ENVIRONS, the parts or places which surround another place, as the *environs* of a city or large town.

ENVOY, a person deputed by government to negotiate some affair with any foreign

prince or state. There are envoys *ordinary* and *extraordinary*, as well as ambassadors, they are equally the same under the protection of the law of nations, and enjoy all the privileges of ambassadors, but, being in rank below them, they are not treated with equal ceremony. The word *envoy* is also sometimes applied to resident ministers.

ENVY, a feeling that springs from pride or disappointed ambition excited by the sight of another's superiority or success, accompanied with some degree of malignity, and usually with a desire to depreciate him.

EPIGRAPH in rhetoric a figure of speech, which consists in demonstrating and proving universal propositions by particulars.

EPANADIPLOISIS, in rhetoric, a figure of speech which begins and ends with the same words.—In medicine the return of a cold fit, in a semi tertian fever, before the hot fit is ended.

EPANALEPSIS a figure of speech in which the same word is repeated by way of emphasis.—In medicine, a restoration to life.

EPANODOS, in rhetoric, a figure in which the same or similar words are used in two or more sentences.

EPANORTHOSIS in rhetoric, the act of changing weak or faint expressions for those which are more energetic.

EPAPHORELISIS in medicine a removal or taking away applied particularly to repeated hemorrhomys.

EPARIHA, in mineralogy, a sort of liver coloured argillaceous earth.

EPASIS in medicine a tumour, more particularly of the parotid glands.

EPHAIL or EPIHA in Hebrew antiquity a measure both for liquids and dry goods.

EPACTS in chronology the excesses of the solar month above the lunar synodical month and of the solar year above the lunar year of twelve synodical months. The epacts then are either *annual* or *menstrual*. Suppose the new moon to be on the 1st of January, since the lunar month is 29 days, 12 hours 44 minutes 3 seconds and the month of January contains 31 days the menstrual epact is 1 day 11 hours 13 minutes 37 seconds. The annual epact is nearly 11 days: the Julian solar year brings 365 days 6 hours and the Julian lunar year 354 days, 8 hours, 48 minutes, 38 seconds.

EPARCHY the prefecture or territory under the jurisdiction of an *eparch* or governor.

EPAULE, in fortification, the shoulder of the bastion, or the angle of the face and flank which is often called the *angle of the epaule*.

EPAILLEMENT, in fortification a work raised to cover sideways made of earth gabions &c. It also denotes a mass of earth, called a square orillon raised to cover the cannon of a casemate, and faced with a wall.

EPAILLET or EPAULET an ornamental badge worn on the shoulder by military and naval officers. In the English

"ENVY, TO WHICH THE 'GENOPLY' WINDS A SLAVE IN EMULATION IN THE LEARN'D OR BRAVE"—SO SAYS ALEXANDER POPE

[E H]

A New Dictionary of the Belles Lettres.

[E P]

EPHEMERA EXIST IN SUCH QUANTITIES IN CARNATIONS THAT THEY ARE COLLECTED, AND USED AS MANURE FOR THE LAND

army all officers now wear two epaulettes the bullion in those of field officers and captains are distinguished by being much thicker. The epaulettes of a colonel have a silver star surmounted by a crown on the strap, those of a lieutenant colonel have a crown while those of a major are distinguished by a star. In the navy masters and commanders have one epaulette on the left shoulder post captains under three years one epaulette on the right shoulder afterwards two epaulettes rear admirals have one star on the strap of the epaulette vice admirals two stars and admirals three stars.

EPENTHESIS the insertion of a letter or syllable in the middle of a word, as, *al-tu-m* for *altum*.

EPHEBIA, in antiquity puberty, or the age of fifteen.

EPHEDRA in botany, a genus of plants in the Linnean system, class 22 *Dioecia* order 12 *Monodelphia*.

EPHRELIS in medicine a broad solitary or aggregated spot on the face back of the hand or breast, arising from exposure to the sun.

EPHEMERA the *DAY FLY* a genus of flies belonging to the order *Neuroptera* and so called from their living only one day and a night they have two gibbous protuberances on the top of the head resembling eyes the tail is furnished with hairs and the antennae are short. To this genus belong a variety of species differing from each other in the length of their lives some living but a few hours and others several days. From the short duration of the existence of these insects the term *ephemeral* has been derived which is used to signify anything short lived or temporary. The *ephemeræ* live but a few hours after becoming perfect insects appearing generally a short time before sunset and rising and descending like gnats in immense swarms. They emerge from the chrysalis on the banks of a stream and make their exit from the envelope or case. When at rest these insects preserve the wings in a vertical position and are so found in a semi torpid state a short time prior to their death. In the larva state they are said to live a year and in that of the chrysalis or pupa, two years.

EPHIMERIS (plu *ephemerides*) in astronomy a table or collection of tables showing the daily state of the heavens or the places wherein all the planets are to be found every day at noon. It is from these tables that the eclipses conjunctions and aspects of the planets are calculated and determined. In medicine *ephemerides* are those diseases which return at particular times of the moon.

EPHIMESIS in medicine incubus, or the night mare.

EPHIDROSIS in medicine a violent and morbid perspiration.

EPHOD an ornament or upper garment worn by the Jewish priests. It was a sort of girdle which being brought from behind the neck and over the two shoulders and

hanging down before, was put across the stomach then carried round the waist, and used as a girdle to the tunic.

EPHODOS in medicine, the ducts or passages by which the excrements are evacuated.

EPHORI in Grecian antiquity magistratus established in ancient Sparta to balance the regal power. The authority of the *ephori* was very great they were five in number, presided over shows and festivals, had the care of the public money specially superintended the education of youth and were the arbiters of war and peace.

EPHALOS in medicine an intense fever, in which both heat and cold are felt at the same time.

EPIC or *heroic poem*, a poem narrating a story partly real and partly feigned representing in a sublime style some signal and fortunate action distinguished by a variety of great events and intended to form the morals and affect the mind with the love of virtue. The *epic* may treat very different subjects grave and elevated, like Dante's and Milton's poems glowing and romantic like Ariosto's or cheerful and ludicrous it affords indeed a wide range from the sublimity of *Paradise Lost* to the wit of *Hudibras*. The great epic writers of antiquity are Homer and Virgil among the moderns Milton Tasso Camoens Dante and Ariosto besides many English poets of our own day whose claims to the honour are indisputable.

EPICANTHUS in anatomy, the angle of the eye.

EPICARPIUM a topical medicine applied to the wrist.

EPICENF in grammar an epithet for the gender of such words as are common to both sexes.

EPICERASTICA medicines which by mixing with acrimonious juices temper them and render them less troublesome.

EPICHRILMA in logic a mode of reasoning which comprehends the proof of one or both the premises of a syllogism, before the conclusion is drawn.

EPICLETIAN pertaining to Epictetus, the Stoic philosopher a man who was held in such high esteem that it is said his study lamp was sold after his death for three thousand drachmas.

EPICHIROTONIA in Grecian antiquity the annual ceremony of revising the laws which was instituted by Solon. They gave their votes by holding up their hands hence the name.

EPICITHARISMA in the ancient drama, the last part of the interlude or a flourish of music after the play was over.

EPICRANIUM, in anatomy the common integuments aponeurotic and muscular expansion which lie upon the cranium.

EPICUREANS, a numerous sect of philosophers in Greece and Rome the disciples of Epicurus who flourished about 300 years B.C. They maintained that sensual pleasure was man's chief felicity that the world was formed by a concourse of atoms and not governed by Providence, that the

RICHTER SAYS, 'THE EPIC POET MAY FLY FROM REGION TO REGION BETWEEN HEAVEN AND HELL, BUT HE MUST DESCRIBE HIS WAY.'

CAUSES WHICH PRODUCE A DISTURBED STATE OF MIND, BY THEIR EFFECTS ON THE NERVOUS SYSTEM, FAVOUR EPIDEMICS.

gods resided in the extramundane spaces, in soft, inactive ease, and eternal tranquillity; that future rewards and punishments were idle chimeras; and that the soul was extinguished with the body. They are mentioned in the xviii chapter of the Acts of the Apostles. Epicurus himself maintained a more manly philosophy than the generality of his followers; he held, indeed, that pleasure was the chief end of human pursuit; and this pleasure he placed in an exemption from pain, and a perfect tranquillity of body and mind; but the means which he pointed out as conducive to this end were prudence, temperance, fortitude, and justice, in the union of which perfect happiness consists. He pursued pleasure, therefore, in its most rational acceptation, and his life seems to have been stained with few vices. The precepts and practices of the Epicureans have, however, loaded his memory with unmerited infamy; and an Epicurean, according to the perverted meaning of his doctrine, is one who is devoted to sensual enjoyments, particularly those of the table.

EPICYCLE, in the ancient astronomy, a little circle whose centre is in the circumference of a greater circle.

EPICYCLOID, in geometry, is a curve generated by a point in one circle, which revolves about another circle, either on the concavity or convexity of its circumference, and thus differs from the common cycloid, which is generated by the revolution of a circle along a right line.

EPIDEMIA, in Grecian antiquity, festivals kept in honour of Apollo and Diana, at the stated seasons when these deities, who could not be present everywhere, were supposed to visit different places, in order to receive the vows of their adorers.

EPIDEMIC, a disease which prevails in a place or tract of country only for a temporary period, or that attacks many people at the same season. There are some epidemics which prevail every year, and which are produced by the various changes of the seasons. Thus, the spring is accompanied by inflammatory diseases; summer by complaints in the stomach and bowels; autumn by catarrhs; and winter by intermittents. An epidemic at its commencement is usually mild, and becomes more dangerous as it spreads; but as it goes off, it again generally assumes a mild form. Epidemics are not originally contagious; it is only under particular circumstances, especially if the disorder is a violent one, and many patients are crowded into a small room, so as to form a corrupt atmosphere about the sick, that contagion takes place. That which is frequently ascribed to contagion, is only the consequence of a violent shock of the nervous system at the sight of a sick person, perhaps in a loathsome state, whereby the disease, to which the body was already disposed, is more quickly developed.

EPIDENDRA, in botany, a term sometimes used for the parasitical plants, or those which grow on trees, shrubs, and

other vegetables; as the mistletoe, dodder, &c.

EPIDENDRIUM, a genus of perennial plants, class 20 *Gynandria*, order 1 *Dianthia*.

EPIDERMIS, in anatomy, the cuticle or scarf skin; a thin membrane covering the skin of animals, or the bark of plants.

EPIDOTE, a mineral, found crystallized in rhombic prisms variously modified, both laterally and at its extremities. Its colour is usually some shade of green; and it has two varieties, the *zoisite* and *manganian epidote*. Magnificent crystals of it, two or three inches in length, and between one and two in diameter, are found at Arendal, in Norway, and are hence called *Arendalite*; but they are not much esteemed in jewellery.

EPIGASTRIC, *pertaining* to the upper part of the abdomen. — *Epigastric vessels*, the arteries and veins belonging to the *epigastric region*; the former being branches of the coeliac artery, and the latter of the iliac veins.

EPIGLOTTIS, in anatomy, one of the cartilages of the larynx, whose use is to cover the glottis when food or drink is passing into the stomach, to prevent it from entering into the larynx and obstructing the breath.

EPIGRAM, a short poem or composition in verse, treating only of one thing, and ending with some lively, ingenious, and natural thought or point. Boileau says, the finesse and subtlety of the epigram should turn upon the words, rather than the thoughts, by which means he reduces it to the nature of a pun, or equivocal. From its concise and expressive character, it is well fitted for satire; but an epigram may be didactic, satiric, comic, lyric, or elegiac. — Originally, epigrams were inscriptions on tombs, statues, temples, triumphal arches, &c.

EPILEPSY, a disease of the medullary system, which deprives the afflicted of sensation and volition, accompanied by involuntary contraction of the muscles. It was formerly called the falling sickness, because those who were attacked by it fell suddenly to the ground.

EPILOBUM, in botany, Willow-herb, a genus of plants, class 8 *Otetandria*, order 1 *Monogynia*. The species are perennials.

EPILOGUE, in the drama, a speech addressed to the audience when the play is ended. In the modern tragedy the epilogue is usually smart and lively, intended, probably, to compose the passions raised in the course of the representation; but it has been compared to a merry jig upon the organ, after a good sermon, to wipe away any impressions that might have been made by it, and send the congregation away just as they came. — In rhetoric, the conclusion of a speech, containing a recapitulation of the whole.

EPINICION, in the Greek and Latin poetry, is a poem or composition celebrating a victory. Also, a festival on account of a victory.

IT OFTEN HAPPENS THAT MEN WITH CHRONIC COMPLAINTS, HYPOCHONDRIACS, &c. ARE PRONE FROM EPIDEMIC DISORDERS.

[EPI]

EPIPH'ANY, a Christian festival, observed on the sixth of January (the twelfth day after Christmas), in honour of the appearance of our Saviour to the magi, or wise men, who came to adore him, and bring him presents. The Greek fathers use the word for the appearance of Christ in the world, the sense in which St. Paul uses the word, 2 Tim 1 10. On the evening of this day plum cakes are divided in family parties, by drawing lots for imaginary characters, an old custom continued for its good cheer and merriment.

EPIPHLEBOS, in medicine, an epithet for one whose veins appear prominent.

EPIPHONE'MA, in rhetoric, a sententious explanation or remark, not closely connected with the general tenor of the oration, and generally expressed with vehemence.

EPIPHORA, in medicine, a preternatural effluxion of the eyes, a disease in which the tears, from increased secretion, or other causes, accumulate in front of the eye, and trickle over the cheek.

EPIPHYLLONPLRMOUS, in botany, an epithet for plants which bear their seeds on the back of the leaves, as ferns.

EPIPHYSIS, in anatomy, a bony substance, or as it were a lesser bone, affixed to a larger or principal bone, by a cartilage. In young subjects these epiphyses are not continuous to the principal bone, but are only connected by the intermediate cartilage, hence they are called appendages to the bones.

EPIPLIXIS, a rhetorical figure, which, by an elegant kind of upbraiding, endeavours to convince.

EPIPOCE, a rhetorical figure, by which one aggravation, or striking circumstance, is added to another, as, "He not only spared the rebels, but encouraged them; not only encouraged them, but rewarded them."

EPIPOCLEF, in surgery, a rupture of the caul or omentum.

EPIPLOON, in anatomy, the omentum or caul.

EPISCOPACY, a form of church government by diocesan bishops.

EPISCOPALIAN, an appellation given to those who adhere to the episcopal form of church government and discipline. Until the last act was repealed, none but episcopalian, or members of the Church of England, were qualified to fill any office, civil or military.

EPISODE in poetry, a separate incident, story, or action, which a poet invents, and connects with his principal action, that his work may abound with a greater variety of events though, in a more limited sense, all the particular incidents of which the action or narration is compounded, are called episodes. In epic poetry, there is much more room for the episode than in dramatic, where the poem is confined to a present action. The term *episode* has also been transferred to historical painting in a sense analogous to that which it bears in poetry.

EPISPAS'MOS, in medicine, a quick inspiration of the breath.

EPISPAS'TIC, in medicine, signifies a blister, or a topical remedy applied for attracting the humours of the skin.

EPISTAXIS, in medicine, a repeated bleeding of the nose.

EPISTLE, a letter, or letter massive, communicating intelligence to a distant person. It is rarely used in familiar writings, but in those which are solemn and formal, as the epistles of St. Paul, the epistles of Cicero, Pliny, &c. The epistles of St. Paul, which are fourteen in number, make part of the canon of the New Testament, besides which there is one general epistle of St. James, two of St. Peter, three of St. John, and one of St. Jude.

EPISTOLOG'RAPHY, the art or practice of writing letters.

EPISTROPHE, in rhetoric, a figure of speech in which several successive sentences end with the same word or affirmation, as, "Are they Hebrews? so am I. Are they Israelites? so am I. Are they of the seed of Abraham? so am I." &c.

EPISTYLE, in ancient architecture, a term used by the Greeks for what we call the *architrave*, viz a massive piece of stone or wood laid immediately over the capital of a column.

EPITAPH, a monumental inscription in honour or memory of a deceased person, or an inscription engraven or cut on a tomb, to mark the time of a person's decease, his name, and family, usually with some eulogium of his virtues or heroic deeds. The Romans inscribed their epitaphs to the *manes*, *dis manibus*, and frequently introduced the dead as speaking to the living. Sometimes they were full of moral sentiments, and adorned with carved work. The epitaphs of the present day are too often replete with fulsome compliments and expressions of respect which, not being deserved, were never paid in the lifetime of the deceased. The Germans have a most expressive proverb, "He lies like a tombstone, and is as impudent as a news paper." Whatever the merits of the party might have been, whether he illuminated the world of science by his discoveries, or advanced the interests of his country, while he adorned his own brow with victorious laurels, or whether by his benevolence he administered to the comforts of his fellow-creatures,—no long panegyric should mar the simplicity of his epitaph: it should be modest, brief, and unadorned.

EPITASIS, in ancient poetry, the second part or division of a dramatic poem, in which the plot, entered upon in the first part, or *prolous* was carried on, heightened, and worked up, till it arrived at its height, called *catastasis*. — In medicine, an increase of the paroxysm of a fever. — In rhetoric, that part of an oration in which the orator addresses himself most forcibly to the passions.

EPIPHALAMUM, a nuptial song, or poetical composition in praise of the bridegroom and bride, with wishes for their

WITH THE BEST POETS, THE EPISODE IS NOT AN UNNECESSARY APPENDAGE, BUT HELPS TO DEVELOPE THE GENERAL PLOT.

A YEAR OF 365 DAYS, WITHOUT ANY INTERCALATION, IS CALLED AN **ERATIC YEAR**; A **LEAP YEAR** CONSISTS OF 364 DAYS.

prosperity. Among the Greeks and Romans, it was sung by young men and maids at the door of the bridal chamber.

EPITHEM, in medicine, any external application used as a fomentation.

EPITHET, an adjective expressing some real quality of the thing to which it is applied. We have frequent occasion for the use of the word *epithet* in this work, (in defining botanical and other scientific terms,) which those who consult our pages cannot fail to notice.

EPITOME, a brief summary or compendium, containing the substance or principal matters of a book.—*To epitomise*, therefore, is to shorten a literary production by judicious abridgment.

EPITROPE, or **EPITROPY**, in rhetoric, a figure of speech, by which one thing is granted, with a view to obtain an advantage; as "I concede the fact, but this very concession overthrows your own argument."

EPIZEUXIS, in rhetoric, a figure which repeats the same word, without any other intervening: such is that of Virgil, "nunc, nunc, insurgite remis."

EPIZOOTIC, in geology, an epithet given to such mountains as contain putrefactions of animal remains, or the impressions of animal substances.

EPIZOOTY, a pestilence among brutes.

EPOCH, a certain fixed period, or point of time, made famous by some remarkable event, and serving as a standard in chronology and history. The principal of these are the Creation, 4004 a.c.; the Flood, 2348 a.c.; the birth of Abraham, 1996 a.c.; the conquest of Canaan, 1451 a.c.; the taking of Troy, 1184 a.c.; the finishing of Solomon's Temple, 1104 a.c.; the first Olympiad, 776 a.c.; the building of Rome, 753 a.c.; the era of Nabonassar, 747 a.c.; the founding of the Persian Empire, by Cyrus, 559 a.c.; the death of Alexander, 323 a.c.; the death of Cæsar, 44 a.c.; the birth of Christ, 1; or the commencement of the Christian era; the Hegira of Mahomet, 622 A.D.—The Christian era used by almost all Christian nations, dates from January 1st, the middle of the fourth year of the 194th Olympiad, in the 753d of the building of Rome, and 4714th of the Julian period. The Christian year, in its division, follows exactly the Roman year, consisting of 365 days for three successive years, and of 366 in the fourth year, which is termed *leap year*. The simplicity of this form has brought it into very general use, and it is customary for astronomers and chronologists, in treating of ancient time, to date back in the same order from its commencement. The Christian year (or Julian year), arranged as we have shewn, was 11' 11" too long, amounting to a day in nearly 129 years; and, towards the end of the 16th century, the time of celebrating the church festivals had advanced ten days beyond the periods fixed by the Council of Nice, in 325. It was in consequence ordered, by a bull of Gregory XIII., that the year 1582 should consist of 355 days only, which was effected by omitting ten days in the month

of October, viz. from the 5th to the 14th; and, to prevent the occurrence of a like irregularity, it was also ordered, that, in three centuries out of four, the last year should be a common year instead of a leap year, as it would have been by the Julian calendar. The year 1600 remained a leap year, but 1700, 1800, and 1900, were to be common years. This amended mode of computing was called the *new style*, and was immediately adopted in all Roman Catholic countries, while the *old style* continued to be employed by Protestants. In 1700, however, the Protestants of Germany commenced with the new style; and in 1752 it was adopted in England, by omitting eleven days, to which the difference between the styles then amounted. The Russians continued to use the old style till the year 1830, when they followed the example of the other nations of Europe.

EPODE, in lyric poetry, the third or last part of the ode, the ancient ode being divided into strophe, antistrophe, and epode. The word is now used for any little verse or verses, that follow one or more great ones.

EPOPEE, or **EPOPEIA**, in poetry, the fable, or subject of an epic poem.

EPOTIDES, in the naval architecture of the ancients, two thick blocks of wood, one on each side the prow of a galley, for warding off the blows of the rostra of the enemy's vessels.

EPOPTÆ, in antiquity, a name given to those who were admitted to view the secrets of the greater mysteries, or religious ceremonies of the Greeks.

EPROUVETTE, the name of an instrument for ascertaining the strength of dried gunpowder, or of comparing the strength of different kinds of gunpowder.

EPSOM SALTS, in chemistry, sulphate of magnesia, which was formerly procured by boiling down the mineral water from the spring at Epsom, but is now prepared from sea water. Its component parts are water, sulphuric acid and magnesia, and it is used as a cathartic.

EPULONES, in Roman antiquity, public officers who assisted at the sacrifices, and had the care of the *epulum*, or sacred banquet, committed to them.

EPULOTIC, in medicine, an application for cicatrizing and healing wounds or ulcers, or to dispose the parts to recover soundness.

EQUABLE, an epithet for uniform motion, &c.; or that which is neither accelerated nor retarded.

EQUALITY, a term of relation between things the same in magnitude, quantity, or quality. Also, the same degree of dignity or claims; as, the *equality* of men, in the scale of being: an *equality* of rights, &c.

EQUANIMITY, that even and calm frame of mind and temper, under good or bad fortune, which is not easily elated or depressed. A truly great man bears misfortunes with *equanimity*, and carries himself in prosperity without vain exultation or excessive joy.

EQUATION, in algebra, that disposi-

ALL NATIONS AT PRESENT, USING EITHER THE OLD OR NEW STYLE, COMMENCE THE YEAR WITH THE 1ST OF JANUARY.

[equ]

[equ-

THE DAILY SEASON WITHIN THE TROPICS IS WHEN THE SUN IS IN VERTICAL SIGHT; AT OTHER TIMES THERE IS NOT A CLOUD FOR MONTHS.

tion of quantities, by which one set is made equal to another; or in which two quantities, equal in value, but differently represented, are put equal to each other by means of the sign of equality; as, $3s = 36d.$, or $s = 12d = 6s$.—*Equation of payments*, in arithmetic, a rule for finding a time when if a sum be paid which is equal to the sum of several others due at different times, no loss will be sustained by either party.

—*Equation*, in astronomy, a term used to express the quantity added to, or subtracted from, the mean position of a heavenly body to obtain the true position.—*Equation of time*, denotes the reduction of the apparent time or motion of the sun, to equable, mean, or true time. The difference between true and apparent time arises from two causes, the eccentricity of the earth's orbit, and the obliquity of the ecliptic.

EQUATOR, in astronomy and geography, a great circle of the terrestrial globe, equidistant from its poles, and dividing it into two equal hemispheres; one north and the other south. It is called *equator*, because when the sun is in it, the days and nights are of equal length, hence it is called also the *equinoctial*, and when drawn on maps and globes, it is called the *equinoctial line*, or by mariners simply *the line*. All places which are on it have invariably equal days and nights. It crosses the centre of Africa, the islands of Sumatra, Borneo, Celebes, &c., in Asia, then traverses the Pacific Ocean, and crosses South America, in Columbia, thence proceeds through the Atlantic back to Africa.—To cross *the line*, in navigation, is to pass over the equator.

EQUERRY, an officer of state under the master of the horse. There are five equerries, who ride out with her majesty, for which purpose they give their attendance monthly, one at a time, and have a table provided for them.

EQUES AURATUS, a Roman knight, so called because none but knights were allowed to gild their armour.

EQUESTRIA, a place in the Roman theatres where the knights or equites sat.

EQUESTRIAN GAMES, in Roman antiquity, (*ludi equestres*), horse-races, of which there were five kinds, the *prodromus* or plain horse-race, the chariot race, the decursory race about funeral piles, the *ludi seculares*, and the *ludi neptunales*.—*Equestrian order*, the second rank in Rome, next to the senators.—*Equestrian statue*, the representation of a person on horseback.

EQUIAN GULAR, in geometry, an epithet given to figures, whose angles are all equal, as a square, an equilateral triangle, a parallelogram, &c.

EQUICURVAL, in geometry, having equal legs, but longer than the base, as, an *equicrural triangle*.

EQUIDIFFERENT, in mathematics, an epithet for such things as have equal differences, or are arithmetically proportional.—In crystallography, having a different number of faces presented by the prism and by each summit; and these three num-

bers form a series in arithmetical progression, as 6, 4, 2.

EQUILATERAL, in geometry, having all the sides equal; as an *equilateral triangle*.

EQUILIBRIST, one who keeps his balance in unnatural positions and hazardous movements; entertaining the spectator by his skilful motions and varying attitudes. In the East they are very common, and their feats are truly surprising.

EQUILIBRIUM, in mechanics, equipoise, or equality of weight. the state of the two ends of a lever or balance when they are charged with an equal weight, and hang exactly even and level, in a position parallel to the horizon.

EQUIMULTIPLE, in arithmetic and geometry, a number multiplied by the same number or quantity. Hence *equimultiples* are always in the same ratio to each other, as the simple numbers or quantities before multiplication. Thus if 2 and 3 are multiplied by 4, the multiples, 8 and 12, will be to each other as 2 and 3.

EQUINOCTIAL, in astronomy, a great circle of the sphere, under which the equator moves in its diurnal course. It is so called, because whenever the sun comes to this circle, the days and nights are equal all over the globe, being the same with that which the sun seems to describe, at the time of the two equinoxes of spring and autumn.—*Equinoctial Points*, the two points, Aries and Libra, where the equinoctial and ecliptic cross each other.—*Equinoctial Colure*, the great circle passing through the poles of the sphere, and the equinoctial points.

EQUINOX, in astronomy, the time when the sun enters either of the equinoctial points, where the ecliptic intersects the equinoctial. When the sun is in this situation, the horizon of every place is divided into two equal parts by the circle bounding light and darkness, hence the sun is visible everywhere twelve hours, and invisible for the same time in each 24 hours. As the sun is in one of them, in the spring, viz. March 21st, it is called the *vernal equinox*, and in the other, in autumn, viz. September 23d, it is called the *autumnal equinox*. At all other times the lengths of the day and night are unequal, and their difference is the greater the more we approach either pole, and in the same latitude it is every where the same. Under the line this inequality entirely vanishes there, during the day, which is equal to the night, the sun always ascends six hours, and descends six hours. In the opposite hemisphere of our earth, the inequality of the days increases in proportion to the latitude. the days increase there, while the nights diminish with us and vice versa.

EQUIPAGE, the furniture of an army or body of troops, infantry or cavalry, including whatever is necessary for a military expedition.—*Camp equipage* includes tents, and everything necessary for accommodation in camp.—*Field equipage* consists of arms, artillery, waggons, tumbrils,

THOSE STORMS WHICH TAKE PLACE ABOUT THE TIME THE SUN CROSSES THE EQUATOR, ARE CALLED EQUINOCTIAL GALES.

[ERA

IT IS THE PROVINCE OF A JUDGE TO LOOK TO THE OBJECTS OF THE LEGISLATURE, HE IS NOT TO SET ASIDE THE LAW, BUT TO ENFORCE IT

&c.—When we speak of a body of troops being furnished with arms and warlike apparatus, we say they are *equipped* for service.

EQUIPOLLENCE, in logic, an equivalence, or agreement, either as to the nature of the thing or as to the grammatical sense of any two or more propositions, that is, when two propositions signify one and the same thing, though they express it differently.

EQUIRIA, in antiquity, games instituted by Romulus in honour of Mars and which consisted in horse racing. They were celebrated on the third of the calends of March.

EQUISETUM in botany Horsetail, a genus of plants in the Linnæan system, class 24 *Cryptogamia*, order 1 *Felices*. Natural order of ferns.

EQUIFANI, in botany, a term used in the foliation of plants, for leaves that ride as it were over one another.

EQUITES amongst the Romans, were persons of the second degree of nobility, immediately succeeding the senators in point of rank. Every *equus* or knight had a horse kept at the public charge; he received also the stipend of an horseman to serve in the wars, and wore a ring which was given him by the state. The *equites* composed a large body of men and constituted the Roman cavalry for there was always a sufficient number of them in the city, and nothing but a review was requisite to fit them for service.

EQUITY, in a moral sense is the impartial distribution of justice. So, in an enlarged view Blackstone observes equity, in its true and general meaning is the soul and spirit of all law. positive law is construed and rational law is made by it. In this equity is synonymous with justice. In English jurisprudence a court of equity or chancery is a court which corrects the operation of the literal text of the law and supplies its defects by reasonable construction and by rules of proceeding and deciding which are not admissible in a court of law. Equity then is the law of reason, exercised by the chancellor or judge, giving remedy in cases to which the courts of law are not competent. It will remove legal impediments to the fair decision of a question depending at law. It will prevent a party from improperly setting up at a trial some title or claim which would be inequitable. It will compel him to discover on his own oath facts which he knows are material to the right of the other party but which a court of law cannot compel the party to discover. It will provide for the safety of property in dispute pending litigation. It will counteract or control or set aside, fraudulent judgments. It will also exercise, in many cases, *exclusive* jurisdiction, particularly in granting special relief beyond the reach of the common law. It will grant injunctions to prevent waste or irreparable injury, or to secure a settled right, or to prevent vexatious litigations or to compel the restitution of title deeds, it

will appoint receivers of property, where it is in danger of misapplication. It will prohibit a party from leaving the country in order to avoid a suit, it will decree a specific performance of contracts respecting real estates. It will in many cases, supply the imperfect execution of instruments, and reform and alter them according to the real intention of the parties, it will grant relief in cases of lost deeds and securities, and, in all cases in which its interference is asked its general rule is, that he who asks equity must do equity. In short, its jurisdiction is almost undefined where the positive law is silent, but substantial justice entitles the party to relief. It is however, deeply to be regretted that the intricacy of our laws renders it so often necessary to seek redress in a court of equity. *Æquitas sequitur legem* is an old maxim in law, but from the great increase of suits in chancery, some think it ought to be thus translated 'after a man has been at law it is necessary that he should go to equity.'

EQUITY OF REDEMPTION in law, is the advantage allowed to one who mortgages his property, to have a reasonable time allowed him to redeem it, for although the estate upon non payment of the money, becomes vested in the mortgagee yet equity considers it only a pledge for the money, and gives the party a right to redeem which is called his *equity of redemption*.

EQUUS in zoology a genus of animals comprehending those useful domestic animals the horse the ass and the mule.

EQUIVALLENTS, a term employed in chemical philosophy to express the particular weight or quantity of any substance which is necessary to saturate any other with which it can combine. Tables of the combining quantities of all chemical agents have been drawn up and arranged to guide the chemist in experimental researches. The utility of these tables is very extensive, and they are rendered still more useful when accompanied by a logarithmic sliding scale, the application of which to this purpose was a happy invention of Dr Wollaston.

—In a general sense, the word *equivalent* signifies that which is equal in value, weight, worth, &c with something else. Thus, a debtor who is not able to pay his creditor in money, may pay him an equivalent.

EQUIVOICAL an epithet for whatever is ambiguous or susceptible of different constructions, as, that man a character is very *equivocal*.

EQUIVOCA TION, the use of equivocal terms which may be understood by the hearer in a different sense from that in which they are taken by the speaker. He who is guilty of *equivocation*, may be fairly suspected of hypocrisy.

EQUIVOQUE a word or phrase susceptible of different significations.

head or limb of any creature violently torn from the body so as to give it a jagged appearance.

ERECT, in botany, an epithet for a stem, leaf, or flower, &c.; as *erectus caulis*, a stem standing perpendicularly from the ground; *flor erectus*, an erect flower, or one which has its aperture directed upwards, &c.—In heraldry, an epithet for any thing upright, or perpendicularly elevated, as wings erect, &c.

EREMITICAL, (from *eremite*, a hermit) living in solitude, or in seclusion from the world.

ERGOT, in fariery, a stub, like a piece of soft horn, situated behind and below the pastern joint.—Also, a dark-coloured shoot, sometimes an inch long, from the ears of grain, particularly of rye.

ERICA, in botany, a genus of plants, class 8 *Octandria*, order 1 *Monogynia*. The species consist of different kinds of *heaths*.

ERIOCEPH'ALUS, in botany, a genus of plants, class 19 *Syngenesia*, order 4 *Polypetala accessoria*. The species are shrubs.

ERIOMETER, an instrument for measuring the fibres of wool, silk, &c.

ERIOPH'ORUM, in botany, a genus of plants, class 3 *Triandria*, order 1 *Monogynia*. The species are perennials.

ER'MINE, in zoology, a species of *Mustela*, with narrow ears, and of the size of the weasel. In winter, the whole body of the ermine is of a pure snow white, except the tip of the tail, which is of a deep black, and some spots of a greyish yellow about the head and shoulders; in summer, the upper part of the body is of a pale tawny brown colour, but the tail is tipped with black. The fur of the ermine is in great request; it was formerly one of the insignia of royalty, and is still used by judges. This animal inhabits the northern climates of Europe, Asia, and America; and in its habits it is very similar to those of the weasel, frequenting barns and outhouses, and feeding not only on mice and rats, but destroying poultry, birds, eggs, &c.—*Ermine*, in heraldry, a fur used in coat armour, and supposed to represent the linings and doublings of mantles and robes.

EROTIC POETRY, a term for amatory poetry. The name of *erotic* writers has been applied particularly to a class of romance writers who belong to the later periods of Greek literature, and whose works abound in sophistical subtleties and ornaments.

EROTOMANY, a term employed by some writers to denote that modification of insanity, of which the passion of love is the origin, and in which the love of a particular individual constitutes the predominant idea, occupying the whole attention of the patient. It sometimes passes into perfect delirium, leads to suicide, hysteria, &c. Young people are peculiarly subject to it, who have an excitable nervous system and lively imagination, who give themselves up to an excess in pleasure, or are spoiled by reading romances, and rendered effeminate by an injudicious education and indolence.

ERPETOLOGY, that part of natural history which treats of reptiles.

ERRATIC, wandering, or having no certain course; also, not fixed or stationary; hence the planets are called *erratic stars*; and fevers which observe no regular periods, are denominated *erratic fevers*.

ERRATUM, an error of the press; in the plural, *Errata*, a list of which is usually printed at the beginning or end of a book.

ER'ROE, a wandering or deviation from the truth. An Error may be either *voluntary* or *involuntary*; when committed through carelessness or haste it is a *blunder*.—*Error*, in law, is a mistake committed in pleading, or in a process; whereupon a writ of *error* is brought to remedy it, which carries the suit to another tribunal for redress.

ERUBESCENCE, a blushing; redness of the skin or surface of any thing.

ERU'CA, the White-rocket, in botany, a species of *brassica*, with lyrate leaves, hairy stalks, and smooth pods.

ERU'CTATION, the act of belching wind from the stomach; also a violent bursting forth or ejection of wind, &c. from the earth.

ERUDITION, the attainment of profound learning and extensive knowledge, obtained by study and instruction; particularly learning in history, antiquity, and languages, as distinct from the useful arts and sciences.

ERU'GINOUS, partaking of the substance or nature of copper or the rust of copper.

ERUPTION, a violent breaking or bursting forth of anything, particularly of flames and lava from a volcano. Also, a sudden or violent rushing forth of men or troops for invasion.—In medicine, a sudden and copious excretion of humours on the skin in pustules.

ERYNGIUM, in botany, a genus of plants, class 5 *Pentandria*, order 2 *Digynia*. The flowers are collected in a round head, similar to a thistle; the receptacle is paleaceous or chaffy; and the young shoots are esculent. One of the species of *eryngo* was formerly much employed as a tonic, but it has now gone out of use.

ERYSIPELAS, in medicine, an inflammatory affection, particularly of the skin, attended with fever. This disease is often called St. Anthony's fire: it is brought on by all the causes that are apt to excite inflammation, such as injuries of all kinds, the external application of stimulants, exposure to cold, and obstructed perspirations.

ERYTHRI'NA, in botany, the Coral-tree, a genus of plants, class 17 *Diadelphia*, order 4 *Decandria*; the corolla of which is papilionaceous, and consists of four petals, the fruit is a very long pod, and the seeds kidney-shaped.

ERYTHROCYA'NEUS, in ornithology, the red and blue macaw. This bird is the finest of the parrot kind; being a full yard long, from the point of the bill to the end of the tail, and its plumage adorned with the most beautiful variety of colours.

THE DISEASE VULGARLY KNOWN BY THE NAME OF SHINGLES (FROM THE FRENCH "CEINTE," A BELT), IS A SPECIES OF ERYSIPELAS.

[ESC]

The Scientific and Literary Treasury ;

[ESS]

ESCALADE, in the military art, a furious attack made upon a rampart, or scaling the walls of a fortification, by filling up the ditches with bundles of faggots, called fascines, and entering by ladders; without proceeding in form, breaking ground, or carrying on regular works to secure the men—a mode of attack much adopted in the late wars, but generally accompanied with great slaughter.

ESCALOP, in ichthyology, a class of bivalvular shell-fish, whose shell is regularly indented. In the centre of the top of the shell is a trigonal sinus with an elastic cartilage for its hinge.

ESCAPE, in law, is where a person arrested gains his liberty before he is delivered by law. In civil cases, after the prisoner has been suffered voluntarily to escape, the sheriff can never after retake him, and must answer for the debt; but the plaintiff may retake him at any time. In the case of a negligent escape, the sheriff, upon fresh pursuit, may retake the prisoner, and the sheriff shall be excused if he have him again before any action is brought against himself for the escape. In criminal cases, an escape of a person arrested is an offence against public justice, and the party is punishable by fine and imprisonment.

ESCAPEMENT, a contrivance for transmitting the power of a timepiece to the balance or pendulum, to regulate its movements.

ESCARGATOIRE, a nursery of snails.

ESCARPMENT, or **ESCARP**, in the military art, the exterior slope facing fortified works; the interior slope being the *counterscarp*.

ESCHAR, in surgery, the crust or scab occasioned by burns or caustic applications. **ESCHAROTIC**, in medicine, a caustic application, or one which has the power of searing or destroying the flesh.

ESCHEAT, in law, lands or profits that fall to a lord within his manor, either by forfeiture, the death of the tenant, or through failure of heirs.

ESCORT, a guard or company of armed men attending an officer, or baggage, provisions, or munitions conveyed by land, to protect them from an enemy, &c.

ESCREOL, in heraldry, one of the exterior ornaments of the escutcheon, representing a slip of parchment or paper, on which the motto is generally put.

ESCUAGE, in feudal customs, a kind of knight-service, called service of the shield, by which the tenant was bound to follow his lord to the wars at his own charge.

ESCUAPIAN (from *Æsculapius* the physician), pertaining to the healing art.

ESCULENT, an epithet for such plants or roots as may be eaten.

ESCURIAL, a celebrated palace and monastery in Spain, about twenty miles from Madrid, built by Philip II. It is in the shape of a gridiron, and contains the king's palace, St. Lawrence's church, the monastery of Jeronimites, and the free schools. It was erected in consequence of a vow made by Philip, on the day of the

battle of St. Quentin, and dedicated to St. Lawrence, whose festival was on that day. Though the building is immensely large and the most superb in the kingdom, its exterior has rather the austere simplicity of a convent than the elegance of a palace. It is a quadrangle, 740 feet in length by 680 in breadth; and is said to have cost 60 millions of dollars.

ESCUTCHEON, in heraldry, the shield on which a coat of arms is represented. It is an imitation of the ancient shields used in war.

ESDRAS, the name of two apocryphal books, usually bound up with the Scriptures. They were always excluded the Jewish canon.

ESPOUSALS, in law, a contract or mutual promise of marriage between a man and woman.

ESPREIT DE CORPS, a French phrase, signifying that species of attachment with which persons, more especially military men, are animated to the corps or service to which they belong.

ESOTERIC, an epithet applied to the private instructions and doctrines of Pythagoras; opposed to *esoteric*, or public.

ESPALTER, a fruit tree, having the branches trained to a frame, or fastened to stakes, and spread laterally. *Espaliers* are usually planted in rows about a garden, so as to enclose quarters or separate parts.

ESPIONAGE, a system of employing spies, or secret emissaries, either in military or political affairs.

ESPLANADE, in fortification, the glacis of the counterscarp, or sloping of the parapet of the covered way towards the country. The word is now also used for a sloping walk or promenade.

ESQUIRE, anciently a shield or armour-bearer: the person that attended a knight in time of war, and carried his shield. It is now a title given to the sons of knights, or those who serve the king in any worshipful calling, as officers of the king's courts, counsellors at law, &c. It has, however, become a sort of vague and undefined compliment, placed at the end of a man's name, and may be regarded more as an expression of respect than anything else.

ESSAY, in literature, a composition intended to prove or illustrate a particular subject, usually shorter and less methodical than a treatise.

ESSENCE, in chemistry, denotes the purest, most subtle, and balsamic part of a body; extracted either by simple expression, or by means of fire, from fruit, flowers, &c. Of these there are a great variety, used on account of their agreeable smell and taste, by apothecaries, perfumers, and others.—In philosophy, that which constitutes the particular nature of a being or substance, and which distinguishes it from all others.

ESSENES, or **ESSENIANS**, in Jewish antiquity, one of the three ancient sects among that people, who outdid the Pharisees in their most rigorous observances. They allowed a future state, but denied a

A JUSTICE OF THE PEACE IS AN ESQUIRE NO LONGER THAN HE HOLDS HIS COMMISSION, UNLESS HE IS OTHERWISE ENTITLED TO BE.

THE TITLE OF ESQUIRE WAS FIRST USED TO PERSONS OF FORTUNE, WHO WERE NOT ATTENDANTS ON KNIGHTS, ABOUT THE YEAR 1245.

[EST]

A New Dictionary of the Welles Letters.

[ETB]

resurrection from the dead. Their way of life was very singular; they did not marry, but adopted the children of others whom they bred up in the institutions of their sect: they despised riches, and had all things in common. They are not once mentioned in the New Testament, because from their love of solitude, they were little known, and from their inoffensive way of life our Saviour had no occasion to censure them, as he frequently does the Pharisees and Sadducees.

ESSENTIAL OILS, in chemistry, volatile oils, having a strong aromatic smell, and which are drawn from plants by distillation in an alembic with water, in distinction from empyreumatic oils, which are raised by an open fire without water. The principal volatile or essential oils are those of turpentine, aniseed, nutmeg, lavender, cloves, caraway, peppermint, spearmint, saffras, camomile, and citron. The taste of these oils is acrid and burning; and their odour very pungent, generally resembling the taste and smell of the vegetables affording them.—*Essential salts*, such salts as are procured from plants, and have the property of crystalizing.—*Essential properties*, in logic, such as necessarily depend upon, and are connected with, the nature and essence of a thing, in distinction from the *accidental*.

ESSOIN, in law, an excuse by reason of sickness or any other just cause for one that is summoned to appear and answer an action, &c.—The first three days of a term are called *essoin days*, as three days are allowed for the appearance of suitors.

ESSORANT, in heraldry, a term for a bird standing on the ground with its wings expanded, as if it had been wet, and was drying itself.

ESTABLISHMENT, in a military sense, the quota of officers and men in an army, regiment, or company, which being much greater in war than in peace, has given rise to the distinctive terms of War Establishment and Peace Establishment.—The word is also used when speaking of the ministers of a church established by law, as belonging to the *Establishment*.

ESTAFETTE, a military courier, sent from one part of an army to another; or a speedy messenger who travels on horseback.

ESTACADE, in the military art, a French word for a dyke constructed with piles in the sea, a river, or morass, to oppose the entry of troops.

ESTATE, in law, the title or interest that a person has in lands, tenements, or other effects; comprehending the whole in which a person has any property. Estates are either *real* or *personal*; otherwise distinguished into freeholds, which descend to heirs; or chattels and effects, which go to executors or administrators. There are also estates for life, for years, at will, &c.

—*Estates of the Realm* are the distinct parts of any state or government, as the king, lords, and commons, in England.

ESTHER, a canonical book of the Old Testament, containing the history of a

Jewish virgin, dwelling with her uncle Mordecai at Shushan, in the reign of Ahasuerus, one of the kings of Persia. Archbishop Usher supposes Darius Hystaspes to be the Ahasuerus of Scripture, and Artystona to be Esther. Scaliger considers him as Xerxes, and his queen Hamestris as Esther. Josephus, on the contrary, asserts that Ahasuerus was Artaxerxes Longimanus; and the Septuagint, throughout the whole book of Esther, translate Ahasuerus by Artaxerxes.

ESTIMATE, a judgment or opinion formed of the value, degree, extent, or quantity of any thing, without ascertaining it. Also a computation of probable value or cost, such as is generally prepared by engineers, architects, and builders, previous to the commencement of any undertaking.

ESTIVATION, the act of passing the summer; and whatever pertains to summer is termed *estival*.—*Revolution*, in botany, denotes the disposition of the petals within the floral gem or bud; 1. *convolute*, when the petals are rolled together like a scroll; 2. *imbricate*, when the edges lap over; 3. *conduplicate*, when they are doubled together; 4. *valvate*, when as they are about to expand they are placed like the glumes in grasses.

ESTOVERS, in law, a reasonable allowance out of lands or goods for the subsistence of a man accused of felony, during his imprisonment. But it is more generally taken for certain allowances of wood made to tenants, and called, from the Saxon, *house-bote*, *hedge-bote*, *plough-bote*, &c.

ESTRAPEADE, the motion of a restive horse, which, to get rid of his rider, rears high and kicks violently.

ESTRAY, a tame beast found without any owner known, which, if not reclaimed within a year and a day, falls to the lord of the manor.

ESTREAT, in law, a true copy or duplicate of an original writing, particularly of the penalties or fines to be levied by the bailiff or other officer, of every man for his offence.

ESTUARY, an arm of the sea; or the mouth of a river or lake, where the tide meets the current.

ESURINE SALTS, in chemistry, those which are of a fretting or eating quality, which abound in the air of places situated near the sea-coast, and where great quantities of coal are burnt.

ET CÆTERA, and the contraction *etc.* or *&c.* denote the rest, or others of the kind; and so forth.

ETCHING, a method of engraving on copper or steel, in which the lines and strokes are eaten in with aquafortis. [See ENGRAVING.]

ETERNITY, everlasting duration, without beginning or end; a term expressive of that perpetuity which can only be imagined, on account of the impossibility of conceiving when time was not, or will not be; hence many have concluded that there has been an eternity of past time, and must be an eternity of future time.

THE OILS OF PLANTS ARE CALLED ESSENTIAL, BECAUSE IN THEM THE ESSENCE OR ODOUR OF THE VEGETABLES ARE CHIEFLY FOUND.

THE FLAVOUR OF LIQUORS ARISES FROM THEIR ESSENTIAL OILS, AND THEIR INTOXICATING PROPERTIES FROM ALCOHOL.

[ETI]

The Scientific and Literary Treasury :

[RUD]

ETESIAN WINDS, a term applied to yearly or stated periodical winds, answering to the monsoons of the East Indies.—By *Etesian winds*, in ancient history, are meant such winds as blow at stated times of the year, from whatever part of the compass they may come.

ETHER, in chemistry, a light, volatile, and inflammable liquid, the product of the distillation of equal measures of alcohol and sulphuric acid. Its specific gravity is to water, as 632 to 1000: it boils at 98°.—The name of ether is also given to the subtle matter or gas which fills space, and is supposed to be much finer and rarer than atmospheric air.

ETHEREAL, containing or filled with ether; as *ethereal space*, or the *ethereal regions*.

ETHICS, the doctrine of manners, or science of moral philosophy, which teaches men their duty and the springs and principles of human conduct.

ETHIOP'S MINERAL, in chemistry, black sulphuret of mercury.—*Ethiop's martial*, iron in the first stage of calcination.

ETHMOID'AL, in anatomy, one of the common sutures of the skull, which goes round the *os ethmoides*, from which it derives its name, separating it from the bone in contact with it.—The *os ethmoides* is one of the most curious bones in the human body: it is exceedingly light, spongy, and consists of many convoluted plates, which form a net-work, like honey-comb. It is curiously enclosed in the *os frontale*, betwixt the orbital processes of that bone. One horizontal plate receives the olfactory nerves, which perforate that plate with such a number of small holes, that it resembles a sieve; whence the bone is named *cribriform*, or *ethmoid* bone. Other plates, dropping perpendicularly from this one, receive the divided nerves, and give them an opportunity of expanding with the organ of smelling; and these bones upon which the olfactory nerves are spread out, are so much convoluted as to extend the surface of this sense very greatly, and are named spongy bones. Another flat plate lies in the orbit of the eye; and being very smooth, by the rolling of the eye, it is named the *os planum*, or smooth bone. So that the ethmoid bone supports the fore-part of the brain, receives the olfactory nerves, forms the organ of smelling, and makes a chief part of the orbit of the eye.

ETH'NICAL, pertaining to the heathen nations, or those which were not converted to Christianity.

ETHOLOGY, a treatise on morality or the science of ethics. Hence, one who writes on the subject of manners and morality, is termed an *ethologist*.

ETIOLATION, the operation of being whitened, by excluding the light of the sun: a term often used in botany.

ETIOLOGY, an account of the causes of anything, particularly of diseases.

ETIQUETTE, (pron. *etiket'*) rules and ceremonies of good manners observed to-

wards particular persons, either at court or in genteel life.

ETRAPADE, in archæology, a crane and pulley, which was formerly used in France by way of a torture.

ETYMOLOGY, a branch of philology, which teaches the origin and derivation of words, with a view to ascertain their radical or primary signification. In grammar, it comprehends not only the derivation of words, but their various inflections and modifications. One who is well versed in the deduction of words from their originals, is called an *etymologist*.

EUCCHARIST, the sacrament of the Lord's Supper; so called because the death of our Redeemer is thereby commemorated with thankful remembrance, and bread and wine are taken as emblems of his flesh and blood.

EUCHLORINE, in chemistry, protoxide of chlorine.

EUCHOLOGY, the ritual of the Greek church, in which are inscribed the order of ceremonies, sacraments, and ordinances.

EUCHYMIA, or **EUCHYMY**, in medicine, a good state of the blood and other fluids of the body.

EUCHYSID'ERITE, in mineralogy, a variety of augite.

EUCLASE, a species of emerald, of a greenish white colour, and remarkably brittle.

EUCRASY, in medicine, such a well proportioned mixture of qualities in bodies, as to constitute sound health.

EU'DIALYTE, a mineral of a brownish red colour.

EUDIOMETER, an instrument for ascertaining the purity of air, or the quantity of oxygen and nitrogen in atmospherical air. When a mixture of nitrous gas is to be made with atmospherical air, the most convenient apparatus consists in a glass tube closed at top, and graduated by a diamond into cubic inches and parts. The lower aperture may be widened, in order that the gases may more easily be passed up, and likewise to afford the facility of its standing alone upon the pneumatic shelf. It is likewise usual and advantageous to fit a stopper in the mouth by grinding. There are various kinds of eudiometers, by which the method of analyzing air differs; and in all of them there is at times some uncertainty. The eudiometer of Davy, more recently invented, is, however, said to be free from objection; and the apparatus is portable, simple, and convenient: Take a small glass tube, graduated into one hundred equidistant parts; fill this tube with the air to be examined, and plunge it into a bottle, or any other convenient vessel, containing a concentrated solution of green muriate or sulphate of iron, strongly impregnated with nitrous gas. All that is necessary to be done, is, to move the tube in the solution a little backwards and forwards; under these circumstances, the oxygen gas contained in the air will be rapidly absorbed, and condensed by the nitrous gas in the solution, in the form of nitrous acid. It is

SULPHURIC ETHER WAS FIRST MADE KNOWN UNDER THE NAME OF SWEET OIL OF VITRION, IN 1640, BY WALTERUS CORDUUS.

ETHER ALTERS GRADUALLY WITH CONTACT OF AIR; ABSORBING OXYGEN, AND CHANGING INTO ACETIC ACID AND WATER.

EUR.]

A New Dictionary of the Belles Lettres.

[EVA

THE GREATEST EVAPORATION FROM THE EARTH'S SURFACE, IN THIS COUNTRY, TAKES PLACE IN JUNE; THE LEAST, IN JANUARY.

necessary to observe, that the state of the greatest absorption should be marked, as the mixture afterwards emits a little gas which would alter the result. The air of London, examined by means of Davy's eudiometer, was found, in all the different seasons of the year, to contain 0.21 of oxygen; and the same was the case with air taken at Islington and Highgate; in the solitary cells in Coldbath-fields prison, and on the river Thames. But the quantity of water contained in a given bulk of air from these places, differed considerably.

EUDIOMETRY, the measurement of the quantity of oxygen contained in atmospheric air, or in any gas in which it is not intimately combined. No sooner was the composition of the atmosphere known, than it became an inquiry of importance to find out a method of ascertaining, with facility and precision, the relative quantity of oxygen gas contained in a given bulk of atmospheric air. To attain such a measurement, it is merely necessary to present to atmospheric air, some substance which combines with its oxygen, and which either does not afford any gaseous product, or affords one that is easily abstracted and measured.—[See the preceding article.]

EUHARMONIC, in music, producing harmony or concordant sounds.

EUKAIRITE, a mineral of a shining lead gray colour and granular structure.

EULOGY, a speech or writing in commendation of a person on account of his valuable qualities or beneficial services.

EUNOMY, equal law, or a well-adjusted constitution of government.

EUPATORIUM, in botany, a genus of plants, class 19 *Syngenesia*, order 1 *Polygamia equalis*. The species are perennials, and consist of different kinds of agrimonies.

EUPPEPSY, in medicine, good concoction in the stomach; perfect digestion.

EUPHEMISM, in rhetoric, a figure by which things in themselves disagreeable and shocking, are expressed in terms neither offensive to good manners nor repulsive to "ears polite."

EUPHONY, an easy and smooth enunciation of words. A grammatical licence, whereby a letter that is too harsh is converted into a smoother, contrary to the ordinary rules, for the purpose of promoting smoothness and elegance in the pronunciation.

EUPHORBIA, in botany, a genus of plants of many species, mostly shrubby herbaceous succulents, some of them armed with thorns. They belong to class 11 *Dodecandria*, order 3 *Tripteria*.

EUPHORBIA, in medicine, a concrete gum-resin, the produce of an African perennial plant. When first chewed it has little taste, but it soon gives a very acrid burning impression to the tongue, palate, and throat, which is very permanent, and almost insupportable.

EURITE, or **WHITESTONE**, in geology, a finely granulated felspar, or very small-grained granite, with the parts so intimately blended as often to appear compact.

EURITHMY, in architecture, painting, and sculpture, is a certain majesty, elegance, and ease in the various parts of a body, arising from its just proportions. In medicine, *eurithmy* signifies a good disposition of the pulse.

EUSTATHIANS, a sect of Christians, the followers of Eustathius, an Armenian bishop in the fourth century, who, under pretence of great purity and severity, introduced many irregularities.

EUSTYLE, in architecture, a sort of building in which the columns are placed at the most convenient distances from each other, most of the intercolumniations being just two diameters and a quarter of the column.

EUTYCHIAN, a religious sect in the fifth century, called after one Eutycheus, who maintained, among other things, that the flesh of Christ differed in its nature from that of mankind.

EVACUANTS, in medicine, such medicines as diminish the animal fluids, by throwing out some morbid or redundant humour, or such as attenuate and promote its motion and circulation.

EVACUATION, in medicine, the discharge of superfluous humours or excrements out of the body, by cathartics, &c. — *Evacuation*, in military affairs, the leaving a town, fortress, or any place which has been occupied as a military post or position.

EVANGELIST, a general name given to those who write or preach the gospel of Jesus Christ. The word is of Greek origin, signifying one who publishes glad tidings, or is the messenger of good news. But it is applied principally to the writers of the four Gospels, or *Evangelia*, viz. Matthew, Mark, Luke, and John. — The word also denotes certain ministers in the primitive church, who assisted the Apostles in diffusing the knowledge of the gospel, and travelled about to execute such commissions as they were entrusted with, for the advancement of Christianity.

EVAPORATION, in natural philosophy, is the conversion of water into vapour, which, in consequence of becoming lighter than the atmosphere, is raised considerably above the surface of the earth, and afterwards, by a partial condensation, forms clouds. It differs from exhalation, which is properly a dispersion of dry particles from a body. When water is heated to 212° it boils, and is rapidly converted into steam; and the same change takes place in much lower temperatures; but in that case the evaporation is slower, and the elasticity of the steam is smaller. As a very considerable proportion of the earth's surface is covered with water, and as this water is constantly evaporating and mixing with the atmosphere in the state of vapour, a precise determination of the rate of evaporation must be of very great importance in meteorology.

EVASION, the act of eluding or escaping from the pressure of an argument, or from an accusation, charge, or interrogatory.

IN HOT, DRY WEATHER, THE EVAPORATION FROM PLANTS IS INCREASED; IN DAMP OR WET WEATHER IT IS INCONSIDERABLE.

EVATES, a branch of the Druids, or ancient Celtic philosophers. Strabo divides the British and Gaulish philosophers into three sects, Bardae, Evates, and Druids. He adds, that the Bardae were the poets and musicians; the Evates, the priests and naturalists; and the Druids were moralists as well as naturalists.

EVECTICA, or **EVECTICS**, that part of phisic which teaches how to acquire a good habit of body.

EVECTION of the moon, in astronomy, one of her most considerable irregularities, caused by the action of the sun upon her; the general effect of which is to diminish the equation of the centre at the syzygies, and to increase it in the quadrature.

EVENING, or **EVE**, the precise time when evening begins is not ascertained by usage. In strictness, evening commences at the setting of the sun, and continues during twilight, and night commences with total darkness. But it sometimes includes a portion of the afternoon; as in the phrase, "the morning and evening service of the church;" and in customary language it extends to bed-time; as "I spent the evening with a friend."—Figuratively, we use it for the decline of life, or old age; as "the evening of life."—*Evening star*, in astronomy, Hesperus or Vesper; Venus, when visible in the evening.

EVERGREEN, in horticulture, a species of perennials which preserve their verdure all the year round, such as laurels, hollies, bays, pines, &c.

EVIDENCE, in its most general sense, means the proofs which establish, or have a tendency to establish, any facts or conclusions. It may be divided into three sorts, mathematical, moral, and legal. The first is employed in the demonstrations which belong to pure mathematics; the second is employed in the general affairs of life, and in those reasonings which are applied to convince the understanding in cases not admitting of strict demonstration; the third is that which is employed in judicial tribunals for the purpose of deciding upon the rights and wrongs of litigants. According to our system of jurisprudence in common law trials, it is the peculiar province of a jury to decide all matters of fact. The verdict of the jury is, however, to be given, and the trial is to be had, in the presence of a judge or judges, who preside at the trial, and are bound to decide all matters of law, arising in the course of the trial. Whenever, therefore, a question arises, whether anything offered as proof at such trial is or is not proper to go before the jury as evidence, that question is to be decided by the court, and, unless permitted by the court, it can never legally come before the consideration of the jury. Hence, whatever is so permitted to be brought before the jury, for the purpose of enabling them to decide any matter of fact in dispute between the parties, is in a legal sense, evidence, and is so called in contradistinction to mere argument and comment. This gives rise to a very important distinction,

at the common law, as to the competency and the credibility of evidence. It is competent, when by the principles of law, it is admissible to establish any fact, or has any tendency to prove it. It is credible, when, being introduced, it affords satisfactory proof of the fact. It follows, therefore, that evidence may be competent to be produced before a jury, when it may nevertheless not amount to credible proof, so as to satisfy the minds of the jury; and, on the other hand, it may be such as, if before them, would satisfy their minds of the truth of the fact, but yet, by the rules of law, it is not admissible. Whether there is any evidence of a fact, is a question for the court; whether it is sufficient, is a question for the jury.

EVIL, in philosophy, &c. is either moral or natural. Moral evil is any deviation of a moral agent from the rules of conduct prescribed to him. Some make the essence of moral evil consist in the disagreement of our manners to the divine will, whether known by reason or revelation; others, in being contrary to reason and truth; and others, in being inconsistent with the nature, faculties, affections, and situation of mankind.

EVOCATI, soldiers among the Romans, who having served their full time in the army, went afterwards volunteers at the request of some favourite general; on which account they were called by the honourable names of *Emeriti* and *Beneficarii*.

EVOCATION, in Roman antiquity, a solemn invitation or prayer to the gods of a besieged town, to forsake it and come over to the besiegers.

EVOLUTE, in geometry, an original curve from which another is described.

EVOLUTION, in military tactics, the complicated movement of a body of men when they change their position by counter-marching, wheeling, &c.—In geometry, the unfolding or opening a curve, and making it describe an evolute.—In algebra, the extraction of roots from powers; the reverse of involution.

EVOLVENT, in geometry, the curve described from which the evolute.

EWRY, an office in the royal household, where they take care of the table linen, &c.

EXACERBATION, in medicine, the increased violence of a disease. The term is generally restricted to the periodical increase of remittent and continued fevers, where there is no absolute cessation of the fever.

EXACTION, the act of demanding with authority, and compelling to pay or yield; as the *exaction* of tribute or obedience.

EXERESIS, in surgery, the operation of extracting or taking away something that is hurtful to the human body.

EXAGGERATION, in rhetoric, a kind of hyperbole, whereby things are augmented or amplified, by saying more than the strict truth will warrant.—In painting, a method of giving a representation of things too strong for the life.

EXALTATION, in astrology, the dignity

IT IS A GENERAL RULE IN LAW, THAT REPUTATION OF A FACT, IS NOT TO BE TAKEN AS EVIDENCE.

IF A MAN KILL ANOTHER UPON SLIGHT PROVOCATION, OR USE DANGEROUS WEAPONS, THE LAW PRESUMES THE ACT IS MALICIOUS.

[EXC]

A New Dictionary of the Welles Letters.

[EXC]

IT IS USUAL IN DRAWING FOREIGN BILLS OF EXCHANGE, TO DRAW THEM IN SETS, OR DUPLICATES, LEAST THE FIRST SHOULD BE LOST.

which a planet acquires in certain signs or parts of the zodiac, which dignity is supposed to give it an extraordinary efficacy and influence.—In pharmacy, the refinement or subtilisation of bodies or their qualities and virtues.

EXAMINATION, in its primary sense, is a careful and accurate inspection or inquiry, in order to discover the real state of any thing.—In judicial proceedings, an attempt to ascertain truth, generally on the oath of the party examined, by interrogatories.—In schools, an inquiry into the acquisitions of the students, by questioning them in literature and the sciences, or by hearing their recitals.—In chemistry and the sciences generally, a searching for the nature and qualities of substances, by experiments.

EXAMINERS, in law, two officers in the court of Chancery, who are appointed, on oath, to examine witnesses on either side.

EXANTHEMA, or **EXANTHEMATA**, among physicians, any kind of efflorescence or eruption, as in measles, small-pox, scarlatina, &c. The term is now limited by systematic nosologists, to such eruptions as are accompanied with fever.—The adjective is *exanthematicus*.

EXANTHOPIA, in medicine, a species of melancholy madness, in which the patient fancies himself a brute.

EX'ARCH, in antiquity, an officer sent by the emperors of the East into Italy, as prefect or governor.—*Exarch* also denotes an officer still subsisting in the Greek church, who visits the provinces, in order to see whether the bishops and clergy do their duty.

EXARTICULATION, in surgery, the dislocation of a joint.

EXAUCTIONATION, or **EXAUTHORATION**, in Roman antiquity, temporary dismissal from service: thus the *exauctori milites* were deprived of their pay and arms, without being absolutely discharged.

EXCALCEATION, among the Hebrews, was a law, whereby a widow, whom her husband's brother refused to marry, had a right to summon him to a court of justice, and, upon his refusal, might *excalceate* him, that is, pull off one of his shoes, and spit in his face; both of which were considered actions of great iniquity.

EX'CELLENCY, a title of honour formerly given to kings and emperors, but now given to governors, ambassadors, &c. who are elevated by virtue of particular offices. The title of excellency is in no case hereditary, or transferable from one member to another, but always belongs to the office, and is only borne, on the European continent, by ministers in actual service, by the highest court and military dignitaries, and by ambassadors and plenipotentiaries. Foreign ministers are addressed by the title of *your excellency*, by way of courtesy, even if they have no rank which entitles them to this distinction; but *charges d'affaires* never receive this title.

EXCEPTION, in law, the denial of

what is alleged and considered as valid by the other party, either in point of law or in pleading.—*Bill of exceptions*, is a statement of exceptions to evidence, filed by the party, and which the judge must sign or seal.

EXCESS, in arithmetic and geometry, is the difference between any two unequal numbers or quantities, or that which is left after the lesser is taken from or out of the greater.—In morals, any indulgence of appetite or passion, beyond the laws of God or the rules of propriety.

EXCHANGE, in commerce, traffic by permutation, or the act of giving one thing or commodity for another. The receipt or payment of money in one country for the like sum in another, by means of *bills of exchange*. Thus, *A* in London is creditor to *B* in Paris, to the amount of 100*l*. *C* in London is debtor to *D* in Paris, in a like sum: by the operation of the bill of exchange, the London creditor is paid by the London debtor, and the Paris creditor is paid by the Paris debtor; and, consequently, two debts are paid, though no specie is sent from London to Paris, or from Paris to London. This is the principle of a bill of exchange; and the great convenience here represented is the foundation of exchange itself. That variation *above* and *below par*, which is called the course of exchange, results from the same causes that act upon the price of commodities of every other kind. If bills upon Paris be scarce, that is, if Paris is but little indebted to London, the London creditor, who wants bills on Paris to remit to that city, is obliged to purchase them dearly; then the course of exchange is *above par*: if, on the other hand, London owes less to Paris than Paris owes to London, Paris bills will be proportionably plenty, and the exchange with that city *below par*. Hence, it is a maxim that, when the course of exchange rises *above par*, the balance of trade runs against the country where it rises.—In London, bills of exchange are bought and sold by brokers, who go round to the principal merchants, and discover whether they are buyers or sellers of bills. A few of the brokers of most influence, after ascertaining the state of the relative supply of and demand for bills, suggest a price at which the greater part of the transactions of the day are settled, with such deviations as particular bills, from their being in very high or low credit, may be subject to. In London and other great commercial cities, a class of middle-men speculate largely on the rise and fall of the exchange, buying bills when they expect a rise, and selling them when a fall is anticipated.—*Exchange*, in arithmetic, is the finding what quantity of the money in one place is equal to a given sum of another, according to a certain course of exchange.—*Course of exchange* is the current price betwixt two places, which is always fluctuating and unsettled.—*Arbitration of exchange* is a calculation of the exchanges of different places to discover which is the most profitable.

WHEN BILLS ARE DRAWN IN SETS, EACH MUST CONTAIN A CONDITION THAT IF SHALL BE PAYABLE ONLY WHILE THE OTHERS REMAIN UNPAID.

[EXC]

The Scientific and Literary Treasury;

[EXE]

—*Exchange of Prisoners*, in war, the act of giving up men on both sides, upon certain conditions agreed to by the contending parties.

EXCHANGE, (often contracted into *CHANGE*), signifies a building or other place in considerable trading cities, where the merchants, agents, bankers, brokers, and other persons concerned in commerce, meet at certain times, to confer and treat together of matters relating to exchanges, remittances, payments, adventures, assurances, freights, and other mercantile negotiations both by sea and land.

EXCHEQUER, in British jurisprudence, an ancient court of record, in which all causes concerning the revenues and rights of the crown are heard and determined, and where the crown revenues are received. It took this name from the cloth that covered the table of the court, which was partly-coloured or chequered. This court is said to have been erected by William the Conqueror.—The public Exchequer is under the control of the lords of the Treasury, and of a minister called the chancellor of the exchequer.—To institute a process against a person in this court, is called to *exchequer* him.

EXCHEQUER BILLS, bills for money, or promissory notes, issued from the exchequer, under the authority of government, and bearing interest.

EXCISE, an inland duty, paid in some instances upon the commodity consumed, or on the retail, which is the last stage before consumption, but in others this duty is paid at the manufactories. The excise was first introduced by the parliament which beheaded Charles I. and its great founder was Mr. Pym, and is now one of the most considerable branches of the national revenue. It was formerly farmed out, but is at present managed by the government by commissioners, who receive the whole product of the excise, and pay it into the exchequer.

—The officer who inspects excisable commodities and rates the duties on them is called an *exciseman*.

EXCISION, in surgery, a cutting out, or cutting off any part of the body.

EXCITABILITY, susceptibility of increased vital action by the force of stimulants.

EXCITING CAUSES, in medicine, are those which immediately produce disease, or those which excite the action of predisposing causes.

EXCLAMATION, emphatical utterance, or the sign by which emphatical utterance is marked, thus (!).—In grammar, a word expressing some passion, as wonder, fear, &c.

EXCOMMUNICATION, an ecclesiastical censure, whereby a person is excluded from communion with the church, and deprived of some civil rights. In the present state of church-government in England, excommunication is seldom used but as a sort of writ of outlawry on contempt of the bishop's court, in the several descriptions of causes that belong to ecclesiastical

jurisdiction. It is published in the church, and if the offender does not submit in forty days, the civil magistrate interposes, and the excommunicated person is imprisoned till he submits, and obtains absolution.—The Roman Catholics use the phrase *fulminating an excommunication*, to signify the solemn pronouncing of an excommunication after several admonitions. This fulmination principally consists of curses, execrations, and other odious ceremonies, and is called *anathema*, [which see.]—*Excommunication* amongst the Jews was of three kinds or degrees. The first was called *Niddah*, and was a separation for a few days. The second was *Cherem*, and was a separation attended with execration and malediction; the third was *Shammatha*, and was the last and greater excommunication.—*Excommunication* amongst the Greeks and Romans excluded the person, on whom it was pronounced, from the sacrifices and temples, and delivered him over to the *Furies*.

EXCREMENTI TIOUS, in medicine, consisting of matter evacuated or proper to be evacuated from the human body.

EXCRESCENCE, in surgery, a preternatural tumour which arises upon the skin, either in the form of a wart or tubercle.

EXCRETION, in medicine, a separation of some fluid, mixed with the blood, by means of the glands. It is also applied to the discharges from the bowels, which are called *alvine excretions*.

EXCUBITE, in antiquity, the watches and guards kept in the day by the Romans, in distinction from *vigilie*, which were kept at night.

EXEAT, in ecclesiastical history, a term employed in the permission which a bishop grants to a priest to go out of his diocese.

EXECUTION, in law, the completing or finishing some act, as of judgment or deed, and it usually signifies the obtaining possession of any thing received by judgment of law. Also, the carrying into effect a sentence or judgment of court; as the infliction of capital punishment.

EXECUTIONER, the officer who inflicts capital punishment in pursuance of a legal warrant, the common hangman.

EXECUTIVE, in politics, that branch of the government which executes the functions of governing the state. The word is used in distinction from *legislative* and *judicial*. The body that deliberates and enacts laws, is *legislative*, the body that judges or applies the laws to particular cases, is *judicial*, and the body that carries the laws into effect, or superintends the enforcement of them, is *executive*. In all monarchical states this power rests in the prince.

EXECUTOR, in law, a person appointed by another's last will and testament, to have the execution of the same after his decease, and the disposing of the testator's goods and effects, according to the intent of the will.

EXECUTORY, in law, signifies that which is to take effect on a future contingency; as an *executory devise* or remainder.

EXCHEQUER BILLS WERE INVENTED AND FIRST ISSUED IN 1606; AND WERE FIRST CIRCULATED BY THE BANK OF ENGLAND IN 1706.

SENTENCES OF EXCOMMUNICATION FROM ROME WERE FORBIDDEN TO BE USED IN ENGLAND, UNDER SEVERE PENALTIES, IN 1531.

[XXE]

A New Dictionary of the Belles Lettres.

[XXI]

EXEDRÆ, in antiquity, a general name for such buildings as were distinct from the main body of the churches, and yet within the limits of the consecrated ground.

EXEGESIS, a discourse intended to explain or illustrate a subject.

EXEMPLAR, a pattern or model; the ideal model which an artist attempts to imitate.—That which serves as a model for imitation, or as a warning for others, is termed *exemplary*; as, *exemplary justice*; *exemplary punishment*.

EXEQUATUR, an official recognition of a person in the character of consul or commercial agent, authorizing him to exercise his powers.

EXERCISE, the exertion of the body, for health, amusement, labour, or the attainment of any art. Exercise increases the circulation of the blood, attenuates and divides the fluids, and promotes a regular perspiration, as well as a due secretion of all the humours; for it accelerates the animal spirits, and facilitates their distribution into all the fibres of the body, strengthens the parts, creates an appetite, and helps digestion. Whence it arises, that those who accustom themselves to exercise are generally very robust, and seldom subject to diseases. It should never be forgotten by those of studious habits, that the delicate springs of our frail machines lose their activity, and the vessels become clogged with obstructions, when we totally desert from exercise; from which consequences arise which necessarily affect the brain: a mere studious life is therefore equally prejudicial to the body and the mind. We may further observe, that an inclination to study ought not to be carried to the extent of aversion to society and motion. The natural lot of man is to live among his fellows; and whatever may be his situation in the world, there are a thousand occasions wherein his physical energies may be rendered serviceable to his fellow-creatures, as well as to himself. Many rational causes have therefore given rise to the practice of particular exercises; and those legislators who deserve to be called the most sagacious and benevolent, have instituted opportunities for enabling youth who devote themselves to study, to become expert also in laudable exercises. "We shall walk, run, dance, swim, fence, sail, and ride to little purpose (says Dr. Tissot), unless we make choice of an agreeable friend to accompany us. Solitude is the bane of man; inasmuch, that it is difficult to tell which suffers most, the soul in its qualities, or the body in its temperament, from being alone. Too great a concourse of people breeds disease. Too much company is destructive to cheerfulness. For the sake of both mind and body, therefore, we should move in a little circle, and let heaven circumscribe it for us."—*Mental exercise* is the exertion of the mind or faculties for improvement, as in the various branches of literature, art, and science.—*Military exercise* consists in the use of arms, in marches, evolutions, &c.—*Naval*

exercise consists in the management of artillery, and in the evolutions of fleets.

EXERGUE, a term used by medallists to denote the little space around and without the work or figures of a medal for an inscription, &c.

EXFOLIATION, in surgery, the scaling of a bone; the process of separating, as pieces of unsound bone from the sound part.—In mineralogy also, to *exfoliate* is to scale off or separate in thin laminae.

EXHALATION, a general term for all effluvia or steams raised from the surface of the earth, in form of vapour.

EXHAUSTION, in mathematics, a method of proving the equality of two magnitudes by a *reductio ad absurdum*, or showing that if one is supposed either greater or less than the other, there will arise a contradiction.

EXHEREDATION, in the civil law, a father's excluding a child from inheriting any part of his estate.

EXHIBIT, any paper produced or presented to a court or to auditors, referees, or arbitrators, as a voucher, &c.—In chancery, a deed or writing produced in court and sworn to, and a certificate of the oath indorsed on it by the examiner or commissioner.

EXHIBITION, a public display of whatever is interesting either as a matter of art or curiosity. Also, a benefaction settled for the benefit of scholars in the universities, that are not on the foundation. The person receiving this is called an *exhibitor*.—*Exhibition* was anciently an allowance for meat and drink, such as the religious appropriators made to the poor depending vicar.

EXHUMATION, the digging up of a dead body that has been interred.

EXIGENT, in law, a writ or part of the process of outlawry. The *exigent* or *exigi facias* requires the defendant to be proclaimed in five county courts successively, to render himself; and if he does not, he is outlawed.

EXILE, a state of banishment or expulsion from one's country by authority; or it may be an abandonment of one's country, for a foreign land, from disgust or any other motive, which is called *voluntary exile*.

EXISTENCE, the state of being, or having an actual essence. Mr. Locke says, that we arrive at the knowledge of our own existence, by intuition; of the existence of God, by demonstration; and of other things, by sensation. As for our own existence, continues he, we perceive it so plainly, that it neither needs, nor is capable of, any proof. I think, I reason, I feel pleasure and pain; can any of these be more evident to me than my own existence? If I doubt of all other things, that very doubt makes me perceive my own existence, and will not suffer me to doubt. If I know I doubt, I have as certain a perception of the thing doubting, as of that thought which I call doubt: experience then convinces us, that we have an intuitive knowledge of our own existence.

REAL CRIMINALS ARE AT PRESENT SELDOM EXILED, AS IT IS UNJUST TO LET LOOSE OUR OFFENDERS UPON NEIGHBOURING STATES.

THE ANCIENT REPUBLICS SOMETIMES EXILED MEN ON MERE SUSPICION THAT THEY MIGHT BECOME DANGEROUS TO REPUBLICAN LIBERTY.

[EXO]

The Scientific and Literary Treasury ;

[EXP]

EXIT, a departure; a term used to denote the action of quitting the stage by a player after he has performed his part. Figuratively, the act of quitting this mortal existence.

EXOCOETUS, or Flying-fish, in ichthyology, a genus of fishes of which there are three species. The *Exocoetus exilis*, or the Mediterranean flying fish, is about fourteen inches in length, and is found principally in the Mediterranean and Atlantic seas, frequently alone, and sometimes in small companies. By the extraordinary length of its pectoral fins it is enabled to quit the water and support a flight, about three feet above the surface, for the distance of 80 or 100 yards, after which it is obliged to return to the water and moisten its fins, which even in this short progress become hard and dry. The fishes are persecuted by the dorado under the water, and by the gull or albatross above its surface, and thus often escape destruction by the one only to incur it from the other.

EXO DIA, amongst the Romans, were a sort of after-piece, performed by young gentlemen when the play was concluded. They bore no relation to the drama before exhibited, but were intended to revive, or rather improve the *Pescennine versus*, which had fallen into disuse. Professional actors never performed any part in the *Exodia*.

EXODUS, a canonical book of the Old Testament, being the second of the Pentateuch, or five books of Moses. It contains a history of the departure of the children of Israel from Egypt, from which it received its name.

EX ODE, in the Greek drama the concluding part of a play, or that part which comprehends all that occurs after the last interlude.

EX OFFICIO, in law, the power a person has, by virtue of his office, to do certain acts without special authority — *ex-officio informationes* are prosecutions commenced at the suit of the king, in cases of such great danger, as that the safety of the state might be involved by waiting for the usual course of law.

EX OGLOSS, a genus of fishes found in the American seas, whose lower jaw is trilobed, and the middle lobe protruded serves as a tongue.

EXOMPHALOS, in surgery, a rupture of the navel.

EXORCISM, the expulsion of evil spirits from persons or places by certain adjurations and ceremonies. Exorcism makes a considerable part of the superstition of the church of Rome, the rituals of which forbid the exorcising any person without the bishop's leave. — From many passages in Irenæus, Origen, Epiphanius, and Josephus, it is evident that the Jews about our Saviour's time, pretended to a power of casting out devils, by some arts or charms derived from Solomon. For a further proof of their pretences in this respect, see Acts xix. 13, Mark ix. 38, Luke ix. 59. Exorcists in the ancient christian church, were employed in casting out demons, and were ordained for that express purpose.

EXORCIST, one who by prayers and incantations professes to cast out evil spirits.

EXORDIUM, in rhetoric, the commencement of a speech, serving to prepare the audience for the main subject. It may be formal and deliberate, or abrupt and vehement, according to the nature of the subject and occasion.

EXOSTOSIS, in surgery, a preternatural eminence or excrescence of a bone, whether attended with an erosion or not.

EXOSTRA, in antiquity, a bridge thrust out of a turret by pulleys on the walls, by which the besiegers gained an entrance into the town.

EXOTERICÆ, in rhetoric, a term applied to such of Aristotle's lectures as were open to all persons.

EXOTIC, an appellation for the produce of foreign countries. Exotic plants are such as belong to a soil and climate entirely different from the place where they are raised, and therefore can be preserved for the most part only in green houses.

EXPANSIBILITY, the capacity for extension in bulk or surface.

EXPANSION, in natural philosophy, the enlargement or increase of bulk in bodies, chiefly by means of heat. This is one of the most general effects of caloric, being common to all bodies whatever, whether solid or fluid, or in an aeriform state. In some cases bodies seem to expand as they grow cold, as water in the act of freezing, this, however, is known to be no exception to the general rule, but is owing to the arrangement of the particles, or to crystallization, and is not a regular and gradual expansion like that of metals, or other solid substances, by means of heat. In various metals likewise an expansion takes place in passing from a fluid to a solid state, which is accounted for in the same way. The degree of expansion produced in different liquids, varies very considerably. In general, the denser the fluid, the less the expansion. Water expands more than mercury, and alcohol, which is lighter than water, expands more than water. The expansion of aeriform fluids may be exhibited by bringing a bladder, partly filled with air, and the neck closely tied, near the fire, the bladder will soon be distended, and will, if the heat be strong enough, burst. — We also apply the word *expansion* to surface, as the expansion of a sheet of water, but not to a line or length without breadth.

EX-PARTE, in law, on one side, as *ex-parte* statement, a partial statement, or that which is made on one side only.

EXPATRIATION, the forsaking one's own country, with a renunciation of allegiance, and with a view of becoming a permanent resident and citizen in another country.

EXPECTANT, in law, an epithet for whatever has a relation to, or dependance upon another.

EXPECTANCY, in law, a state of waiting or suspension. An *estate in expectancy* is one which is to take effect or commence after the determination of another estate.

IN THE 3RD CENTURY, AN IDEA PREVAILED THAT HEAVEN'S WERE POSSESSED BY DEVONS, HENCE EXORCISM WAS JOINED WITH BAPTISM.

WHEN DRY AIR IS SATURATED WITH MOISTURE, ITS BULK INCREASES, AND ITS SPECIFIC GRAVITY DIMINISHES.

[XP]

A New Dictionary of the Belles Lettres.

[XP]

Estates of this kind are *remainders* and *reversions*.

EXPECTATION, in the doctrine of chances, is applied to any contingent event, upon the happening of which some benefit is expected.—*Expectation* differs from *hope* in this: hope originates in desire, and may exist with little or no ground of belief that the desired event will arrive; whereas expectation is founded on some reasons which render the event probable.—*Expectation*, of life, is a term used to express the number of years, which, according to the experience of bills of mortality, persons at any age may be expected to live.

EXPECTORANTS, those medicines which promote expectoration, or a discharge of mucus from the trachea and lungs.

EXPEDIENT, a temporary means of effecting an object, without regard to ulterior consequences.

EXPEDITATE, in the English forest laws, is to cut out the balls or claws of a dog's fore-feet, for the preservation of the royal game.

EXPEDITION, the march of an army, or the voyage of a fleet, to a distant place, for hostile purposes; as, the *expedition* of the English to Holland; the *expedition* of the French to Egypt.

EXPERIENCE, the source of knowledge arising from the faculty of memory, and the power of reasoning by analogy. Thus, we learn the instability of human affairs by observation or by *experience*.

EXPERIMENT, an act or operation designed to discover some unknown truth, principle, or effect.—In chemistry, a trial of the results of certain applications and motions of natural bodies, in order to discover something of their laws, nature, &c.—*Experimental* knowledge is the most valuable, because it is most certain, and most safely to be trusted.

EXPERIMENTAL PHILOSOPHY, those branches of science, the deductions in which are founded on experiment, as contrasted with the moral, mathematical, and speculative branches of knowledge. The principal experimental science is Chemistry: but there are many others, as, Optics, Pneumatics, Hydrostatics, Electricity, Magnetism, &c.

EXPERIMENTUM CRUCIS, a leading or decisive experiment.

EXPIATION, a religious ceremony, by which satisfaction is made for sins of omission or commission, accidental or intentional. The chief mode of expiation among the Jews and Pagans was by sacrifice.—*Expiation*, in a figurative sense, is applied by divines to the pardon procured to men's sins, by the obedience and death of Christ.

EXPIRATION, in anatomy, that part of respiration which consists in expelling the air out of the lungs.

EXPLOSION, in natural philosophy, a sudden and violent expansion of an aerial, or other elastic fluid, by which it instantly throws off any obstacle that happens to be in the way, sometimes with incredible

force, and in such a manner as to produce the most astonishing effects. It differs from mere expansion, by being sudden and violent, while the latter acts gradually and uniformly for some time.

EXPONENT, in algebra, the number or figure which, placed above a root at the right hand, denotes how often that root is repeated, or how many multiplications are necessary to produce the power.—*Exponential curves* are such as partake both of the nature of algebraic and transcendental ones.

EXPORTATION, that part of foreign commerce which consists in sending out goods for sale, and which is therefore the *active* part of trade, as importation, or the purchasing of goods is the *passive*.—We apply the word *exports* to goods or produce which are sent abroad or usually exported.

EXPOSITOR, one who explains the writings of others; it is applied particularly to those who profess to expound the Scriptures.

EX POST FACTO, (literally, from something done afterwards), as an *ex post facto* law, a law which operates upon a subject not liable to it at the time the law was made.

EXPOSTULATION, in rhetoric, a warm address to a person, who has done another some injury, representing the wrong in the strongest terms, and demanding redress.

EXPRESS, a messenger or courier sent to communicate information of an important event, or to deliver important dispatches.

EXPRESSED OIL, in chemistry, such oils as are procured from any substance by simple pressure, as the oil of almonds, &c.

EXPRESION, in painting, the distinct and natural exhibition of character or of sentiment in the characters represented. The term *expression* is frequently confounded with that of *passion*, but they differ in this, that *expression* is a general term, implying a representation of an object agreeably to its nature and character, and the use or office it is to have in the work; whereas *passion*, in painting, denotes a motion of the body, accompanied with certain indications of strong feeling portrayed in the countenance; so that every *passion* is an *expression*, but not every *expression* a *passion*.—*Expression*, in rhetoric, the elocution, diction, or choice of words suited to the subject and sentiment.—In music, the tone and manner which give life and reality to ideas and sentiments.—*Theatrical expression*, is a distinct, sonorous, and pleasing pronunciation, accompanied with action suited to the sentiment.

EXPROPRIATION, the surrender of a claim to exclusive property.

EXPULSION, in medicine, a discharge of saliva by spitting.

EXPURGATORY, serving to purify from anything noxious or erroneous; as the *expurgatory* index of the Romanists, which directs the expunction of passages of authors contrary to their creed or principles.

EXSANGUIOUS, an epithet for animals which are destitute of red blood.

THE EXPLOSIVE FORCE OF A VOLCANO IS SOMETIMES SUCH AS TO THROW A STONE OF TWO HUNDRED TONS A DISTANCE OF EIGHT MILES.

THE FORCE OF AN EXPLOSION DEPENDS ON THE QUANTITY OF THE ELASTIC FLUID, AND THE VELOCITY IT ACQUIRES BY HEAT.

[EXT]

The Scientific and Literary Treasury ;

[EYE]

EXSICCATION, the act of drying, or the evaporation of moisture.

EXSTIPULATE, in botany, an epithet for plants which have no stipulus.

EXSUDATION, in medicine, a discharge of humours or moisture from animal bodies, by sweat or exstillation through the pores.

EXTANT, an epithet for anything which still subsists or is in being; as a part only of the writings of Cicero are *extant*.

EXTEMPORE, without previous study or meditation; as he writes or speaks *extempore*. Though an adverb, it is often unnecessarily and improperly used as an adjective; as an *extempore* sermon, instead of an *extemporary* or *extemporaneous* sermon, &c.

—To *extempore* well, requires a ready mind well furnished with knowledge.

EXTENSION, in philosophy, one of the common and essential properties of body, or that by which it occupies some part of universal space.

EXTENSOR, in anatomy, an appellation given to several muscles, from their extending or stretching the parts to which they belong.

EXTENT, in law, is used in a double sense; sometimes it signifies a writ or command to the sheriff for the valuing of the lands or tenements of a debtor; and sometimes the act of the sheriff, or other commissioner, upon this writ; but most commonly it denotes an estimate or valuation of lands.

—*Extent in aid*, a seizure made by the crown, when a public accountant becomes a defaulter, and prays for relief against his creditors.

EXTENUATION, the act of representing anything less faulty or criminal than it is in fact; it is opposed to *aggravation*.

EXTINGUISHMENT, in law, the annihilation of an estate, &c. by means of its being merged or consolidated with another.

EXTORTION, the unlawful act of any person in authority, who by colour of his office, takes money or any other thing when none is due. Whenever property of any kind is wrested from a person by menace, duress, violence, authority, or by any illegal means, it is *extortion*. The word *extort* has a very wide signification. Conquerors *extort* contributions from the vanquished; officers often *extort* illegal fees, confessions of guilt are *extorted* by the rack, promises which men are unable to perform are sometimes *extorted* by duress, &c.

EXTRA, a Latin preposition denoting beyond or excess; as *extra-work*, *extra-pay*, &c. It serves as a prefix to numerous English words.

EXTRACT, in literature, some select matter or sentence taken from a book.—In law, a draught or copy of a writing.—In chemistry, the purer parts of any substance extracted from its grosser parts by means of decoction, and formerly also by distillation, until they were of the consistence of paste.—*Extractive principle*, a peculiar principle supposed to form the basis of all vegetable extracts.

EXTRAFOLIA'CEOUS, in botany, an

epithet for that which grows on the outside of a leaf.

EXTRAJUDICIAL, out of the ordinary course of legal proceedings.

EXTRAMUNDANE, beyond the limit of the material world.

EXTRAORDINA'RII, in Roman antiquity, a chosen body of men consisting of a third part of the foreign horse, and a fifth of the foot, which was separated from the rest of the forces borrowed from the confederate state, with great policy and caution; so prevent any design that they might possibly entertain against the natural forces.

EXTRAVAGANZA, in music, the Italian for a kind of composition remarkable for its wildness and incoherence.—Irregular dramatic pieces, generally of the burlesque cast, are also sometimes called *extravaganzas*.

EXTRAVASATION, in contusions and other accidents of the cranium, is when one or more of the blood-vessels distributed on the *dura mater* are broken, whereby there is such a discharge of blood as oppresses the brain, frequently bringing on violent pains, and at length death itself, unless the patient is timely relieved.

EXTREME, the utmost point, or furthest degree; as the *extremes* of heat and cold; the *extremes* of virtue and vice.—In logic, the extreme terms of a syllogism are the predicate and subject. Thus, "Man is an animal: Henry is a man, therefore Henry is an animal;" the word animal is the greater extreme, Henry the less extreme, and man the medium.—In mathematics, the *extremes* are the first and last terms of a proportion.

EXTREMITY, in its primary sense, signifies the utmost point or border of a thing. It also denotes the highest or furthest degree; as the *extremity* of pain or suffering; or the Greeks have endured oppression in its utmost *extremity*.—In painting and sculpture, the *extremities* of the body, are the head, hands, and feet.—In anatomy, this term is applied to the limbs, as distinguishing them from the other divisions of the animals, the head and trunk. The *extremities* are four in number, divided, in man, into upper and lower; in other animals, into anterior and posterior. Each extremity is divided into four parts; the upper into the shoulder, the arm, the fore-arm, and the hand; the lower into the hip, the thigh, the leg, and the foot.

EXUVIÆ, in natural history, the cast skins, shells, or coverings of animals.—In geology, the spoils or organic remains of animals found in the earth, supposed to be deposited there at the deluge, or in some great convulsion or change which the earth has in past periods undergone.

EYAS, in ornithology, a young hawk just taken from the nest, not able to procure its own food.

EYE, in anatomy, the organ of sight, or that part of the body, whereby visible objects are represented to the mind. The eye ball is the immediate agent in refracting the rays of light, and collecting them

EXTRACT, IN PHARMACY, INCLUDES ALL THOSE VEGETABLE PREPARATIONS WHICH ARE OBTAINED IN A SOLID STATE FROM SOLUTIONS.

EXTRACTS SHOULD ALWAYS BE PREPARED, IF POSSIBLE, FROM THE JUICE OF THE FRESH PLANT, UNDER POWERFUL PRESSURE.

F]

A New Dictionary of the Belles Lettres.

[FAB

into a point, so as to form an image of the object from which they are reflected. For this purpose, there is in it a series of perfectly transparent parts, which execute the various refractions, a nervous pulp on which the rays of light thus refracted make an impression to be conveyed to the sensorium by the optic nerve. The visual organ, simple when thus considered, becomes much more complicated if we include all the apparatus added for the purposes of protection or assistance. The muscles which move the globe in various directions, the eye lids, which cover and protect in front, and the parts which secrete the tears, and convey them into the cavity of the nostril, are all so intimately connected in situation and function with the globe, that they must be included in the general description. In speaking of the mechanism of the organ of vision, we may not improperly liken it to a natural camera obscura, provided with a lens, which, at the back of the eye, forms a picture, on an expansion of the nerves, called the retina. When the lens is too convex, the picture falls short of the nerve, and the person is short sighted when the picture tends to form beyond the nerve, owing to the lens not being sufficiently convex, then the person is long sighted. In the first case, a concave glass is required, and in the latter a convex glass, as in aged persons.—The word *eye* is used in a vast variety of senses, both literal and figurative.—*Eye*, in architecture, is

used to signify any round window, made in a pediment, an attic, the reins of a vault, &c.—*Eye of a dome*, an aperture at the top of a dome, as that of the Pantheon at Rome, or of St Paul's at London, it is usually covered with a lantern.—*Eye of the volute*, is the centre of the volute, or that point in which the helix, or spiral of which it is formed, commences.—*Eye* in gardening, signifies a little bud or shoot, inserted into a tree, by way of graft.—*Eye of an apple, a pear, &c.*, the extremity opposite to the stalk.—*Eye of the anchor*, the hole wherein the ring of the anchor is put into the shank.—*The eyes of a ship*, are the parts which lie near the hawse holes, particularly in the lower apartments.—*EYEBOLT*, in ships, a bar of iron or bolt, with an eye, formed to be driven into the deck or sides, for the purpose of hooking tackle to.

EYEBRIGHT, or *EUPHRASIA*, a genus of plants, of several species.

EYGGLASS, in telescopes, the glass next the eye and where there are several, all except the object glass are called *eye glasses*. Also, a glass to assist defective vision.

EYE SERVICE, service performed only while under the inspection of an employer.

EYESTONE, a small calcareous stone used for taking substances from between the lid and ball of the eye.

EYRIE or *EYRY*, the place where birds of prey construct their nests.

F.

F, the sixth letter of the alphabet, is a labial articulation formed by placing the upper teeth on the under lip and accompanied with an emission of breath. Its kindred letter is *f*, which is chiefly distinguished from *f* by being more vocal. The Romans for some time used *k* inverted then, *q* for *V* consonant as *DIQI* for *DIVI*. Some have supposed that this was one of the three letters invented by Claudius but many inscriptions belonging to periods much anterior to the time of Claudius exhibit this singular use of this letter *F* as a numeral, with the Romans, signified 40 with a dash over it, 40 000. On medals, monuments, &c., *F* stands for *Fabius Fabius Felix, Faustus, &c.*—With merchants, *f* signifies *folio* (page). *F* often stands in medical prescriptions and on documents for *fact* (let it be made or done). *F* also stands for *fellow* as *F.A.S.* *Fraternitas Antiquariorum Socius* or *Fellow of the Antiquarian Society*.—*Fl* is the abbreviation for *form*, or guilder, and *fr* for *fiance*.—In music, *f* over a line, means *forte*, *ff*, *molto forte*, and *F* is the nominal of the fourth note in the natural diatonic scale of C.

FA, in music, one of the syllables invented by Guido Areteine, to mark the fourth note of the modern scale, which rises thus, *ut, re, mi, fa*.

FABIAN an epithet signifying that line of military tactics which declines the risk of a battle in the open field, but seeks every opportunity of harassing the enemy by countermarches, ambuscades, &c. It is so called from Q. Fabius Maximus, the Roman general opposed to Hannibal.

FABLE, a fictitious narration, or species of didactic allegory which may be described as a method of inculcating practicable rules of worldly prudence or wisdom, by imaginary representations drawn from the physical or external world. It consists properly of two parts the symbolical representation and the application of the instruction intended to be deduced from it which latter is called the *moral* of the tale, and must be apparent in the fable itself, in order to render it poetical. The satisfaction which we derive from fables does not lie wholly in the pleasure that we receive from the symbolical representation, but it lies deeper, in the feeling that the order of nature is the same in the spiritual and ma

THOSE IMPRESSIONS OF THE EYE ARE PERMANENTLY CONTINUOUS, WHICH ARE REPEATED SEVEN TIMES IN A SECOND

[FAC]

terial worlds: and the fabulist, whose object is not merely to render a truth perceptible by means of a fictitious action, chooses his characters from the brute creation.—Some fables are founded upon irony; some are pathetic; and some even aspire to the sublime; but, generally speaking, a fable should possess unity, that the whole tenor of it may be easily seen; and dignity, since the subject has a certain degree of importance.—We find that fables have been highly valued, not only in times of the greatest simplicity, but among the most polite ages of the world. Jotham's fable of the trees is the oldest that is extant, and as beautiful as any that have been made since. Nathan's fable of the poor man is next in antiquity, and had so good an effect as to convey instruction to the ear of a king. We find *Æsop* in the most distant ages of Greece; and in the early days of the Roman commonwealth, we read of a mutiny appeased by the fable of the belly and the members. To which we may add, that although fables had their rise in the very infancy of learning, they never flourished more than when learning was at its greatest height.—*Fable* is also used for the plot of an epic or dramatic poem, and is, according to Aristotle, the principal part, and, as it were, the soul of a poem. In this sense the fable is defined to be a discourse invented with art, to form the manners by instruction, disguised under the allegory of an action.

FABRIC, in general, denotes the structure or construction of anything; but particularly of buildings, as a church, hall, house, &c. It is also applied to the texture of cloths, or stuffs; as this is cloth of a beautiful fabric.

FABULOUS AGE, that period in the history of every nation in which supernatural events are represented to have happened. The fabulous age of Greece and Rome is called also the *heroic age*.

FACADE (pron. *fassa'de*), in architecture, the front or external aspect of an edifice. As in most edifices only one side is conspicuous, viz. that which faces the street, and usually contains the principal entrance, this has been denominated, *par excellence*, the facade.

FACE, in anatomy, the front part of the head, and the seat of most of the senses, comprising the forehead, the eyes and eyelids, the nose, cheeks, mouth, and chin. The bones of the face are divided into those of the upper and under jaw: the upper consists of thirteen bones, and the under is formed of one bone. The muscles of the face are those of the eye-lid, eye-ball, nose, mouth, and lips. The human face is called the image of the soul, as being the place whence the ideas, emotions, &c. of the soul are chiefly set to view. Nor can it be denied that the character of each individual is often strongly marked by the conformation of the countenance: physiognomy, therefore, in a certain degree, always has existed; but the great question is, how far we can reduce our experience to certain rules. For our own parts, we believe that both

physiognomists and phrenologists have carried their speculations to an absurd length.

—Face, among painters and artists, is used to denote a certain dimension of the human body, adapted for determining the proportion which the several parts should bear to one another: thus the different parts of the body are said to consist, in length, of so many faces.—We also use the word *face* in speaking of the surface of a thing, or the side presented to the view of a spectator; as, the face of the earth; the face of the sun; the face of a stone, &c.

FA'CETS, the name of the little faces or planes to be found in brilliant and rose diamonds.

FACIAL LINE OR ANGLE. These terms are used in describing the conformation that exists in the bones of the face, &c. and which so strikingly characterizes the varieties of the human race. On the relation of the jaw to the forehead is founded the *facial line*, discovered by Peter Camper. Suppose a straight line drawn at the base of the skull, from the great occipital cavity across the external orifice of the ear to the bottom of the nose. If we draw another straight line from the bottom of the nose, or from the roots of the upper incisor teeth to the forehead, then both lines will form an angle which will be more acute the less the shape of the face, in brutes, resembles that of men. In apes, this angle is only from 45° to 60° ; in the orang-outang, 63° ; in the skull of a negro, about 70° ; in a European, from 75° to 85° . In Grecian works of statuary, this angle amounts to 90° : In the statues of Jupiter, it is 100° .

FA'CIES HIPPOCRATICA, in medicine, that death-like appearance which consists in the nostrils being sharp, the eyes hollow, the temples low, the tips of the ears contracted, the forehead dry and wrinkled, and the complexion pale or livid. It is so called from Hippocrates, by whom it has been so justly described in his prognostics.

FAC-SIM'LE, an imitation of an original in all its traits and peculiarities. The object of fac-similes is various; but in all cases their perfect accuracy is indispensable.

FAC'TION, a party in political society, combined or acting in union, in opposition to the prince, government, or state; usually applied to a minority, but it may be applied to a majority. Rome was almost always disturbed by factions; and the best interests of Britain are at this hour woefully neglected, owing to the continual ferment into which the country is thrown by different factions.

FAC'TI'TIOUS, in chemistry, &c., any epithets for what is made by art, in distinction from what is produced by nature; as, *factitious cinnabar*; *factitious air*.

FACTOR, in commerce, an agent or correspondent residing in some remote part, commissioned by merchants to buy or sell goods on their account, to negotiate bills of exchange, or to transact other business for them. It is universally held in courts

OAT, AMONG ENGLISH WRITERS, AND LA FONTAINE, AMONG THE FRENCH, WERE THE MOST EMINENT FABULISTS.

THERE ARE A GREATER NUMBER OF VESELS AND NERVES IN THE FACE, THAN IN ANY OTHER EXTREMITY PART.

[FAI]

of law and equity, that the principal is held liable for the acts of his agent, provided that the conduct of the latter be conformable to the common usage and mode of dealing; but an agent cannot delegate his rights to another so as to bind the principal, unless expressly authorised to nominate a sub-agent. [For more special information on this important subject, see the act 6 Geo. IV. c. 94.]—*Factor*, in arithmetic, a name given to the multiplier and multiplicand, because they constitute the product; thus 4 and 5 are the factors of 20. Also an algebraic term, answering to the division in arithmetic. — Establishments for trade, in foreign parts of the world, are called *factories*. — The word *factory* is now also used for a manufactory on an extensive scale.

FACTORAGE, the allowance or percentage given to factors by the merchants and manufacturers, &c. who employ them; and which is usually fixed by special agreement between the merchant and factor.

FACULÆ, in astronomy, a name given to certain bright spots in the sun.

FACULTY, a term used to denote the powers or capacities of the human mind, viz. understanding, will, memory, imagination, &c. — If it be a power exerted by the body alone, it is called a *corporeal* or *animal* faculty; if it belong to the mind, it is called a *rational* faculty. And it may further be distinguished into the *natural* faculty, or that by which the body is nourished; and the *vital*, or that by which life is preserved, &c. — *Faculty*, a term applied to the different members or departments of an university, divided according to the arts and sciences taught there. In most universities there are four faculties; of arts, including humanity and philosophy; of theology; of physic; and of civil law. The degrees in the several faculties of our universities are those of bachelor, master, and doctor. — *Faculty*, in law, a privilege granted to a person, by favour and indulgence, of doing that which, by the strict letter of the law, he ought not to do. — *Faculty of Advocates*, a term applied to the college or society of advocates in Scotland, who plead in all actions before the court of session, judiciary and exchequer.

FÆCES, in chemistry, dregs, impurities, or sediment, that settles at the bottom after distillation, fermentation, &c.

FAGA'RA, in botany, a genus of plants, class 4 *Tetrandria*, order 1 *Monogynia*. The species are shrubs.

FAGO'NIA, in botany, a genus of plants, class 10 *Dicandria*, order 1 *Monogynia*. The species are perennials.

FAGUS, in botany, the beech-tree, a genus of the *monocoria* order of the *polyandria* class. It contains three species: of which the beech-tree rises to the height of 60 or 70 feet, and in stateliness and grandeur of outline vies with the oak. Its leaves are oval and serrated; its flowers are produced in globular catkins, and are succeeded by angular fruit, called *mast*, which, like acorns, serves as food for swine.

Its bark has a peculiar silvery appearance, which, added to the gracefulness of its growth and the elegance of its foliage, renders it a beautiful object in forest scenery. Its wood is much employed in turnery, and for chairs. The chestnut-tree, another species, often grows to a vast size, and was formerly much used for the purposes of building. It is now used for liquor casks and other purposes; and its fruit is valuable for swine and deer.

FAHLERZ, in mineralogy, gray copper ore; sometimes called tetrahedral copper pyrite.

FAHLUNITE, in mineralogy, a subspecies of octahedral corundum.

FAIENCE, or *IMITATION PORCELAIN*, a kind of pottery, superior to the common sorts in its glazing, beauty of form, and richness of painting. It derived its name from the town of Faenza, in Romagna, where it is said to have been invented in 1299. It reached its highest perfection in the 16th century; and some pieces were painted by the great artists of the period, which are highly valued as monuments of early art.

FAINTS, (in the distillation of whiskey) the weak spirituous liquor that runs off from the still after the proof spirit is taken away. This crude spirit is much impregnated with fetid essential oil, and is therefore very unwholesome.

FAIR, a kind of market, on a most extensive scale, granted to a town, by privilege, for the more speedy and commodious providing of such things as the place stands in need of. It is incident to a fair, that persons shall be free from being arrested in it for any other debt contracted than what was contracted in the same; or, at least, promised to be paid there. The most important fairs now held are probably those of Germany, and particularly the *Leipzic* fairs, where books form so important a branch of its commerce. But neither at home nor abroad can they have the importance they formerly had, because the communication between different parts of a country has become so easy, that merchandise may now be readily obtained direct from the places where it is produced or manufactured. It cannot have escaped general observation, that many fairs are held on church holidays; which is thus accounted for: Gregory the Great, in order to render popular the festival of the patron saints of churches, encouraged the people, on the day of the festival, to erect booths of branches about the church, and to feast therein, and amuse themselves with innocent pastimes. This custom was introduced into England from the continent, and must have been equally familiar to the Britons and Saxons, being observed among the churches of Asia and Europe in the sixth century, and by those of Western Europe in the seventh. As the people resorted in crowds to the festival, a considerable provision would be naturally required for their entertainment. The prospect of interest invited the little traders of the country to

THE THREE LEIPZIG FAIRS, VIZ. NEW-YEAR'S FAIR, EASTER FAIR, AND ST. MICHAEL'S FAIR, EACH LASTS THREE WEEKS.

THE CITY OF DREFT, IN HOLLAND, WAS AT ONE TIME FAMOUS FOR THE MANUFACTORY OF "FAIENCE," CALLED ALSO BELT WARE.

[FAL]

come with their wares; thus, among the many pavilions for hospitality in the neighbourhood of the church, various booths were erected for the sale of commodities. Basil expressly mentions the numerous appearance of traders at these festivals in Asia; and Gregory notes the same custom to be common in Europe. And, as the festival was observed on a *feria*, or holy-day, it as naturally assumed to itself, and as naturally communicated to the mart, the appellation of *feria*, or *fair*. [By the act 3 Geo. IV. c. 55, it is ordered, that at all fairs held within ten miles of Temple-bar, business and amusements of all kinds shall cease at 11 o'clock in the evening; and not recommence before 6 o'clock in the morning, under a penalty of 40s. to be paid by any master, mistress, or other person, having the care or management of any house, shop, room, booth, standing, &c.]

FAIRY, an imaginary spirit or being. Fairies were supposed to assume a human form, though they were of an extremely diminutive size, and distinguished by a variety of fantastical actions, good or bad, but never failing to exercise a magic power over mortals. In an age of ignorance, the imagination easily substitutes a poetical mythology in the place of natural causes. The native land of this fairy mythology is Arabia, from whence it was brought to Europe by the Troubadours. The European name *fairy* comes from *fatum*, fate. The Italians still call a fairy, *fata*; and they are often mentioned in the traditions of the Italians, who, as well as the Arabians, had stories of a country inhabited by fairies. After the introduction of them into the romances of Europe, the notion of fairies quickly spread; and the tales of their doings were so fixed in the popular belief, that they were continually seen in ruined castles, or gambolling in the forests by moonlight, &c., so that they did not appear at all extraordinary or unnatural when brought upon the stage by Shakspeare. For a long time *fairy tales* were fashionable; but they multiplied so fast, and occupied so much space in the lighter literature of the day, that satiety produced disgust, and they were at length irrevocably consigned to the nursery.—*Fairy of the mine*, an imaginary being supposed to inhabit mines, wandering about in the drifts and chambers, always employed, yet effecting nothing.—*Fairy ring or circle*, a phenomenon frequently seen in the fields, consisting of a round bare path with grass in the middle, formerly ascribed to the dances of the fairies. It has been supposed by some, that these rings are the effect of lightning; but a more rational theory ascribes them to a kind of fungus which grows in a circle from the centre outwards, destroying the grass as it extends, while the interior of the circle is enriched by the decayed roots of the fungi.

FABRY-STONE, the fossil echinite, abundant in chalk-pits.

FAITH, in divinity and philosophy, the firm belief of certain truths upon the testi-

mony of the person who reveals them. The grounds of a rational faith are, that the things revealed be not contrary to, though they may be above natural reason; that the revealer be well acquainted with the things he reveals; that he be above all suspicion of deceiving us. Where these criterions are found, no reasonable person will deny his assent. Whatever propositions, therefore, are beyond reason, but not contrary to it, are, when revealed, the proper matter of faith.—*Justifying, or saving faith*, signifies perfect confidence in the truth of the Gospel, which influences the will, and leads to an entire reliance on Christ for salvation.—*Public faith*, is represented on medals sometimes with a basket of fruit in one hand, and some ears of corn in the other; and sometimes holding a turtle-dove. But the most usual symbol, is with her two hands joined together.

FAKIR, or **FAQUIR**, a devotee, or Indian monk. The fakirs are a kind of fanatics in the East Indies, who retire from the world, and give themselves up to contemplation. Their great aim is to gain the veneration of the world by their absurd and cruel penances, outdoing even the mortifications and severities of the ancient Christian anchorites. Some of them mangle their bodies with scourges and knives; others never lie down; and others remain all their lives in one posture. There are also another kind of fakirs, who do not practise such severities, but make a vow of poverty, and go from village to village, prophesying and telling fortunes.

FALCA'DE, in horsemanship, is when the horse throws himself upon his haunches, as in very quick curvetts.

FAL'CATED, an epithet for any thing in the form of a sickle: thus, the moon is said to be *falcated* when she appears horned, or in the shape of a sickle.

FAL'CHION, a kind of sword turned up somewhat like a hook.

FAL'CIFORM PROCESS, in anatomy, a process of the *dura mater*, in the form of a *fals*, or sickle, that separates the two hemispheres of the brain.

FALCINELLUS, in ornithology, a bird supposed to be of the heron kind, with a long crooked bill; called by some the black heron. It is somewhat larger than a pigeon, and is of a greenish colour, variegated with purple.

FAL'CO, in ornithology, a genus of birds, of the order of the *Accipitres*, which have three toes always before, and only one behind. This genus comprehends the eagle, osprey, hawk, gyr-falcon, buzzard, kite, kestrel, &c. For the most part they are rapacious tribes, and feed on putrid carcasses; yet seldom, and never but when pressed by extreme hunger, attack living animals. They are bold, and fly with great speed when high in the air, but slowly in its lower regions; have an exquisite sense of smell, and are very quick-sighted, they are not gregarious, but generally build their nests in clefts of impending rocks.

FAL'CON, a bird nearly allied to the

FAIRS TEND TO PROMOTE COMMERCE, AND DIFFUSE A KNOWLEDGE OF THE PRODUCTS, ARTS, AND CUSTOMS OF OTHER COUNTRIES.

FAIRS HAVE BEEN KNOWN TO KEEP THE HANDS CLASPED TOGETHER SO LONG, THAT THEIR NAILS HAVE GROWN FIRMLY INTO THE FLESH.

[FAL]

hawk, about the size of a raven, and capable of being trained for sport, in which it was formerly much employed. It is usually represented in coats of arms with bells on its legs, and also decorated with a hood, virois, rings, &c.

FAL'CONET, a small cannon, or piece of ordnance.

FAL'CONRY, the art of training all kinds of hawks, but more especially the larger sort, called the gentle falcon, to the exercise or sport of hawking. This sport was much practised in Europe and Asia in the chivalric ages, and continued in favour till the 17th century; but the invention of firearms gradually superseded it. In France, England, and Germany, falconry was at one time in such high esteem, that during the reign of Francis I. of France, his grand falconer received an annual revenue of 4000 livres; had under him fifteen noblemen and fifty falconers; and enjoyed the privilege of hawking through the whole kingdom at pleasure. The whole establishment, which cost annually about 40,000 livres, attended the king wherever he went, and those who were distinguished for their skill in the sport were loaded with royal favours. In England, falconry was also in high esteem, and there is to this day a hereditary grand falconer (the duke of St. Alban's), who, by virtue of his office, presents the king, or queen regnant, with a cast of falcons on the day of the coronation. A similar service is performed by the representative of the Stanley family in the Isle of Man. In our old books on the art of hawking, it is quite laughable to see what minute directions are given for training and attending to the falcon; and were the subject worthy of the space it would occupy, we should be tempted to copy some of them. In Persia, falcons not only attack all kinds of birds, but even gazelles. They are taught to fasten themselves on the heads of these creatures, and to peck at their eyes, which checks them until the hounds come up. In this way wolves were formerly hunted in Europe. After a long course of training, so as to increase their natural courage and ferocity, they were taken into the field, capped or hooded, so as to see no object but their game; and as soon as the dogs stopped or sprung it, the falcon was unhooded, and tossed into the air after his prey.

FAL'DVAGE, a privilege which certain lords anciently reserved to themselves of setting up folds for sheep in any fields within their manors, the better to manure them.

FALLING STAR, in meteorology, a phenomenon that is frequently seen, and which has been usually supposed to depend on the electric fluid. Sir Humphry Davy, however, in a lecture delivered at the Royal Institution, gave many reasons against this opinion, and conceived that they are rather to be attributed to falling stones; remarking, that when their appearance is frequent, they have all the same direction. This phenomenon has recently attracted an unusual de-

gree of attention, and given rise to many communications from scientific men in different parts of the world; so much so, indeed, that we cannot hesitate to give, at some length, such observations on them as appear to convey a familiar and pleasing description of them. We must at the same time premise that the observations made have led to different conclusions, and that no well-established theory has sprung from them. After noticing their periodical return for several years on the nights of the 12th and 13th of November, which had also been simultaneously observed from various distant points of the earth; Dr. Olbers came to the conclusion, that they are heavenly bodies of inconsiderable dimensions, but which in common with all others of a similar nature, have a regular motion. And it is inferred that the remarkable and very unequal distribution of those small bodies revolving round the sun, which form the fire-balls and shooting-stars of our planetary system, as well as the general resemblance and nearly similar nature of all the meteoric stones which fall from time to time (taking into consideration both their external characters, and also their chemical composition), seem to indicate, not only that they have one common origin, but also that it was one common cause which has thus hurled them into space. But, in reference to this theory, it has very naturally been asked, how is it that they become ignited? and how is it that in the extremely rare medium in which they move, they continue glowing, or indeed, burning with such brilliancy?—We now come to a description of the falling stars or asteroids, observed Nov. 12, 1833, by Mr. R. C. Woods, who stationed himself at Richmond, Surrey, for the purpose of observing that phenomenon: In the afternoon of the 12th, the sun sank below the horizon, so as to predominate a clear night, there being a rich profusion of red, orange, and rosy-coloured lines. From 12 o'clock (midnight, 12th) till 25 minutes past 3 on the 13th, nine meteors fell, crossing the Milky Way at angles of from 70 to 80 degrees; six were without trains, and three with trains. At 35 minutes past 3, nothing could exceed the beauty and grandeur of the heavens; from E.N.E. to N., meteors fell like a shower of bombshells in a bombardment, and in such rapid succession as to defy every attempt to watch their particular direction and course among the stars, or to ascertain their number. The whole visible heavens were illuminated by the light such a prodigious number of meteors diffused in their descent towards the earth, and a more beautiful and magnificent sight cannot possibly be conceived. At 55 minutes past 3 the 'shower' ceased, and after 4 o'clock all traces of meteors were gone; the stars however, shone without diminution in number or brightness, and the atmosphere was remarkably clear. —We see by an article in the Vienna Official Gazette, that a similar observation was made in Germany at the same time by M. Karl Van Littrow, who says, "On the 11th of November, during five hours after six in the

IN FEUDAL TIMES SOME VASSALS WERE BOUND TO APPEAR ANNUALLY WITH A WELL-TRAINED FALCON AND A PROPER DOG.

METEORIC STONES FALL IN ALL LATITUDES, AND THEIR SUBSTANCE HAS A CRYSTALLINE CHARACTER, REGULAR AND SUD-
DEN.

evening, the sky being clear, we counted about twenty falling stars in an hour, so that the phenomenon was increasing. On the 12th of November, the sky being quite cloudy, no observation of the kind could be made. On the 13th of November, the sky suddenly cleared up half an hour before midnight, and remained perfectly serene till day-break. During these six hours we noted 1002 falling stars, of which by far the greater part were of the first magnitude, with a long horn of light, and casting much shade, like the moon. The phenomenon decidedly increased from the beginning of the observation till about four in the morning, when it seemed to have reached its culminating point.—That this phenomenon has not decreased, is evident from the following account which appeared in the Paris journals during August, 1839: "Letters from various parts of France inform the Academy of Sciences that the phenomenon exhibited itself with more or less splendour on the nights of the 9th to the 11th of August. Everywhere the same direction from the north-east to the south-west has been remarked. At Paris, for instance, astronomers have ascertained that the average number of shooting stars which on other days scarcely exceed eight in an hour, amounts to twenty-five, thirty, forty, and even fifty in the same lapse of time. The height at which they are is considerable; calculations combined with observation carrying it sometimes to sixty leagues; as for their rapidity it is between eight and twenty-two leagues per second. Several of those fine meteors, after kindling in their fall, re-ascended as if they had been driven back by a fluid of a certain density."—Though we have already, perhaps, given to this article undue space, considering our limits, there is something so graphic in the following account, which we copy from a newspaper dated Sept. 8, 1839, that we cannot resist the opportunity of giving it to our readers:—"Between the hours of ten on Tuesday night and three on Wednesday morning, in the heavens was observed one of the most magnificent specimens of that extraordinary phenomena the falling stars and northern lights ever witnessed for many years past. The first indication of this singular phenomenon was about ten minutes before ten, when a light crimson, apparently vapour, rose from the northern portion of the hemisphere, and gradually extended to the centre of the heavens, and by ten o'clock, or a quarter past, the whole, from east to west, was one vast sheet of light. It had a most alarming appearance, and was exactly like that occasioned by a terrific fire. The light varied considerably; at one time it seemed to fall, and directly after rose with intense brightness. There were to be seen mingled with it volumes of smoke, which rolled over and over, and every beholder seemed convinced that it was "a tremendous conflagration." The consternation in the metropolis was very great, thousands of persons were running in the direction of the supposed awful

catastrophe. The engines belonging to the Fire Brigade stations in Baker-street, Farringdon-street, Watling-street, Waterlo-road, and likewise those belonging to the West of England station—in fact, every fire-engine in London was horsed, and galloped after the supposed "scene of destruction," with more than ordinary energy, followed by carriages, horsemen, and vast mobs. Some of the engines proceeded as far as Highgate and Holloway before the error was discovered. These appearances lasted for upwards of two hours, and towards morning the spectacle became one of more grandeur. At two o'clock on Wednesday morning the phenomenon presented a most gorgeous scene, and one very difficult to describe. The whole of London was illuminated as light as noon day, and the atmosphere was remarkably clear. The southern hemisphere at the time mentioned, although unclouded, was very dark, but the stars, which were innumerable, shone beautifully. The opposite side of the heavens presented a singular, but magnificent contrast; it was clear to the extreme, and the light was very vivid; there was a continual succession of meteors, which varied in splendour. They apparently formed in the centre of the heavens, and spread till they seemed to burst; the effect was electrical, myriads of small stars shot out over the horizon, and darted with that swiftness towards the earth that the eye scarcely could follow the track; they seemed to burst also, and throw a dark crimson vapour over the entire hemisphere. The colours were the most magnificent that ever were seen. At half-past two o'clock the spectacle changed to darkness, which on dispersing, displayed a luminous rainbow in the zenith of the heavens and round the ridge of darkness that overhung the southern portion of the country. Soon afterwards columns of silvery light radiated from it; they increased wonderfully, intermingled amongst crimson vapour, which formed at the same time, and when at the full height the spectacle was beyond all imagination. Stars were darting about in all directions, and continued until four o'clock, when all died away. During the time that they lasted a great many persons assembled on the bridges across the river Thames, where they had a commanding view of the heavens, and watched the progress of the phenomenon attentively."

FALLING SICKNESS. [See EPILEPSY.]

FALLOPIAN TUBES, in anatomy, two canals or ducts arising in the womb of a tortuous figure, but approaching to a conic form, joined to the fundus, one on each side. They received their name from Gabriel Fallopius, a celebrated Italian anatomist and physician of the 16th century, who is said to have first ascertained their use and office in the process of conception.

FAL'LACY, a logical artifice, or an argument framed so as to deceive; a sophism.

FAL'LOW, a term applied to land which is left uncultivated for one or more years,

THE IONES FALUTE, AND SUCH OTHER LUMINOUS METEORS, ARISE FROM PUTRID AND FERMENTING VEGETATION OR SOILS.

[FAN]

A New Dictionary of the Belles Lettres.

[FAN]

IN THE BEIGN OF ELIZABETH, FANS WERE MADE OF OSTRICH FEATHERS, WITH CURIOUSLY-BROUGHT HANDLES OF GOLD, SILVER, OR IVORY.

with a view to exterminate weeds, and to enable it to fix those atmospherical elements which promote vegetable growth, and which are exhausted by repeated crops of the same kind. As a succession of the same crops tends to impoverish the soil, a rotation of different crops is necessary. Potatoes and grain are exhausting; but after them, the soil is ameliorated by tares, turnips, &c.

FALLOW DEER, in zoology, the *Cervus dama* of Linnaeus, having horns branched, recurved, and compressed. This animal usually forms one of the ornaments of English parks.

FALSE, contrary to the truth or fact: the word is applicable to any subject physical or moral.—*False*, in music, an epithet applied by theorists to certain chords, because they do not contain all the intervals appertaining to those chords in their perfect state. Those intonations of the voice which do not truly express the intended intervals are also called *false*, as well as all ill-adjusted combinations.

False, an epithet used also in law, as *false imprisonment*, the trespass of imprisoning a man without lawful cause.—In mineralogy, as *false diamond*, a diamond counterfeited with glass.—It is also a word much used in military affairs; as, a *false alarm*, a *false attack*, &c.—*False flower*, in botany, a flower which does not seem to produce any fruit.—*False roof*, in carpentry, that part of a house which is between the roof and the covering.

FALSETTO, in music, an Italian term, denoting that species of voice in a man, the compass of which lies above his natural voice, and is produced by artificial constraint.

FAMILIAR SPIRITS, demons, or evil spirits, supposed to be continually within call and at the service of their masters, sometimes under an assumed shape; sometimes compelled by magical skill, and sometimes doing voluntary service. In Eastern stories, nothing is more common than the mention of magic gems, rings, &c., to which are attached genii, sometimes good, sometimes bad; but in modern Christian Europe, the notion of *familiars* has always been restricted to evil spirits.

FAMILY, the collective body of persons who live in one house, under one head. Also the kindred or lineage of a person: thus the Israelites were a branch of the family of Abraham; and the descendants of Reuben, of Manasseh, &c. were called *families*.—*Family*, in natural history, any order of animals, or other natural production allied to each other by certain distinctive characteristics.—*Family of curves*, in mathematics, a congeries of several kinds of curves, all of which are defined by the same equation, but in a different manner, according to their different orders.

FANATIC, one who indulges wild and extravagant notions of religion, and sometimes exhibits strange motions and postures, and vehement vociferation in religious worship.—The ancients called those

fanatici who passed their time in temples (*fana*), and being often seized with a kind of enthusiasm, as if inspired by the divinity, exhibited wild and antic gestures. Prudentius represents them as cutting and slashing their arms with knives: shaking the head was also common among the *fanatici*; hence the word was applied to different religious sects who, on their first appearance amongst us, sought notoriety by the extravagance of their actions and by pretending to inspiration.

FANDAN'GO, an old Spanish dance, which proceeds gradually from a slow and uniform to the most lively motion. It is seldom danced but at the theatre, and in the parties of the lower classes; nor is it even then customary to dance it with those voluptuous looks and attitudes which distinguish the true fandango. There is another species of fandango, called the *bolero*, the motions and steps of which are slow and sedate, but grow rather more lively towards the end. In these dances the time is beat by castanets.

FANFARE (*French*), a short, lively, loud, and warlike piece of music, composed for trumpets and kettle-drums. Also, small, lively pieces, performed on hunting-horns, in the chase. From its meaning is derived *fanfaron*, a boaster, and *fanfaronade*, boasting.

FAN-PALM, in botany, the *Corypha umbraculifera*, one of the most magnificent of trees, is a native of Ceylon, Malabar, and the East-Indies. It attains the height of 60 or 70 feet, with a straight, cylindrical trunk, crowned at the summit by a tuft of enormous leaves, which separate near the outer margin into numerous leaflets, and are usually 18 feet long, exclusive of the leaf-stalk, and 14 broad; a single one being sufficient to protect 15 or 20 men from the rain. When this palm (sometimes called the talipot-tree, or the great fan-palm) has reached the age of 35 or 40 years, it flowers—a long, conical, scaly spadix rising to the height of 30 feet from the midst of the crown of leaves, and separating into single alternate branches, which, at the base, extend laterally sometimes 20 feet, the whole covered with whitish flowers, and presenting a most beautiful appearance. The fruit is very abundant, globose, about an inch and a half in diameter, and requires 14 months to ripen, after which the tree soon perishes, flowering but once in the whole course of its existence. The Indians use the leaves for umbrellas, tents, or for covering their houses; the pith, after being pounded, is made into a kind of bread, which is of great use in times of scarcity.

FANTASIA, in music, the name generally given to a species of composition, supposed to be struck off in the heat of the imagination; and in which the composer is allowed to give free range to his ideas, unconfined by the rules of the science. Some limit the term to mere extemporaneous effusions, which are transitive and evanescent: differing from the *capriccio* in this, that though the latter is wild, it is the re-

"FAMILIARS" IN THE INQUIRY, WERE PERSONS WHO ASSISTED IN APPENDING THE ACCUSED, AND CONVERTING THEM TO PRISON.

[FAS]

The Scientific and Literary Treasury;

[FAS

sult of premeditation, and becomes permanent, whereas the *fantasia* when finished, no longer exists.

FARCE, a dramatic piece or entertainment of low comic character. It was originally a droll, or petty shew exhibited by mountebanks and their buffoons in the open streets, to gather the people together. It has, however, long been removed from the street to the theatre, and instead of being performed by merry-andrews to amuse the rabble, is acted by comedians, and become the entertainment of a polite audience. As the aim of a farce is to promote mirth, the dialogue is not refined, nor is there any opportunity lost to excite laughter, however wild or extravagant the plot, or however ridiculous the characters.

FARE, money paid for the passage of a person in any vehicle, either by land or by water.

FARINA, in natural history, signifies literally meal or flour, but is also applied to the pulverulent and glutinous part of wheat, and other grain, before as well as after it has been ground.

FARINA FÆCUNDANS, among botanists, the impregnating meal or dust on the apices or anthers of flowers, which, being received into the pistil or seed-vessel of plants, fecundates the rudiments of the seeds in the ovary, which otherwise would decay and come to nothing. The manner of obtaining the farina of plants for microscopical observation is this: gather the flowers in the midst of a dry sun-shiny day, when the dew is perfectly off, then gently shake off the farina, or lightly brush it off with a soft hair pencil, upon a piece of white paper, then take a single tale of singlass between the nippers, and, breathing on it, apply it instantly to the farina, and the moisture of the breath will make that light powder stick to it. If too great a quantity is found adhering to the tale, blow a little of it off, and if there is too little, breathe upon it again, and take up more. When this is done, put the tale into the hole of a slider, and applying it to the microscope, see whether the little grains are laid as you desire, and if they are, cover them up with another tale, and fix the ring, but care must be taken that the tales do not press upon the farina in such a manner as to alter the form.

FARM, a large portion of land, employed in the purposes of husbandry and let on lease at a certain yearly rent. He who holds a farm and is a tenant or lessee thereof, is a *farmer*—"To farm," in a general sense, is to hire at a fixed rent any post, situation, or property, from which larger but unhxed profits may be obtained, thus, one agreeing to pay a certain yearly sum, in consideration of receiving the tolls at a turnpike, is said to *farm* the turnpike.

FARRIERY, the art of preventing, or curing the diseases of horses. This is now called the *veterinary art*, and the smith whose business it is to shoe horses is denominated a *farrier*. Indeed, it is said by some, that they were originally called *fer-*

riers, from their working in iron, and that hence arose the word *farrier*, which, as they also undertook the management and cure of horses, designated their joint trade.

FASCES, in Roman antiquity, bundles of rods with an axe in the centre of each bundle carried before the consuls as a badge of their office. The use of the fasces was introduced by the elder Tarquin as a mark of sovereign authority: in after times they were borne before the consuls, but by turns only, each having his day. These latter had twelve of them, carried by so many lictors.

FASCIA, in architecture, any flat member having a considerable breadth and but a small projection, as the band of an architrave, lintel, &c.—In anatomy, the name of any aponeurotic expansion of muscles which binds parts together.

FASCIATILIS, in anatomy, an epithet for a muscle which moves the leg.

FASCICULAR, in botany, an epithet for a root of the tuberous kind, with the knobs collected in bundles, as in *Peonia*.

FASCICULITE, in mineralogy, a variety of fibrous hornblend, of a fascicular structure.

FASCICULUS, in medicine, denotes a handful, or according to some, as much as can be taken up between the finger and the thumb.—In botany, a species of inflorescence in which several upright approximating flowers are collected together.

FASCINATION, a kind of witchcraft or enchantment supposed to operate by the influence of the eye. A belief in fascination appears to have been very generally prevalent in most ages and countries. It has been till very recently, and in some remote districts is even yet, prevalent among the Scotch Highlanders, and the inhabitants of the Western islands, where the fear of the evil eye has led to various precautions against its influence, and in Turkey, when a child is born, it is immediately laid in the cradle and loaded with amulets, while the most absurd ceremonies are used to protect it from the noxious fascination of some invisible demon. Nay, the evil eye is there feared at all times, and supposed to affect persons of all ages, who, by their prosperity, may be the objects of envy.

FASCINES, in fortification, small branches, or bavinns bound up in bundles, which are used in raising batteries, filling up the moat, binding the ramparts where the earth is bad, making parapets, &c.

FASCIOLE, in entomology, the Gourd Worm, or Fluke—a kind of flat worm often found in the intestines of animals.

FASHION PIECES, in ships, the hindmost timbers which terminate the breadth, and form the shape of the stern.

FASNAITE, in mineralogy, a variety of augite, found in Fassa, in the Tyrol.

FASTI, in antiquity, the name of the Roman calendar, in which were set down all days of fasts, pleadings, games, ceremonies, the names of their officers, and other public concerns throughout the year.

FASTA, occasional abstinence from food, on days appointed by public authority to be

THE FASCICULOUS PART OF SEEDS IS CONVERTED INTO SACCHARINE JUICE BY THE VEGETABLE POWER OF DIGESTION.

THE POWER OF FASCINATION (OR OF STUPIDITY BY TERROR) IS POSSESSED BY SERPENTS, &c. OVER ANIMALS DESTINED FOR THEIR PREY.

[FAT]

A New Dictionary of the Belles Lettres.

[FAT]

observed in fasting and humiliation. Solemn fasts have been observed in all ages and nations, especially in times of mourning and affliction. Among the Jews, besides their stated fast days, they were occasionally enjoined in the time of any public calamity. They were observed upon the second and fifth days of the week, beginning an hour before sunset, and continuing till midnight on the following day. On these occasions they always wore *sackcloth* next their skins, rent their clothes, which were of coarse white stuff, sprinkled ashes on their heads, went barefoot, and neither washed their hands nor anointed their bodies as usual. They thronged the temple, made long and mournful prayers, and had every external appearance of humiliation and dejection. In order to complete their abstinence, at night they were allowed to eat nothing but a little bread dipped in water, with some salt for seasoning, except they chose some bitter herbs and pulse. Our Saviour, by condemning some abuses committed in fasting, plainly intimates that it is a duty, though he does not enjoin it.

FAT, in anatomy, an oleaginous matter, secreted from the blood, and filling up the cavity of the adipose cells. Its uses are, 1. to serve as a kind of covering to the body, in order to defend it from cold and other injuries, 2. to defend the more tender and sensible parts from being too strongly irritated by the salts, 3. to preserve in good order the flexion of the muscles, of the cutis, and of the other parts between and about which it is placed, 4. to facilitate the motions of some parts, as the eyes, jaws, &c., 5. to fill up a number of empty interstitial spaces, and by that means to add greatly to the symmetry and beauty of the parts, as is evidently the case in the face, the neck, &c., and 6. to prevent the painful pressure and attrition of the parts, particularly in the soles of the feet, &c., where the fat is copiously disposed, and serves in the place of a cushion for the muscular flesh to rest upon. There is also great reason to suppose, that when the body does not receive nourishment in the usual way, the regress of the fat into the veins supplies that defect.—Fats vary in consistence, colour, and smell, according to the animals from which they are obtained, thus, they are generally fluid in the cetaceous tribes, soft and rank flavoured in the carnivorous, solid and nearly scentless in the ruminants, usually white and copious in well-fed young animals, yellowish and more scanty in the old. Their consistence varies also according to the organ of their production, being firmer under the skin, and in the neighbourhood of the kidneys, than among the movable viscera. The animal oils and fats combine with the alkalies, and form with these perfect soaps. With some of the earths, and metallic oxides also, they form saponaceous compounds, and they even facilitate the oxidation of some of the metals, as copper and mercury, by the atmospheric air. Animal fat is not homogeneous, but consists of two

substances, *stearine* and *elaine*, the former of which is solid, the latter liquid, at common temperatures, and on the different proportions of which its degree of consistence depends.

FATALISM, the belief of an unchangeable destiny, to which every thing is subject, uninfluenced by reason, and independent of a controlling cause, the doctrine, in short, which teaches that all things take place by an inevitable necessity.

FATA MORGANA, a singular aerial phenomenon seen in the straits of Messina. This atmospherical refraction is not, however, altogether confined to that locality, it having occasionally been seen on our own coasts. But we will describe it as it there appears. "When the rising sun shines from that point whence its incident ray forms an angle of about 45° on the sea of Reggio, and the bright surface of the water in the bay is not disturbed either by the wind or current, when the tide is at its height, and the waters are pressed up by currents to a great elevation in the middle of the channel, the spectator being placed on an eminence, with his back to the sun and his face to the sea, the mountains of Messina rising like a wall behind it, and forming the back ground of the picture,—on a sudden there appears in the water, as in a catoptric theatre, various multiplied objects—numberless series of pilasters, arches, castles, well delineated regular columns, lofty towers, superb palaces, with balconies and windows, extended alleys of trees, delightful plains, with herds and flocks, armies of men on foot, on horseback, and many other things, in their natural colours and proper actions, passing rapidly in succession along the surface of the sea, during the whole of the short period of time while the above mentioned causes remain. All these objects, which are exhibited in the Fata Morgana, are proved by the accurate observations of the coast and town of Reggio by P. Minasi, to be derived from objects on shore. If, in addition to the circumstances before described, the atmosphere be highly impregnated with vapour, and dense exhalations, not previously dispersed by the action of the wind and waves, or rarified by the sun, it then happens, that in this vapour, as in a curtain extended along the channel to the height of above forty palms, and nearly down to the sea, the observer will behold the scene of the same objects not only reflected from the surface of the sea, but likewise in the air, though not so distinctly or well defined as the former objects of the sea. Lastly, if the air be slightly hazy and opaque, and at the same time dewy, and adapted to form the iris, then the above mentioned objects will appear only at the surface of the sea, as in the first case, but all vividly coloured or fringed with red, green, blue, and other prismatic colours."

FATE, destiny depending on a superior cause and uncontrollable. According to the Stoics, every event is determined by Fate, and in the sense in which the mo-

THE PRINCIPAL AND MOST USEFUL VARIETIES OF FAT AND ANIMAL OILS, ARE SPEARMINT, TALLOW, LARD, AND THE RUBBER OF WHALES.

AT TIMES APPEARED TO BRING THE FENICE COAST CLOSE TO SURREY.

[FEA]

The Scientific and Literary Treasury ;

[FEA]

derms use the word, it implies the order or determination of Providence

FATHER, in church history is applied to ancient authors who have preserved in their writings the tradition of the church. Thus St. Chrysostom, St. Basil &c. are called Greek fathers, and St. Augustine and St. Ambrose Latin fathers. No author who wrote later than the 12th century is dignified with the title of father. It is also a title of honour given to prelates and dignitaries of the church to the superiors of convents to congregations of ecclesiastics and to persons venerable for their age or quality. Thus we say the right reverend father in God, the holy father &c. — He who creates or invents or composes anything, thus, God as creator is the father of all men. Jabal was the father of such as dwell in tents. Homer is considered as the father of epic poetry. A wise and affectionate king is called the father of his country &c. — *Adoptive father* he who adopts the children of another and acknowledges them as his own. — *Natural father* the father of an illegitimate child. — *Putative father* one who is only reputed to be the father. — *Father in law* the father of one's husband or wife. — *Father land* the native land of one's father or ancestors.

FATHOM a measure of six feet used chiefly at sea in sounding the depth of water measuring cordage &c.

FALLS a term applied by miners to the fractures or interruptions in various strata.

FANALIA three Roman festivals annually observed in honour of the god Faunus. The first was kept on the ides of February, the second on the 16th of the calends of March, and the third on the nones of December. The sacrifices on these occasions were lambs and kids. It is supposed that the Roman Faunus was the same with the Greek Pan.

FALNS rural deities among the Romans represented with horns on their heads sharp pointed ears and the rest of their bodies like goats. They were the mythological demi gods of woods and forests thence called *sylvan* deities.

FAUX JOUR (French) *false light* a term used in the fine arts signifying, that a picture is placed so that the light falls upon it from a different side from that which the painter has represented the light in the picture as falling upon objects or that it is covered with a bright glare so that nothing can be properly distinguished.

FAVISSE large vaults under ground in the area of the Roman capitol where the Romans carefully lodged and deposited with a degree of religious care the old statues and other sacred utensils when they happened to be broken such a superstitious veneration did they pay to every thing belonging to the capitol.

FAWN a young deer a buck or doe of the first year.

FEALT in feudal law an oath taken on the admittance of any tenant to be true to the lord of whom he held his land. Under

the feudal system of tenures, every vassal or tenant was bound to be true and faithful to his lord and to defend him against his enemies. The tenant was called a liege man the land a liege fee and the superior, a liege lord.

FEASTS or FESTIVALS in a religious sense are anniversary times of feasting and thanksgiving such as Christmas Easter, &c. Feasts were of divine institution intended by the Deity to perpetuate among his chosen people the Jews the memory of his mercies and miracles as well as to keep alive the friendship betwixt the different tribes and families by bringing them together on solemn occasions, and offering up their thanksgivings in the holy city.

Among Christians *movable feasts* are those which depending on astronomical calculations do not always return on the same days of the year. Of these the principal is Easter which runs all the rest as Palm Sunday Good Friday Ash Wednesday Sexagesima, Ascension day Pentecost and Trinity Sunday. *Immovable feasts* those which are constantly celebrated on the same day of these the principal are Christmas day or the Nativity the Circumcision Epiphany Candlemas or the Purification Lady day or the Annunciation All Saints and All Souls and the days of the several apostles. — The four quarterly feasts or stated times which return on the same days are usually reserved to be paid are Lady day or the annunciation of the Virgin Mary on the 26th of March the nativity of St. John the Baptist on the 24th of June the feast of St. Michael the arch angel on the 29th of September and Christmas or rather of St. Michael the apostle on the 21st of December. — The feasts of the ancients were conducted with great ceremony. The guests wore white garments decorated themselves with garlands and often anointed the head and breast with fragrant oils. The banqueting room was also often adorned with garlands and roses which were hung over the table as the emblem of silence hence the common phrase to communicate a thing, *sub rose* (under the rose). The luxurious Romans drank out of crystal amber and the costly *myrra* (a kind of porcelain introduced by Pompey) as well as onyx beryl and elegantly wrought gold set with precious stones. After the meal was ended flute players female singers dancers and buffoons of all kinds amused the guests or the guests themselves joined in various sports and games.

FEATHER a general name for the covering of birds it being common to all of them to have their whole body or the greatest part of it covered with feathers or plumage. Feathers consist of a tube a shaft and barbs or vane. The tube is a hollow, transparent horny cylinder constituting the root of the feather the shaft is elastic and contains a white dry and very light pith and the barbs run in a uniform direction broad on one side narrow on the other, covering each side of the shaft. The feathers of birds are periodically changed which

AT THE ROMAN BANQUETS THE GUESTS NEVER SAT BUT RECLINED ON MAGNIFICENT COLUMNS OR SOPHAS ARRANGED ROUND THE TABLE

AT THE GREEK FEASTS MEN ONLY WERE INVITED BUT AMONG THE GUESTS OF THE ROMANS, WOMEN FORMED AN INCONSIDERABLE PORTION

[FEE]

A New Dictionary of the Belles Lettres.

[FEL]

is called *moulting*. When part of a feather is cut off, it does not grow out again, and a bird whose wings have been clipped, remains in that state till the next moulting season, when the old stumps are shed, and new feathers grow out.—When chemically analyzed, feathers seem to possess nearly the same properties with hair.—They may be considered as of four kinds, 1 quills, or the feathers of the wings, 2 those which cover the body, 3 the down which grows close to the skin, and 4 the long ones of the tail. Of the first description, the goose, the turkey, and the crow, supply those usually employed in writing. The down of the swan is sometimes made into muffs and other articles of dress. Goose feathers are most esteemed for beds, and they are best when plucked from the living bird, which is done thrice a year, in the spring, midsummer, and beginning of harvest. The feathers of the eider duck, called *eider down*, possess in a superior degree all the good qualities of goose down, but it should only be used as a covering to beds, for by much pressure it loses its elasticity.—Feathers make a considerable article in commerce, particularly those of the ostrich, heron, swan, peacock, turkey, goose, and duck. They also afford a source of employment to the *plumassier*, or artisan who prepares them for the toilette, to ornament the heads of ladies, or to give a finishing stroke to the gay exterior of military men.—Ostrich feathers are imported from Algiers, Tunis, Alexandria, Madagascar, and Benegal.

FEB RIFUGE, in medicine, an appellation given to such medicines as mitigate or remove a fever.

FEBRUARY, in chronology, the second month of the year, reckoning from January, first added to the calendar of Romulus by Numa Pompilius. February derived its name from *Februa* a feast held by the Romans in this month, in behalf of the *manes* of the deceased, at which ceremony sacrifices were performed, and the last offices were paid to the shades of the defunct. February in a common year consists only of 28 days, but in the bisextile year it has 29, on account of the intercalary day added that year.

FECIALES, a college of priests instituted at Rome by Numa, consisting of twenty persons, selected out of the best families. Their business was to be arbitrators of all matters relating to war and peace, and to be the guardians of the public faith.

FEDERAL GOVERNMENT, such a government as consists of several independent provinces or states, united under one head, but the degree to which such states give up their individual rights may be very different, although as relates to general politics they have one common interest, and agree to be governed by one and the same principle. Of such kind is the government of the United States of America.

FEE a reward or recompense for professional services as the fees of lawyers, physicians, &c. Public offices have likewise

their settled fees, for the several branches of business transacted in them.

FEE ESTATE, in law, properly signifies an inheritable estate in land, held of some superior or lord, and in this sense it is distinguished from *allodum*, which is the absolute property in land. It is the *theory* of the English law that all the lands of the kingdom, except the royal domains, are held in fee, or by a tenure, of some superior lord, the absolute or allodial property being only in the king, so that all the tenures are strictly feudal. The most ample estate a person can have is that of *fee simple*, and such an estate can be had only in property that is inheritable, and of a permanent nature.—*Fee farm*, a kind of tenure without homage, fealty, or other service, except that mentioned in the *troffment*, which is usually the full rent. The nature of this tenure is, that if the rent is in arrear or unpaid for two years, then the feoffee and his heirs may have an action for the recovery of his lands.

FEELERS, a term generally applied to the antennae of insects, which are vulgarly called horns, but, strictly, the feelers are distinguished from antennae by being short, naked, and placed near the mouth. They are used in searching for food.

FEELING, one of the five external senses, by which we obtain the ideas of solid, hard, soft, rough, hot, cold, wet, dry, and other tangible qualities. This sense is the coarsest, but at the same time the surest of all others: it is besides the most universal. We see and hear with small portions of our body, but we feel with all. Nature has bestowed that general sensation wherever there are nerves, and they are everywhere, where there is life. Were it otherwise, the parts divested of it might be destroyed without our knowledge. All the nervous solids, while animated by their fluids, have this general sensation, but the papilla, in the skin, those of the fingers in particular, have it in a more exquisite degree. Like every other sense, feeling is capable of the greatest improvement: thus we see that persons, born without arms, acquire the nicest feeling in their toes and, in blind people, this sense becomes so much developed, that individuals born blind, and acquiring the faculty of sight in after life, for a long time depend rather on their feeling than on their sight, because they receive clearer ideas through the former sense.

FEINT, in military tactics, a mock attack, made to conceal the true one.

FELIS, in zoology, a genus of the order *fera*. This tribe is temperate in its habits, climbs trees, sees best by night, and when falling from a height lights on the feet waves the tail when in sight of prey, and refuses vegetable food except from necessity. It includes the lion, tiger, cat, panther, &c., which we accordingly call the *feline* race.

FELLOES, the pieces of wood which form the circumference or circular part of the wheel.

THE INHABITANTS OF GREENLAND, AND OTHER COLD COUNTRIES, WEAR THE SKINS OF SEVERAL SORTS OF WATER-FOWLS, WITH THE FEATHERS INSIDE.

AFTER FEATHERS FOR BEDDING HAVE BEEN DRIED IN THE SUN, THEY ARE PUT IN BAGS AND BEATEN WITH POLES TO GET OFF THE DIRT.

[FEM]

The Scientific and Literary Treasury;

[FER]

FELLOW, the member of a college or of a corporate body—This word has a very wide and opposite meaning, for though we say, in speaking of a skilful artist, this man has not his *fellow*, we also apply it in the most ignoble sense, and say, such a one is a mean or worthless *fellow*.

FELLOWSHIP, in arithmetic, a rule by which the loss and gain of each particular person in a joint-stock concern is discovered.

FELO DE SE, in law, a person that, being of sound mind, and of the age of discretion, wilfully causes his own death. The goods and chattels of a *felo de se* are forfeited to the king but the coroner's jury, summoned for the purpose of inquiring into the cause of death, &c., frequently save the forfeiture, by finding a verdict of lunacy, to which they are inclined on a favourable interpretation, that it is impossible for a person in his senses to do a thing so contrary to nature.

FELONY, in law, includes generally all capital crimes below treason, such as murder, burglary, &c., and is punished with death or transportation, according to the enormity of the offence.

FELSPAR, or **FELDSPAR**, a mineral compound of silica, alumina, and potash, one of the constituents of granite, softer than quartz, harder than glass, and generally white, greyish, or reddish. The general figure of the numerous crystals of feldspar is an oblique prism, with unequally produced planes, whose number varies from four to ten. These prisms are terminated by summits, ordinarily composed of two large culminating faces, and several smaller faces, which seem to obey no constant law of arrangement hence it results, that the forms of feldspar are among the most difficult of any to understand and describe. In its decomposed state, feldspar furnishes the *petunee*, or Cornish stone, so much used in the porcelain and best pottery manufactures.

FELT, a sort of coarse wool, fur, or hair, used in the making of hats. The method of working up the materials into a species of cloth, independently of either spinning or weaving is called *felting*. These materials are intimately mixed together by the operation of *bowing*, which depends on the vibrations of an elastic string, the rapid alternations of its motion being peculiarly well adapted to remove all irregular knots and adhesions among the fibres, and to dispose them in a very light and uniform arrangement. This texture, when pressed under cloths and leather, readily unites into a mass of some firmness, and by various subsequent operations a hat is formed.

FELUC'CA, a light open vessel with six oars, much used in the Mediterranean. It has this peculiarity, that its helm may be used either at the head or the stern.

FEMALE-FLOWER, in botany, a flower which is furnished with the pistil, or female organs.

FEMALE SCREW, a screw, the spiral

thread of which is cut in the cavity of the cylinder.

FEME COVERT, in law, a married woman, who is under covert of her husband. By the common law of England, the legal capacity of a woman to contract, or sue and be sued, separately, ceases on her marriage, and her husband becomes liable to her debts existing at that time—*Feme sole*, a single woman—*Feme-sole merchant*, a woman who carries on trade alone, or without her husband.

FEMININE, in grammar, denoting the female gender.

FEMORAL, belonging to the thigh, as, the *femoral artery*.

FEN, a place partially overflowed with water, abounding in bogs, and producing sedges, coarse grass, or other aquatic plants. The fens generally teem with wild ducks, teal, pike, eels, &c.

FENCING, the art of using skilfully a sword or foil either in attack or defence. In the exercise of this art, foils or thin swords are used, which, being blunted at the points, and bending readily, are rendered harmless.

FEN CRICKET, in entomology, *Gryllotalpa*, an insect that digs for itself a little hole in the ground.

FENDERS, a sea term for pieces of old cable, &c. hung over the sides of a ship to keep off other ships.

FENESTRA, in anatomy, a term applied to two openings or *foramina* within the ear, distinguished by the names of the oval and the round fenestra.

FENNEL, in botany, a fragrant plant of the genus *Anethum*, cultivated in gardens.

FEODUM, **FEOD** or **FEUD**, in feudal law, the right which the vassal had in land, &c. to use the same, and take the profits thereof, rendering unto his lord such *fecs*, duties, and services, as belonged to military tenure.

FEOFFMENT, in law, is a gift or grant of any manors, messuages, lands, or tenements to another *in fee*, that is, to him and his heirs for ever, by delivery of seisin, and possession of the estate granted. The giver is called the *feoffer*, and the person who is thus invested is called the *feoffee*.

FERÆ, in zoology the third order of animals in the Linnæan system, including such as have from six to ten conic fore teeth and one tusk as the seal, the dog, the wolf, the hyena, the jackal, the lynx, the tiger, the panther, &c.

FERÆ NATURÆ, in law, are beasts and birds that are wild, as foxes, hares, wild-ducks, &c., in which no person can claim any property.

FIRALIA, in antiquity, a festival observed among the Romans, on the 21st of February, or, according to Ovid, on the 17th, in honour of the *manes* of their deceased friends and relations. During the ceremony, which consisted in making presents at their graves, marriages were forbidden, and the temples of the divinites shut up, because they fancied that during this festival, departed spirits suffered no

BEFORE THE BLOWPIPE, UPON CHARCOAL, FELSPAR BECOMES GLASSY, SEMI TRANSPARENT, AND WHITE, BUT HELPS WITH DIFFICULTY.

— THE THREE QUICKNESS AND ACCURACY TO THE EYE, AND SELF-POSSESSION TO THE MIND.

[FER]

A New Dictionary of the Belles Lettres.

[FER]

pains in hell, but were permitted to wander about their graves, and feast upon the meats prepared for them.

FEE DE FOURCHETTE, in heraldry, a cross having at each end a forked iron, like that formerly used by soldiers to rest their muskets on.

FEBENTARIA, in ancient Rome, a sort of light-armed soldiers.

FERIA, in the Romish breviary, is applied to the several days of the week; thus Monday is the *feria secunda*, Tuesday the *feria tertia*, and so on.

FERIA, in Roman antiquity, holidays, or days upon which they abstained from business. The *ferie* were of several kinds, namely, *Feria stativæ*, or stated festivals; *feria conceptivæ* or movable feasts; *feria imperativæ*, or occasional festivals enjoined by the consuls or other magistrates on some public occasion; and *feria denicales*, for private occasions. There were also the *feria Latina*, kept by the fifty Latin towns on Mount Albanus; and the *feria mundina*, festivals kept for nine days on the appearance of any prodigy.—It was a pollution of the *feria*, according to Macrobius, if the *rex sacrorum* or *flamines* saw any work done on them, and therefore they ordered proclamation to be made by the herald, that every one might abstain from work; and whoever transgressed the order was fined.

FERINE, an epithet for such beasts as are wild and savage, as lions, tigers, wolves, bears, &c.

FERIO, in logic, a mode in the first figure of syllogisms, consisting of a universal negative, a particular affirmative, and a particular negative.—A similar mode in the third figure of syllogisms, is termed *ferison*.

FERMENTATION, that change in the principles of organic bodies which begins to take place spontaneously as soon as their vital functions have ceased, and by them are at length reduced to their first principles. This has been distinguished into three stages, the *vinous*, *acetous*, and *putrefactive*. It is ascertained almost beyond doubt, that the vinous fermentation takes place only in such bodies as contain saccharine juices. In this the most remarkable product is a volatile, colourless, slight inflammable fluid, which mixes with water in all proportions, and is called alcohol. The acetous fermentation is distinguished by the product known by the name of vinegar, which is the least destructible of the vegetable acids. It does not appear, however, that fermentation is absolutely necessary for the production of this acid, as there are many other chemical processes by which it may be obtained or produced. The acetous fermentation is conducted on a large scale, for yielding the common vinegar of commerce. In France, it is prepared by exposing weak wines to the air during warm weather. In England, it is made from a solution of brown sugar, or molasses, or an infusion of malt. The vinegar thus obtained, however, always contains a large quantity of mucilaginous and other vegeta-

ble matters, the presence of which renders it liable to several ulterior changes. In the putrid fermentation, bodies appear to be reduced into their most simple parts. Ammonia is the product which has been remarked as the chief of this process, and is no doubt produced by the combination of the hydrogen and nitrogen gases, which are disengaged together. Fermentation differs from effervescence. The former is confined to animal and vegetable substances; the latter is applicable to mineral substances: the former is spontaneous; the latter, produced by the mixture of bodies.

FERN, a weed, very common in dry and barren places, which is very injurious to the land in which it has once taken root. Ferns are of the *cryptogamia* class, without flowers or apparent germ, similar to lichens, mushrooms, and mosses. Between the tropics, several species form small trees, having something of the aspect of palms, and are considered one of the greatest ornaments of those regions.

FERRARIA, in botany, a genus of plants, class 20 *Gynandria*, order 2 *Dianthia*. The species are bulbous, and include the iris, narcissus, &c.

FERRET, an animal of the genus *Mustela*, or weasel tribe, of a pale yellow colour, with red eyes and a long snout; it is much used in catching rabbits and rats.

FERRIC, pertaining to or extracted from iron.—*Ferric acid* is the acid of iron saturated with oxygen.

FERRI-CALCITE, in mineralogy, a species of calcareous earth or limestone combined with a large portion of iron.

FERRILITE, in mineralogy, a variety of trap, containing iron in the state of oxide.

FERRO-CYANATE, in chemistry, a salt formed by the union of ferro-cyanic acid with a salifiable base, as the *ferro-cyanate* of ammonia or potash.

FERRO-PRUSSIATE, in chemistry, a compound of the ferro-prussic acid with a base.

FERRO-PRUSSIC, or **FERRO-CYANIC**, in chemistry, terms designating a peculiar acid, formed of prussic acid and protoxyde of iron.

FERRO-SILICATE, in chemistry, a compound of ferro-silicic acid with a base, forming a substance analogous to a salt.

FERRO-SILICIC, in chemistry, a term designating a compound of iron and silic.

FERRUINOUS, of the colour of rust or the oxide of iron.

FERRUM, a genus of minerals of the order of metals. [See IRON.]

FEB'ULA, in ecclesiastical history, signifies a place separated from the church, wherein the *audientes* were kept, as not being allowed to enter the church.—Under the eastern empire, the *ferula* was the emperor's sceptre, as is seen on a variety of medals; it consisted of a long stem or shaft, and a flat square head.—*Ferula*, or *Ferula*, an instrument of correction, in schools, with which boys are beaten on the palm of the hand.

LEAD IS USED BY WINE-MERCHANTS TO STOP THE ACETIC FERMENTATION OF WINE, AND TO RENDER WHITE WINES TRANSPARENT.

IN ALL VINOUS FERMENTATIONS, A DECOMPOSITION OF THE SACCHARINE MATTER TAKES PLACE, AND CARBONIC ACID IS PRODUCED.

[FES.]

The Scientific and Literary Treasury ;

[FEU]

FERULA, in botany, a genus of plants, class 5 *Pentandria*, order 2 *Digynia*. The species are perennials, and consist of the different kinds of fennel.

FERULACEOUS, in botany, an epithet pertaining to reeds or canes; or to plants resembling the ferula.

FERULÆ, in surgery, splinters or chips of different matter, as of wood, bark, leather, paper, &c. applied to bones that have been disjunct, when they are set again.

FERRY, the place or passage where boats pass over water to convey passengers.

FESCENINE VERSES, in ancient Rome, were a sort of extemporary dialogue, in which the performers with a gross and rustic kind of raillery reproached each other, as well as their audience, with their vices and foibles. They received their name from Fescennia, a town in Tuscany, where this species of rude poetry was first used. Under cover of this practice much indecency prevailed; and the emperor Augustus therefore prohibited it, as tending to corrupt the public morals.

FESSE, in heraldry, one of the nine honourable ordinaries, consisting of a line or belt drawn directly across the shield, from side to side, and containing the third part of it. When figures are contained within the breadth of the fesse, it is said to be charged, or they are said to be *en fesse*.—*Fesse point*, the exact centre of the escutcheon.—*Fesse waye*, or *in fesse*, denotes any thing borne in the way of a fesse: that is, in a rank across the middle of the shield.—*Parte per fesse*, a parting across the middle of the shield, from side to side, through the fesse point.

FESTINO, in logic, a mood of syllogisms in the second figure, in which the first proposition is a universal negative, the second a particular affirmative, and the third a particular negative.

FESTIVALS. [For the religious feasts of the Christians, and the feasts of the ancients, see *FESTAS*.] To which may be added,—that although it is impossible not to recognize in these festivals a Jewish, and, in part, also a pagan origin, it was, nevertheless, subsequently ordained by special ecclesiastical regulations, that they should not be celebrated in common with Jews, heathens, or heretics. In fact, to prevent these festivals from degenerating, and to preserve the distinction between them and the heathen customs, the Christian church implored the exercise of the civil powers for the preservation of the purity of the holidays and customs, and for the prohibition of all public amusements by which the sanctity of divine worship might be impaired. In this manner the Christian festivals united the serious and moral character of the Jewish with a certain freedom and cheerfulness, which they acquired from a system of paganism.

FESTOON, in architecture and sculpture, &c. an ornament representing flowers, fruits, and leaves, intermixed or twisted together; suspended at the ends, and falling down in the form of an arch.

FESTUCA, in botany, a genus of plants, class 3 *Triandria*, order 2 *Digynia*. The species are perennials, and consist of the different kinds of fescue-grass.

FETICHISM, or **FETICISM**, the worship of idols among the negroes of Africa, among whom *fetich* is the name by which an idol is designated. They believe that the household or family *fetich* narrowly inspects the conduct of every individual in the house, and rewards or punishes each according to his deserts.

FETLOCK, a tuft of hair that grows behind the pastern joint in the feet of many horses.

FEUD, an inveterate quarrel between families or parties in a state. The word is not applicable to wars between different nations, but to intestine wars and animosities between families, clans, or tribes.

FEUDAL SYSTEM, a form of government anciently subsisting in Europe, and which, about twelve centuries ago, was so universally received, that Spelman calls it "the law of nations in our western world."

It still forms the basis of modern customs, and therefore every Briton, who would understand the history of his country, the origin of its political constitution, the tenure of its landed property, and the general basis of its polity, should make himself acquainted with it. With respect to the origin of this system, we are told that it is to be found in the military policy of the Celtic or northern nations, known by the names of Goths, Vandals, Franks, Huns, and Lombards, who overran Europe on the declension of the Roman Empire, and brought it with them from the countries out of which they emigrated. According to the feudal scheme, a victorious leader allotted considerable portions of land, called *feoda*, *fiefs*, or *feuds*, to his principal officers, who in their turn, divided their possessions among their inferiors; and the condition upon which these rewards were given, was that of faithful military service both at home and abroad. To this they engaged themselves by an oath of fealty; in the event of a breach of which, either by not performing the service agreed upon, or by deserting their lord in time of battle, &c., the lands were to return to their original possessor. Every person, therefore, who was a feudatory, i. e. who had received lands, was bound to do every thing in his power to defend the lord of his fee; while, on the other hand, the latter was no less subordinate to his immediate superior; and so on up to the prince himself. Thus the several orders of vassals formed a system of concentric circles, of which each was under the influence of the next, and all moved around a common centre, the king, as the supreme feudal lord. As there was a graduated scale from the lowest vassal to the prince or lord paramount of the territory, every man's interest was involved in the security of the whole; and every man was a pledge of security to his neighbour. In the midst of that disinterestedness of sentiment which belongs to a rude state of

THERE ARE THIRTY-FOUR RELIGIONS AND FOUR CIVIL FESTIVALS OBSERVED BY THE ESTABLISHED CHURCH OF ENGLAND.

IN THE GERMAN EMPIRE, IF ANY ONE WAS SENTENCE A LORD FOR A VASSAL, NO ONE TOOK CARE FOR HIS SAFETY.

society, the connection of the lord and his vassal was of the most admirable nature; and, as in the end of all social combinations, each individual contributed to support that strength by which he was protected. But besides these feudal grants, which were held only on the terms of military service above mentioned, there were others called *allodial*, which were given upon more enlarged principles. To these every free man had a title, and could not only claim his territory as well as the rest, but dispose of it at his pleasure. A part of their freedom consisted in liberty to go to the wars; for this, in the times to which we are referring, was the only way to acquire any degree of renown. Only the serfs or villeins, were destined to follow the arts of peace. The feudal vassals, properly so called, constituted the army; while the national militia was composed of the allodial proprietors. It has, however, often been argued, that the bare theory of feudal government, as a permanent institution, however fair-seeming, is hollow; that the family connexion it supposes could be but a source of minute, domestic tyranny; and that in their best period, the customs enumerated must have been liable to the grossest abuse. In process of time, the evil increased to an enormous height; and even the political value of the system decayed. In its vigour, it had at least constituted a regular, powerful, and compact system of government; a unanimity had pervaded the various departments of the state; and while the power was internally diffused, it presented to foreign nations a united and formidable front. As the ideas engendered by property advanced, and the great grew more avaricious of money than of glory; and when, it ought perhaps to be added, man's notions of right and order became more correct, nothing was heard of but the enormities of the powerful, and the sufferings of the humbler classes; and the strength of feudal governments declined amidst a spirit of disaffection too universal to be checked.—Mr. Hallam, in his work on the Middle Ages, ably exhibits a picture of the advantages and disadvantages of the feudal system: a portion of which we will here abridge. If, says he, we look at the feudal polity as a scheme of civil freedom, it bears a noble countenance. To the feudal law it is owing, that the very names of right and privilege were not swept away, as in Asia, by the desolating hand of power. The tyranny which, on every favourable moment, was breaking through all barriers, would have rioted without control, if, when the people were poor and disunited, the nobility had not been brave and free. So far as the sphere of feudality extended, it diffused the spirit of liberty, and the notions of private right. The bulk of the people, it is true, were degraded by servitude; but this had no connexion with the feudal tenures. As a school of moral discipline, the feudal institutions were perhaps most to be valued. Society had sunk, for several centuries

after the dissolution of the Roman empire, into a condition of utter depravity; where, if any vices could be selected as more eminently characteristic than others, they were falsehood, treachery, and ingratitude. In slowly purging off the lees of this extreme corruption, the feudal spirit exerted its ameliorating influence. Violation of faith stood first in the catalogue of crimes, most repugnant to the very essence of a feudal tenure, most severely and promptly avenged, most branded by general infamy. The feudal law-books breathe throughout a spirit of mutual obligation. The feudal course of jurisdiction promoted, what trial by peers is peculiarly calculated to promote, a keener feeling and readier perception of moral as well as of legal distinctions. And as the judgment and sympathy of mankind are seldom mistaken in these great points of veracity and justice, except through the temporary success of crimes, or the want of a definite standard of right, they gradually recovered themselves, when law precluded the one and supplied the other. In the reciprocal services of lord and vassal, there was ample scope for every magnanimous and disinterested energy. The heart of man, when placed in circumstances which have a tendency to excite them, will seldom be deficient in such sentiments. No occasions could be more favourable, than the protection of a faithful supporter, or the defence of a beneficent suzerain, against such powerful aggression, as left little prospect except of sharing in his ruin. From these feelings, engendered from the feudal relation, has sprung up the peculiar sentiment of personal reverence and attachment towards a sovereign, which we denominate loyalty; alike distinguishable from the stupid devotion of eastern slaves, and from the abstract respect with which free citizens regard their chief magistrate. Men who had been used to swear fealty, to profess subjection, to follow, at home and in the field, a feudal superior and his family, easily transferred the same allegiance to the monarch. It was a very powerful feeling which could make the bravest men put up with slights and ill-treatment at the hands of their sovereign; or call forth all the energies of disinterested exertion for one whom they never saw, or in whose character there was nothing to esteem. In ages when the rights of the community were unfelt, this sentiment was one great preservative of society; and though collateral or even subservient to more enlarged principles, it is still indispensable to the tranquillity and permanence of every monarchy. In a moral view, loyalty has scarcely perhaps less tendency to refine and elevate the heart than patriotism itself; and holds a middle place in the scale of human motives, as they ascend from the grosser inducements of self-interest, to the furtherance of general happiness, and conformity to the purposes of Infinite Wisdom.

FEVER, in medicine, a disease characterized by an increase of heat, an accel-

TO HOLD THE FEUDAL LORD'S STIRROP, OR WALK BEFORE HIM ON CERTAIN OCCASIONS, WAS SOMETIMES A SUFFICIENT SERVICE.

[FIR]

The Scientific and Literary Treasury ;

[FIG]

rated pulse, great thirst, and an impaired state of several functions. The varieties are numerous; but the grand division is into *remitting* fevers, which subside or abate at intervals; *intermitting* fevers, which intermit or entirely cease at intervals; and *continued* fevers, which neither remit nor intermit.

FEUIL'LAN'S, an order of bare-footed monks, who observe the same rules with the Benardines.

FIAT, in law, a short order or warrant signed by a judge, for making out and allowing certain processes.—*Fiat justitia* are the words written by the king on his warrant to bring a writ of error in parliament, &c.

FIBRINE, in chemistry, a peculiar organic compound, found both in animals and vegetables. It is a soft solid, of a greasy appearance, insoluble in water, which softens in the air, becoming viscid, brown, and semi-transparent. It exists in chyle; it enters into the composition of blood; and it forms the chief part of muscular flesh. As the basis of flesh it is a very nutritious substance, and is essential to the sustenance of carnivorous animals.

FIBRE, in anatomy, a simple filament, serving to form other parts. Some are hard and elastic; others are soft and flexible; some are so small as scarcely to be visible; while others are larger and appear to be composed of still smaller fibres. They constitute the substance of the bones, cartilages, muscles, nerves, veins, &c.—*Fibre* is also used to denote the slender filaments which compose other bodies, whether animal, vegetable, or mineral; but more especially, the capillary roots of plants.

FIBROLITE, a mineral that occurs with corundum, of a white or gray colour, composed of minute fibres.

FIBRIL'LA, in botany, the branch or division of a radical fibre.—In anatomy, *fibrilla* are small fibres.

FIB'ULA, in anatomy, the outer and smaller bone of the leg. It is nearly of a triangular figure, and stands parallel to, but distant from the *tibia*.

FICTION, in law, a supposition that a thing is true without enquiring whether it is or not, so that it may have the effect of truth, as far as is consistent with equity.

FIEF, a fee; an estate held of a superior or condition of military service. [See *Fief* and *System*.]

FIELD, in heraldry, the whole surface of the shield or escutcheon.—*Field*, in military tactics, the ground chosen for any battle.—*Field*, in painting, the ground or blank space on which anything may be drawn.

FIELD-MAR'SHAL, the highest military officer in England.—*Field-officer*, a military officer above the rank of a captain, as a major or colonel.—*Field-colours*, in war, are small flags of about a foot and a half square, which are carried along with the quarter-master general, for marking out the ground for the squadrons and battalions.—*Field pieces*, small cannons, from

three to twelve pounds, carried along with an army in the field.—*Field-staff*, a weapon carried by the gunners, about the length of a halbert, with a spear at the end; having on each side ears screwed on, like the cock of a match-lock, where the gunners screw in lighted matches, when they are upon command.—*Field-works*, in fortification, are those thrown up by an army in besieging a fortress, or by the besieged to defend the place.

FIELD-DUCK, a species of bustard, nearly as large as a pheasant.

FIELDFARE, a migratory bird, of the genus *Turdus* or thrush. They pass the summer in the northern parts of Europe, but visit Great Britain in winter.

FIGUS, in botany, a genus of plants, class 23 *Polygamia*, order 3 *Tricoeca*. The species are shrubs or trees, the *Ficus carica*, *Caprificus*, *Ficus Indica*, &c.

FIERI FAC'IAS, in law, a judicial writ commanding the sheriff to levy the debt or damages on the goods of one against whom judgment has been had in an action of debt.

FIFTEENTH, an ancient tribute or tax laid upon cities, boroughs, &c. through all England, and so termed because it amounted to a fifteenth part of what each city or town had been valued at; or it was a fifteenth of every man's personal estate according to a reasonable valuation. In doomsday-book, there are certain rates mentioned for levying this tribute yearly.

FIG, the fruit of the fig-tree (*Ficus carica*). Figs are produced abundantly in Turkey, Greece, Italy, Spain, France, and northern Africa. They are of an oblong shape, and of a dark purple or brownish colour, with a pulp of a sweet taste. When ripe, they are generally dried in ovens to preserve them, and then packed very closely in the small chests and baskets in which we import them. Dried figs, with barley bread, are now the ordinary food of the lower classes in Greece and the Archipelago.

FIGURAL, or **FIGURATE NUMBERS**, are such as do or may represent some geometrical figure in relation to which they are always considered, as *triangular numbers*, *pentagonal numbers*, *pyramidal numbers*, &c.

FIGURATIVE, a term applied to whatever is expressed by obscure resemblances; as the types and mysteries of the Mosaic law; and also to any expression which is not taken in its primary and literal sense.

FIGURE, in physics, denotes the surface or terminating extremities of any body; and, considered as a property of body affecting our senses, is defined, a quality which may be perceived by two of the outward senses—touch and sight.—*Figure*, in geometry, the superficies included between one or more lines; and is denominated either *rectilinear*, *curvilinear*, or *mixed*, according as the extremities are bounded by right lines, curve lines, or both. In the higher geometry, the term is applied to three mechanical curves, called the *figure of the secants*, *figure of the sines*,

A DELAYED STATE OF THE STOMACH AND PRIMA VIE IS GENERALLY THE PROXIMATE CAUSE OF AN INTERMITTENT FEVER.

THE YELLOW FEVER PREVAILS IN THE WEST INDIES, SOUTH AMERICA, PARTS OF NORTH AMERICA, AND IN SOME PARTS OF ASIA.

[FIL]

A New Dictionary of the Belles Lettres.

[FIL]

and figure of the *tangents*.—*Figure*, in fortification, is the plan of any fortified place, or the interior polygon, which, when the sides and angles are equal, is called a *regular*, and when unequal, an *irregular* figure.—*Figure*, in astrology, signifies a description of the disposition of the heavens at a certain hour, in which the places of the planets and stars are marked in a *figure* of twelve triangles, called houses.

—*Figure*, in dancing, denotes the several steps which the dancer makes in order and cadence, considered as they mark certain *figures* on the floor.—*Figure*, in rhetoric, a mode of speaking or writing in which words are deflected from their ordinary signification, thereby expressing a passion with more emphasis and beauty than by the ordinary way. Rhetorical figures are often highly serviceable as well as ornamental, and serve to awaken and fix attention; but they are to be used with prudence and caution; for whatever is described in a multitude of words, or is carried on to a disproportionate length, fails of the end proposed, and grows tiresome rather than pleasing. The principal figures of rhetoric are the metaphor, allegory, simile, and personification; which, with their further divisions into hyperbole, climax, antithesis, &c., will be found under their respective heads.—*Figure*, in painting and designing, denotes the lines and colours which form the representation of any animal, but more particularly, of a human personage. Thus a painting is said to be full of figures, when there are many representations of men; and a landscape is said to be without figures, when there is nothing but natural scenery.—*Figures*, in arithmetic, are certain characters whereby we denote any number which may be expressed by any combination of the nine digits, &c.

FIL'ACER, an officer of the common-pleas, so called from his filing the writs on which he makes out processes. There are fourteen of these officers, who are severally allotted to particular divisions and counties, and make out all original processes, real, personal and mixed.

FIL'AMENT, in botany, the thread-like part of the stamen, which supports the anther.

FIL'ARIA, in entomology, a genus of the class *Vermes*, and order *Intestina*: the most destructive is the *Filaria-medinensis*, or Guinea-worm; which inhabits both India, and is frequent in the morning-dew, whence it enters the naked feet of the slaves, and creates the most troublesome itching, accompanied with inflammation and fever. It is frequently from eight to ten feet in length, and not larger than a horse-hair.

FIL'LE, in mechanics, an instrument used in smoothing and polishing metals, formed of iron or steel, and cut in little furrows. Files are called by different names, according to their various degrees of fineness; and are also distinguished from their shape, as flat, half-round, three-square, four-square and round.

FIL'ICES, in botany, an order of plants

of the class *Cryptogamia* in the Linnæan system, including the fern, horse-tail, adder's tongue, maiden-hair, spleenwort, &c.

FILIFORM, in botany, having the form of a thread or filament; as a filiform style or peduncle.

FILLAGREE-WORK, or *FILIGHANE*, a delicate and elaborate manufacture, primarily executed in threads of gold and silver, but lately imitated with coloured and gilt paper. In Sumatra, manufactures of filagree-work are carried to very great perfection. In China also, where the filagree is mostly of silver, many beautiful articles are produced.

FIL'LET, in architecture, a little square member, ornament, or moulding, used in various places, but generally as a corona over a great moulding.—Among painters and gilders, a little rule or line of leaf-gold, drawn over certain mouldings, or on the edges of frames, panels, &c.—In heraldry, a kind of narrow bordure, which runs quite round near the edge.

FIL'LIBEG, a dress reaching only to the knees, worn in the highlands of Scotland.

FIL'LY, a term among horse-dealers, to denote the female or mare colt.

FILM, a thin skin or pellicle, as on the eye. In plants, it denotes that thin woody skin which separates the seeds in pods.

FILTRATION, the process by which a liquid is freed from solid bodies mixed with it, or from any impurities which it holds in solution, by passing it through a linen or woollen bag, or filtering paper. Various other contrivances have also been invented for purifying muddy, corrupt, and putrid water, and rendering it fit for drinking; such as a porous kind of stone, sand, charcoal, &c.; and many patents have been obtained for filtering machines, some of which are excellent. In the "Proceedings of the British Association," the following *simple water filter* is recommended by Mr. J. T. Hawkins, which as it is effectual, and neither expensive nor troublesome, is worth knowing. The material is charcoal, which must be perfectly well burnt, and kept from exposure to the atmosphere; a test of good charcoal is that, when pulverized, it sinks rapidly in water. The charcoal must be supported on an indestructible material, as a plate of burnt clay, perforated with holes. The filter may consist of a common garden-pot, or similar vessel, with holes at the bottom. The lower part may be filled with round pebbles, then some smaller pebbles, then some coarse sand, and, finally, a stratum of pounded charcoal, of about three or four inches in thickness. It is a great mistake to put any material as sand, above the charcoal, with the view of arresting the grosser particles of impurity, as the sand will quickly stop up and be unpervious to water. A filter prepared as above directed, will render water perfectly clean and sweet for many years.—In the filtering establishments at Paris, there are a great number of small boxes, lined with lead, which are open at top, and contain at bottom a bed of charcoal between two layers of sand.

IT IS OFTEN DESIRABLE SO TO CONSTRUCT THE FILTERING APPARATUS, AS THAT THE LIQUID SHOULD ASCEND BY HYDROSTATIC PRESSURE.

THE ITALIANS, WHO FIRST INTRODUCED FILLAGREE-WORK, PLACED SMALL BEADS UPON IT, AND GAVE TO IT THE NAME OF "FILIGHANE."

[FIN]

The Scientific and Literary Treasury ;

[FIN]

When the waters of the Seine and Marne arrive at Paris, very highly charged with salt, and undergo depuration in those boxes, it is found necessary to renew the upper strata every day, if not twice a-day. But lately, a most important improvement in filtration has been invented by Mons. de Fonville, which is, to close the little filtering boxes hermetically, and to cause the water to pass through the filtering mass, not by its own weight merely, or by a simple charge but by high pressure. This mode is now practised at the Hotel Dieu, and it is asserted that 24 gallons of clarified water are thus produced in one minute. In cleaning the hermetically closed filters of the Hotel Dieu, the workmen, whose business it is, open suddenly and almost simultaneously, the cocks of the tubes which connect the bottom and top of the apparatus with the elevated reservoir, or with the body of the feeding pump. The filter is thus tumultuously agitated by two cross currents, which have the effect of detaching from the filtering gravel, the foreign matters which would otherwise remain adhering to it.

FILTRUM, in mineralogy, a Mexican stone, known also by the name of the filtering stone, of which it has the properties.

FIMBRIÆ, appendages disposed by way of fringe round the border of anything. Hence *fimbriate* is a term used in botany for fringed, or surrounded by bristles; and *fimbriated*, in heraldry, is an epithet for an ordinary with a narrow bordure or hem of another tincture.

FIN, in natural history, a well known part of fishes, consisting of a membrane supported by rays, or little bony or cartilaginous ossicles; their use being to propel them rapidly through the water. Fishes, in general, possess five kinds of fins: 1st, the *dorsal*, or those of the back, varying in number from one to four; 2. the *pectoral*, or breast fins, which are inserted immediately below the gills; 3. the *ventral*, or abdominal fins, which are placed under the throat or belly, and point backwards; 4. the *anal* fins, situated under the tail; and, 5. the *caudal*, or tail fin, serving as the rudder by which the fish steers itself. Articulating with points of the internal skeleton or frame-work, the fins possess great power. The muscles which move them are very strong, and, by a peculiar arrangement, they are enabled to erect the spines immovably at will, which is observed when fishes are taken by the hook. In colour and size, the fins of fish present the greatest variety, affording excellent characters for distinguishing the species.

FINAL CAUSES, the purposes or ultimate ends in view. The *efficient* cause is that which produces the event or effect; the *final* cause is that for which anything is done.

FINALE, the concluding part of a musical composition. In instrumental pieces, it has mostly a character of vivacity, and requires a quick movement and lively performance.

FINANCES, in political economy, denote the revenue of a king or state, or in other words, the money raised by loans, taxes, &c., for the public service. The English system of finance rests on the produce of the various taxes which have been imposed at different periods, the aggregate amount of which, after deducting the expenses of collection, together with a few small articles which cannot properly be called taxes, forms the whole of the public income: this income is annually appropriated to the several branches of the national expenditure, and when, in consequence of any extraordinary expenses, it is known that the income of the current year will be insufficient to meet all the demands upon it, it is usual to borrow the sum necessary to make up the deficiency, either from individuals or public bodies, and to allow a fixed rate of interest on the money thus obtained, till the principal shall be repaid, or till the period originally agreed upon shall have expired.—A person employed in the economical management and application of the public money is called a *financier*.

FINCH, in ornithology, a numerous class of birds, forming the genus *Fringilla* of Linnaeus; of which the most celebrated are the goldfinch, canary, and linnet.

FINE, in law, a penalty or amends made in money for an offence; also money paid for the renewal of a lease, and a conveyance of lands or tenements in order to cut off all controversies.

FINE ARTS, a term somewhat indefinite in its meaning, but generally applied to those arts which depend on the mind and imagination; opposed to the mechanical.

FINERY, the furnace in which metals are refined, that is, hammered and fashioned into what is called a blossom, or square bar.

FINGERS, in anatomy, the extreme part of the hand divided into five members, usually called the four fingers and the thumb. The names of the fingers, reckoning from the thumb, are,—1, *pollex*; 2, *index*; 3, *medius*; 4, *annularis*; 5, *auricularis*. In each of these there are three bones, which make three phalanges, the upper of which are much larger than the lower. Their exterior surface is convex, and their interior plane, but somewhat hollowed, for the convenience of grasping.

FINGERING, in music, the act of disposing of the fingers in a convenient, natural, and apt manner, in the performance of any instrument, but more especially the organ and piano-forte. Good fingering is one of the first things to which a judicious master attends, for to a facility in this branch of the performer's art must a pupil look, as the means of acquiring a facile and graceful execution, and the power of giving passages with articulation, accent, and expression.

FINITE, in mathematics, an epithet for a series, line, &c., which is bounded or limited, in extent, duration, &c., in distinction from *infinite*.

SEVERAL WOUNDS ARE SOMETIMES INFLECTED ON FISHERMEN BY THE SPIRY PROCESSES OF THE FINS OF CERTAIN FISH.

THE CANARY BIRD IS THE MOST REMARKABLE AND MELODIOUS OF THE FINCH TRIBE, AND THE GOLDFINCH IS THE HANDSOMEST.

[FIR]

A New Dictionary of the Belles Lettres.

[FIR]

FINNO'CHIA, or **SWEET-FENNEL**, in botany, a species of fennel, cultivated in gardens as a salad herb.

FINTO, in music, a feint or an attempt to do something and not to do it; as *cadenza finto*, when having done every thing proper for a true character, instead of falling on the right final, a higher or a lower note is taken.

FIR-TREE, the name of several species of the genus *Pinus*; as the Scotch fir, the silver fir, spruce fir, &c. [See *PINE*.]

FIRE. In former times, fire obtained a place among the elements, and was for a long time considered to be a constituent part in the composition of all bodies, and to require only the concurrence of favourable circumstances to develop its activity. Its all-consuming energy, the samilarity of its effects to those of the sun, its intimate connexion with light, its terrible and yet beneficent power,—easily explain how it happened that, in times when cause and effect, form and essence, were not yet distinctly separated, fire became an object of religious veneration, a distinguished element in mythology, an expressive symbol in poetry, and an important agent in the systems of cosmogony. When natural philosophy was treated in the schools, theories were adopted to which little attention is paid in the present age, when all science is founded on facts and observations. Caloric, he it a material agent or the consequence of vibratory motion, is at present considered the cause of the phenomena which were formerly ascribed to fire; and though its nature is as unknown to us as that of fire was to the ancients, the substitution of one of these terms for the other has introduced a greater precision of language, and cause and effect are no longer confounded under the same name.—*Effects and properties of Fire*. From repeated experiments we learn, 1. that, in general, both solids and fluids manifest an expansive motion upon being heated; 2. that the direct inflammable matter of fuel, is oil, or an unctuous substance; 3. that no fuel will burn or consume, without the admission of fresh air; 4. that the air which has once passed through burning fuel is, of itself, unfit to animate fire again; 5. that flame exists only on the surface of fuel. It appears to be a property belonging to fire, that its parts endeavour equally to diffuse themselves; that is, by moving every way, and consequently tend neither more nor less to one point than another. If fire be collected in any body so as to be perceivable by our senses, it removes itself out of the same by its own power, and expands every way from the centre of its space or body. The parts of some bodies are extremely volatile, and will be dissipated by the action of fire; others are to be found whose parts are of such a nature, as not to yield to the force of fire, or the velocity communicated to them will not be able to dissolve the corpuscular attraction; but when this glowing velocity of the parts is abated, or, in other words,

when the fire in the body is extinct, the parts, and, of course, the whole body, appear unaltered: of which we have striking instances in the asbestos and amiantum.

—Speaking of the mechanical origin of heat and cold, Mr. Boyle says, "In the production of heat, there appears nothing on the part either of the agent or patient, but motion and its natural effects. When a smith briskly hammers a small piece of iron, the metal thereby becomes exceedingly hot; yet there is nothing to make it so, except the forcible motion of the hammer impressing a vehement and variously determined agitation of the small parts of the iron, which, being a cold body before, grows, by that super-induced commotion of its small parts, hot: first, in a more loose acceptation of the word, with regard to some other bodies, compared with which it was cold before; then, sensibly hot; because this agitation surpasses that of the points of our fingers; that in this instance oftentimes the hammer and anvil continue cold, after the operation; which shews that the heat acquired by the iron was not communicated by either of those implements, as heat; but produced in it by a motion, great enough strongly to agitate the parts of so small a body as the piece of iron, without being able to have the like effect upon so much greater masses of metal as the hammer and the anvil. Though if the percussions were often and briskly renewed, and the hammer were small, this also might be heated; whence it is not necessary, that a body itself be hot to give heat." Fire is contained in the largest quantity in air: and the pure part of it, that is, *oxygen*, being disposed to unite with many other matters, most of the ordinary processes of combustion and inflammation are the result of the sudden union of oxygen with some other substance, in which case the fire that was contained in the oxygen of the air is disengaged and let loose. [See *COMBUSTION*.]—*Subterranean fires*. The warm springs, the existence of extinct volcanoes, the effects of those still in activity, and the fact that the temperature of the earth becomes warmer the deeper we descend, have induced many philosophers to adopt the idea of subterranean fires, or of a central fire. According to the former hypothesis, there are combustible materials, in a state of ignition, in the bowels of the earth, which produce the heat indispensable for the production of the above-mentioned phenomena. The latter hypothesis supposes that the globe was once in a state of igneous fusion, that the surface has gradually become solid by cooling, and that the interior of the earth is still liquid and hot, and may remain so for ever, if the heat received from the sun is equal to that which it lost by radiation. [See *EARTH, VOLCANO, &c.*]

FIRE-ARMS, a general designation for all sorts of guns, fowling-pieces, blunderbusses, pistols, &c., which effect their discharge by the combustion of gunpowder.

A FIRE BURNS BRIEFLY IN COLD WEATHER, BECAUSE, AS THE AIR IS DENSE, IT AFFORDS MORE NOURISHMENT TO THE FIRE.

WHEN A FIRE IS EXTINGUISHED BY THE RAY OF THE SUN, IT IS BECAUSE THEY ENGAGE THE OXYGEN WHICH BEFORE FED IT.

The manufacture of these weapons in England is very extensive; and in order to prevent the numerous accidents which would otherwise occur from the bursting of ill-constructed barrels, the act 55 Geo. III. c. 59. imposes a fine of 20*l*. on any person using, in any of the progressive stages of its manufacture, any barrel not duly proved; on any person delivering the same, except through a proof-house; and on any person receiving, for the purpose of making guns, &c., any barrels which have not passed through a proof-house.

FIRE-BALLS, in military operations, balls which are capable of being ignited and burned: such, for instance, as are thrown by night from mortars or howitzers towards quarters which it is desirable to examine.—In natural philosophy, globular masses of fire, of different magnitudes, occasionally seen moving through the atmosphere with greater or less velocity. With regard to the nature of these phenomena there are various conjectures. [See FALLING STARS, METEORS, &c.]

FIRE-DAMP. [See DAMPS.]

FIRE-DRESS, an invention of the chevalier Aldini, consisting of an exterior light armour of metallic gauze, (which fabric was discovered by Sir Humphry Davy to be impervious to flame), and of an inner covering of a material which is a slow conductor of heat. Among flexible fibrous substances capable of being spun and woven into tissues, the asbestos possesses pre-eminently the property of slowly conducting heat: but woollen, cotton, &c., by immersion in certain saline solutions, may serve to prevent the transmission of injurious heat to the body, during a temporary exposure of some minutes to the action of flame on the outward covering of wire gauze.

FIRE-ENGINE, an engine for extinguishing fire, which consists of two forcing pumps so combined that their joint action produces a constant and powerful stream of water, which, by means of a pipe, may be directed at pleasure to any point. The handles are so disposed, that, while the piston of one pump is up, that of the other is down; and they are elongated for the purpose of enabling a great number of men to work them at the same time.—By an ingenious application of steam power to the working of fire-engines, Mr. Brnithwaite has added greatly to their usefulness. As soon as an alarm is given, the fire is kindled, and the bellows attached to the engine are worked by hand. By the time the horses are harnessed in, the fuel is thoroughly ignited, and the bellows are then worked by the motion of the wheels of the engine; so that generally by the time it reaches the fire the steam is ready. This engine will deliver about 9000 gallons an hour to a height of 90 feet, through an adjutage of 7-8ths of an inch; and the expense of fuel is stated to be only sixpence an hour.

FIRE-FLY, a small kind of beetle, common in America, which emits a beautiful phosphoric light from the under surface of

the terminal segments of the abdomen. The phosphoric light produced by these insects is of a greenish yellow, and proceeds from a collection of yellowish matter under the tail, which is kindled or extinguished at pleasure, and which nature seems to have provided, as in the case of the glow-worm, in order to direct the sexes to each other.

FIRE-SHIP, a vessel filled with combustibles, and fitted with grappling-irons, which, with the advantage of a favourable wind, hook on to the enemy's vessels, and set them on fire.

FIRE-WORKS, compositions of sulphur, saltpetre, charcoal, and other ingredients; formed in a variety of ways, and which exhibit a handsome appearance when exploded. [See PYROTECHNY.]

FIRE (GREEK), a destructive composition, used in war from the 7th to the 13th century. When the Arabs besieged Constantinople in 668, the Greek architect Calliculus of Heliopolis, deserted from the caliph to the Greeks, and took with him a composition, which, by its wonderful effects, struck terror into the enemy, and forced them to take to flight. Sometimes it was wrapped in flax attached to arrows and javelins, and so thrown into the fortifications and other buildings of the enemy, to set them on fire. At other times it was used in throwing stone balls from iron or metallic tubes against the enemy. The receipt for the composition of the *Greek fire* was long supposed to be lost; but the baron Von Aretin of Munich has, it is said, discovered in a Latin MS. of the 13th century, in the central library in that city, a dissertation on the Greek fire, which contains the receipt.

FIRE-BOTE, in our old customs, is fuel or string for necessary use, allowed to tenants, out of the lands granted to them.

FIRMAMENT, in Scripture, denotes the great arch or expanse over our heads, in which are placed the atmosphere and the clouds, and in which the stars appear to be placed, and are really seen.—In the Ptolemaic astronomy, the firmament is the eighth heaven or sphere, with respect to the seven spheres of the planets which it surrounds. It is supposed to have two motions; a diurnal motion, given to it by the *primum mobile*, from east to west about the poles of the ecliptic; and another opposite motion from west to east, which last it finishes, according to Tycho, in 25,412 years, according to Ptolemy, in 36,000; and according to Copernicus, in 25,900; in which time the fixed stars return to the same points in which they were at the beginning. This period is commonly called the Platonic, or great year.

FIRING-IRON, in farriery, an instrument not unlike the blade of a knife; which, being made red-hot, is applied to a horse's hams, or other places, such as preternatural swellings, scaly knots, &c. in order to discuss them.

FIR'KIN, an English measure of capacity, containing nine gallons of beer.

THE INTERIOR OF A GUN-BARREL IS THE BORE; ITS DIAMETER, THE CALIBRE; THE FRONT END, THE MUSELE; AND THE BACK END, THE BRECH.

THE PRIME MATERIALS IN FIREWORKS ARE NITRE, SULPHUR, AND CHARCOAL, WITH THE FILINGS OF IRON, STEEL, COPPER, AND ZINC.

[FIS]

FIR'MAN, a passport or licence granted in Turkey and India for the liberty of trade.

FIRST FRUITS, offerings made to God by the Hebrews, of part of the fruit of their harvest, as an acknowledgment of his sovereign dominion. They were called first-fruits because they were offered in the temple before any part of the crop was touched.

—*First-fruits*, in the church of England, are the profits of every spiritual benefice for the first year, according to the valuation in the king's books.

FISC, or **FISCUS**, the treasury of a prince, or state. It differs from the *erarium*, which was the treasury of the public, or people: thus, when the money arising from the sale of condemned persons' goods was appropriated for the use of the public, their goods were said to be *publicari*; but when it was destined for the support of the prince, they were called *confiscari*.

FISCAL, in the civil law, something relating to the pecuniary interest of the prince or people. The officers appointed for the management of the *fisc*, were called *procuratores fisci*, and *advocati fisci*.

FISH. We refer the reader to the word **ICHTHYOLOGY** for a scientific view of the different orders and varieties of fish,—a class of animals which inhabit the seas, rivers, lakes, &c., and which are so constituted that they cannot exist for any considerable time out of water. We shall here merely give a few instances of the increase of some of them, whose extraordinary fecundity has excited attention, and regarding which the following facts have been verified:—A cod-fish has been found to produce 3,686,760 eggs or spawn; and a ling, 19,248,625. Herrings, weighing from four ounces to five and three-quarters, from 21,285 to 36,960. Mackerel, 20 ounces, 464,061. Soals, of five ounces, 38,772; one of fourteen ounces and a half, 100,362. A flounder of two ounces, 133,407; one of twenty-four ounces, 1,357,403. Lobsters, from 14 to 36 ounces, contain 21,699; a prawn, about 3,800; and a shrimp, from 2,800 to 6,800. And yet, to use the words of a recent writer, "to enumerate the thousands, and even millions of eggs, which are impregnated in the herring, the cod, the ling, and indeed in almost the whole of the esculent fish, would give but an inadequate idea of the prodigious multitudes in which they flock to our shores; the shoals themselves must be seen in order to convey to the mind any just notion of their aggregate mass."—The word *fish* is used in the singular, for fishes in general, or the whole race.—*Fishes*, in heraldry, are the emblems of silence and watchfulness, and are borne either upright, imbowed, extended, endorsed, &c.

FISHERIES, places where fish are caught in great abundance, so as to constitute an important article in commerce. The principal fisheries for salmon, herrings, mackerel, pilchards, &c. are along the coasts of England, Scotland, and Ireland; for cod, on the banks of Newfoundland, Nova Scotia,

and Labrador; as also on the coasts of Holland; and for whales, in those seas which wash the shores of Greenland, and also in various parts within the tropics.

The number of vessels engaged in the North American cod fishery, British, American, French, Dutch, and Spanish, is calculated to amount to 6000 or 7000, which take about 40,000,000 fish annually. On taking them, they merely cut off the head, open them, sprinkle them with salt and throw them in the hold; and as they make two or three fares in a season, the fish are taken home to be cured. Those vessels which are intended for the Labrador, or Coast fishery, arrive there in June, and select a place for fishing somewhere on the coast of the bay of Chaleurs, the gulf of St. Lawrence, straits of Belleisle, or the entrance to Hudson's Bay. Here they spend the summer, as they cure the fish on the coasts, drying them either on the rocks, or on flakes erected for the purpose. On arriving, they anchor, dismantle their vessels, and convert them into stationary houses. The cod are usually taken by line, nets being but rarely employed; and as they bite with great voracity, almost anything serves for bait.—*Mackerel* are found in large shoals in the ocean, but especially on the French and English coasts. They enter the English channel in April; and, proceeding as the summer advances, about June they are on the coasts of Cornwall, Sussex, Normandy, Picardy, &c. where the fishery is most considerable. They are taken either with a line or nets: the latter is preferable; and is usually performed in the night-time. They are eaten fresh, and are also pickled in salt or brine.—*Herrings* are remarkable for their immense numbers; they move in shoals, sometimes occupying many miles in extent, and several fathoms in depth. The presence of the herring is easily discovered, by the great flights of birds which accompany them during the day, by the unctuous matter with which the water is covered, and in the night, by the brilliant phosphoric light which they emit. They are taken generally by night in nets, which are sometimes of enormous extent, and are dragged by a capstan. Herrings are very plentiful about the Orcaades in June and July; in the German ocean in September and October; and in the English channel in October, November, and December.—The chief *Salmon* fisheries are in England, Scotland, and Ireland, in the rivers, and sea-coasts adjoining to the river mouths. Those most distinguished for salmon in Scotland, are the river Tweed, the Clyde, the Tay, the Dee, the Don, the Spey, the Ness, the Bewley, &c., in most of which it is very common about the height of summer, especially if the weather happen to be very hot, to catch four or five score of salmon at a draught. The chief rivers in England for salmon are the Tyne, the Trent, the Severn, and the Thames. The fishing usually begins about January, and in Scotland they are obliged to cease about the 15th of August, because, as it is then supposed, the fish come up to spawn, it

FISHES PERISH IN WATER THAT HAS BEEN BOILED, IN CONSEQUENCE OF THE WATER BEING THEN DEPRIVED OF ATMOSPHERIC AIR.

[FIS]

THE PRACTICE OF BRINGING FISH TO THE LONDON MARKETS BY LAND-CARRIAGE FIRST TOOK PLACE IN THE YEAR 1781.

would be depopulating the rivers to continue fishing any longer. It is performed with nets, and sometimes with a kind of locks or weirs made on purpose, which in certain places have iron or wooden gratings so disposed, in an angle, that being impelled by any force in a contrary direction to the course of the river, they may give way and open a little at the point of contact, and immediately shut again, when the force is removed. On coming up the rivers, the fish enter by these valves, which then close, and prevent their return. They are also taken by being attracted to the surface of the water by a light, when they may either be speared, or taken in a net spread for the purpose, and lifted with a sudden jerk from the bottom. — *Anchovies* are fished for on the coast of Provence, in the months of May, June, and July, at which season shoals of this fish regularly come into the Mediterranean through the straits of Gibraltar. They are likewise found in plenty in the river of Genoa, on the coast of Sicily, and on that of the island of Gorgona, opposite to Leghorn, these last are reckoned the best. *Anchovies* are seldom fished for but in the night time, for if a fire be kindled on the poops of the vessels, the anchovies will come in greater numbers into the nets. About 120,000 lbs are annually consumed in Great Britain. — The principal *Surgeon Fishery* is in the mouth of the Volga, on the Caspian Sea, where the Russians employ a great number of hands, and catch them in a kind of inclosure formed by large stakes, representing the letter Z, repeated several times. These fisheries are open on the side next the sea, and close on the other side, by which means the fish are embarrassed, and easily taken, either in nets or by spearing. At certain seasons, thousands of *Cossacks* appear on the ice in sledges, each provided with a spear, several poles, and other instruments. As soon as the herman of the fishers sets forward, they all dash after him in their sledges, the ice is cut, the spears cast, fishmongers, assembled from all parts of the empire, buy the fish, and the ice is soon covered with surmings. It soon finds its way to St Petersburg, &c. and the value of the fish, including that of the caviar and isinglass, imported into the interior, annually amounts, it is said, to at least 2,000,000 rubles. — The *Northern Whale Fishery*, on the coast of Greenland, begins in May, and continues till the end of July. The manner of taking whales is as follows. As soon as the fishermen hear the whale bellow, they cry out *fall! fall!* and every ship gets out its long boat, in each of which there are six or seven men, they row till they come pretty near the whale, when the harpooner strikes it with the harpoon. This requires great dexterity, for through the bone of his head there is no striking, but near his spout there is a soft piece of flesh, into which the iron sinks with ease. As soon as he is struck, they take care to give him rope enough, otherwise, when he goes down, as he frequently does, he would inevitably sink

the boat, this rope he draws with such violence, that if it were not well watered, it would, by its friction against the sides of the boat, be soon set on fire. The line fastened to the harpoon is six or seven fathoms long, and is called the forerunner, it is made of the finest and softest hemp, that it may slip the easier to this they join a heap of lines of 90 or 100 fathoms each, and when there are not enough in one long boat, they borrow from another. The man at the helm observes which way the rope goes, and steers the boat accordingly, that it may run exactly out before, for the whale runs away with the line with so much rapidity, that he would overset the boat, if it were not kept straight. After they have taken a sufficient number of whales, or when they grow too scarce to render their stay any longer advantageous, they cut them up, stow away the fat in the hold of the vessel, and leave the carcasses to be devoured by the bears, who are very fond of the flesh. Nothing then remains but to sail homewards, where the fat is melted down into oil. — The *Southern Whale Fishery* consists of three distinct branches, viz. 1st, the spermaceti whale, which is found in all tropical climates, but especially on the coasts of New Zealand and Japan. The ordinary duration of the voyage of a ship from England, employed in this department of the fishery, is about three years. 2d, the common black whale of the southern seas, met with principally on the coast of Brazil. And, 3d, the sea elephant, or southern walrus, met with in the seas near California, and the islands of Desolation, South Georgia, &c. Vast numbers of these animals are annually captured, and they furnish an abundance of oil. — It appears that, while our northern whale fishery has long been declining, the American southern whale fishery has risen into great importance. It is, however, very generally believed, that in the south, as well as in the north, there is a very perceptible decrease in the supply of fish, and that the whale fisheries have consequently passed their zenith. — Besides, the before mentioned fisheries, there are several others both on the coasts of Great Britain and in the North Seas, which although not much the subject of merchandize, employ great numbers both of ships and men, as, the oyster fishing at Colchester, Faversham, the Isle of Wight, in the Swales of the Medway, &c., and the lobster fishing all along the British channel, the Firth of Edinburgh, on the coast of Northumberland, on the coast of Norway, &c. &c.

FISHING, the art of catching fish, whether by means of nets, or of spears, lines, rods, and hooks. By several statutes it is provided, that no person shall fish in any pond or moat, without the owner's consent, on pain of three months imprisonment, nor shall any one take fish in a river without a licence obtained from the owner, upon forfeiture of 10s. to the poor, and triple damages to the party aggrieved.

FISHING-FROG, in ichthyology, the

THE DOGGER-BANK, IN THE NORTH SEA, 190 MILES LONG, IS THE FAVOURITE RESORT OF TURBOT, COD, SOLE, HERRINGS, &c.

[FLA]

A New Dictionary of the Belles Lettres.

[FLA]

Lophius or toad-fish, whose head is larger than its body.

FISSILE, an epithet often used in mineralogy, &c., for that which may be cleft or divided in the direction of the grain, or of natural joints.

FIS'ISHED, in zoology, an epithet for an animal whose toes are separate, or not connected by a membrane.

FIS'SURE, a narrow chasm made by the parting of any substance.—In surgery, a crack or slit in a bone, either transversely or longitudinally.

FISTULA, in surgery, a deep, narrow, and callous ulcer, generally arising from abscesses.—*Fistula-lachrymalis*, a disease which attacks the great caruncle in the inward corner of the eye; a disorder accompanied with a flowing of tears.—*Fistula*, an ancient musical instrument resembling our common flute or flageolet.

FISTULAR, among botanists, an epithet applied to leaves and flowers that are tubular, or resemble a hollow pipe.

FISTULIFORM, in mineralogy, an epithet for such substances as are in round hollow columns.

FIT, a sudden and violent attack of disorder, in which the body is often convulsed, and sometimes senseless; as a *fit* of apoplexy or epilepsy, &c. We also apply the word to the first attack or the return of certain diseases; as, a *fit* of the gout, &c.

FITCH'ET, an animal of the weasel or ferret kind; the polecat.

FIXA'TION, in chemistry, the making any volatile spirituous body endure the fire.

FIXED AIR, the name formerly given by chemists to the air which was extricated from lime, magnesia, and alkalies, now commonly called carbonic acid gas, [which see].

FIXED OILS, in chemistry, such oils as are obtained by simple pressure; in distinction from volatile or essential oils.

FIXED STARS, in astronomy, such stars as always retain the same apparent position and distance with respect to each other; and are thus distinguished from planets and comets, which are revolving bodies.

FLAG, a general name for colours, standards, banners, ensigns, &c.—*To strike or lower the flag*, is to pull it down upon the cap in token of respect or submission.—*To strike the flag* in an engagement, is the sign of surrendering.—*To hang out the white flag*, is to ask quarter; or in some cases, it denotes that the vessel has no hostile intention, but comes to trade, &c. *The red flag* is a sign of defiance and battle.—*To hang the flag half-mast high*, is a token or signal of mourning.

FLAG, in botany, a sort of rush, or aquatic plant with a bladed leaf. There are different kinds, as the common flag, or water iris, that grows in rivers and bears a yellow flower; the corn flag, or gladiolus, a bulbous plant; and the sweet flag, a perennial; which two last are cultivated in gardens.

FLA'GELLANTS, in church history, a fanatical sect in the 13th century, who

maintained that remission of sins was not to be obtained without flagellation. Accordingly, they walked in procession, preceded by priests carrying the cross, and publicly lashed themselves till the blood ran down their naked bodies.

FLAG-OFFICERS, those who command the several squadrons of a fleet; as admirals, vice-admirals, and rear-admirals. [See ADMIRAL.]

FLAG-SHIP, a ship commanded by a flag-officer, who has a right to carry a flag, in distinction from the secondary vessels under his command.

FLAME, the small parts of an inflammable or unctuous body, that are set on fire, or briskly agitated or thrown off, with a certain vibrative motion at the surface of that body into the open air. Simple ignition never exceeds in intensity of light the body by the contact of which it is produced: but flame consists of volatile inflammable matter, in the act of combustion, and combination, with the oxygen of the atmosphere. Many metallic substances are volatilized by heat, and burn with a flame, by contact of the air in this pure state. Dr. Ure observes, that the flame of combustible bodies may, in all cases, be considered as the combustion of an *explosive mixture* of inflammable gas or vapour with air. It cannot be regarded as a mere combustion at the surface of contact of the inflammable matter. This fact is proved by holding a taper, or a piece of burning phosphorus, within a flame made by the combustion of alcohol. The flame of the taper, or of the phosphorus, will appear in the centre of the other flame, proving that there is oxygen even in its interior part.

FLA'MEN, in Roman antiquity, the name of an order of priests, instituted by Romulus or Numa; authors not being agreed on this head. Originally there were three priests so called; the *Flamen Dialis*, consecrated to Jupiter; *Flamen Martialis*, sacred to Mars; and *Flamen Quirinalis*, who superintended the rites of Quirinus or Romulus.

FLAMIN'GO, in ornithology, a fowl constituting the genus *Phenicopterus*, of the grallae order; a native of Africa and America. It resembles the heron in shape, but is entirely red, except the quill-feathers.

FLANK, the side of an army, or a battalion encamped on the right and left.—

In fortification, that part of a bastion which reaches from the curtain to the face; or any part of a work that defends another work along the outside of its parapet.

FLAN'NEL, a slight, loose, woollen stuff, which serves to keep the body warm, because, from its light and spongy texture, it does not admit of a passage for the heat.

FLAT, in music, a character which lowers a note one semitone.

FLAT'TING, in gilding, is the giving the work a light touch, in the places not burnished, with a pencil dipped in size, in which a little vermilion is sometimes mixed.

FLATULENCE, in medicine, air generated in a weak stomach and intestines by

THE NAKED EYE CAN DISCRIMINATE STARS TO THE SIXTH OR SEVENTH MAGNITUDE; TELESCOPES CAN REACH EVEN TO A 16TH.

SEVERAL EARTHLY BODIES, BUT MORE ESPECIALLY LINES, ARE REMARKABLE FOR THE GREAT LIGHT THEY GIVE WHEN IGNITED.

INDIANS ON THE NORTH-WEST COAST OF AMERICA ARE OFTEN OBLIGED TO REMOVE THEIR RESIDENCES TO ESCAPE THE MYRIADS OF FLEAS THERE.

[FLE]

The Scientific and Literary Treasury ;

[FLO]

imperfect digestion, occasioning distension, uneasiness, and frequent eructations.

FLAX, a plant, from the fibres of which linen thread is made. Common flax is an annual; but the other kinds are perennials.

FLEA, in entomology, an insect of the genus *Pulex*. It is of a deep purple colour, and is remarkable for its agility in leaping, for which it has three pairs of legs. It sucks the blood of larger animals, and its bite is very troublesome. The muscular power of the flea is truly wonderful. It has been known to draw 70 or 80 times its own weight, resist the ordinary pressure of the fingers in our endeavours to crush it, and leap two hundred times its own length. Hence it is called by the Arabians, "the father of leapers." Supposing the same relative force to be infused into the body of a man six feet high, he would be enabled to leap three times the height of St. Paul's! Latreille tells us of a flea which dragged a silver cannon twenty-four times its own weight, mounted on wheels, and was not alarmed when this was charged with gunpowder and fired off. And there is no reason to doubt the assertion; inasmuch as the feats of the "industrious fleas," exhibited in London, are not a whit less marvellous.

FLEAM, an instrument for lancing the gums or bleeding cattle.

FLEECE, a flock of wool, or what comes from a sheep at one shearing.—*Order of the Golden Fleece*, an order of knighthood instituted by Philip II. duke of Burgundy.

FLEET, a squadron of ships of war, belonging to any prince or state. It also denotes any number of trading ships, employed in a particular branch of commerce. Merchant-fleets generally take their denomination from the place they are bound to, as the Turkey-fleet, East-India-fleet, &c. These, in times of peace, go in fleets for their mutual aid and assistance: in time of war, besides this security, they procure convoys of men of war, either to escort them to the places whither they are bound, or to a certain place or latitude.—It is also the name of a prison in London, where debtors are confined; and to which persons are committed by the courts of chancery and common-pleas. It is situated in Farringdon-street, and derives its name from the float or fleet of the river, which, like an uncovered sewer, formerly ran near the building, and was called Fleet-ditch. *Fleta*, from the Saxon *flet*, signifies, in barbarous Latin, a place where the tide comes up.

FLESH, in anatomy, the muscular part of an animal body, in which the blood-vessels are so small as to retain only blood enough to give them a red colour.—*Flesh*, in botany, the pulpy substance of any fruit or root.

FLEXOR, in anatomy, a name applied to several muscles, whose office it is to bend the parts to which they belong; in opposition to the *extensore*, which open or stretch them.

FLEXURE, in geometry, the bending or curving of a line or figure: thus, when a line first bends one way and then another, the point where the bend changes to the other side is called the "point of contrary flexure."

FLINT, in natural history, a semi-pellucid stone, being a subspecies of quartz, of one uniform substance, and free from veins; but of different degrees of colour, and surrounded with a whitish crust. Flints occur almost always in nodules or tubercular concretions of various and very irregular forms. They break with an even, glossy surface; are moderately transparent, very hard, and capable of a fine polish; readily strike fire with steel; make not the least effervescence with aquafortis, and burn to a whiteness. The uses of flint, as an ingredient in the manufacture of glass and fine pottery-ware, are described under the proper heads.

FLITCH, in naval language, the name of a piece of small timber applied to ships for the purpose of sawing up into boat-timber.

FLOAT, a raft or number of pieces of timber fastened together with rafters athwart, to be driven down a river with the tide.—*Floating Breakwater*, a marine contrivance, consisting of a series of square frames of timber, connected by mooring chains or cables, and intended to break the violence of the agitated waves; either to allow vessels to ride within these quadrangular basins with more safety, or to produce smooth water in bathing places on a rough coast.—*Floating-bridge*, in war, a kind of double bridge, the upper one projecting beyond the lower one, and capable of being moved forward by pulleys, used for carrying troops over narrow mounts in attacking the outworks of a fort. Floating-bridges of a very large size have also of late been constructed for the transit of passengers and goods across creeks, harbours, &c., by the application of steam-power.—*Floating-light*, on shipboard, a hollow vessel of tinned iron-plate, made in the form of a boat, with a reflector or lantern, for the purpose of saving those who may have the misfortune to fall overboard in the night.

—*Floating battery*, vessels used as batteries to cover troops in landing on an enemy's coast.—*Float-boards*, those boards fixed to water wheels of under-shot mills, serving to receive the impulse of the stream, by which the wheel is carried round.

FLOATING (*the art of*). The following information, derived from an unique publication by Mr. Walker, is worth remembering:—"Any human being who will have the presence of mind to clasp the hands behind the back, and turn the face towards the zenith, may float at ease, and in perfect safety, in tolerably still water—ay, and sleep there, no matter how long. If not knowing how to swim, you would escape drowning when you find yourself in deep water, you have only to consider yourself an empty pitcher; let your mouth and nose, not the top part of your heavy head, be the

IN STRIKING A FLINT AGAINST STEEL, THE INTENSE EXCITEMENT OF THE LATTER OCCASIONS THE PARTICLES OF HEAT TO TAKE FIRE.

[FLO]

A New Dictionary of the Belles Lettres.

[FLO]

highest part of you, and you are safe, but thrust up one of your bony hands, and down you go, turning up the handle tips over the pitcher. Having had the happiness to prevent one or two drownings by this simple instruction, we publish it for the benefit of all who either love aquatic sports or dread them."

FLOETZ, or **FLETZ**, in geology, horizontal beds or strata, which lie over the transition rocks, and of which there are two formations, one called *floets*, or secondary, containing the petrified remains of animalcules, and vegetables now extinct, and the other, consisting of similar formations, and the alluvial soils lying upon them, containing the remains of animals similar to those now in existence, and consisting of basalt, wacke, greystone, slate, coal, trap, sand, loam, fragments of ore, &c.

FLOOD, a body of water, rising, swelling, and overflowing land not usually covered with water.—By way of eminence, the universal deluge is called *the flood*.

FLOOD GATE, a sluice or gate that may be opened or shut, for the admission or exclusion of the water.

FLOOD MARK, the mark which the sea makes on the shore, at the highest tide, high water mark.

FLORA LIA, a feast kept by the Romans in honour of the goddess *Flora*. This feast began April the 20th, and continued till the first of May, during which time the *Ludi Florales* were celebrated.

FLORID STYLE, in literary composition, that which is too much enriched with figures and flowers of rhetoric. Longinus uses the terms *florid* and *affected style* in differently, and describes them as quite contrary to the true sublime.—The *florid style* of architecture, or *florid Gothic*, an elaborate kind of Gothic architecture, filled with points, ramifications, mullions, &c.

—*Florid*, in music, any composition or performance of a rich and embellished kind.

FLORIN, a coin of different value, the silver florin of Holland is worth about 1s 8d. Most of the gold florins are of a coarse alloy, weighing variously from about fourteen to seventeen carats.

FLORES CENCE, in botany, the season when plants expand their flowers.

FLOSS SILK, the name given to the portions of ravell'd silk broken off in the flature of the cocoons. It is carded like cotton or wool, and spun into a soft coarse yarn or thread, for making shawls, socks, and other articles where an inferior kind of silk may be used.

FLOS, in botany, the name of several species of plants. Also the general name for the flower.

FLOS CULE, in botany, a partial or lesser sort of an aggregate flower.

FLOS CULOUS, in botany, an appellation given to compound flowers, made up of a number of florets in tunnel shaped petals, and inclosed in the same common cup.

FLOS FER RI, in mineralogy, a variety of arragonite, occurring in little cylinders, sometimes diverging and ending in a point,

and sometimes branched, like coral. It is found in veins of sparry iron, from which it takes its name.

FLOT'SAM, in law, a term for goods lost by shipwreck, but which are floating on the sea.—There are two other uncouth terms made use of to describe wrecked goods, viz., *jetsam* and *lagan*, the former, when the goods are sunk, and the latter, when they are sunk, but tied to a cork or buoy to be found again.

FLOUR, the finely ground and sifted meal of wheat or other grain. [See BRAN.]

FLOUR ISH, in music, a prelude or preparatory air, without any settled rule. Also the decorative notes which a singer or instrumental performer occasionally introduces.—In military language, it is the sounding of trumpets on receiving an officer or other person of distinction.

FLOWER, that beautiful part of a plant we call the blossom, the parts or divisions of which are called petals. It contains the parts of fructification, or the germ of the fruit, and consists of a calyx, corolla, stamens, and pistil.—A writer in the *New Monthly Magazine* thus picturesquely describes the blooming flowers on the Alps—"Wherever there is a handful of earth, there also is a patch of wild flowers. If there be a crevice in the rock sufficient to thrust in the edge of a knife, there will the winds carry a few grains of dust, and there straight up springs a flower. In the lower parts of the Alps they cover the earth with beauty. Thousands, and tens of thousands, blue, and yellow, and pink, and violet, and white, of every shadow and every form, are to be seen, vying with each other, and eclipsing every thing besides. Midway they meet you again, sometimes fragrant, and always lovely, and in the topmost places, where the larch and pine, and the rhododendron, (the last living shrub), are no longer to be seen, where you are just about to tread upon the limit of perpetual snow, there will peep up and blossom "the Forget me not," the Alpine ranunculus, and white and blue gentian, the last of which displays a blue of such intense and splendid colouring, as can scarcely be surpassed by the heavens themselves. It is impossible not to be affected at this meeting with these little unsheltered things, at the edge of eternal barrenness. They are the last gifts of beneficent, abundant nature. Thus far has she struggled and striven, vanquishing rocks, and opposing elements, and sowing here a forest of larches, and there a wood of pines—a clump of rhododendrons, a patch of withered herbage, and, lastly, a bright blue flower."—Flowers were in great request at the entertainments of the ancients, being provided by the master of the feast, and brought in either at the beginning of the feast, or before the second course. They were likewise used by them in bedecking tombs.

FLOWERS, in chemistry, a term formerly applied to a variety of substances procured by sublimation, and were in the form of slightly colouring powder. Hence, in all old

THE COLOURS OF FLOWERS DEPEND ON LIGHT, ALL OF THEM BECOMING WHITE IF THEY ARE KEPT IN TOTAL DARKNESS.

AS YET HE DEEMED AT ITS PROPER MEAT FOR BAKING, WHEN FLOUR THROWN INTO IT BECOMES BLACK WITHOUT FLAME.

[FLU]

The Scientific and Literary Treasury ;

[FLU]

books, we find mention made of the flowers of antimony, arsenic, zinc, and bismuth, which are the sublimed oxides of these metals, either pure or combined with a small quantity of sulphur: we have also still in use, though not generally, the terms *flowers of sulphur*, *benzoin*, &c.

FLOWERS, ARTIFICIAL, a considerable article of manufacture, particularly in France, where they are made with astonishing skill and taste, and give employment to an immense number of hands.—The savages of South America manufacture perfect feather flowers, derived from the brilliant plumage of their birds, which closely resemble the products of vegetation; and with this advantage, that the colours never fade.

FLOWER-DE-LIS, (sometimes written, incorrectly, *flower-de-luce*), in heraldry, a bearing representing the lily, the hieroglyphic of royal majesty.—In botany, the iris or flag-flower.

FLOWERS, LANGUAGE OF. Among oriental nations the language of flowers, as it is called, has acquired a significant character. Dr. Madden, in his travels, alluding to this has the following passage:—"A Turkish lady of fashion is wooed by an invisible lover. In the progress of the courtship, a hyacinth is occasionally dropped in her path by an unknown hand, and the female attendant at the bath does the office of a Mercury, and talks of a certain effendi seeking the lady's love, as a nightingale aspiring to the affections of a rose." The charm of novelty has sometimes attracted attention in the Western world to this tender language, and dictionaries have been composed to explain its mysteries; but it is only among the lively and imaginative mortals of the East, that it has ever been brought to perfection.

FLUATES, in chemistry, salts of which the fluoric acid is the chief ingredient. They are distinguished by the following properties:—When sulphuric acid is poured upon them, they emit acrid vapours of fluoric acid, which corrode glass; when heated, several of them phosphoresce; they are not decomposed by heat, nor altered by combustibles; and they combine with silica by means of heat. Most of them are sparingly soluble in water.

FLUID, in physiology, an appellation given to all bodies whose particles easily yield to the least partial pressure, or force impressed; moving easily among themselves, and accommodating themselves to all changes of position, so as always to preserve a level surface. From the gravity of fluids arises their pressure, which is always proportioned to the gravity: for if the particles of fluids have equal magnitude and weight, the gravity or pressure must be proportioned to the depth, and equal in every horizontal line of fluid.—*Fluidity* stands directly opposed to solidity or firmness, and is distinguished from liquidity and humidity, inasmuch as the latter imply also wetting and adhering. Melted metals, air, ether, smoke, and flame, are fluid but not liquid bodies, their parts being dry,

and leaving no sense of moisture. Fluidity is the effect of heat.

FLUORIC ACID, in chemistry, a gaseous substance procured from fluor spar, which is of a corroding nature, and will dissolve glass, for which reason it has been used for etching on glass. This acid gas readily combines with water; and when dropped in, a hissing noise is produced with much heat. Its odour is very penetrating, and its vapour dangerous to inspire. When applied to the skin, it instantly disorganises it, and produces the most painful wounds. This gas has received the name of *fluo-silicic acid*, because it is regarded as a compound of fluoric acid and silica.

FLUORINE, in chemistry, the supposed basis of fluoric acid.

FLUOROUS ACID, in chemistry, the acid of fluor in its first degree of oxygenation.

FLUOR SPAR, in mineralogy, the foliated fluuate of lime; a species of mineral which abounds in nature, and consists of a calcareous earth in combination with fluoric acid. Though sometimes massive, it is almost always regularly crystallized. The variously coloured specimens called *Derbyshire spar*, are worked upon the turning-lathe into vases and other ornaments.

FLUOSILICATE, in chemistry, a compound of fluoric acid, containing silica, with some other substance.

FLUOSILICIC, in chemistry, an epithet for that which is composed of or contains fluoric acid with silica.

FLUSH, a term in a game at cards where they are all of a suit.—In carpentry, a term signifying that two bodies joined together make an even surface.

FLUTE, the common or English, a musical wind instrument, consisting of a tube about eighteen inches in length, furnished with holes at the side for the purpose of varying its sounds by stopping and opening them with the fingers.—The *German flute* is formed of several joints or pieces screwed into each other, with holes at the side, and the addition of several brass or silver keys, to temper the tones to the various flats and sharps.

FLUTES, or **FLUTINGS**, in architecture, perpendicular channels, or cavities, cut along the shaft of a column or pilaster. They are chiefly effected in the Ionic order, where they had their first rise; though they are also used in the richer orders, as the Corinthian and Composite; but seldom in the Doric, and scarcely ever in the Tuscan. Each column has twenty-four flutes, and each flute is hollowed in exactly a quadrant of a circle. The Doric, however, has but twenty. Between the flutes are little spaces that separate them, called *stria* or *flats*: though, in the Doric, the flutes are frequently made to join to one another, without any intermediate space at all; the list being sharpened off to a thin edge, which forms a part of each flute. Fluted columns are sometimes termed *reeded*.

THE FREEING POINT IN A THERMOMETER IS WHERE THE QUICKSILVER BECOMES STATIONARY WHEN IMMERSED IN MELTING ICE.

THE BOILING POINT IN A THERMOMETER IS WHERE THE QUICKSILVER REMAINS STATIONARY WHEN STANDING IN BOILING WATER.

[FLY]

A New Dictionary of the Belles Lettres.

[FOC]

FLUX, in chemistry, a general term to denote any substance or mixture added to assist in the fusion of minerals. The fluxes made use of in experiments consist usually of alkalis, which render earthy mixtures fusible, by converting them into glass, or by converting glass itself into powder. Limestone, fluor spar, borax, and several earthy or metallic oxides, are employed as fluxes in metallurgy.—*Flux*, in medicine, an extraordinary issue, or evacuation of some humours of the body.—*Flux and Reflux*, the regular and periodical motion of the sea, which happens twice in 24 hours, 48 minutes. By the flux, or advancing motion of the tide, the water rises, by the reflux, or ebbing of the tide, it sinks, and the period at which the water is in a manner at rest, is called *high-water*.

FLUXIONS, a method of calculation invented by Sir Isaac Newton. In this branch of mathematics, magnitudes of every kind are supposed to be generated by motion. This science is employed in the investigation of curves, in finding the contents of solids, and computing their surfaces, in finding the centres of gravities and oscillation of different bodies, the attractions of bodies under different forms, the direction of wind, which has the greatest effect on an engine, and in the solution of many other interesting and important problems.

FLY, in zoology, a winged insect of various species, the distinguishing characteristic of which is, that their wings are transparent. By this, flies are distinguished from beetles, butterflies, grasshoppers, &c. Some flies have two wings, and others four.—*Fly*, in mechanics, a heavy wheel at right angles with the axis of a windlass or jack, to regulate the motion of a machine. When used as a collector of power, the fly is frequently seen with heavy knobs at the opposite ends of the straight line.—*Fly*, among mariners, that part of a compass on which the thirty two points are described.

FLY-BLOW, the deposit of eggs by flies, which afterwards become maggots, as the grub state of future flies.

FLY-CATCHER, in ornithology, a genus of birds, the *Muscicapa*, with a bill flattened at the base, almost triangular, notched at the upper mandible, and beset with bristles. They are of infinite use in destroying those numerous swarms of noxious insects engendered by heat and moisture, which are continually on the wing, and which, though weak and contemptible when individually considered, are formidable to vegetation by their numbers.

FLYERS, in architecture, stars that do not wind, but are made of an oblong square figure, and go straight forward, the second standing behind the first, and so on.

FLY-HONEYBUCKLE, in botany, a shrub, the *Halleria lucida* of Linnæus.

FLYING, the progressive motion of a bird, or other winged animal, in the liquid air. The parts of birds chiefly concerned in flying, are the wings, by which they are

sustained or wafted along. "The manner of flying is this the bird first bends his legs, and springs with a violent leap from the ground, then opens and expands the joints of his wings, so as to make a right line perpendicular to the sides of his body: thus the wings, with all the feathers therein, constitute one continued lamina. Being now raised a little above the horizon, and vibrating the wings with great force and velocity perpendicularly against the subject air, that fluid resists those successions, both from its natural inactivity and elasticity, by means of which the whole body of the bird is protruded. The resistance the air makes to the withdrawing of the wings, and consequently the progress of the bird, will be so much the greater, as the waft or stroke of the fan of the wing is longer but as the force of the wing is continually diminished by this resistance, when the two forces come to be in equilibrium, the bird will remain suspended in the same place, for the bird only ascends so long as the arch of air the wing describes makes a resistance equal to the excess of the specific gravity of the bird above the air. If the air, therefore, be so rare as to give way with the same velocity as it is struck withal, there will be no resistance, and consequently the bird can never mount." Birds never fly upwards in a perpendicular line, but always in a parabola. In a direct ascent, the natural and artificial tendency would oppose and destroy each other, so that the progress would be very slow. In a direct descent they would aid one another, so that the fall would be too precipitate.

FLYING-FISH, the *Exocoetus* of naturalists, a fish which is enabled, by the vibration of its large pectoral fins, to leave the water when alarmed or pursued, and sustain itself for several seconds in the air. In tropical seas they rise from the water in shoals, of thousands at a time, when disturbed by the passing of a ship, or pursued by a dolphin. They spring from the crest of a wave, and, darting forward, plunge into another to wet the membrane of the fins, and in this manner continue their flights for several hundred yards together. [See *Exocoetus*.]

FLYING PINION, the part of a clock, having a fly or fan, by which it gathers air, and checks the rapidity of the clock's motion, when the weight descends in the striking part.

FLY-ORCHIS, in botany, the *Orchis maculosa*, a plant, so called from the resemblance it bears in figure to that of a fly.

FLYTRAP, in botany, a species of sensitive plant, the *Dionæa muscipula*, or Venus' Fly-trap, the leaves of which consist of two lobes, that have the property of closing when irritated within, and consequently of seizing any insects which happen to light on them.

FOCAL DISTANCE, in mathematics, the distance of the focus, which, in the parabola, is its distance from the vertex: and in the hyperbola, from the centre.

THE FOOT OF A FLY IN SHAPE RESEMBLES A CURVECOMB, AND WHEN IT THEY BRUSH OFF THE DUST FROM THEIR HEAD AND WINGS.

A DETACHMENT OF TROOPS EMPLOYED TO MOVE ABOUT AND WATCH THE MOTIONS OF AN ENEMY, IS CALLED A "FLYING-PARTY."

FOG]

The Scientific and Literary Treasury ;

[FON

FOCILE MAJUS, in anatomy, the greater bone of the arm, called *ulna*; or the greater bone of the leg, called *tibia*. The lesser bone of the arm or leg is termed *foecile minus*.

FODDER, in husbandry, any kind of food for cattle. *Green fodder* consists of grass, tares, hay, &c. *Dry fodder*, of oats, barley, and beans.

FODDERTORIUM, in law, provision of fodder or forage, made to the king's purveyors.

FOCUS, in optics, the point of convergence or concurrence, where all the rays of light meet after passing through a convex lens. It should be observed, however, that the focus is not, strictly speaking, a point, but a small circle, one-eighth the thickness of the lens, when it is convex on both sides; for the rays are not accurately collected into one and the same place or point, owing to the different nature and refrangibility of the rays of light, to the imperfections in the figure of the lens, and other similar impediments.—*Focus*, in geometry and conic sections, a certain point in the parabola, ellipse, and hyperbola, where the rays reflected from all parts of these curves concur and meet.

FETUS, in physiology, signifies the young of animals while in the womb, particularly after it is formed; till which time it is more properly called an *embryo*.

FOG, an imperfect condensation of the air, consisting of a large proportion of air, and a small one of aqueous vapour. Fogs happen in winter, about the change of the weather, from frost to thaw, or from thaw to frost; but in summer and spring, from the expansion of the dew. Fogs are more frequent in those seasons of the year when there is a considerable difference of temperature in the different parts of the day; as, for instance, in autumn, when, in the warmest part of the day, the air is capable of holding a great quantity of aqueous matter in solution, which on cooling towards evening, it is no longer capable of dissolving.—A correspondent of the "Magazine of Natural History," in speaking of the density and awful blackness of a "London fog," particularly of one which occurred Jan. 27, 1831, says, "this extraordinary appearance is, however, caused by a very ordinary accident, viz. a change of wind; and which may be accounted for as follows:—The west wind carries the smoke of the city to the eastward in a long train, extending to the distance of twenty or thirty miles; as may be seen in a clear day, by any person on an eminence five or six miles from the city, and looking across in the direction of the wind; say from Harrow-on-the-Hill, for instance. In this case, suppose the wind to change suddenly to the east, the great body of smoke will be brought back by an accumulated mass, and, as this repasses the city, augmented by the clouds of smoke from every fire therein, it causes the murky darkness alluded to."

FOG-BANK, an appearance in hazy weather, which frequently resembles land

at a distance, but which vanishes as you approach it.

FOIL, among jewellers, a thin leaf of metal placed under precious stones, to increase their lustre and improve their colour. Hence anything of a different colour or quality, which serves to adorn or set off another thing to advantage, is termed a *foil*.—In fencing, an elastic piece of steel, or sword without a point, to fence with by way of exercise. The *foil* usually has a button or piece of cork at the end, covered with leather.

FOLIACEOUS, in botany, having leaves intermixed with flowers; as, a *foliaceous* spike.—In mineralogy, having the form of a leaf or plate; as, *foliaceous* spar.

FOLIAGE, in architecture, the representation of leaves, flowers, and branches, intended to ornament and enrich capitals, friezes, pediments, &c.

FOLIATE, in botany, furnished with leaves.

FOLIATED, in mineralogy, consisting of thin plates; lamellar; as, a *foliated* structure.

FOLIATING, a term used for covering the backs of looking-glasses with a thin coat of tin and quicksilver.

FOLIATION, in botany, the leafing of plants, or the disposition of the nascent leaves within the bud.

FOLIO, in account books, denotes a page, or rather both the right and left hand pages, these being expressed by the same figure.—*Folio*, a book of the largest size, the leaves of which are formed by once doubling a sheet of paper.

FOLIOLE, in botany, one of the single leaves, or leaflets, which together constitute a compound leaf.

FOLIOUS, in botany, having leaves intermixed with the flowers.

FOLKLAND, in law, copyhold land; or land held by the commonalty at the will of the lord.

FOLKNOTE, a word used in England before the Norman conquest to denote an annual assembly of the people, answering in some measure to a modern parliament. Some authors however, allege that the folknote was an inferior court, or common-council of a city or borough.

FOLLICLE, in botany, a seed-vessel opening on one side longitudinally, and having the seeds loose in it.

FOMENTATION, the act of bathing any part of the body with a decoction of herbs, &c. made hot, for the purpose of easing pain or dispersing tumours. A similar application with bags of herbs and other ingredients is called a dry fomentation.

FONT, a large basin or stone vessel in which water is contained for baptizing infants, or other persons. It is so called, probably, because baptism was usually performed among the primitive Christians at springs or fountains.—*Font*, or *Font*, a complete assortment of printing types of one size, including a due proportion of all the letters, points, figures, accents, &c.

CLOUDS, FOGS, AND MISTS, ARE ALL ALIKE; THE VAPOUR AT A DISTANCE WE CALL A CLOUD; WHEN WE ARE IMMERSSED IN IT, A FOG.

IN 1783, ALL EUROPE WAS ENVELOPED WITH A DRY FOG, AT THE MOMENT OF A VOLCANIC ERUPTION IN ICELAND AND CALABRIA.

[FOO]

A New Dictionary of the Belles Lettres.

[FOR]

IN GOOD BREAD, EVERY 100 LBS IS FOUND TO CONTAIN 80 LBS OF NUTRITIOUS FOOD, BUTCHER'S MEAT AVERAGES ONLY 35 LBS IN 100

FONTAINA'LIA, in Roman antiquity, a religious feast celebrated Oct 13, in honour of the nymphs of wells and fountains. The ceremony consisted in throwing nosegays into the fountains, and putting crowns of flowers upon the wells.

FOOD, in its largest sense, direct and metaphorical, includes whatever is taken for nourishment, in reference to the animal economy, whatever solid or liquid aliment is received into the stomach, and, in a more confined sense, solid aliment only. After being masticated in the mouth, our food passes through the gullet, into the stomach, where it is reduced to a pulp, called chyme. This passes into the pylorus and duodenum, where it is separated into chyle, which is absorbed by the lacteal vessels of the animal, and the superfluous parts are ejected through the colon and rectum.—We are told that in the first ages men lived upon acorns, berries, and such fruits as the earth spontaneously produces, then they proceeded to eat the flesh of wild animals taken in hunting but their numbers decreasing, and mankind multiplying, necessity taught them the art of cultivating the ground, to sow corn, &c. When they began to make a free use of domestic animals, they roasted them only boiling was a refinement in cookery which for ages they were strangers to, and fish, living in an element men were unused to, were not eaten till they grew somewhat civilized.

FOOL, in ordinary language, signifies one who is deficient in intellect, or who pursues a course contrary to the dictates of reason. In scripture the word *fool* is often used for a wicked or depraved person but in its most legitimate sense the term *fool* means one who is destitute of reason either from having been born an idiot or become idiotic from some injury done to the brain.—To play the fool, to act the buffoon to occupy one's time in absurd trifling.

FOOT, the lower extremity of the leg or that part of the body of most animals whereon they stand. Animals are distinguished, with respect to the number of their feet into *bipeds* two footed, as men and birds, *quadrupeds*, four footed, like most land animals, and *multipedes*, or many footed, as insects.—*Foot*, a measure of length consisting of 12 inches supposed to be taken from the length of a man's foot. Geometricians divide the foot into 10 digits, and the digit into 10 lines.—A *Foot square*, is the same measure, both in breadth and length, containing 144 square or superficial inches.—And a *cubic* or *solid foot* is the same measure in all the three dimensions, length, breadth, and depth or thickness, containing 1728 cubic inches.—*Foot*, in poetry, a certain number of syllables which serve for measuring the verse.—*Foot*, in military language, soldiers who serve on foot, or infantry, as distinguished from cavalry.

FOOTSTALK, in botany, a partial stem supporting the leaf, or connecting it with the stem and branch, a petiole.

FORAGE, all kind of provender for cattle, especially for horses in time of war.—A *foraging party*, those who are sent out by the general in order to collect provisions either for the horses or for the troops.

FORAMEN, in anatomy, a name given to several apertures, or perforations in various parts of the body, as, 1 the external and internal foramina of the cranium or skull, 2 the foramina in the upper and lower jaw, 3 the foramen lachrymale, and, 4 the foramen membrane tympani.—*Foramen ovale*, an oval aperture or passage through the heart of a fœtus, which closes up after birth. It arises above the coronal vein, near the right auricle, and passes directly into the left auricle of the heart, serving for the circulation of the blood in the fœtus, till such time as the infant breathes and the lungs are open.

FORCE, in mechanics, the energy or impulse with which one body affects another, with reference to the direction of motion, and the centres of the masses. It consists in the transfer of the motion of one body to another.—*Physical force*, is the force of material bodies. *Moral force*, is the power of acting on the reason in judging and determining.—*Force*, in law, signifies any unlawful violence offered to persons or property.—A *forcible entry*, is a violent and actual entry into houses, or lands, and a *forcible detainer*, is a violent withholding the possession of lands, &c, so that the person who has a right of entry is hindered therefrom.—The word *force* has numerous other meanings, as strength or power for war—virtue—efficacy—validity—destiny—necessity, &c.

FORCEPS, in surgery, an instrument for extracting anything from a wound, &c. Also, a pair of scissors for cutting off or dividing the fleshy membranous parts of the body.

FORCING, among gardeners, a method of obtaining fruits and flowers before their season by the application of heat.—The forcing down wines so as to render them fit for immediate use, is also called *forcing*.

FORE, a sea term for near the stem, as 'fore and aft,' that is, from stem to stern.

FORECASTLE, a short deck in the fore part of the ship above the upper deck.

FORECLOSE, in law, to exclude or bar the equity of redemption on mortgages, &c.

FOREMAST, the mast of a ship which is placed in the forepart or forecabin, and carries the foremast and foretop sail yards. *Foremast men*, those who take in the top-sails furl the sails, &c.

FORE SHORTENING, in painting, the art of correctly conveying to the mind the impression of the entire length of an object, when represented as viewed in an oblique or receding position.

FOREST, a large tract of land covered with trees, differing from a wood chiefly in its extent.—The forests in England are of such great antiquity, that, excepting the New Forest in Hampshire, by William the Conqueror, and Hampton court, by Henry

POTATOES YIELD 25 LBS OF NUTRIMENT IN 100, CARROTS, 14 LBS., AND GREENS, ONLY 8 LBS., WHILE PEARCE BEANS, IN THE GRAIN, YIELD 92 LBS.

[FOR]

THE ANGLO-NORMAN RINGS TURNED, WITH THE MOST BARBAROUS SEVERITY, SUCH PERSONS AS KILLED DEER IN ANY OF THEIR FORESTS.

VIII. it is said that there is no record or history, which makes any certain mention of their origin, though they are mentioned by several writers, and in many of our laws and statutes. The four principal forests are the New-forest, Sherwood-forest, Dean-forest, and Windsor-forest.

FO'BESTALLING, the act of buying or bargaining for any provisions or merchandise, before they reach the market at which they were going, with an intent to sell the same again at higher prices.

FO'BESTAY, in a ship's rigging, a large rope reaching from the foremast head towards the bowsprit end, to support the mast.

FOR'FEITURE, in law, the loss of some right, privilege, or estate, goods, lands, or employments, &c. for neglecting to do one's duty, or for some crime committed.

FORGE, a small furnace, wherein smiths and other artificers of iron or steel, &c. heat their metals red-hot, in order to soften and render them more malleable. The word *forg* is also used for a large furnace, or *iron-works*, in which the ore taken from the mine is melted down.

FORPIC'ULA, in entomology, the Earwig (which see.) — *Forficula marina*, or *Sea-sawig*, an insect found about the seashores, and so called from its resemblance to the common earwig.

FOR'GERTY, in law, the fraudulent making or altering any deed, or writing, &c. to the prejudice of another man's right, particularly the counterfeiting the signature of another with intent to defraud.

FORGET-ME-NOT, (*Myosotis palustris*) in botany, a small herbaceous plant, bearing alternate and lanceolate leaves, and small blue flowers, whose brilliancy renders them conspicuous notwithstanding their diminutive size. This little flower (owing perhaps to its clear blue, the colour of fidelity) is considered the emblem of friendship, and accordingly finds a conspicuous place in the bouquets of love and sentiment, both floral and poetical.

FORLORN-HOPE, in military affairs, a detachment of men appointed to lead in an assault, to storm a counterescarp, enter a breach, or perform any other service attended with great and imminent peril.

FORM, in physiology, the essential and distinguishing modification of the matter of which any body is composed. — *Form*, in a moral sense, the manner of being or doing a thing according to rules: thus we say, a *form* of government, a *form* of argument, &c. — *Form*, in law, the rules established and requisite to be observed in legal proceedings. — *Form*, in mechanics, a kind of mould in which any thing is wrought. — *Form* also denotes the external appearance or surface of a body, or the disposition of its parts, as to the length, breadth, and thickness. — *Essential form* is that mode of existence which constitutes a thing what it is, and without which it could not exist.

FORM (pronounced as *form*, a stool to sit on), in printing, pages or columns of

type, properly arranged, and enclosed and locked in an iron frame called a chase, for the purpose of being put to press. There are two forms required for every sheet, one for each side; and each form consists of more or fewer pages, according to the size of the books. — In schools, a *class*.

FORM'ALIST, one who observes the outward forms and ceremonies of worship, for appearance sake, without possessing the life and spirit of pure religion.

FORMA PAU'PERIS, a law term. When a person has just cause of suit, but is so poor, that he cannot defray the usual charges of suing at law or in equity, on making oath that he is not worth *5*l.**, and producing a certificate from some lawyer that he has good cause of suit, the judge will admit him to sue in *forma pauperis*; that is, without paying any of the usual fees to counsel, &c.

FORMATIONS, in geology, the general name of the various strata which compose the surface of the earth, and supposed to be formed at different remote periods. In most of the formations there are some mineral and fossil affinities; and in many, even where the external differences are apparently complete, there are some common characters, by the aid of which a passage from the one to the other can be traced. It is also worthy of observation, that the unvarying succession of formations to each other, in the geological series, has been found to exist in parts of the earth widely separated from each other, and warrants not only the belief that they have come into their order successively, but that the causes which brought each formation to its place were of one class, whether of igneous or of aqueous origin, and operated simultaneously.

FORMIC A'CID, in chemistry, originally the acid of ants, which was extracted from them either by distillation or expression with water. At the present day *formic acid* is procured from the application of a gentle heat to a mixture of tartaric acid, water, and the protoxide of manganese. It is extremely sour, and continues liquid at very low temperatures.

FORMICA, the ANT [which see.]

FORMICA-LE'O, or Ant lion, in entomology, an insect so called from its devouring great numbers of ants. It is the caterpillar or worm of a fly much resembling the libellule, or dragon-flies.

FOEM'ULA, in mathematics, a general theorem or literal expression for resolving any part of a problem. — *Formula*, in theology, a profession of faith.

FORT, in the military art, a small fortified place, surrounded with a moat, rampart, and parapet; or with palisades, stockades, and other means of defence.

FORTIFICATION, the art or science of fortifying a place, or of putting it in such a posture of defence, that every one of its parts defends, and is defended, by some other parts, by means of ramparts, parapets, moats, and other bulwarks; so that a small number of men within may be

THE COAL FORMATION CONSISTS OF A SERIES OF ALTERNATE BEDS OF COAL, SLATE CLAY, SANDSTONE, AND SOMETIMES CARBONIFEROUS LIMESTONE.

THE FOSSIL OR ORGANIC REMAINS IN STRATA ARE ALWAYS THE SAME KIND IN SIMILAR STRATA, WHEREVER THEY MAY BE FOUND.

able to defend themselves for a considerable time against the assaults of a numerous army without.—*Ancient fortification*, at first, consisted of walls or defences made of trunks, and other branches of trees, mixed with earth, to secure them against the attacks of the enemy. This was afterwards altered to stone-walls, on which were raised breast-works, behind which they made use of their darts and arrows in security.—*Modern fortification*, is that which is flanked and defended by bastions and out-works, the ramparts of which are so solid, that they cannot be beat down but by the continual fire of several batteries of cannon. The principal works belonging to a fortification are, the ditch or trench made round each work; the rampart, or elevation of earth, raised along the faces of any work, to cover the inner part; the parapet, or that part of a rampart which serves to cover the troops planted there; the bastion, that part of the inner enclosure of a fortification making an angle towards the field; the counterscarp, the slope of the ditch facing the body of the place; the covert way, the space extending round the counterscarp; and the glacis, the part beyond the covert way, to which it serves as a parapet. In recent times, however, fortification has undergone important changes, and engineers have adopted different systems; but those which have acquired the greatest reputation in Europe, are the systems of count Pagan, the baron de Coehorn, von Scheiter, and marshal Vauban.

FORTITUDE, the basis or source of coolness and intrepidity in danger, of patience in suffering, of forbearance under injuries, and of magnanimity in all conditions of life. In fine, fortitude is the virtue of a rational and considerate mind, founded on a sense of honour and a regard to duty. The motives to fortitude are many and powerful, and this virtue tends much to the happiness of the individual, by giving composure and presence of mind, and keeping the other passions in due subordination.

FORUM, in Rome, a public place where causes were judicially tried, and orations delivered to the people. There were six of these forums, viz. the *Romanum*, *Julianum*, *Augustinum*, *Palladium*, *Trajanum*, and *Salustii* forum. The chief of these was the *forum Romanum*, called by way of eminence *the forum*. In this was an apartment called the *rostra*, where the lawyers pleaded, and the orators harangued the people, &c. Here was also the *comitium*, or hall of justice, with the sanctuary of Saturn, the temple of Castor, &c., altogether forming a most splendid place. The word *forum* was also applied to a place of traffic, or market-place: of these there were vast numbers, as the *forum piscarium*, *olitiorum*, &c. These were generally called *fora venalia*, in distinction from the former, which were called *fora civilia*.—In the law, *forum* signifies a court of justice, the place where disputed rights are settled; hence *forum competentis*, a competent jurisdiction; *forum incompe-*

tens, a court not authorized to try the cause, &c.

FOSS, in fortification, a hollow ditch, commonly full of water, lying between the scarp and the counterscarp.—*Foss*, or *fossa*, in anatomy, a kind of cavity in a bone, with a large aperture, but no exit or perforation.—*Fossa*, in our ancient customs, was used to signify a ditch full of water, wherein women convicted of felony were drowned.—*Foss-way*, one of the four principal highways of England, that anciently led through the kingdom; supposed to have been the work of the Romans, and having a ditch on one side. One of these reached from Totness in Devonshire to Barton on the Humber.

FOSSIL, in natural history, any substance penetrated with earthy or metallic particles, which is dug out of the earth, whether that be its natural or its accidental situation; the first being called *native*, the second *extraneous*.—1. *Native fossils* are substances found either buried in the earth, or lying on its surface, of a plain simple structure and showing no signs of containing vessels, or circulating juices; as earths, salts, and metallic bodies.

—2. *Extraneous fossils* are bodies of vegetable or animal origin, accidentally buried in the earth; as plants, shells, bones, &c., many of which are petrified. The oldest rocks of the secondary formation contain aquatic plants and reeds, and adjoining these are madreporae, encrinurites, and various zoophytes, little removed above vegetation; in the next series are ammonites, and various molluscs, very different from any existing animals: above these are found fishes, bamboos, and ferns, all of extinct species. Between the old and the newest floetz formations, shells and fish increase in number, with amphibia; as lacerata, testudo, and some serpents. In the newest floetz formations are found remains of seals, whales, birds, monstrous land animals, and fresh-water shells; and in the alluvial and modern soils, in peat bogs, and low beds, bones of the elephant, rhinoceros, hippopotamus, &c. appear.

FOSSIL-COPAL, a resinous substance found in perforating the bed of blue clay at Highgate, near London; which appears to be a true vegetable gum or resin, partly changed by remaining in the earth. It is sometimes called Highgate resin.

FOTHER, a weight of lead containing eight pigs. At the mines the weight of a *fother* is 22 cwt. and a half; but with the plumbers in London it is 19 cwt. and a half.

FOTHERING, a sea term for stopping leaks in the bottom of a ship, by letting down a sail by the corners, and putting chopped rope-yarn, wool, oakum, &c. between it and the ship's side. By repeating this operation several times, these substances are sometimes sucked into the cracks, and the leak becomes either wholly or partially stopped.

FOUGADE, in the art of war, a small mine, in the form of a well, eight or ten feet wide, and ten or twelve deep, dug un-

[FOX]

der some fortified place, charged with sacks of powder, and covered with stones or earth, for destroying the works by explosion.

FOUNDATION, the basis or groundwork of any thing; usually that part of a building which lies on the ground.—*Foundation* denotes also a donation or legacy, either in money or lands, for the maintenance and support of some community, school, or charitable institution.

FOUNDER, one from whom any thing originates; as, the founder of a sect of philosophers; the founder of a family. Also one who endows any public establishment.

—*Founder*, likewise implies, an artist who casts metals, in various forms, for different uses; as a founder of cannon, bells, statues, printing type, &c.

FOUNDRY, or **FOUNDERY**, signifies the house and works occupied in casting metals; and also the art of casting them into various forms for use. As, at the present day, our iron foundries are by far the most important, we shall endeavour to give (on the authority of Dr. Ure's admirable work), a slight sketch of them:—The operations of an iron foundry consist in re-melting the pig-iron of the blast furnaces, and giving it an endless variety of forms, by casting it in moulds of different kinds. These moulds are in general very heavy, consisting of two parts at least, which must be separated, turned upside down several times, and replaced very exactly upon one another. The casting is generally effected by means of large ladles or pots, in which the melted iron is transported from the cupola, where it is fused. Coke is the only kind of fuel employed to effect the fusion. A well-mounted foundry, such as the author describes, (consisting of the various workshops, magazines for pig-iron, a vast area properly called the *foundry*, in which the moulds are made and filled with the melted metal, blast and air furnaces, &c.) will occupy a square surface of about 80 yards in each side, and will be capable, by casting in the afternoon and evening of each day, partly in large and partly in small pieces, of turning out from 700 to 800 tons per annum, with an establishment of 100 operatives, including some moulding boys. There are three distinct methods of making the moulds: 1. in green sand; 2. in baked sand; and 3. in loam. And it is of course essential,—that each mould should present the exact form of its object,—that it should have such solidity that the melted metal may be poured into it, and fill it entirely without altering its shape in any point,—and that the air which occupies the vacant spaces in it, as well as the carburetted gases generated by the heat, should have a ready vent; for if they are but partially confined, they expand by the heat, and may crack, even blow up the moulds, or at any rate become dispersed through the metal, making it vesicular and unsound. The metal is usually melted at a cupola furnace, the heat of which is so intense, from its construction and the effect of the blowing

machine, that the metal begins to melt in about twenty minutes after its introduction; and successive charges are then made every ten minutes nearly, the amount of the charges varying with the size of the furnace, and the speed required for the operation; the pigs have been previously broken into pieces weighing at most 14 or 16 lbs.—The chief talent of the founder consists in discovering the most economical mixtures, and so compounding them as to produce the desired properties in the castings. One piece, for example, may be required to have great strength and tenacity to bear heavy weights or strains; another must yield readily to the chisel or the file; a third must resist sudden alternations of temperature; and a fourth must be pretty hard. The filling in of the melted metal is managed in two ways. For strong pieces, whose moulds can be buried in the ground at seven or eight yards distance from the furnace, the metal may be run in gutters, formed in the sand of the floor, sustained by plates or stones. The clay plugs is pierced with an iron rod when all is ready. When from the smaller size, or greater distance of the moulds, the melted metal cannot be run along the floor from the furnace, it is received in cast iron pots or ladles, lined with a coat of loam: these are either carried by the hands of two or more men, or transported by the crane. Between the successive castings, the discharge hole of the furnace is closed with a lump of clay, applied by means of a stick, having a small disc of iron fixed at its end. After the metal is somewhat cooled, the moulds are taken asunder, and the excrescences upon the edges of the castings are broken off with a hammer; and they are afterwards more carefully trimmed or chipped by a chisel when quite cold. The loss of weight in foundry is about 6½ per cent. upon the pig-iron employed. Each casting always requires considerably more than its own weight of iron. This excess forms the gates, false seams, &c.; the whole of which being deducted, shows that 1 cwt. of coke is consumed for every 3 cwt. of iron put into the furnace; for every 138 cwt. of crude metal, there will be 100 cwt. of castings, 32 of refuse pieces, and six of waste.

FOUNTAIN, in natural philosophy, a spring or source of water rising out of the earth. Among the ancients, fountains were held sacred, and even worshipped as a kind of divinities.—An *artificial fountain*, or *jet d'eau*, is water ejected from a pipe, either by being raised to a higher level than the top of the pipe, or by being compressed by an engine. [See ARTESIAN WELLS.]

FOVILLA, in botany, a fine substance, imperceptible to the naked eye, emitted from the pollen of flowers.

FOX, (*Vulpes*), in zoology, an animal of the genus *Canis*, much resembling the common dog in form, and chiefly distinguished by a long bushy tail. He burrows in the earth, and is generally described as crafty and cunning beyond measure; but much of the cunning suspiciousness of manner for

ALL THE PRINCIPAL CITIES OF ANCIENT GREECE AND ROME BOASTED OF THEIR WEALTH BY BRUINATING THEIR STATUES OF BRASS.

THE FOUNTAINS AT THE TUILERIES, VERSAILLES, AND ST. CLOUD, ARE SPLENDID STRUCTURES; BUT IF ROME THEY ARE STILL MORE BEAUTIFUL.

[FRÆ]

which the fox is notorious, arises from his defective vision; in broad day-light his attitudes and motions partake of the uncertainty of his sight, and he appears to be most cunning when he is really most shortsighted. Foxes prow about in the night, and prey on poultry, rabbits, and hares; but they are very timid, fleet, and, when old, sagacious in evading their enemies. They emit an odour which enables dogs to scent and follow them. Foxes breed only once a-year, and bring forth commonly in April four or five young, which, like puppies, are born blind.

FOX-GLOVE, in botany, the *Digitalis* of Linnaeus, the species of which are mostly perennials.

FOWL, the largest sort of birds, whether domestic or wild, as geese, pheasants, partridges, &c.; also a full-grown chicken or young hen.

ROWLING, the art of taking or killing birds, either by means of snares or nets, or by various devices, as imitating their voices or using decoy birds and the like.

FRACTION, in arithmetic and algebra, a combination of numbers representing one or more parts of a unit or integer: thus four-fifths is a fraction, formed by dividing a unit into five equal parts, and taking one part four times. Fractions are divided into *vulgar* and *decimal*. Vulgar fractions are expressed by two numbers with a line between them. In these, the figure above the line is called the *numerator*, and the figure below the line the *denominator*. The theory of vulgar fractions is one of the most important in algebra, and a correct understanding of them is of great importance for the proper prosecution of arithmetical and mathematical studies.—*Decimal fractions* include every fraction, the denominator of which is ten, or a power of it. They are usually expressed by writing the numerator only, with a point before it by which it is separated from the whole number; thus .5, which denotes five-tenths, or half the whole number: .25, that is, a fourth part of the whole number.

FRACTURE, in mineralogy, the manner in which a mineral breaks, which is one of its specific characters. The fracture is either compact or smooth, foliated or lamellar, conchoidal, striated, or nodular, &c.—*Fracture*, in surgery, the breaking of any bone by an external act of violence. It is *simple* when the bone only is divided; *compound*, when the bone is broken, with a laceration of the integuments.

FRENUM, in anatomy, a term applied to some membranous ligaments of the body; as, the *frænum linguae*, or ligament under the tongue, which sometimes ties it down too close to the bottom of the mouth, and then requires to be incised or divided, in order to give this organ its proper and free motion.

FRAGA'RIA, in botany, a genus of plants, class 12 *Cossandria*, order 3 *Polygynia*. The species consist of several kinds of strawberries.

FRANC, a French coin, worth twenty sols, or ten-pence sterling.

FRAN'CHISE, in a general sense, signifies some privilege or exemption from ordinary jurisdiction. A franchise may be vested either in bodies politic, or corporations; in borough towns, or in individuals; as the electoral franchise. Corporate liberties being usually held by charter, are all said to be derived from the crown, but some lie in prescription without the help of any charter.

FRANCIS' CANS, Friars-Minor, or Grey-Friars, the religious order of Saint Francis, by whom they were founded about the year 1200.

FRANK, an exemption from paying postage for letters, which before the "penny-postage" bill came into operation, Jan. 10, 1840, was enjoyed to a certain extent by all members of parliament. It is said, that before this act abolished the privilege of *franking*, nine millions of letters were annually sent post-free.—*Frank-free*, a term much used in our old law, as *frankpledge* freemen, who used to be pledges or sureties for the good behaviour of those who were of their community.—*Frank-ferm*, anciently signified lands changed in the nature of the fee by *soffment*, &c. out of the knight's service for other certain yearly services.—*Frank-fold*, is where the lord has the liberty of folding his tenants' sheep within his manor.—*Frank-almoigne*, in law, a tenure by which a religious corporation holds lands to them and their successors for ever, on condition of praying for the soul of the donor.—*Frank-chase*, or *free-chase*, is the liberty of keeping beasts of chase or royal game therein, protected even from the owner of the land himself, with a power of hunting them thereon.

FRANKINCENSE, an odouriferous, dry, resinous substance, procured from the juniper tree in Turkey and the East Indies. It is of a pale yellow colour, very inflammable, and is used as a perfume.

FRANKS, an appellation given by the Turks, and other nations of Asia, to all the people of the western parts of Europe, English, French, Italians, &c.

FRANK'LINITE, a mineral compound of iron, zinc, and manganese, found in New Jersey, North America, and named from Dr. Franklin.

FRATERNITIES, in the middle ages, consisted of pious laymen who formed societies for the purpose of relieving the sick and destitute, and performing other Christian duties.

FRA'TRAGE, in law, a partition among brothers or co-heirs coming to the same inheritance or succession; also that part of the inheritance that comes to the youngest brothers.

FREE-BENCH', in law, a widow's dower in a copyhold estate.

FREE'HOLD, that land or tenement which is held in fee simple, fee tail, or for term of life.—*Freehold in deed* is the real possession of lands, &c. in fee or for life.

THE SWIFT FOX (CANIS VELOX) INHABITS THE VAST PLAINS OF TARTARY, AND HE SPEED CAN SURPASS THE FLEETEST ANTelope.

THE PRIVILEGE OF LETTERS PASSING FREE OF POSTAGE TO AND FROM MEMBERS OF PARLIAMENT WAS ESTABLISHED BY 25 GEO. III.

[FRE]

The Scientific and Literary Treasury;

[FRI]

—*Freehold* in law is the right a person has to such lands or tenements before his entry.

FREEHOLDER, the possessor of a freehold estate, or of a lease for life, worth 40s. per annum, who is thereby qualified to vote for a knight of the shire, or representative of the county in parliament.

FREEMAN, in ancient law, one free from servitude, as distinguished from a vassal or bondman. At the present day, a freeman is one who enjoys the freedom of a city or borough.

FREESTONE, a hard and durable kind of gritstone, but finer sanded, and a smoother stone. It is called free, from its being of such a nature as to cut freely in any direction: such is the Portland-stone, and the freestone of Kent.

FREETHINKER, one who rejects revelation; or, in plain language, a deist. *Freethinking*, in England, first appeared in the form of opposition to abuses in the church, which were attacked in the reign of James II. and William III. It possibly also originated in France from the same cause, but there it assailed all revealed religion; and it is more than probable, that to the example of those revilers of true religion, the pernicious tenets of the free-thinking or deistical school have latterly prevailed to such a frightful extent.

FREEZING, in philosophy, the conversion of a fluid body into a firm and solid mass by the action of cold. Upon the principle of the absorption of heat, are founded the various artificial methods of producing cold and congelation. The process of freezing may be artificially produced by means of the air pump, and sometimes by certain freezing mixtures, or compositions of such ingredients as when mixed with other bodies, cause them to congeal; such as snow and common salt, or muriate of ammonia, nitre and water, &c. Evaporation likewise produces cold. In Spain, a kind of earthen jars, called *busaros*, is used, the earth of which is so porous, being only half-baked, that the outside is kept moist by the water that filters through it; and, though placed in the sun, the water in the jar becomes as cold as ice. It is a common practice in China, to cool wine or other liquors by wrapping a wet cloth round the bottle and hanging it up in the sun. The water in the cloth evaporates, and thus cold is produced. Ice may be produced at any time by the evaporation of ether. Water freezes when the air is 32°; wax solidifies at 150°; lead at 600°; mercury at 39° below zero.

FREIGHT, in navigation and commerce, the hire of a ship, or a part thereof, for the conveyance and carriage of goods from one place to another: or the sum agreed on between the owner and the merchant, for the hire and use of a vessel. In a more extended sense, it means the burden of such ship. Freight being the return made for the conveyance of goods or passengers to a particular destination, no claim arises for its payment in the event of a total loss; and our

law authorities have decided, that in case of a total loss with salvage, the merchant may either take the part saved or abandon. But after the merchant has made his election, he must abide by it.

FRENCH CHALK, in mineralogy, a variety of indurated talc, in masses composed of small scales. It combines with grease, and is useful in drawing.

FRENCH-HORN, a musical wind instrument made of copper. It possesses a range of three octaves, and is capable of producing tones of great sweetness.

FRESCO, a method of painting in distemper or size colours on walls, so as to endure the weather. It is performed with water colours on fresh plaster, so that the colours incorporating with it, and drying on the wall, become very durable. It is asserted that there are specimens of fresco-painting extant of the time of Constantine the Great. It was long neglected, but began to revive in the 15th century; and though Michael Angelo and Raphael produced some noble specimens of the art, it fell into disrepute until the Germans in recent times took it up again.

FRET, in architecture, an ornament consisting of two lists or small fillets variously interlaced or interwoven, and running at parallel distances equal to their breadth.

—*Fret-work* is sometimes used to fill up and enrich flat empty spaces; but is mostly practised in roofs, which are fretted over with plaster-work.—*Fret*, in heraldry, a bearing composed of six bars, crossed and interlaced; by some called a *true lover's knot*.

—*Frets*, in music, certain short pieces of wire fixed on the finger-boards of guitars, &c. at right angles to the strings, and which, as the strings are brought into contact with them by the pressure of the fingers, serve to vary and determine the pitch of the tones. Formerly these frets or stops consisted of strings tied round the neck of the instrument.—*Frette*, a term used by miners to express the worn sides of the banks of rivers in mine countries.

FRIAR, (from the French *frere*, a brother), a term common to monks of all orders; there being a kind of fraternity, or brotherhood, between the several religious persons of the same monastery. Friars are generally distinguished into four principal branches, viz.: 1. Minors, gray friars or Franciscans; 2. Augustines; 3. Dominicans or black friars; 4. White friars or Carmelites.

FRICASEE, a dish of food made by cutting chickens, rabbits, or other small animals into pieces, and dressing them in a frying-pan, or a like utensil.

FRICITION, in mechanics, the rubbing of the parts of engines and machines against each other, by which means a great part of the effect is destroyed. The causes of friction are, 1, the roughness of the contiguous surfaces; 2, the irregularity of the figure, which arises either from imperfect workmanship, or from the pressure of one body on another; 3, an adhesion, or attraction, which is more or less powerful according to

THE MOST POWERFUL MEANS OF ARTIFICIAL REFRIGERATION IS AFFORDED BY THE EVAPORATION OF LIQUEFIED CARBONIC ACID GAS.

THE FREEZING POINT DENOTES THE POINT OF DEGREE OF COLD, SHOWN BY A MERCURIAL THERMOMETER, AT WHICH CERTAIN FLUIDS BEGIN TO FREEZE.

[FRI]

A New Dictionary of the Belles Lettres.

[FRO]

the nature of the bodies in question; and 4, the interposition of extraneous bodies, such as moisture, dust, &c. It is found that the quantity of friction is always proportional to the weight of the rubbing body, and not to the quantity of surface; and that it increases with an increase of velocity, but is not proportional to the augmentation of celerity.—The resistance called *friction* performs important offices in nature and works of art. Were there no friction, all bodies on the surface of the earth would be clashing against one another; but at present whenever a body acquires a great velocity, it soon loses it by friction against the surface of the earth; the friction of water against the surfaces it runs over soon reduces the rapid torrent to a gentle stream; the fury of the tempest is lessened by the friction of the air on the face of the earth; and the violence of the ocean is subdued by the attrition of its own waters.—*Friction*, in medicine, the rubbing any part of the body with the hand, flesh-brush, flannel, or other substance, or with oils, liniments, &c., with a view to the preservation or restoration of health, and which is often found a most efficacious remedy.

FRI'DAY, the sixth day of the week, so called from *Frea*, or *Friga*, a goddess worshipped by the Saxons on this day.

FRI'GATE, a ship of war, light built, and a good sailer. Frigates have two decks, and generally mount from twenty to forty-four guns.

FRIGATOON', a Venetian vessel built with a square stern, without any foremast: it is used in the Adriatic.

FRIENDSHIP, a noble and virtuous attachment between individuals, springing from a pure source: this is *true* friendship. *Fales* friendship may subsist between bad men, as between thieves—a temporary attachment springing from interest, which may change in a moment to enmity and rancour.

FRINGILL'A, in ornithology, a comprehensive genus of birds, of the order *Passerines*, with the beak of a conic sharp-pointed figure, the two chaps of which mutually receive each other. To this genus belong the goldfinch, the chaffinch, greenfinch, yellow-hammer, canary-bird, linnet, sparrow, &c.

FRI'GID ZONES, in geography, the two zones or divisions of the earth, comprehended between the poles and the polar circles. They are the north frigid zone, at the north pole, and the south frigid zone, at the south pole. The frigid zone enjoys an atmospheric calm which is unknown in temperate regions: it has no storms, no hail, and scarcely a tempest; while the splendour of the aurora borealis, reflected by the snow, dispels the darkness of the polar night. The days, for several months, though of a monotonous magnificence, astonishingly accelerate the growth of vegetation. In three days, or rather, three times twenty-four hours, the snow is melted, and the flowers begin to blow.

FRIEZE, or **FRIZE**, in architecture,

that part of the entablature between the architrave and cornice. It is usually enriched with figures of animals or other ornaments of sculpture.—A coarse kind of woollen cloth or stuff.

FRIT, or **FRITT**, in the glass manufacture, the matter or ingredients of which glass is to be made, after they have been calcined or baked in a furnace. It is of different kinds, according to the quality of the glass; but chiefly composed of silice and fixed alkali.

FRITH, an arm of the sea; or the opening of a river into the sea; as, the *Frith* of Forth, the *Frith* of Clyde, &c.—Among the Anglo-Saxons it signified a wood.

FRITH'GILD, in archaeology, a guild-hall; also a company or fraternity.

FRITHSOKEN, in law, a liberty of having frankpledge, or surety of defence.

FRITILLARIA, a genus of plants, class 6 *Hexandria*, order 1 *Monogynia*. The species are bulbous: as, the crown-imperial, Persian lily, &c.

FROG, in zoology, an amphibious animal, of the genus *Rana*, with four legs, a naked body, and no tail. It is remarkable for swimming with rapidity, and for taking large leaps on land. Frogs remain in a torpid state during winter. Besides the common frog, there are a great many other species, the most singular of which is that called the *bull-frog*, a native of the northern parts of America, with four divided toes on the fore feet, and five webbed ones on the hinder. This animal, when the limbs are extended, measures nearly two feet; the trunk of its body being about eight inches long, and four or five in breadth. It is very voracious, and frequently swallows the young of water-fowl, before they have strength to shift for themselves. Its croaking is so loud as to resemble the roaring of a bull heard at a distance, whence its name.

—*Frog*, in farriery, the hard projecting substance in the hollow of a horse's foot.

FROND, in the Linnæan system of botany, a term for a kind of stem which has the branch united with the leaf, and frequently with the fructification.

FRONDES'CENCE, in botany, the precise time of the year and month in which each species of plant unfolds its leaves.

FRON'DOUS, in botany, an epithet for a flower which produces branches charged with both leaves and flowers.

FRONT, in perspective, a projection or representation of the face or forepart of an object, or of that part directly opposite to the eye, which is more usually called the orthography.

FRONTAL, in architecture, a little pediment or front-piece over a small door or window.—In medicine, a preparation to be applied to the forehead.

FRONTALIS, in anatomy, an epithet for a muscle of the forehead, which serves to contract the eyebrows.

FRONT'ATEL, in botany, an epithet for the leaf of a flower, which grows broader and broader, and perhaps terminates in a right line: it is used in opposition to cus-

THE FORCE NECESSARY TO MOVE A WHEEL-CARRIAGE ON A LEVEL ROAD, IS ABOUT ONE TWENTY-FIFTH OF THE LOAD.

ACTION OR PARSING WITH MOTION BY ONE BODY, IS ALWAYS EQUAL TO THE REACTION OR RECEPTION OF IT BY ANOTHER.

[FUEL]

The Scientific and Literary Treasury;

[FUEL]

pidated; that is, when the leaves of the flower end in a point.

FRONTIER, the border, confine, or extreme part of a kingdom or province, bordering on another country. Frontiers were anciently called marches.

FRONTINAC, a species of French wine, named from the place in Languedoc where it is produced.

FRONTIS OS, in anatomy, one of the bones of the skull which joins the bones of the sinuiput and temples by the coronal suture.

FRONTISPIECE, in architecture, the principal face of a building.—An ornamental engraving fronting the first page of a book.

FROST, in physics, that state of the natural world in which the atmosphere so absorbs the caloric from bodies on the surface of the globe, as to leave them, more or less, without fluidity or expansion. Water, like the earth, seems not disposed to receive any very intense degree of cold at a considerable depth or distance from the air; the vast masses of ice found in the northern seas being only many flakes and fragments, which, sliding under each other, are, by the congelation of the intercepted water, cemented together. But near the earth's surface the power of frost is immense: a freezing liquid will burst the strongest vessels in which it is enclosed; and in a severe frost the largest oaks are sometimes known to split.—Frost, being produced by contact with the atmosphere, naturally proceeds from the external parts of bodies inwards; so the longer a frost is continued, the thicker the ice becomes upon the water in ponds, and the deeper into the earth is the ground frozen.—*Hoar-frost* is the dew frozen or congealed early in cold mornings.

FRUCTESCENCE, in botany, the precise time when the fruit of a plant arrives at maturity, and its seeds are dispersed.

FRUCTIFICATION, in botany, the temporary part of vegetables, appropriated to their propagation, consisting of the flower and the fruit.

FRUIT, in a general sense, signifies whatever the earth produces for the nourishment and support of animals; but in a more limited sense, the produce of a tree or other plant; as apples, pears, cherries, melons, &c. The structure and parts of different fruit differ in some things, but in all the species the essential parts of the fruit appear to be only continuations or expansions of those which are seen in the other parts of the tree; and the same fibres are continued to them from the root.

FRUMENTACEOUS, in botany, an epithet for plants that have their stalks pointed, and their leaves like reeds, bearing their seeds in ears, like corn.

FRUSTUM, in mathematics, part of some solid body separated from the rest.—*Frustum of a Cone*, the part of a cone that remains when the top is cut off by a plane parallel to the base; it is otherwise called a *truncated cone*.

FRUTESCENT, in botany, an epithet for that which from herbaceous is becoming shrubby; as a *frutescent* stem.

FRUTEX, in botany, a shrub; a plant having a woody durable stem, but less than a tree.

FUOL, in botany, a genus of plants in the Linnæan system, comprehending most of those which are commonly called seaweeds, from which, when burnt, an impure alkali is procured called kelp.

FUCUS, the name given by the ancients to a sea plant, from which a dye was procured for dyeing woollen and linen cloths.

Fucus is also the appellation of a paint, or composition applied on the face, to beautify it and heighten the complexion. The fucus of the Roman ladies was a kind of white earth or chalk, brought from Chio and Samos, dissolved in water.

FUEL, any matter which serves to feed or maintain fire; as wood, coal, charcoal, peat, &c. From every combustible the heat is diffused either by radiation or direct communication to bodies in contact with the flame. In a wood fire the quantity of radiating heat is to that diffused by the air, as 1 to 3; or it is one fourth of the whole heating power. The radiating heat from charcoal fires constitutes one third of the whole emitted. The heating power of good coke is equal to nine-tenths of that of wood charcoal. And the radiating heat emitted by burning *pit-coal* is greater than that of charcoal. In many cases the hot air which passes into the flues or chimneys may be beneficially applied to heating, drying, roasting, &c.; but care ought to be taken that the draught of the fire be not thereby impaired, and an imperfect combustion of the fuel produced.

FUGITIVE, in literature, short and occasional compositions either in poetry or prose; written in haste or at intervals, and considered to be fleeting and temporary.

FUGUE, in music, a species of composition, in which the different parts follow each other, each repeating in order what the first had performed.

FULCRUM, in mechanics, the prop or support by which a lever is sustained.—In botany, the part of a plant which serves to support or defend it.

FULGURATION, in the art of assaying, is a term by which the sudden brightening of the melted gold and silver in the *cupel* is designated, when the last film of vitreous lead and copper leaves the surface.

FULLER'S EARTH, a soft, friable mass of lithomarge clay, unctuous to the touch, and remarkable for the property of absorbing oil, wherefore it is used by fullers to take grease out of cloth. It is found in great abundance in Bedfordshire, Berkshire, Hampshire, Surry, and some other counties. In order to prepare it for the fuller's use, it is first baked, then thrown into cold water, where it falls into powder, and the separation of the course from the fine is accomplished by a simple method, called washing over.

FULLING, the art of cleansing, scour-

[FUN]

EIGHT-AND-A-HALF PARTS OF GUNPOWDER EXPLODED BY A PERCUSSION CAP, HAVE AN EQUAL FORCE WITH TEN EXPLODED BY A PLAIN LOCK.

ing, and pressing cloths, to make them stronger, closer, and firmer, which is done by means of a water mill, called a *rolling* or *scouring* mill.

FULMAR, in ornithology, a fowl of the genus *Procellaria*, or petrel kind, larger than a gull, possessing the singular faculty of spouting from its bill a quantity of pure oil against its adversary. It inhabits the Hebrides, and feeds on the fat of whales.

FULMINATION, in chemistry, explosion or detonation, accompanied with a very considerable degree of sound. All these equally imply rapid decomposition with or without flame, and the intensity of sound alone distinguishes the idea of *fulmination* from those of *detonation* and *explosion*.—*Fulmination* is also used for the denunciation, or execution of a sentence of anathema; as the *fulminations* of the Vatican.

FULMINATING POWDER, a powder that explodes upon the application of certain degrees of heat, with instantaneous combustion, and prodigious sound. These are sometimes made with metals, and sometimes without; as, for instance, the *fulminating powder*, which is made of nitre, potash, and the flowers of sulphur, triturated in a warm mortar. If this powder be fused in a ladle, and then set on fire, it will explode with a noise like thunder. If a solution of gold be precipitated by ammonia, the product will be *fulminating gold*, a grain of which, if held over a flame, will explode with a sharp loud noise. But of all these explosive compounds, that which in a manufacturing point of view is the most useful, is the *fulminate* of mercury, now so extensively used as a priming to the caps of percussion locks.

FULMINIC ACID, in chemistry, the explosive constituent of *fulminating mercury* and *fulminating silver*, being generated by the reaction of alcohol and the acid nitrates of these metals. All attempts to insulate *fulminic acid* have proved unsuccessful, as it explodes with the slightest decomposing force.

FUMIGATION, a process by means of which the nitrous and other mineral acids, in a state of vapour, are dispersed through any place, in order to purify apartments, goods, or articles of apparel supposed to be imbued with some infectious or contagious poison or fumes. The most effectual agents for this purpose are chlorine gas, *muratic acid* gas, or *nitric acid* vapour.

FUNCTION, any office, duty, or employment belonging to a particular station or character; as, the *functions* of a judge, a bishop, &c.—*Functions*, applied to the actions of the body, are divided into *vital*, *animal* and *natural*. The *vital functions* are those necessary to life, and without which the individual cannot subsist; as the motion of the heart, lungs, &c. The *natural functions* are such as we cannot subsist any considerable time without; as the digestion of the aliment, and its conversion into blood. Under *animal functions* are included the senses of touching, tasting, &c. memory, judgment, and voluntary mo-

tions, without any of which an animal may be said to exist, though under great privations. In short, all parts of the body have their own functions, or actions peculiar to themselves. Life consists in the exercise of these functions, and health in the free and ready exercise of them.—*Function*, in algebra, denotes any compound quantity; and when one of the component quantities is variable, it is said to be a *variable function*.

FUNDS, a term adopted by those who speak of the public revenue of nations, to signify the several taxes that have been laid upon commodities, either by way of duties of custom, or excise, or in any other manner, to supply the exigencies of the state, and to pay interest for what sums it may have occasion to borrow.—The capital stock of a banking institution, or the joint stock of a commercial or manufacturing house, constitutes its *funds*; and hence the word is applied to the money which an individual may possess, or the means he can employ for carrying on any enterprise or operation.—The *Funding system* commenced in England shortly after the Revolution of 1688, and as the sums were at first borrowed for short periods, and partially repaid, the first transaction which assumed the character of a permanent loan was when, at the establishment of the Bank of England, in 1693, its capital, then amounting to 1,200,000*l.*, was advanced to the government.—A *sinking fund* is a sum of money appropriated to the payment of the public stock, or the payment of the public debt.

FUNERAL RITES, ceremonies accompanying the interment or burial of any person. These rites differed among the ancients according to the different genius and religion of each country. The ancient Christians testified their abhorrence of the pagan custom of burning the dead; and always deposited the body entire in the ground; and it was usual to bestow the honour of embalming upon the martyrs, at least, if not upon others.

FUNERAL GAMES. The celebration of these games among the Greeks, mostly consisted of horse-races: the prizes were of different sorts and value, according to the quality and magnificence of the person that celebrated them. The garlands, given to victors on this occasion, were usually of parsley, which was thought to have some particular relation to the dead. Among the Romans, the funeral games consisted chiefly of processions; but sometimes also of mortal combats of gladiators, around the funeral pile.

FUNGATE, in chemistry, a compound of fungic acid and a base.

FUNGIC ACID, in chemistry, an acid obtained from mushrooms.

FUNGIN, the fleshy part of mushrooms, now considered as a peculiar vegetable principle.

FUNGITE, a kind of fossil coral.

FUNGIFORM, in mineralogy, having a termination similar to the head of a fungus.

ALL REAL MUSHROOMS HAVE A PLEASANT TASTE, AND MAY THEREBY BE DISTINGUISHED FROM ANY KIND OF FUNGUS THAT IS POISONOUS.

[GAE]

The Scientific and Literary Treasury;

[GAE]

FUNGUS, in botany, an order of vegetables, belonging to the *cryptogamia* class of Linnaeus. The fungi have so little of the common and general appearance of vegetables, that many have denied them to be such, and contended for their being only excrementous matter, protruded from decaying vegetables of other kinds. The word is also applied to excrescences on plants.—In surgery, the term *fungus* is applied to any morbid excrescence, whether in wounds or arising spontaneously.

FURLONG, a long measure, equal to 1-8th of a mile, or forty poles. It is also used in some law-books, for the eighth part of an acre.

FURLOUGH, leave granted to a non-commissioned officer or soldier to be absent for a given time from his regiment.

FURNACE, an apparatus for melting metals, &c., variously constructed, according to the nature of the substance which is to be heated or rendered liquid by fusion. It must of course be capable of transferring great heat to bodies, and consist of a suitable fire-place, and receptacles to contain the articles to be operated upon; and sometimes supplied with a dome, so as to reverberate the heat and flame. In the smelting of some ores, several different kinds of furnaces are necessary; in the copper works, for instance, there is the calcining, the melting, the roasting, the refining, and the igniting furnaces.

FUSEE, a small tube, filled with combustible materials, by which fire is communicated to the powder in a bomb; but as its contents burn slowly, time is given before the charge takes fire, for the bomb to

reach its destination. *Fusée* was also till lately used for a small neat firelock; but *fusil* is the more modern word.—*Fusée*, the cylinder round which the chain of a clock, watch, or jack, is wound.

FUSION, the liquefaction of a solid body by means of heat; as in the case of metals, glass, and similar bodies. Those substances which admit of being fused are termed *fusible*, but those which resist the action of fire or heat are termed *refractory*.

—*Watery fusion*, the melting of certain crystals by heat in their own water of crystallization.

FUSILEER, a soldier belonging to what is termed the light infantry; they were formerly armed with a *fusil*; but they are not now so distinguished, their muskets being like the rest.

FUSTIAN, a kind of coarse thick tweeled cotton, which is generally dyed of an olive, leaden, or other dark colour.—In literature, an inflated style of writing, in which high-sounding and bombastic terms are used, instead of such as are natural, simple, and suited to the subject.

FUSTIC, the wood of a species of mulberry (*Morus tinctoria*), a large tree growing in most parts of South America, in the United States, and the West India islands. It is very extensively used as an ingredient in the dyeing of yellow; for which purpose large quantities of it are annually imported. There is another kind, called *Zante*, or *young fustic*, which is a small shrub, of the sumach species. This imparts a beautiful bright yellow dye to cottons, &c., which, when proper mordants are used, is very permanent.

G.

G, the seventh letter in the English alphabet; but in the Greek, and all the oriental languages, it occupies the third place. It is a mute, and cannot be sounded without the assistance of a vowel. It has a hard and a soft sound, as in *game*, and *gesture*; and in many words, as in *sign*, *reign*, &c. the sound is not perceived. As a numeral it formerly stood for 400, and with a dash over it, for 400,000. **G**, in music, is the nominal of the fifth note in the natural diatonic scale of **C**, and to which Guido applied the monosyllable *sol*. It is also one of the names of the highest cliff.

GABIONS, in fortification, baskets made of osier-twigs, of a cylindrical form, six feet high, and four wide; which, being filled with earth, serve as a shelter from the enemy's fire.

GABRONITE, in mineralogy, a yellowish stony substance, distinguished by the large quantity of soda it contains.

GAD, among miners, a small punch of iron, with a long wooden handle, used to break up the ore.

GAD'FLY, an insect of the genus *Estrus*, which deposits its eggs on the backs of horses and other cattle. It is sometimes called the *breeze*.

GADOLINITE, a mineral, usually found in amorphous masses, and having the appearance of vitreous lava. It contains a new earth, called *yttria*.

GAD'US, in ichthyology, the Cod-fish. There are 28 species of this genus, the most important is the *Gadus morhua*, or common cod, which inhabits the northern seas of Europe and America, in innumerable shoals.

GAELIC, or **ERSE**, is the name of that dialect in the ancient Celtic language, which is spoken in the Highlands of Scotland. It is a generally received opinion, that the Celtic, at the time of the Roman invasion, was universally spoken over the

THE ROMANS BUILT THEIR IRON FURNACES OF HIGH HILLS, THAT THE FORCE OF THE WIND MIGHT SERVE IN LIEU OF BELLOWS.

SOME YEARS AGO A CHAPEL WAS OFFERED IN LONDON FOR THE PERFORMANCE OF DIVINE WORSHIP IN THE GAELIC TONGUE.

A New Dictionary of the Useful Letters.

[GAL

BY THE GALACTOMETER, WE FIND THAT THERE IS, IN CREAM, A LESS SPECIFIC GRAVITY THAN THE SAME MILK WHEN SKIMMED.

west of Europe; for, although divided into a variety of dialects, yet they all show the clearest proofs of a common origin. The Gaelic, which, from a variety of causes, has retained much of its original purity, is bold, expressive, and copious. It derives no assistance from the languages either of Greece or Rome, from which it differs in its structure and formation. More than two-thirds of the names of places in Great Britain and Ireland are of Celtic origin, which, if other proofs were wanting, would establish the fact of its once having been the language of the country.

GAFF, in nautical language, a sort of boom or pole, used to extend the upper edge of the sails, as in the main-sail of a sloop, &c.

GAGE, or GAUGE, an instrument for ascertaining measures of different kinds; as, a *sliding-gage*, used by mathematical instrument makers for measuring and setting off distances; a *wind-gage*, an instrument for measuring the force of the wind on any given surface; a *tide-gage*, for determining the heights of tides; and various others.

GAIL'LIARDE, an ancient Italian dance, of a sportive character and lively movement. It was sometimes called *Romanesque*, because it was said to have come originally from Rome.

GAL'ACTIN, in chemistry, that which constitutes the principal substance in the sap of the cow-tree, or *galactodendron utile* of South America, where it is used as a substitute for cream. The sap, on standing, throws up a white matter, which, after being well washed, and dried *in vacuo*, over sulphuric acid, constitutes galactin. It is yellow, translucent, brittle, has a resinous appearance, and is tasteless.—The cow-tree of Guiana produces a glutinous, milky fluid, like an animal. It frequently grows upon the sides of a rock, and has dry coriaceous leaves. For several months of the year, its foliage is not moistened by a single shower of rain, and its branches appear entirely dried up; but, upon piercing the trunk, particularly at the rising of the sun, there flows a sweet and nourishing yellow juice, having a balsamic perfume, with many of the qualities of milk. In the morning, the natives of the country in which this vegetable fountain grows, visit it with bowls, in which they carry home its milk for their children: so that this tree, says Humboldt, seems to present the picture of a shepherd, distributing the milk of his flock. Akin to this, is a milk tree called *Hya-hya*, in Demerara, which is described by Mr. Smith, its European discoverer, to yield a copious stream of thick, rich, milky fluid, destitute of all acrimony, and only leaving a slight clamminess upon the lips. A tree which was felled on the banks of a small stream, had completely whitened the water in an hour or two. Dr. Christison finds the milk to consist of a small portion of casein, and a large proportion of a substance possessing in some respects peculiar properties, which

appear to place it intermediate between casein and the resins: its nutritive qualities are therefore extremely slight, or at least very questionable.

GALACTITE, a fossil substance resembling French chalk in many respects, but when immersed or triturated in water, having the colour of milk.

GALACTOMETER, or LACTOMETER, an instrument for ascertaining the quality of milk.

GALAXY, in astronomy, the *Via Lactea*, or *Milky Way*; a long, white, luminous track, which seems to encompass the heavens like a girdle; forming nearly a great circle of the celestial sphere. This, like every other phenomenon of nature, has supplied the poet with many a fantastic, and many a beautiful dream. The invention of the telescope has confirmed the conjecture of sciences, that it consists in a multitude of stars, too remote to be separately distinguished by the naked eye. Dr. Herschel says, that in the most crowded part of the Milky Way he has had fields of view that contained no less than 588 stars, and these were continued for many minutes, so that, in a quarter of an hour, he has seen 116,000 stars pass through the field of view of a telescope of only 15' aperture; and at another time, in forty-one minutes, he saw 258,000 stars pass through the field of his telescope.

GAL'BANUM, in medicine, the concrete juice of the *Bubon galbanifera*, a shrubby plant, belonging to the natural order *Umbellifera*, and is usually imported from Syria, Persia, and the East-Indies. This gum-resin comes in large, soft, ductile masses, of a whitish colour, and possessing an acrid, bitter taste, with a disagreeable odour. In its medical properties, it is intermediate between ammoniac and assafetida.

GALENA, in mineralogy, the sulphuret of lead, found both in masses and crystallized. It occurs in primitive and transition mountains, but is more frequently found in secondary rocks, especially in compact limestone. It constitutes beds and veins; and is found more or less in every country: in England it is very abundant; and it is also widely dispersed over the United States of America. Most of the lead of commerce is obtained from galena, and usually contains a little silver. [See LEAD.]

GALENIC, in medicine, that manner of proceeding in medicine which is founded upon the principles of Galen, or which that physician introduced.—*Galenical medicines*, those that are formed by the easier preparations of vegetables; as by infusion, or decoction, or by combining and multiplying ingredients; while the *chemical*, to which they are opposed, are those produced by extracting the more intimate and remote virtues by means of fire and elaborate preparations, as calcination, digestion, fermentation, &c.

GALL, in natural history, a protuberance or tumour produced by the puncture of in-

GALLS ARE THE MOST POWERFUL OF ALL THE VEGETABLE ASTRINGENTS, AND ARE FREQUENTLY USED WITH GREAT EFFECT IN MEDICINE.

[GAL]

The Scientific and Literary Treasury ;

[GAL

sects, on plants and trees of various kinds, but more particularly on the oak.—**GALL-FLY.** There are a multitude of insects which form these excrescences, the principal of which is the *cynips*. Like others of the genus, the female pierces a branch, and deposits an egg in the interior, around which, in the course of a few days, an excrescence is thrown out, affording nourishment to the young insect, and protecting it from external injury until it has attained its full size, when after having undergone metamorphoses, it penetrates the sides of the excrescence, and comes out into the open air.

GALL-BLADDER, a membrane situated in the concave side of the liver, the use of which is to collect the bile, first secreted in the liver, and mixing it with its own peculiar produce to perfect it farther, to retain it together a certain time, and then expel it.

GALL-STONES, calculeous concretions frequently formed in the gall-bladder, and sometimes occasioning great pain in their passage through the ducts into the *duodenum*, before they are evacuated.

GALLEON, vessels of war formerly used by the Spaniards and Portuguese. In more recent times, those vessels were called *galloons*, in which the Spaniards transported treasure from their American colonies.

GALLERY, in architecture, a long, narrow room, the width of which is at least three times less than its length; by which proportion it is distinguished from a *saloon*. Corridors are sometimes also called *galleries*.—*Galleries* are generally decorated with pictures in oil or *fresco*: hence a large collection of pictures, even if contained in several adjoining rooms, is called a *gallery*.

Gallery, in fortification, a covered walk across a ditch in a besieged town, made of strong planks and covered with earth. It was formerly used for carrying a mine to the foot of the ramparts.—*Gallery (of a mine)*, a narrow passage, or branch of a mine carried on underground to a work designed to be blown up.—*Gallery (in a ship)*, a balcony, projecting from the stern of a ship of war, or of a large merchantman.

GAL'LEY, a kind of low, flat-built vessel, furnished with one deck, and navigated with sails and oars, particularly in the Mediterranean.—An open boat used on the Thames by custom-house officers, &c.—The cook-room or kitchen of a ship of war.—The war-galleys, or *naves longæ*, of the Romans, were variously named from their rows or banks of oars.—*Galley slave*, a person condemned to work at the oar on board a galley, being chained to the deck.—In France, the *galleys* resemble the *hulks* of Great Britain, in which the convicts labour and are confined.

GALLIC ACID, in chemistry, the peculiar acid extracted from gall-nuts. It is slightly acidulous and styptic to the taste, inodorous, crystallizing in white silky needles, and soluble in boiling water or alco-

hol. Its principal constituents are carbon and oxygen.—When an infusion of galls is dropped into a solution of sulphate of iron, it produces a deep purple precipitate, which is a very long time in subsiding. It becomes black by exposure to the air; and in writing ink, this precipitate is retained in suspension by mucilage.

GALLICAN, any thing belonging to France: thus the term gallican church denotes the church of France, or the assembly of the clergy of that kingdom.

GALLICISM, an idiom or phrase of the French language, introduced in speaking or writing another language.

GALLINÆ, in ornithology, the fifth order of birds, under which are comprehended the peacock, pheasant, turkey, partridge, grouse, the domestic cock, &c.

GALLIOT, a small galley or Dutch vessel, carrying a main and mizen-mast, and a large gaff-main-sail; built very slightly, and designed only for chase. It can both sail and row, and has sixteen or twenty oars. All the seamen on board are soldiers, and each has a musket by him on quitting his oar.

GALLINA'CEOUS, an appellation given to the birds of the order *Gallina*.

GAL'LON, a measure of capacity both for dry goods and liquids, containing four quarts.

GALLOON, a narrow thick kind of ferret, or lace, used to edge or border cloths.

GAL'LOP, the swiftest pace of a horse, which is made by springs or leaps; but it may also be a moderate pace, at the pleasure of the rider.

GALLOPA'DE, in the manege, a side-long or curvetting kind of gallop. Also the term for a sprightly and active kind of dance.

GAL'LY, in printing, a wooden or metal frame, into which the compositor empties the lines out of his *composing-stick*, and in which he ties up the page when it is completed.

GAL'VANISM, the development of electrical phenomena without the aid of friction, and in which a chemical action takes place between certain bodies. It derived its name from Galvani, a professor at Bologna, who, in a course of experiments on animal irritability, observed the first striking phenomena which led to its discovery. It occurred in the following manner:—One of his assistants happened to bring the point of his scalpel to the crural nerves of a skinned frog lying near the conductor, upon which the muscles of the limb were agitated with strong convulsions. After this, he continued his experiments in various ways, and ascertained that the mere agency of metallic substances, provided they were dissimilar metals, would produce such convulsions. This subject engaged the attention of experimentalists both before and after the death of M. Galvani, which happened in 1798; but none added any thing materially to his discovery except M. Volta, who repeated the experiments of the former, and found that when two pieces of metal of dif-

[FLO]

THE DIFFERENCE BETWEEN ELECTRICITY AND GALVANISM ARISES MERELY FROM THE BREADTH OF THE STRATA OF THE ELECTRIC CURRENT.

ferent kinds were placed in different parts of an animal, and were either brought into contact or into connexion by means of a metallic arc, convulsions ensued every time, and that this effect was strongest when the metals were zinc and silver, particularly when several pairs of metals were employed, having pieces of moist cloth between them. This led him to the idea of constructing a battery, for the purpose of accumulating electricity, which has since been called the galvanic battery, or voltaic pile. Several improvements upon the voltaic pile were soon made by other philosophers; and the discoveries in galvanism multiplied with a rapidity, and to an extent, surpassing any thing before known in the history of science.—Though it is impossible to do more than give a feeble outline of the discoveries in galvanism in our confined limits, we may still be able to allude to the principal of them. We begin by observing, that the simple contact of different conducting bodies is all that is necessary for the excitement of galvanic electricity. 1. The least complicated galvanic arrangement is termed a *simple galvanic circle*. It consists of three conductors; of which one, at least, must be solid, the second fluid, and the third may be either solid or fluid. This is possessed but of feeble powers, yet they are often sufficiently obvious. 2. *Compound galvanic circles, or galvanic batteries*, are formed by multiplying those arrangements which compose simple circles. Thus, if slates of zinc and of silver, and pieces of woollen cloth of the same size as the plates, and moistened with water, be piled upon each other in the order of zinc, silver, and cloth, and these repeated twenty or thirty times, we have the voltaic pile, the power of which is sufficient to give a smart shock; which shock may be renewed at pleasure, until after a few hours, when the activity of the pile begins to abate, and finally ceases altogether. But the galvanic apparatus, by far the most convenient, and generally used, was invented by Mr. Cruickshank. This is called the *galvanic trough*, which has the advantage of being more easily put in action than the pile, and, as it contains more liquid, can be longer continued in action, and is more energetic. For ordinary experiments, a trough containing fifty pairs of plates, four inches square, is sufficient. In those cases where a greater power is wanted, it may be commanded by uniting the power of several such troughs through the union of the zinc end of one trough with the copper end of another, by a metallic slip or wire. The battery of the Royal Institution, with which Sir Humphry Davy made his great discoveries, is composed of 3000 pairs of plates, each plate having thirty-two square inches of surface. But various improvements and modifications of this battery have been invented by Dr. Wollaston, Mr. Children, and others. The size of the plates composing the galvanic series have been varied from one or two inches square to that of a great number of feet. The bat-

tery of Mr. Children consisted of twenty pairs of copper and zinc plates, each plate being six feet long by two feet eight inches broad.—*Chemical Effects of Galvanism.* The most simple chemical effect of the galvanic battery is the ignition and fusion of metals; the facility of being ignited, in the different metals, being inversely proportional to their power of conducting heat. Hence platinum, which has the lowest conducting power, is most easily ignited; and silver, which conducts heat with greater facility than any other metal, is ignited with more difficulty than any of the rest. The most striking effect of the voltaic battery, however, is the intense light which is produced by placing two pieces of charcoal, cut into the shape of pointed pencils, at the two ends of the wires of an interrupted circuit. When the battery is a very powerful one, and the charcoal points are brought within the thirtieth or fortieth of an inch of each other, a bright spark is produced. By withdrawing the points from each other, a constant discharge takes place, through the heated air, in a space from one to four or more inches, according to the energy of the apparatus, producing a most brilliant arch of light, of considerable breadth, and in the form of a double cone. Platinum introduced into this arch melts as wax does in the flame of a candle; and the light equals the brilliancy of the sun. But the most important chemical effect of galvanism is that of producing decomposition. The substance first decomposed by it was water. When two gold or platinum wires are connected with the opposite poles of a battery, and their free extremities are plunged into the same cup of water, but without touching each other, hydrogen gas is disengaged at the negative wire, and oxygen at the positive side. By collecting the gases in separate tubes as they are formed, they are found to be quite pure, and in the exact proportion of two measures of hydrogen to one of oxygen. In decomposing water or any other compound, the same constituent principle is always disengaged on the same side of the battery; so that the principles which collect around each pole have a certain analogy; inflammable bodies, alkalies, and earths, go to the negative side, while oxygen and acids go more to the positive side. It is also found, that not only are the elements of a compound fluid separated by galvanic energy, to the opposite wires in distant parts of the containing vessel, without the movement of these elements being perceptible, but that the elements may even be evolved in separate portions of the fluid placed in distinct vessels, and connected only by some slight link, as a few fibres of moist cotton or amianthus. Many phenomena, indeed, still more extraordinary, present themselves in connexion with these interesting experiments. The elements of compound bodies are actually conveyed, by the influence of the electric current, through solutions of substances, on which, under other circumstances, they

VEGETABLES ARE BELIEVED TO DERIVE THEIR SUPPORT, BY A GALVANIC PROCESS, AS MUCH FROM THE ATMOSPHERE AS FROM THE SOIL.

[GAN]

BY THE STATUTE OF 25 GEO. III. CERTIFICATES ARE GRANTED FOR KILLING GAME, AND PENALTIES ENFORCED FOR VIOLATION OF THE ACT.

would have exerted an immediate and powerful chemical action, without any such effect being produced. Acids, for example, may be transmitted from one cup, connected with the negative pole, to another cup on the opposite or positive side, through a portion of fluid in an intermediate cup tinged with any of the vegetable coloured infusions, which are instantly reddened by the presence of an acid, without occasioning the slightest change of colour. The same happens also with alkalies. Not only liquids, but solid substances, are decomposed by means of the galvanic energy, and their elements transferred to the opposite wires. And such is the force of this agent, that the most minute portion of a substance thus acted on by either of the wires is collected around it. From these researches, then, the general law is established, that when compounds are placed in the galvanic circuit, their elements are separated from the state of combination in which they exist, and, according to their peculiar nature, are collected,—some around the positive, others around the negative pole; but whether this is effected by attractions, repulsions, or by both, is not yet satisfactorily ascertained. In conclusion, we may observe, that the subject is continually engaging the attention of the scientific world, and that the theory and practice of galvanism must of necessity become more and more completely understood.—[See ELECTRICITY, MAGNETISM, AND VOLTAIC ELECTRICITY.]

GALVANOMETER, an instrument or apparatus for measuring minute quantities of electricity, or the operations of galvanism.

GAMBOGE, a gum-resin, being the inspissated juice of the *Garcinia gambogia*, a large tree growing in the East Indies, Ceylon, &c. It is obtained in commerce in masses of a dull orange colour, possessing no smell, and a slightly acrid taste; and affords a beautiful yellow colour, much used by painters. Its medicinal properties are violently cathartic.

GAME, all sorts of birds and beasts that are objects of the chase.—*Game Laws*. In England laws have been enacted to secure to certain privileged classes the right of hunting and shooting wild birds and animals, and preventing their being destroyed, or sold in the market; and it is believed that nothing has been so fertile a source of crime, among the lower orders, as these enactments. The game laws are justified upon the assumption, that beasts of the chase and game are a sort of unappropriated chattels, and so belong to the crown; and, accordingly, that it is no infringement of the right of any subject to grant to other subjects the privilege of killing them. Another reason which has been urged in favour of these laws, is the preservation of game; but this may be as effectually done by prohibiting all persons from destroying game at certain seasons of the year. By a recent enactment, however, for licensing the sale of game, some

of the principal objections to the game laws have been obviated.

GAMES, in antiquity, were public diversions, or contests, exhibited on certain occasions, as spectacles for the gratification of the people. Such, among the Greeks, were the Olympic, Pythian, Isthmian, and Nemean games; and, among the Romans, the Apollinarian, Circensian, Capitoline, &c. The Romans had three sorts of games, viz. sacred, honorary, and ludicrous. The first were instituted in honour of some deity or hero; the second were those exhibited by private persons, to please the people; as the combats of gladiators, the scenic games, and other amphitheatrical sports. The ludicrous games were much of the same nature with the games of exercise and hazard among us; such were the *ludus Trojanns*, *tesseus*, &c. By a decree of the Roman senate, it was enacted, that the public games should be consecrated, and united with the worship of the gods as a part thereof; whence it appears, that *tesseus*, sacrifices, and games, made up the greatest part, or rather the whole, of the external worship offered by the Romans to their deities.

GAM'UT, or **GAM'MUT**, in music, the table or scale of notes laid down by Guido, and marked by the monosyllables *ut, re, mi, fa, sol, la*; also the first note in the scale.

GANG, in seaman's language, a select number of a ship's crew appointed on any particular service.

GANG'LION, in surgery, a hard movable tumour, in the external or internal part of the carpus, upon the tendons or ligaments in that part, usually unattended with pain.—In anatomy, a small circumscribed tumour, found in certain parts of the nervous system.

GAN'GRENE, in medicine, the first stage of mortification, before the life of the part is completely extinct; when the part is completely dead, it is termed *sphacelus*.

GANGUE, in mining, the earthy, stony, saline, or combustible substance, which contains the ore of metals, or is only mingled with it, without being chemically combined.

GANG'WAY, among seamen, the name of several ways or passages from one part of a ship to another; but it is especially applied to a range of planks laid horizontally along the upper part of a ship's side from the quarter-deck to the forecabin; it is fenced on the outside by iron stanchions, and ropes, rails, or netting.—To bring up to the gangway, is to punish a sailor by seizing and there flogging him.

GAN'NET, in ornithology, the Solan Goose, a fowl of the genus *Feticanus*, with a straight bill, about six inches long, and palmated feet. These fowls frequent the sales of Scotland in summer, where they feed on herrings and other fish. They migrate to the southward in the winter, and appear on the coast of Portugal; but in the breeding season they are found in immense numbers in the Orkneys, and in some

GAMBOGE IS SOMETIMES USED BY CONFECTIONERS TO COLOUR THEIR LIQUEURS, BUT IT IS A PRACTICE MUCH TO BE REPRIMENDED.

[GAR]

A New Dictionary of the Belles Lettres.

[GAR]

parts they form the chief food of the inhabitants.

GANTLET, or **GAUNTLET**, a large kind of glove, made of iron, and the fingers covered with small plates, formerly worn by cavaliers, armed at all points.—To *throw the Gantlet*, is a proverbial phrase, signifying to challenge or defy. The expression derives its origin from the days of chivalry, when he that challenged an opponent in the lists threw down his glove, and he that accepted the challenge took it up.

GANTLOPE, or **GANTLET**, in military affairs, an old punishment in which the criminal, running between the ranks, received a lash from every man. A similar punishment is used on board of ships; but it is seldom inflicted, except for such crimes as are calculated to excite general antipathy among the seamen.

GARNET, in mineralogy, a precious stone of great beauty, usually occurring in crystals more or less regular, and having numerous sides. Its predominating forms are rhomboidal, dodecahedron, and the trapezohedron; its prevailing colour is red of various shades, but often brown, and sometimes green, yellow, or black. *Precious Garnet* is always red, and its crystals are found imbedded in various forms. Fine specimens are found in Ceylon, Pegu, Brazil, &c. The term *oriental* sometimes applied to this variety, indicates not a locality, but merely a great degree of perfection. Garnets are usually disseminated, and occur in all the primitive strata from gneiss to clay slate. In some parts of Germany garnets are so abundant as to be used as fluxes to iron ores; in others, the garnet gravel is washed, pounded, and employed as a substitute for emery. The several varieties have the names of the *precious* or *oriental*, the *pyrope*, the *topazolite*, the *melanite*, the *grossular*, the *pyramite*, and the *colophonite*.

GAOL DELIVERY, a term in law for the clearing of a prison by a judicial condemnation or acquittal of the prisoners; also a commission from the king to deliver or clear the gaols.

GARDENING, that branch of cultivation which teaches us how to dispose fruit-trees, flowers, and herbs, to the best advantage, whether for profit or pleasure; and directs us how to prepare the soil for sowing the different kinds of seeds, as well as how to treat the plants, during their various stages of vegetation, till they repay our care by the produce they yield when arrived at maturity. The general disposition of a garden, and of its parts, ought to be accommodated to the different situations of the ground, to humour its inequalities, to proportion the number and sorts of trees and shrubs to each part, and to shut out from the view of the garden no objects that may become ornamental. We read of the "hanging gardens" and embowered grottoes of ancient times, and of Pliny's Tuscan villa, during the luxurious era of Roman greatness: but it is clear,

that whatever the art of gardening had produced among them, was, with every other trace of refinement, swept away by the barbarians who devastated Italy. The Troubadours of the middle ages speak of symmetrical gardens; yet, though they may have been very agreeable places, we have no reason to suppose them to have exhibited much of the skill of the scientific gardener. At a later period a new taste in gardening prevailed, which had its origin in France. Regularity was carried to excess; clipped hedges, alleys laid out in straight lines, flower-beds tortured into fantastic shapes, trees cut into the form of pyramids, birds, animals, &c. were the order of the day. The Dutch imitated the French, and the English soon after adopted the unnatural fashion; but to their credit be it remembered, the English were the first who felt the absurdity of this style, and the first to abolish it. But in reforming this petty, cramped, and unnatural character, we fell into the opposite extreme; for every appearance of regularity was rejected as hurtful to the beauty of nature, and it was forgotten, that if in a garden we want nothing but nature, we had better leave gardening altogether. The true style of gardening lies between the two extremes. A gardener ought to study nature, to learn from her the principles and elements of beauty, as the painter is obliged to do; but it is by no means a reproach to a garden, that it allows the traces of art.—In Mr. Repton's work on "Landscape Gardening and Landscape Architecture," lately edited by Mr. Loudon, are the following pertinent observations relative to the improved taste which, during the last century, has been manifested in the residences and domains of the English aristocracy. Having spoken of the quadrangular courts, surrounded by lofty walls, &c. which formerly met the view, and were considered as necessary appendages to the mansions of the great, he says, "It is now acknowledged that gloom is not necessary to magnificence, that liberty is not incompatible with greatness, and that convenience is not the sole object of ornament; for though such things as are useful may occasionally be ornamental, it does not follow that ornaments must always be useful; on the contrary, many of those productions of the polite arts which are most admired, are now merely considered ornaments, without any reference to their original uses. This is confessedly the case with works of painting and sculpture (except in that inferior branch of each which relates to portraits), for whatever might be the original uses of pictures or statues, they are now only considered as ornaments, which, by their number and excellence, distinguish the taste, the wealth, and dignity of their possessors. To use these internal marks of distinction only, might be prudent in those countries where it would be dangerous to display any external ornaments of grandeur; but rank and affluence are not crimes in England; on the contrary, we expect to see a marked

[GAS]

difference in the style, the equipage, and the mansions of wealthy individuals; and this difference must also be extended to the grounds in the neighbourhood of their mansions, since congruity of style and unity of character are amongst the first principles of good taste."

GAR-FISH, or **SNA-NEEDLE**, in ichthyology, a long, slender fish, with a flat head, projecting forward into a very long, sharp snout. The sides and belly are of a bright silvery colour, the back is green, and the lower jaw projects considerably beyond the upper.

It makes its appearance on the English coast just previous to the arrival of the mackerel, whose taste it resembles. **GARLIC**, a plant of the genus *Allium*, having a bulbous root, consisting of many small tubercles included in its coats. It has a strong smell and an acrid taste, but is much used for food.

GARTER (ORDER OF THE), a military order of knighthood, said to have been first instituted by Richard I. at the siege of Acre, where he caused twenty-six knights, who firmly stood by him, to wear thongs of blue leather about their legs. It is also understood to have been perfected by Edward III., and to have received some alterations, which were afterwards laid aside, from Edward VI.; but the number of knights remained as at first established, till the year 1786, when it was increased to thirty-two. This order is never conferred but upon persons of the highest rank. The habit and ensigns of this order are the garter, mantle, esp, and collar. The badge of the order is the image of Saint George, called the George; and the motto is *Honi soit qui mal y pense*, or "Evil to him that evil thinks hereof." A vulgar story (says Hume) prevails, but is not supported by any ancient authority, that, at a court ball, Edward the Third's mistress, commonly supposed to be the countess of Salisbury, dropped her garter; and the king, taking it up, observed some of the courtiers to smile, as if they thought he had not obtained this favour by accident; upon which he called out *Honi soit qui mal y pense*.

GAS, a general term employed in chemistry to express all permanently elastic aerial fluids, whether produced by chemical experiments, or evolved in natural processes; but it does not include those aerial substances which arise from water, ether, &c., on the application of heat, because they are readily condensed into their respective fluids again, by a certain reduction of temperature, whereas the gases retain their elasticity in every variation of the temperature and pressure of the atmosphere. Every gas, in fact, consists of some ponderable base or substance, which is maintained in its aeriform state by means of heat or caloric; and each has its distinguishing characters constituting its base. Each kind of gas has also its own peculiar and uniform specific gravity, or weight, although they are all several hundred times lighter than water. They possess many extraordinary properties, and play an im-

portant part in almost all chemical, and in many natural phenomena; on which account we will briefly describe some of the most remarkable;—1. If a quantity of common atmospheric air is enclosed in an inverted glass over mercury, and burning phosphorus is introduced into it, and its introduction repeated till it ceases to burn, it is found, upon measurement, that the portion of air enclosed in the glass is diminished twenty-one parts in the hundred, while seventy-nine remain; and this residue will not support combustion, or maintain animal life, for fire goes out, and animals are suffocated by being placed in it. These twenty-one parts consist of a peculiar kind of air or gas, formerly termed *vital air*, but since named *oxygen*, from its being found to enter into the composition of all acids then known. The remaining seventy-nine parts consist of another peculiar gas, called *azote*, or *nitrogen gas*. Now if a half-extinguished taper is introduced into pure oxygen gas, it blazes up at once; a red-hot wire will burn in it with brilliant scintillations, and burning phosphorus immersed in it throws out a light as dazzling as the sun itself. 2. *Azote*, or *nitrogen gas* has no properties by means of which its action can be subjected to actual inspection; but it is nevertheless important, from the combinations which it forms. Some of these are aqua-fortis, nitrous acid, and the still more remarkable nitrous acid gas. This peculiarly exhilarating substance is one of the compounds of azote with oxygen, and is one of the most singular substances in nature. 3. *Hydrogen gas* is inflammable, of an offensive odour, and is a constituent part of water. When pure, it is fifteen times lighter than atmospheric air, and is therefore used for filling balloons. It retains its gaseous form when combined with carbon, sulphur, and phosphorus. 4. When carbon is burnt in oxygen gas, the gas does not appear to diminish in quantity, but it presents a set of entire new properties, and is found to be changed into *carbonic acid gas*. It is so much heavier than common air, that it can be kept in an open jar, and poured from one vessel to another. From this property, it also sinks always to the lowest place to which it has access, and is thus found at the bottom of caves, drains, wells, &c., so often proving fatal to life. It is absorbed in large quantities by water, to which it communicates a grateful pungency; in which form it constitutes the mineral or soda water of the shops. Thus, by a singular coincidence, does the same gas afford a fatal poison, and a luxurious refreshment. 5. *Chlorine*, a disinfecting and bleaching gas, is procured by the decomposition of muriatic acid, or of salts which contain it, and is highly valuable from its contributions to the health, convenience, and luxury of man.—Having thus briefly described the leading properties and effects of different gases, we will here add a few observations on the solidification of carbonic acid gas, by means of an apparatus

THOUGH HYDROGEN GAS MAY BE TAKEN INTO THE LUNGS, RESPIRATION CANNOT BE MAINTAINED MORE THAN A MINUTE.

THERE ARE MANY OFFICES IN THE NERVE THROUGH WHICH INFLAMMABLE GAS PASSES, WHICH TAKES FIRE ON ITS CONTACT WITH OXYGEN.

[GAS]

A New Dictionary of the Belles Lettres.

[GAS]

consisting of a retort and receiver, constructed by M. Thilorier, of Paris, and lately elucidated by Mr. Faraday, in a lecture before the Royal Institution. It is known, that by subjecting gases to great pressure, their elasticity is so far counteracted, that they become liquid, ethereal, and volatile. The common process is to expose them to the pressure of their own atmospheres. For instance, carbonate of soda and sulphuric acid, mixed together in a perfectly close vessel, generate carbonic acid gas, which soon fills the vessel; and more and more, until by the reaction of the force to escape upon its own particles by condensation, the gas becomes liquid. M. Thilorier's apparatus is constructed upon this principle, with materials sufficient strong to resist the pressure of more than ninety atmospheres. Many successful processes have been made to liquefy carbonic acid gas, and in several of them a white powder had been observed; which, however, was allowed to pass away almost unheeded, until Thilorier contrived to collect the snow-like substance, which he tested, and pronounced to be solid carbonic acid. The liquid carbonic acid is highly volatile, and therefore, by the rapid expansion and evaporation consequent upon its issue from the receiver, is capable of producing an intense degree of cold,—even 189° below the freezing point of water. This frozen substance, cold as it is, may be held in the hand with impunity, or retained in glass in the open air for a considerable time; because it immediately becomes surrounded with its own vapour, and is not in contact with the substance upon which it apparently rests. In order, then, to use it as a cooling agent, two bodies, of widely different temperatures, are to be brought into contact by a third, which must be a good conductor of heat; and for this purpose ether is employed, because it will bear the contact, and still retain its liquid state. Now, although this is not so cold as solid carbonic acid, yet if one's finger were placed into carbonic acid thus dissolved, the effect would be the same as if it were plunged in melted metal. We see, among the scientific notices in the Literary Gazette and Athenæum, that Mr. Addams has exhibited to the British Association two instruments (extensive and ingenious improvements upon Thilorier's apparatus), for the purpose of liquefying and solidifying carbonic acid gas. One consists of brass, and the other of iron, with the power of resisting a pressure on their inward surface of 300 atmospheres, or two tons to the square inch. He also asserted his belief that it may be profitably employed as an agent of motion—a substitute for steam—not directly, as has already been tried by Mr. Brunel, but indirectly, and as a means to circulate and reciprocate other fluids.

GAS-LIGHT, light produced by the combustion of carburetted hydrogen gas, and applied to the illumination of buildings and streets. It appears that Dr. Clayton, about the year 1735, first gave this

a trial, with the view of artificial illumination; though its application to economical purposes was unaccountably neglected for about sixty years. At length, Mr. W. Murdoch, in the employment of Messrs. Watt and Boulton, of the Soho Foundry, instituted a series of judicious experiments on the extrication of gas from the ignited coal; and, in 1798, he erected a gas apparatus on a large scale, at the foundry; thus succeeding in establishing one of the most capital improvements which the arts of life have ever derived from philosophical research and sagacity. In 1803 Mr. Winsor exhibited gas illuminations in the Lyceum, London; and, after presenting to the public a very flattering scheme for instituting a "national light and heat company," the sum of 50,000*l.* was raised from a number of subscribers, and the practicability of lighting the streets of cities was proved by his lighting Pall-Mall. Since that time gas has been more extensively employed every succeeding year, till at length almost all factories, and even the smaller towns, are lighted by it. So great, indeed, were the advantages which the public derived from this brilliant light, that in less than twenty years from Mr. Winsor's experiments in Pall-Mall, there were four great gas companies established in the metropolis, having in all 47 gasometers at work, capable of containing 917,940 cubic feet of gas, supplied by 1315 retorts, which generated per annum upwards of 397,000,000 cubic feet of gas, by which 61,203 private lamps, and 7268 public or street lamps were lighted; for which purpose 50,000 tons of coal were annually consumed! Since that period a prodigious increase has taken place. In the first five years, viz. from 1822 to 1827, the above-mentioned quantity was nearly doubled; and in the succeeding ten years, it again doubled itself. According to the "general summary" which Dr. Ure has given us, there are, for lighting London and its suburbs with gas—18 public gas works; 12 public gas companies; 2,800,000*l.* capital employed in works, pipes, tanks, gas-holders, and apparatus; 450,000*l.* yearly revenue derived; 180,000 tons of coals used in the year for making gas; 1,460,000,000 cubic feet of gas made in the year; 134,300 private burners supplied to about 40,000 consumers; 30,400 public or street ditto; 380 lamp-lighters employed; 176 gas-holders, several of them double ones, capable of storing 5,500,000 cubic feet; 890 tons of coals used in the retorts on the shortest day in 24 hours; 7,120,000 cubic feet of gas used in the longest night; and about 2500 persons employed in the metropolis alone, in this branch of manufacture.—The following is a slight account of the process by which this beautiful light is generated. The best substances for furnishing a gas rich in luminiferous materials are pitcoal, especially the cannel coal, resin, oil, fats of all kinds, tar, &c. The first operation is the decomposition of the coal by heat, which is effected by subjecting the coal,

THE GAS EVOLVED IN STAGNANT WATERS IS CARBURETTED HYDROGEN, AND ABOUNDS IN DECOMPOSED VEGETABLE SUBSTANCES.

THE SULFURETTED HYDROGEN CONTAINED IN COAL GAS BECOMES IT VERY INFURIOS TO SILVER AND PLATED GOODS.

[GAS]

The Scientific and Literary Treasury ;

[GAS]

enclosed in a cast-iron vessel called a retort, to the action of a furnace. Before the retort becomes red-hot, steam issues along with the atmospheric air. When the retort begins to redden, tar distils in considerable quantity, with some combustible gas, of which hydrogen mixed with ammoniacal gas forms a part. When the retort has come to a bright cherry-red heat, the disengagement of gas is most active. By depress the gaseous production diminishes, and eventually ceases entirely, although the heat be increased. In the retort a quantity of carbonized coal or coke remains, while tar is found at the bottom of the receiver, covered with the ammoniacal liquor, and combined with carbonic and sulphurous acids, and sulphuretted hydrogen. In order to obtain a good light gas from coals, the distillation should commence with a retort previously heated to a cherry-red, which heat should be steadily continued during the whole operation, from five to eight hours; but the operation should be stopped some time before gas ceases to come over, lest gases with feeble illuminating power should impoverish the contents of the gasometer. Coal gas, as it issues from the retort, cannot be directly employed for illumination, in consequence of its containing vapours of tar and coal oil, sulphuretted hydrogen, carbonic oxide, &c. It is therefore received in a gasometer, that it may experience uniform pressure, and be discharged uniformly into the pipes of distribution, in order to ensure a steady discharge of gas, and uniform intensity of light in the burners. The apparatus for purifying the gas is constructed on the most scientific principles, and consists principally of various pipes, coolers containing water, and sieves of wire-cloth, on which layers of dry pulverised quicklime are laid, and through which the gas passes. This purifying process is instituted with a view of separating carbonic acid and sulphuretted hydrogen from the gas, the presence of either of which is highly detrimental to its illuminating power.

Oil gas contains no mixture of sulphuretted hydrogen, and requires no other purification than passing through a refrigerator; and as less of it is required for any given quantity of light, the atmosphere of a room is less heated and contaminated by its combustion. It is, however, considerably more expensive than the gas from coal; although the first outlay of capital for a manufactory upon a large scale is less, on account of the smaller size of the necessary pipes and apparatus. The commonest whale oil, or even pilchard-dregs, quite unfit for burning in the usual way, afford abundance of excellent gas. A gallon of whale oil affords about 90 cubical feet of gas, of an average specific gravity of 0.900; and an argand burner, equal to seven candles, consumes a cubical foot and a half per hour. But it is unnecessary to enter into the process of its manufacture; for although its illuminating power is to that of coal gas as 16 to 10, and its formation more simple than that of coal,

yet it is much more expensive, and has a far greater tendency to explode when ignited in combination with common air—both of which are serious objections to its use. It was, however, made by the Portable Gas Company, because they were enabled to compress the gaseous matter obtained from oil to about 1-30th of its volume; hence its portability.—*Resin gas* has also its advantages, which Mr. Brande thus describes:—"The sources of supply are as inexhaustible, and more generally distributed, than those of the coal; and the forests of America, France, Spain, and Italy, yield the turpentine in quantities only limited by the demand. Many large towns in this country, in America, France, Holland, and the Netherlands, have already adopted the use of this gas. The elegance and simplicity of the manufacture, and the comparatively small capital required for the erection of the works, will also give it the preference in the creation of new establishments." For the origin of this improvement we are indebted to Mr. J. F. Daniell, the distinguished meteorologist; his mode of treating the resin is, to dissolve by gentle heat about 8 lbs. in a gallon of the essential oil, which is plentifully formed during the composition of oil for making gas, or of resin itself. This solution was allowed to trickle into the heated retort half filled with coke: thus, from 1000 to 1200 cubic feet of gas are obtained from 1 cwt. of resin, and rather more than the original quantity of volatile oil is condensed, which is again employed for the solution.—With regard to the comparative expense of different modes of illumination, it appears that—one pound of tallow will last 40 hours in six mould candles burned in succession, and costs 8d.; a gallon of oil, capable of affording the light of fifteen candles, for 40 hours, costs 6s., or half the price of mould candles; the cost of wax is about 8½ times that of tallow; and coal gas, as sold at 9s. per 1000 cubic feet, will be one-sixth the price of mould candles—500 cubic inches of coal gas giving a light equal to the above candle for an hour.

GASOMETER, a hollow cylindrical vessel, usually made of cast metal plates, open at one end, and placed upon its open end in a cistern of water rather larger in dimensions than itself. It serves not merely as a magazine for receiving the gas when it is purified, and keeping it in store for use, but also for communicating to the gas in the act of burning such an uniform pressure as may secure a steady unflinching flame. Its size should be proportional to the quantity of gas to be consumed in a certain time; and it should be strengthened interiorly with cross iron rods.—Before the gas is consumed, it is frequently passed through an instrument called a *meter*, in order to ascertain the number of cubic feet which are used in a given time, or in a particular place. The instrument consists of a sort of evolving drum, index-plates, &c., and is filled with water up to a certain height through an orifice in the side of the

THESE NEPHETIC GASES AND METALLIC POISONS WHICH DESTROY ANIMAL LIFE, HAVE THE SAME EFFECT ON VEGETABLES.

THE FIRE-DAMP, SO OFTEN FATAL TO THE MINERS, IS CARBURETTED HYDROGEN, WHICH TAKES PLACE IN THE COAL MINES.

[GAS]

A New Dictionary of the Belles Lettres.

[GAZ]

vessel, in which a plug is fitted. The gas enters by a pipe, causing the drum to revolve from right to left, while it again escapes from an orifice on the other side into the pipes to be consumed. By means of a train of wheel-work fixed upon the axis of the drum, an index is turned, which points out on the index-plate how many cubic feet have passed through the meter.

GASOMETER, the science, art, or practice of measuring gases. It teaches also the nature and properties of these elastic fluids.

GAS-BURNERS, either simple beakers perforated with a small round hole, or a circle with a series of holes to form an argand flame; or two holes drilled obliquely, to make the flame cross, like a swallow's tail; or with a slit constituting a sheet of flame, like most of the street lamps. The burners are mounted with a stop-cock for regulating the quantity of gas. When several jets issue from the same burner, the light is improved by making all the flames unite into one. Speaking of gas-burners, Mr. Accum observes, "An argand burner, which measures in the upper rim half an inch in diameter between the holes from which the gas issues, when furnished with five apertures 1-32nd part of an inch in diameter, consumes two cubic feet of gas in an hour, when the gas flame is 1½ inch high. The illuminating power of this burner is equal to three tallow candles, eight to the pound. An argand burner three-fourths of an inch in diameter, as above, and perforated with holes 1-30th of an inch in diameter (probably fifteen in number) consumes three cubic feet of gas in an hour, when the flame is 2½ inches high; giving the light of four candles, eight to the pound. And an argand burner seven-eighths of an inch diameter, as above, perforated with eighteen holes, 1-32nd of an inch diameter, consumes, when the flame is three inches high, four cubic feet of gas per hour, producing the light of six tallow candles, eight to the pound. The height of the glass chimney should never be less than five inches.

GASIFY, to convert into gas or an aeriform fluid by combination with caloric.

GASTRIC JUICE, in the animal economy, a thin pellucid liquor, separated by the capillary exhaling arteries of the stomach. It is the principal agent in digestion: for it acts with a chemical energy in dissolving food, which is not merely reduced to very minute parts, but its taste and smell are quite changed, and it acquires new and very different properties. It is a powerful antiseptic, and even restores flesh already putrefied.

GASTRONOMY, the science (as it is somewhat facetiously termed) of eating and drinking. Loudly as some declaim against the epicurism of modern gourmands, our gastronomic feats may almost be regarded as specimens of abstinence when compared with the gross and luxurious feeding indulged in by the ancient Romans.

GASTROCELE, in surgery, a rupture of the stomach.

GASTROMANCY, a kind of divination

among the ancients by means of words which seemed to be uttered by the belly.

GASTROGRAPHY, in surgery, the operation of sewing up wounds of the abdomen.

GASTROTOMY, in surgery, the operation of cutting into or opening the abdomen.

GAUGING-ROD, an instrument to be used in measuring the contents of casks or vessels.

GAUZE, a very thin, slight, transparent kind of stuff, woven sometimes of silk, and sometimes only of thread; and frequently with flowers of silver or gold on a silk ground.

GAVELET, in law, an ancient and special *cessavit* used in Kent, where the custom of gavel-kind continues; by which the tenant, if he withdraws his rent and services due to the lord, forfeits his lands and tenements.

GAVEL-KIND, a tenure or custom belonging to lands in Kent, whereby the lands of the father were divided equally at his death among his sons; and the land of a brother, dying without issue, descended equally to his brothers. The principal properties of gavel-kind are, that the tenant is of age to alienate his estate at fifteen years; that the estate does not escheat in case of an attainer and execution for felony, the maxim being—

"The father to the bough,

The son to the plough."

The wife also shall be endowed of a moiety of the gavel kind lands, of which her husband died possessed, during her widowhood; and a husband may be tenant by courtesy of half his wife's lands, without having any issue by her; but if he marries again, not having issue, he forfeits his tenancy. This species of tenure prevailed in England before the Norman conquest, in many parts of the kingdom, if not throughout the whole realm; but particularly in Kent, where it still exists, in consequence, as is affirmed, of the Kentish men having submitted upon the express condition of retaining their peculiar privileges.

GAVOT, a kind of dance, the air of which has two brisk and lively strains in common time, each of which is played twice over.

GAZELLE, or **GAZEL**, an animal of Africa and India, of the *antelope* genus, partaking of the nature of the goat and the deer. Like the goat, it has hollow permanent horns, and it feeds on shrubs; but in size and delicacy, and in the nature and colour of its hair, it resembles the roe-buck. It has cylindrical horns, most frequently annulated on the base, and bunches of hair on its fore legs; but the beauty and brilliancy of its eye is its most remarkable feature.

GAZETTE, a kind of official newspaper, containing an account of transactions and events of public or private concern, which are deemed sufficiently important for insertion therein. *Gazetta* is said to have been the name of a Venetian coin, in value be-

STEAM IS ALWAYS FOUND MIXED WITH THE PERMANENT GASES OF THE ATMOSPHERE, EVEN IN THE DRIEST WEATHER.

DIAMONDS, SAPPHIRES, EMERALDS, RUBIES, TOPAZES, HYACINTHS, AND CHRYSOLITES, ARE RECORDED THE MOST VALUABLE GEMS.

tween a farthing and a halfpenny in England, which was the price of the first newspaper, and hence the name. The first gazette in England was published at Oxford in 1665. On the removal of the court to London, the title was changed to the *London Gazette*. It is now the official newspaper, and is published on Tuesdays and Fridays.

GAZETTEER, a topographical work, alphabetically arranged, containing a brief description of empires, kingdoms, cities, towns, and rivers. It may either include the whole world, or be limited to a particular country. The first work of this kind, with which we are acquainted, is that of Stephen of Byzantium, who lived in the beginning of the sixth century.

GAZONS, in fortification, pieces of fresh earth, covered with grass, and put in form of a wedge, to line the outside of works made of earth, as ramparts, parapets, &c.

GEHLENITE, a recently discovered mineral, by some supposed to be a variety of idocrase.

GELATIN, or **GELATINE**, a concrete animal substance, or jelly, obtained by boiling with water the soft and solid parts; as the muscles, cartilages, bones, tendons, &c. Of this substance, glue and isinglass are examples. Alcohol and tannin precipitate gelatine from its solution; the former by abstracting the water, the latter by combining with the substance itself into an insoluble compound. Gelatine is capable of assuming an elastic or tremulous consistence when cooled, and liquifying again by the application of heat.

GELATINATION, the act or process of converting or being turned into gelatine, or a substance resembling jelly.—The verbs *gelatinate* and *gelatinise*, and the adjective *gelatinous*, are of frequent occurrence in chemical and medical writings.

GELDER-ROSE, in botany, a species of *Viburnum*; also a species of *Spiræa*.

GEM, or **GEMMA**, in botany, the bud or compendium of a plant, covered with scales to protect the rudiments from the cold of winter or other injuries. It is also called the hybernacule or winter quarters of a plant.

GELOSOCOPY, a kind of divination drawn from laughter; or a method of knowing the qualities and character of a person, acquired from the consideration of his laughter.

GEMS, the name given to *precious stones* in general, but more especially to such as by their colour, brilliancy, polish, purity, and rarity, are sought after as objects of decoration. Gems of the most valuable kinds form the principal part of the crown jewels of sovereign princes, and are esteemed not merely for their beauty, but as comprising the greatest value in the smallest bulk. Gems are remarkable for their hardness and internal lustre. Under this name are comprehended the diamond, ruby, sapphire, hyacinth, beryl, garnet, emerald, topaz, chrysolite, &c. To these have been added rock crystals, the finer flints or pebbles, the

cat's eye, the oculus mundi, the chalcedony, the moon-stone, the onyx, the cornelian, the sardonyx, agate, &c. Of most of these species there are some of an inferior class and beauty: these are commonly called by jewellers *occidental stones*. They are mostly the produce of Europe, and found in mines or stone quarries; and are so named in opposition to those of a higher class, which are always accounted *oriental*, and supposed to be only produced in the East.

Gem-engraving, or **Gem-sculpture**, called also *lithoglyphics*, is the art of representing designs upon precious stones, either in raised work, as *cameos*, or by figures cut below the surface, as *intaglios*. This art is of great antiquity, and was probably practised by the Babylonians. Some think the art originated in India; but wherever it originated, we have ample evidence that among the Greeks and Romans it was in high esteem. The merit of cameos and intaglios depends on their execution, as it is termed, or the goodness of the workmanship, and the beauty of their polish. The antique Greek gems are the most highly prized; and, next to them, the Roman ones of the times of the higher empire.—**Artificial Gems**. In order to approximate as near as possible to the brilliancy and reflective power of native gems, a basis, called a *paste*, is made from the finest flint glass, composed of selected materials, combined in different proportions, according to the preference of the manufacturer. This is mixed with metallic oxides capable of producing the desired colour.—The *imitation of antique gems* consists in a method of taking the impressions and figures of antique gems, with their engravings, in glass, of the colour of the original gems. Great care is necessary in the operation, to take the impression of the gem in a very fine earth, and to press down upon this a piece of proper glass, softened or half-melted at the fire, so that the figures of the impression made in the earth may be nicely and perfectly expressed upon the glass.

EMAR'A, the second part of the Talmud or commentary on the Jewish laws.

GEMINI, in astronomy, the Twins, a constellation or sign of the zodiac, representing Castor and Pollux. In the *Britannic catalogue* it contains 86 stars.

GEMMATION, in botany, the state, form, or construction of the bud of plants, of the leaves, stipules, and petioles.

GEMONIÆ SCALE, in Roman antiquity, a place for executing criminals, situated on the Aventine mount, or tenth region of the city.

GENDARMES, or **GENS D'ARMES**, in the history of France, an appellation given to a select body of troops, who were destined to watch over the interior public safety, and consequently much employed by the police. They were so called on account of their succeeding the ancient genarmes, who were completely clothed in armour, and commanded by captain-lieutenants, the king and the princes of the

GENEALOGY, OR A SYSTEMATICAL ACCOUNT OF THE ORIGIN, DESCENT, AND RELATIONS OF FAMILIES, IS A GREAT AID TO HISTORY.

blood being their captains. At the revolution this body was broken up, and the name was given to a corps which was employed in the protection of the streets. August 16th, 1830, a royal ordinance abolished the *gens d'armes*, and established a new body called the *municipal guard* of Paris, to consist of 1448 men, under the direction of the prefect of police.

GENDER, in grammar, a distinction in nouns to mark the sexes; genders are either masculine, for the male sex; feminine, for the female sex; or neuter, for those which are of neither sex. The English language has very few terminations by which the genders are distinguished, such as *count* and *countess*, but generally supplies distinct words; as *boy*, *girl*; whereas, in the Latin and French, the terminations always mark the distinction, as *bonus equus*, a good horse; *bona equa*, a good mare; *un bon citoyen*, a good citizen; *une bonne citoyenne*, a good female citizen.

GENEALOGY, a history of the descent of a person or family from a series of ancestors. In various chapters and military orders, it is required that the candidates produce their genealogy, to show that they are noble by so many descents.—The Jews were anxious to preserve their genealogies entire and uninterrupted; and this care on their part affords an argument of considerable importance with respect to the accomplishment of those prophecies that pertain to the Messiah: accordingly, in their sacred writings, we find genealogies carried on for above 3500 years.

GENERAL, the highest rank in the British army, in which they are successively Major-generals, Lieutenant-generals, and Generals, according to seniority, when promotions are made. The chief commander of an army is often called, by way of distinction, the *general-in-chief*.—A particular beat of drum which in the morning gives notice to the infantry to be in readiness to march, is also called the *general*.

GENERALISSIMO, the supreme general or commander in chief of an army.

GENERAL ISSUE, in law, that plea which denies at once the whole declaration or indictment, without offering any special matter by which to evade it. This is the ordinary plea upon which most causes are tried, and is now almost invariably used in all criminal cases. It puts everything in issue, that is, denies everything, and requires the party to prove all that he has stated. In many cases, for the protection of justices, constables, excise officers, &c., they are, by act of parliament, enabled to plead the general issue, and give the special matter for their justification, under the act, in evidence.

GENERALIZE, to extend from particulars or species to genera, or to whole kinds or classes. Ex: Copernicus *generalized* the celestial motions, by merely referring them to the moon's motion. Newton generalized them still more, by referring this last to the motion of a stone through the air.

GENERATING LINE (or *Fresus*), in geometry, is that by which its motion produces any other plane or solid figure. Thus, a right line moved any way parallel to itself, generates a parallelogram; round a point in the same plane, with one end fastened in that point, it generates a circle. One entire revolution of a circle, in the same plane, generates the cycloid; and the revolution of a semi-circle round its diameter, generates a sphere, &c.

GENERATION, in physiology, the act of procreating and producing a thing which before was not; or, according to the schoolmen, it is the total change or conversion of one body into a new one, which retains no marks of its former state. Thus, we say, fire is generated, when we perceive it to be where before there was only wood, or other fuel: and a chick is said to be generated, when we perceive it where before there was only an egg.

GENERATOR, in music, the principal sound or sounds by which others are produced. Thus the lowest C for the treble of the pianoforte, besides its octave, will strike an attentive ear with its twelfth above, or G in alt., and with its seventeenth above, or E in alt. Hence C is called their *generator*, the G and E its products or harmonics.

GENERIC, or **GENERTICAL**, an epithet pertaining to a genus or kind. It is a word used to signify all species of natural bodies, which agree in certain essential and peculiar characters, and therefore all of the same family or kind; so that the word used as the *generic* name, equally expresses every one of them, and some other words expressive of the peculiar qualities of figures of each are added, in order to denote them singly, and make up what is called the *specific* name. Thus the word *rose*, or *rosa*, is the generic name of the whole series of flowers of that kind, which are distinguished by the specific names of the red rose, the white rose, the moss rose, &c. Thus also we see, *Canis* is the generic name of animals of the dog kind; *Felis*, of the cat kind; *Cervus*, of the deer kind, &c.

GENESIS, a canonical book of the Old Testament, and the first of the Pentateuch, or five books of Moses. The Greeks gave it the name of Genesis, from its beginning with the history of the creation of the world. It includes the history of 2369 years, and besides the history of the creation, contains an account of the original innocence and fall of man; the propagation of mankind; the general defection and corruption of the world; the deluge; the restoration and re-peopling of the earth; and the history of the first patriarchs down to the death of Joseph.

GENET, an animal of the weasel kind, resembling the civet-cat in its musk smell. Also, a small sized, well-proportioned Spanish horse.

GENETHLIACS, the pretended science of calculating nativities; an astrological mystery.

GENICULATED, in botany, knee-joint-

IN ANCIENT GENEALOGY, TIME IS SOMETIMES DIVIDED ACCORDING TO GENERATIONS, OR THE MEAN DURATION OF HUMAN LIFE.

GEN]

The Scientific and Literary Treasury;

[GEO

ed; an epithet applied to a stem, peduncle, or awn, forming a very obtuse angle at the joints.

GENIOGLOSSI, in anatomy, a pair of muscles with which the tongue is thrown out.

GENISTA, in botany, a genus of plants in the Linnæan system, class 17 *Diadelphie*, order 4 *Decandria*. The species are shrubs.

GENITIVE CASE, the second case in Latin and Greek nouns, which denote possession; it is marked in English by a with an apostrophe, thus ('s).

GENIUS, an aptitude for a particular pursuit, founded on some stimulus in youth, by which the mind and faculties are directed to excellence. It combines opposite intellectual qualities; the deepest penetration with the liveliest fancy; the greatest quickness with the most indefatigable diligence. To what is old it gives a new form; or it invents new; and its own productions are altogether original. We estimate it higher than talent, in the common acceptance of that term, which in the capacity for originating in extent and energy is inferior to genius. Where ordinary powers advance by slow degrees, genius soars on rapid wings. But genius does not assume its distinctive character in every exercise of its powers. A gifted poet, for instance, is not necessarily an ingenious philosopher, nor does the statesman's genius include that of the soldier. We distinguish this genius, therefore, into various kinds, as poetical, musical, mathematical, military, &c.; thus, for example, Milton possessed a genius for poetry, Mozart for music, Newton for mathematics, &c. Yet, although the union of great excellence in different walks of art and science is but rarely found in one man, some, like Michael Angelo, who was equally celebrated as a statuary, architect, and painter, are found possessing genius of a most comprehensive character.—By the ancients the word *genius* was used in an absurd or figurative sense, to express a supposed invisible spirit which directs a course of events. There were both good and bad *genii*. According to the belief of the Romans, every person had his own genius, that is, a spiritual being, which introduced him into life, accompanied him during the course of it, and again conducted him out of it at the close of his career. This belief was no doubt a consequence of their idea of a divine spirit pervading the whole physical world; and was probably a personification of the particular structure or bent of mind which a man receives from nature.

GENTILES, a name given by the Jews to all who were not of the twelve tribes of Israel. Among Christians, it is the name of all heathens who did not embrace the Christian faith.

GENTLEMAN, in law, any man above the rank of a yeoman. In common speech, every well-bred man: in short, the term is with great propriety applied to men of education, probity, and good breeding, whatever may be their rank or occupation.

GENUS, in natural history, a subdivision of any class or order of things, whether of the animal, vegetable, or mineral kingdoms. All the species of a genus agree in certain characteristics.—In botany, a *genus* is a subdivision containing plants of the same class and order, which agree in their parts of fructification.—In medicine, a division of any order of diseases which contains the species.—In music, a distribution of the *tetrachord*, or the four principal sounds, according to their quality.

GEOCENTRIC, in astronomy, an epithet designating the place in which a planet appears to us from the earth, supposing the eye to be fixed there, or it is a point in the ecliptic to which a planet seen from the earth is referred.

GENTIANA, in botany, a genus of plants, class 5 *Pentandria*, order 2 *Digynia*, of many species. The common gentian is a native of the mountainous parts of Germany. The root, the only part used, has a yellowish brown colour and a very bitter taste, and is used as an ingredient in stomachic bitters.

GENTOO, a native of India, who follows the religion of the bramins. [See HINDOO.]

GEOIDE, in mineralogy, a roundish lump of agate or other mineral, or a mere incrustation. Its interior is sometimes empty, and the sides of its cavity are lined with crystals; sometimes it contains a solid movable nucleus; and sometimes it is filled with an earthy matter.—*Geodiferous*, producing geodes.

GEOIDESTY, that part of geometry which respects the doctrine of measuring surfaces, and finding the contents of all plain figures.—Hence *geodetic* and *geodetical*, applied to whatever pertains to the art of measuring surfaces.

GEOGNOSY. This word is nearly synonymous with geology; and is used to denote a knowledge of that part of natural history which treats of the substances composing the crust or covering of the globe.

GEOGRAPHY, the description of the surface of the earth, its natural divisions, and local characteristics. The fundamental principles of geography are the spherical figure of the earth, its rotation on its axis, its revolution round the sun, and the position of the axis or line round which it revolves, with regard to the celestial luminary; whence it follows that astronomy is the key of all geographical knowledge. In general terms, the earth is termed a perfect sphere, in which case, the diameter from north to south would be precisely equal to the diameter from east to west; but it having been found that the latter exceeds the former by thirty-six miles, the shape of the earth is more truly denominated an oblate spheroid; by which is to be understood a globe, the upper and lower parts of which are flattened. [See KATY.] General geography comprehends the knowledge of the earth in general, and the affections common to the whole globe, as its figure, magnitude, motions, circles, winds, tides, meteors, divi-

[GEO]

THALES, A DISTINGUISHED GRECIAN PHILOSOPHER, HE SAID TO HAVE SAUGED THAT THE EARTH WAS ORIGINALLY FORMED BY FIRE.

sions into land and water, &c. Particular geography has respect to particular countries, showing their boundaries, figure, climate, seasons, inhabitants, arts, customs, language, history, &c. When it respects regions, districts, or parts of countries, it is called *chorography*; and when particular cities, towns, or villages, &c., it is called *topography*. Ancient geography treats of the countries and places existing among the ancients; modern geography describes the various countries that now exist, and of which we are able to glean information from travellers; sacred geography treats of places mentioned in the Bible. There are also two other aspects under which geography may be considered, viz. physical and political geography. Physical geography comprises geology, hydrography, meteorology, and a description of the animal, vegetable, and mineral kingdoms. In political geography, the earth is considered as the abode of rational beings, according to their diffusion over the globe, and their social relations as they are divided into larger or smaller societies. It does not, however, include that information which is properly and exclusively termed statistical. For, while statistics represents the individual state, as a whole connected in itself, with a perpetual regard to public law, politics, and policy, geography treats exclusively of the local relations of a country.—As a science the ancients knew little indeed of geography; yet we find that they did not overlook or neglect it. It was a constant custom among the Romans, after they had conquered and subdued any province, to have a map of it carried in triumph, and exposed to the view of the spectators. Historians inform us, that the Roman senate, about a hundred years before Christ, sent geographers into various parts to make an accurate survey and mensuration of the globe, but we now know that they scarcely saw the twentieth part of it. Before them, Necho, king of Egypt, ordered the Phœnicians to make a survey of the whole coast of Africa, which they accomplished in three years. Darius procured the Ethiopic sea, and the mouth of the Indus, to be surveyed; and Pliny relates, that Alexander, in his expedition into Asia, took two geographers to measure and describe the roads; and that from their itineraries, the writers of the following ages gleaned the chief of their information. The honour of reducing geography to a system was, however, reserved for Ptolemy, who, by adding mathematical advantages to the historical method in which it had been treated of before, described the world in a much more intelligible manner; delineating it under more certain rules, and fixing the bounds of places from longitude and latitude. As a work of science, therefore, his system deservedly held the first rank among the ancients; and but little was added to what he achieved until the time of Copernicus, a.d. 1520. From that period to the present, the science of geography has been steadily advancing; continual ac-

cessions to it having been made—by new discoveries, by accurate accounts of travels by land and water, by systematic topographies and more precise measurements of countries—in short, by that spirit of investigation which has been awakened, and by the increased industry and intelligence of every succeeding age.

GEOLOGY, the science which describes the structure of the earth, and investigates the successive changes which have taken place in the organic and inorganic kingdoms of nature. In order to give as clear an idea of this science as our circumscribed limits will permit, it will in the first place be necessary to notice the principal modern theories upon which a knowledge of geology may be said to be founded.—According to the sacred theory of Burnet, the whole materials of which the earth is composed were united together in one fluid chaotic mass. When these elements began to separate, the heavier particles formed a nucleus, and the water and the air occupied places according to their specific gravity. The air, however, was not, as we now see it, a transparent, attenuated medium, but it was loaded with exhalations and impurities, which it gradually let fall upon the surface of the water, and then floated upon the whole in cloudless serenity. The deposited matter, constituting a rich crust, sent forth its vegetable productions, and soon became clothed with uninterrupted verdure; everything was smooth, soft, and regular, and there was, he says, an universal spring, for the plane of the ecliptic was coincident with that of the equator. In process of time, however, the green and even surface, just described, began to suffer from the continuous action of the sun's rays, which formed cracks and fissures, that ultimately extended to the abysses of waters beneath, and these being sent forth by elastic vapours expanded by heat, soon inundated the superficies; an universal deluge ensued; and in the violent shocks and convulsions that attended it, rocks and mountains, and all the inequalities of the present surface, had their origin; then the waters gradually subsided into the residuary cavities, forming the ocean; and partly were absorbed into the crevices of the disjointed strata and nucleus; vegetation began to re-appear, and the once uninterrupted and uniform surface was now broken up into islands and continents, mountains and valleys.—We may here remark, that the labours of modern geologists have exploded this fanciful theory, which, though supported with much erudition and plausibility, is now treated merely as an elaborate fiction.—In an essay towards a natural history of the earth, by Woodward, it is supposed that a new crust was deposited on the earth from the waters of the deluge, and that the materials of which it is composed are arranged according to their specific gravity; the heaviest and hardest bodies forming the nucleus, and being covered by those of a finer and lighter quality.—Buffon's theory was far

WONDERFUL AS THE DISCOVERIES BY GEOLOGY ARE FOUND, THAT SCIENCE EXTENDS NO DEEPER THAN A MILE—THE MERE CRUST OF THE EARTH.

[GEO]

The Scientific and Literary Treasury ;

[GEO]

more extravagant: he imagined that the planets in general were struck off from the sun by a comet; and that, being composed of fluid matter, they assumed a spherical form, and, by the operation of centrifugal and centripetal forces, were retained in their orbits. As the earth cooled, the surrounding vapours were condensed on its surface, and other matters finding their way into fissures and cavities, formed veins and masses of metallic and earthy minerals. But by the motion of the earth, by the action of the sun, winds, and tides, new changes were produced. The waters were greatly elevated about the equator, and brought with them solid fragments from the polar regions; the surface of the globe now exhibited a broken and irregular aspect; here land arose, there hollows and cavities were formed. Buffon, in fact, believed the earth to have been liquefied by fire; or, in other words, that it was an extinguished sun or vitrified globe, whose surface had been operated upon by a deluge. He assumed, indeed, that the earth was 75,000 years in cooling to its present temperature, and that in 98,000 years more, productive nature must be finally extinguished.—In Werner's theory, which was highly lauded, and which produced conviction in the minds of many, it is assumed that the materials of which the external crust of the earth is composed were either dissolved or suspended in water; and that the first class of rocks were deposited from a state of chemical solution, and thus exhibit a crystallized appearance. In the next series of rocks a few organised remains are observed, and hence it is concluded that marine animals were created about the time when these rocks, which are called *transition* (or *Silurian*) rocks, were formed. After this period the waters of the earth, holding in suspension particles of matter in a state of minute division, derived from the disintegration of the first series of rocks, began to subside more rapidly, and to deposit that series of strata which are denominated *secondary rocks*, or *floets rocks*, because they are deposited in beds in a horizontal position. By the action of the air and the operation of the water, the three classes of rocks being wasted down and broken, produced inequalities on the surface of the earth, and the waters still further subsiding, deposited the different kinds of alluvial matters. In this system a fifth class of rocks, including those substances which are ejected by volcanoes, are called *volcanic rocks*. The formation of *vertical strata* forms a prominent feature in theories of the earth. According to the theory of Werner, as the waters which held in solution or suspension the materials of which the solid parts of the earth are composed subsided, fissures were formed, and the waters holding in solution other earthy and metallic matters, again covered the earth and deposited these matters in the fissures.—The *Huttonian* theory is founded on the presumption that the surface of the globe is in a state of constant destruction and reno-

vation. By the action of air and water the hardest rocks are subject to decay and decomposition; and the disintegrated materials are conveyed to the ocean, and there accumulating, are formed into horizontal layers. The strata thus deposited are supposed to be consolidated by the heat of central fires; and to the action of the same subterraneous heat, the production of the primitive rocks, which are supposed to have been projected in a state of fusion from the bowels of the earth, is ascribed. To the operation of the same cause, all kinds of basaltic rocks are also supposed to owe their existence; and the materials of metallic veins, and of the vertical strata, have been ejected in a state of fusion from the centre of the earth, and deposited in fissures either previously formed, or which they form for themselves in their progress through the superincumbent strata. In this theory the operation of both fire and water is introduced; the disintegration and decomposition of the solid parts of the globe are produced by water, and, being deposited at the bottom of the ocean, are consolidated and hardened by heat; and a new series of rocks, projected in a state of fusion by the action of the same power, burst through the secondary strata, and elevating it to great heights, constitute a new series of primitive rocks.—Having thus given an outline of the various popular theories which have chiefly engaged the attention of geologists during the last century, we may now remark, that the two prevailing theories of the present time are, 1st, that which attributes all geological phenomena to such effects of existing causes as we now witness; and 2ndly, that which considers them referable to series of catastrophes, or sudden revolutions. The difference in the two theories is in reality not very great; the question being merely one of intensity of power, so that, probably, by uniting the two, we should approximate nearer the truth. The character of geology has, in fact, undergone a total change within the last half century. Geologists now no longer bewilder their imaginations with wild theories of the formation of the globe from chaos, or its passage through a series of hypothetical transformations, but rather aim at a careful and accurate examination of the records of its former state, which they find indelibly impressed on the great features of its actual surface, and to the evidence of former life and habitation, which organized remains, imbedded and preserved in its strata, indisputably afford. That the earth has at different periods been violently convulsed, and that extraordinary changes have in consequence been effected by such convulsions, there is abundant evidence. Without entering into speculations with regard to great and sudden changes which may have taken place anterior to the Mosaic deluge, the traces of that are very conspicuous. So also are the effects of volcanic action, earthquakes, &c., and the changes which they produce on

THE STUDY OF GEOLOGY AFFORDS THE MOST INDUBITABLE EVIDENCE OF THE GRADUAL FORMATION OF THE EARTH, AND ITS INFINITE VARIATION.

THE REGULAR DEPOSITS OF MARINE FOSSILS, AND THE STRATA OF LAND PRODUCTS, SHOW THAT WATER AND LAND HAVE ALTERNATELY COVERED THE GLOBE.

[GEO]

A New Dictionary of the Belles Lettres.

[GEO]

the earth's surface form an important consideration in geology. Although we are entirely ignorant of the means employed by nature in producing volcanic fire, we know that by their violence lava is vomited forth, and that substances which were before buried deep in the bowels of the earth, after having their nature changed or modified, have been raised into mountains. Werner distinguishes two kinds of earthquakes. Some, he says, appear to be connected with a particular volcano, and to have their focus in the same region: these are only felt to the distance of a few leagues around, and their paroxysms are almost always connected with those of the volcano. Others, which appear to have their focus at a much greater depth, and whose effects are much greater, are propagated to immense distances with incredible celerity, and are felt almost at the same time at points thousands of miles distant from each other. It is the agitation of the sea that shows the great extent of the tracts of land which are thus convulsed. In this respect, the earthquake at Lisbon, in 1755, was the most remarkable and most violent that we have on record as ever visiting Europe. In consequence of it, by the concussion on the bottom, or momentary rising or upheaving of the sub-marine land, the sea overflowed the coasts of Sweden, England, and Spain, also the coasts of Antigua, Barbadoes, and Martinique in America. At Cardale bay, in Barbadoes, the tide, which rises only twenty-eight inches, rose twenty feet, and the water appeared as black as ink, owing probably to bituminous matter thrown up from the bed of the ocean. A wave of the sea, sixty feet high, overflooded a part of the city of Cadiz; and the lakes of Switzerland were observed to be in commotion six hours after the first shock. In the year 1772, during an eruption of one of the loftiest mountains in Java, the ground began to sink, and a great part of the volcano, and part of the neighbouring country, fifteen miles long and six broad, was swallowed up. Numerous examples might also be given, were it necessary, of the upraising of the land by earthquakes, and to vast inundations which with irresistible force have swept over our present continents, elevating mountains, excavating valleys, breaking the continuity of strata, and carrying the broken parts to countries far distant from their original situation. By the upheaving of the incumbent surface, while one part was rising, another part would sink, and form a new bed, into which the waters of the ocean would gradually retire. Hence, many of the strata which bear evident marks of having been deposited at the bottom of the sea, and of course in a horizontal state, are now found in a position highly inclined to the horizon, and even occasionally vertical. "Everything," says Humboldt, "indicates that the physical changes of which tradition has preserved the remembrance, exhibit but a feeble image of those gigantic catastrophes which have given mountains

their present form, changed the position of the rocky strata, and buried sea shells on the summit of the higher Alps. It was undoubtedly in those remote times which preceded the existence of the human race, that the raised crust of the globe produced those domes of trappan porphyry, those hills of isolated basalt in vast elevated plains, those solid nuclei covered with the modern lavas of the Peak of Teneriffe, of Etna, and Cotopaxi." We must now proceed to make some general remarks on the component parts of the earth's crust or covering. This consists chiefly of various kinds of rocks and mountain masses, more or less extensive; and of loose stones, gravel, sand, and loam, all of which are produced by the mechanical division of large masses, by their decomposition or disintegration from the action of air, moisture, &c., or from the continued action of streams of water, torrents, &c. Mountains have been found by geologists to consist, at a considerable depth, of strata regularly disposed, which have been classed under the heads of granite, gneiss, mica slate, clay slate, primitive limestone, primitive trap, serpentine porphyry, sienite topaz, quartz rock, primitive flinty slate, and primitive gypsum. These are altogether denominated *primitive rocks*, which have no organic remains, and appear to have been undisturbed. But in the strata above these there are evident signs of violent fractures caused by the action of waters. In this manner valleys have been excavated, and a separation thus occasioned in strata that once evidently formed one continuous range. Such water-worn fragments have, from the cause of their existence, been denominated *divisium*, to distinguish them from other debris produced by causes still in operation, such as the *alluvium* or the accession to lands by inundations, torrents, and the like, as also the volcanic rocks formed by the eruptions of mountains. Besides the rocky fragments and insulated hills above mentioned, the strata above these primitive rocks contain also *organic remains*. In those immediately above, called transition rocks, fossil remains of corals and shells are found in small quantities, as also in the carboniferous limestone that lies next to these rocks. The coal strata, which follow, abound with vegetable remains of ferns, figs, reeds of unknown species, and large trunks of succulent plants, which are altogether unknown either in description or in nature. Above the coals are beds containing corals and shells, which, like those in the strata below, are characterized by this peculiarity, that in some places they are to be found in families, and that in other places there will be found beds of marine shells in one layer, and those peculiar to fresh water in another layer, resting one over the other in alternate succession. In the highest of the regular strata, called the *crag*, will be found the shells at present existing in the same coast, and, lastly, over all these strata is a covering of gravel, which is remarkable for containing the remains of numerous quad-

MARINE SHELLS ARE FOUND IN ELEVATIONS FAR ABOVE THE LEVEL OF THE SEA, AND WHERE THE SEA COULD NOT REACH BY ANY EXISTING CAUSE.

THERE ARE BEDS OF SEA-SHELLS TWO THOUSAND FEET HIGH ON MOUNT Etna, AND STRATA OF GRAY CLAY, FILLED WITH SHELLS, MUCH HIGHER.

IN COAL FORMATIONS ARE FOUND BITUMENIZED TIMBERS, BRANCHES OF SHRUBS, AND LEAVES, WITH SHELLS LIVING AMONG THEM.

rapeda, as the bones, horns, teeth, shells, scales, &c. These animals are for the most part either foreign to the climates where their remains are found, or they are of a larger size than any now known, or they are altogether different from any species of animal hitherto known or mentioned. Thus the races of beings which were last destroyed, lie in the upper strata of the earth, while their predecessors are buried far beneath; but each presents characteristics sufficient to mark and identify them.

—Among the most interesting and important of the phenomena connected with the stratification and division of rocks, are the breaks which not unfrequently occur in copper, coal, and other mines, where one rock seems to have slipped by the adjoining one, or to have changed its place, so that the metallic or other vein running through them both, is interrupted, and the continuation of it is thrown higher or lower than the first part. The particular situation of minerals, their course and position, which constitute the basis of all mining operations, are of great importance. The courses or veins of minerals sometimes follow straight lines of direction, and at others are bent and curved in various directions. A vein is sometimes compressed or diminishes in thickness; it sometimes stops in the direction of its length; and it is said to be lost, when it splits into several small veins. The vein consists either of one or of several species of minerals; it contains cavities of various form and size, either filled with minerals or having their sides encrusted, or covered by crystals of various kinds, which cavities are called *druses*. Very extensive deposits of minerals, of limited length, are termed *standing beds*, or masses; and mountain masses, intersected by great numbers of small veins and deposits, are called *floors*. Foreign deposits of different kinds occur in mountains, and in rocky districts of all sorts. These all deserve and command the attention of the geologist; but there is nothing of more importance and interest than the presence of petrifications, and the remains of those races of animals which are now extinct. [See ORGANIC REMAINS.] We will conclude with a parallel betwixt the sciences of geology and astronomy, as drawn by that true philosopher, Sir J. Herschel: "Like astronomy, the progress of geology depends on the continued accumulation of observations carried on for ages. But, unlike astronomy, the observations on which it depends, when the whole extent of the subject to be explored is taken into consideration, can hardly yet be said to be more than commenced. Yet, to make up for this, there is one important difference, that, while in the latter science it is impossible to recall the past or anticipate the future, and observation is in consequence limited to a single fact in a single moment, in the former the records of the past are always present; they may be examined and re-examined as often as we please, and require nothing but diligence and judgment to put us in possession of their whole contents."

GEOLOGICAL MAPS AND MODELS.

In order to assist the geological student in his inquiries, as well as to facilitate mining operations, there have of late years been published some very valuable maps, representing the different known strata in Great Britain, North America, and various parts of the continent. And at a late meeting of the British Association it was particularly urged by Dr. Buckland and others, that a series of geological works should be perfected and published by the government, as was done by the United States. It appears also, by a method laid down by Mr. Sopwith, that geological models can easily be made, showing not only the position and thickness of the strata in a vertical section, but the actual surfaces and imbedding of the strata lying in different planes, with every undulation and indentation. One of the uses of these models is to point out the partitions of mining property, and prevent trespass; another is, that it makes those who are interested in it acquainted with every particle of coal under the forest; and a third, that it shows them where and how it ought to be worked, and by that means will enable them to prevent a recurrence of that horrible loss of life and destruction of property, which has so frequently taken place.

GEOMANCY, a kind of divination by means of figures or lines, formed by little dots or points, either on the earth or on paper, and representing the four elements, the cardinal points, the planetary bodies, &c. This pretended science was flourishing in the days of Chaucer, and was deeply cultivated by Dryden, at the time of his *resuscitation* of the Knight's Tale. Catian, who wrote a book on geomancy in the 16th century, absurdly enough observes, that it is "no art of enchanting, as some may suppose it to be, or of divination, which is made by diabolical invocation; but it is a part of natural magic, called of many worthy men the daughter of astrology, and the abbreviation thereof."

GEOMETRY, that branch of mathematics which treats of the magnitudes and properties of dimensions; or in other words, the science of magnitude in general, comprehending the doctrines and relations of whatever is susceptible of augmentation and diminution: as the mensuration of lines, surfaces, solids, velocity, weight, &c. with their various relations. The origin of this science is always attributed to Egypt, where it is said to have been produced by the necessity of ascertaining the boundaries of landed property, which are every year effaced by the inundations of the Nile. The Greeks, who cultivated geometry more than any other people, doubtless learned the rudiments from the Egyptians; for Thales, who travelled into Egypt and acquired a sufficient knowledge of astronomy to calculate, must also have first become acquainted with the principles of geometry to assist him in his astronomical inquiries. From the time of Euclid, who died three hundred years before the Christian era, to that of Farback and Müller, who died in the

ALL GEOLOGISTS AGREE THAT THE BONES OF SPECIES NOW KNOWN ARE NEVER FOUND BUT IN LIGNITE, UPPER, ALLUVIAL DEPOSITS.

A New Dictionary of the Welles Letters.

[GEO]

fifteenth century, geometry was neglected. Since its revival, it has benefited by the illustrious labours of Neper, Descartes, Newton, and Leibnitz; and it is universally allowed to be of the utmost value as a branch of general knowledge, since it induces precision of thinking, by admitting nothing but evident and indubitable demonstration. The science of geometry is distinguished into the theoretical and the practical. Theoretical or speculative geometry treats of the various properties and relations in magnitudes, &c. Practical geometry comprehends the construction of figures, the drawing of lines in certain positions, as parallel or perpendicular to each other, &c. Speculative geometry is again distinguished into elementary geometry, that treats of the properties and proportions of right lines and right-lined figures, as also of the circle and its several parts; and the sublime or transcendental geometry, that treats of the higher order of curves, &c. The elementary principles of geometry are explained in definitions and axioms. The following are the most important definitions. A *point* is that which has neither length, breadth, nor thickness. A *line* has length without breadth or thickness. A *superficies*, or *surface*, has length and breadth only, the boundaries of which are lines. A *solid* is a figure which has length, breadth, and thickness. A *curve* continually changes its direction between its extreme points. A *straight line* lies evenly between the parts. *Parallel* lines keep at the same distance from each other when extended indefinitely. A *perpendicular* line is perpendicular to another line. An *angle* is formed by the meeting of two lines in a point; it is a *right angle* when formed by one line falling perpendicularly on another line; an *obtuse angle*, when it is greater than a right angle; and an *acute angle* when it is less. A figure of three sides and angles is called a *triangle*. An *equilateral* triangle is that whose three sides are equal. An *isosceles* triangle is that which has two sides equal. A *scalene* triangle is that whose three sides are all unequal. A figure of four sides and angles is called a *quadrangle*, or *quadrilateral*. A *parallelogram* is a quadrilateral which has both its pairs of opposite sides parallel; and a *rectangle* is a parallelogram, having a right angle. Four-sided figures are moreover distinguished according to their sides and angles, into a *square*, which has all its sides equal and its angles right ones; an *oblong square*, which has its opposite sides equal and its angles right ones; a *rhombus*, having all the sides equal, but the angles not right ones; and a *rhomboid*, having the opposite sides equal and the angles not right ones. When a quadrilateral has none of its sides parallel, it is a *trapezium*, and when only two of its sides parallel, a *trapezoid*. The *diagonal* is the right line which divides a parallelogram into two equal parts. The *base* of a figure is the side on which it is supposed to stand. The *vertex* is the extreme point opposite to the base; the *altitude* is the perpendicular dis-

tance from the vertex to the base. A *circle* is a plane figure bounded by a curve line, called the *circumference*, which is every where equidistant from a certain point within, called its *centre*; the *radius* of a circle is a line drawn from the centre to the circumference; the *diameter* of a circle is a line drawn through the centre, and terminating at the circumference on both sides; an *arc* of a circle is any part of the circumference; a *chord* is a right line joining the extremities of an arc; a *segment* of a circle is any part of a circle bounded by an arc and its chord; a *semicircle* is half the circle or a segment cut off by a diameter; a *sector* is any part of a circle which is bounded by an arc, and two radii drawn to its extremities; and a *quadrant*, or quarter of a circle, is a sector having a quarter of the circumference for its arc. The circumference of every circle is supposed to be divided into 360 equal parts, called *degrees*; each degree into 60 *minutes*; and each minute into 60 *seconds*; hence a semicircle contains 180 degrees, and a quadrant 90 degrees. A *pyramid* is a solid figure contained by planes that are constituted between one plane and one point above it in which they meet. A *prism* is a solid figure contained by plane figures of which two that are opposite are equal, similar, and parallel to one another; and the others parallelograms. A *sphere* is a solid figure described by the revolution of a semicircle. A *cone* is a solid figure described by the revolution of a right-angled triangle about one of the sides containing the right angle. A *cylinder* is a solid figure described by the revolution of a right-angled parallelogram about one of its sides. And a *cube* is a solid figure contained by six equal squares. An *axiom* is a manifest truth not requiring a demonstration: The following are examples of axioms, "Things equal to the same thing are equal to one another;" "The whole is greater than any of its parts, and equal to all its parts." "If equal things be taken from equal things, the remainders will be equal." "Magnitudes which coincide with one another, or which exactly fill the same space, are equal to one another." A *proposition* is something proposed either to be done or to be demonstrated, and is either a problem or a theorem: It is a *problem* when it proposes anything to be done, as to divide a given line into two equal parts, or to raise a perpendicular, &c.; and a *theorem* when it proposes something to be shown, as, that triangles of the same base and altitude are equal to each other, or that all the angles in the same segment of an arc are equal, &c. When something is premised, or demonstrated, in order to render what follows more easy, it is termed a *lemma*. A *corollary* is a consequent truth, gained immediately from some preceding truth or observation. A *scholium* is a remark or observation made upon something going before it.—*Transcendental Geometry*, is the geometry of figures, the relation of whose ordinate and abscissa cannot be expressed algebraically.—*Geometrical Progression* is

PLATO VALUED GEOMETRY SO HIGHLY, THAT HE INSCRIBED OVER THE DOOR OF HIS ACADEMY, "LET NO ONE IGNORANT OF GEOMETRY ENTER HERE."

ABOUT FIFTY YEARS AFTER PLATO, EUCLID COLLECTED THE THEOREMS OF HIS PREDECESSORS, AND ENTITLED THEM THE "ELEMENTS OF GEOMETRY."

when the terms increase or decrease by equal ratios; as 1, 4, 9, 16, 25; or 32, 16, 8, 4, 2.

GEPONITICS, the art or science of cultivating the earth.

GEORAMA, a hollow sphere, 36 feet in diameter, representing the surface of the earth, its mountains, seas, rivers, &c. with great accuracy. It is a Parisian invention.

GEORGE (St.), a saint or hero whose name is famous throughout all the East, and by which several orders, both military and religious, have been distinguished. St. George is usually represented on horseback, in full armour, with a formidable dragon writhing at his feet. His sanctity is established in the Latin as well as the Greek church; and England and Portugal have chosen him for their patron saint. According to ancient legends, this renowned saint was a prince of Cappadocia; whose greatest achievement was the conquest of an enormous dragon, by which he effected the deliverance of Aje, the daughter of a king. The legend belongs to the age of the crusades. The ancient Christian emperors bore the knight upon their standards. To these sacred banners the crusaders attributed a miraculous power, and were sure of conquest while they floated above their heads. Many, however, deny his very existence; and reduce his effigy to a mere symbol of victory gained by the crusaders over the Mussulman nation.

GEORGICS, a poetical composition treating of husbandry, after the manner of Virgil's poems on rural subjects, which are called *Georgics*.

GEORGIIUM SIDUS, or **URANUS**, the name given by Dr. Herschel, in honour of George III., to the planet which he discovered in 1781.

GERANIUM, a genus of plants, class 16 *Monadelphia*, order 5 *Decandria*. Of this there are numerous species, which are remarkable for the beauty either of their leaves or their flowers, or both. The seeds of the flower are contained in a husk, which resembles a stork's beak, whence it has acquired the English name of crane's bill.

GERMAN, a native of Germany. Also, the German language.—*Cousine-german*, the sons or daughters of brothers or sisters; first cousins.

GERMANDER, in botany, the name of several plants, as the rock *germander*, of the genus *Veronica*, and the common and water *germander*, of the genus *Teucrium*.

GERMEN, in botany, the germ, ovary, or seed bud, which is the lower part or base of the pistil, and in the progress of vegetation becomes the seed-vessel.

GERMINATION, in botany, the act of sprouting forth, as applied to the seeds of vegetables; also the time when they vegetate.

GERBECOMIA, that part of medicine which prescribes a regimen for old age.

GERERA, in antiquity, a sort of square shield, used first by the Persians, and afterwards by the Greeks.

GERUND, in grammar, a verbal noun of the neuter gender, partaking of the nature of a participle, declinable only in the singular number, through all the cases except the vocative; as, nom. *amandum*, gen. *amandi*, dat. *amando*, accus. *amandum*, abl. *amando*.

GESNERIA, in botany, a genus of plants, class 14 *Didymia*, order 3 *Angiospermia*. The species are shrubs.

GESTURE, any action or posture intended to express an idea or passion, or to enforce an argument or opinion; hence propriety of gesture is of the first importance to an orator.

GHOST, the soul or spirit separate from the body. The ancients supposed every man to be possessed of three different ghosts, which, after the dissolution of the human body, were differently disposed of. These they distinguished by the names of *Manes*, *Spiritus*, *Umbra*. The *Manes*, they fancied, went down into the infernal regions; the *Spiritus* ascended to the skies, and the *Umbra* hovered about the tomb, as being unwilling to quit its old connexions. —To give up the ghost, a phrase used in Scripture for—to yield up the breath, or expire.

GHOST, HOLY; the third person in the Holy Trinity; but according to the Socinians, a biblical metaphor, to designate the divine influence. All Christians who subscribe to the doctrine of the Athanasian creed, believe the Holy Ghost to have proceeded from the Father and the Son; yet the Son and Holy Ghost are both eternal, since they are co-eternal with the Father. The Greek church maintains that the Holy Ghost proceeds from the Father only; and this difference is one of the main points of distinction between that church and the Roman Catholic. —A military order in France under the old regime, which was abolished by the revolution, but revived by the Bourbons.

GIANT'S CAUSEWAY, a vast assemblage of basaltic crystalized rocks, on the northern coast of Ireland, so extensive and regular as to excite the admiration of every beholder. This magnificent production of nature extends two miles in length along the coast of Antrim, and probably runs under the sea as far as the coast of Scotland, since something of the same kind is met with there, and known by the name of Fingal's Cave. It consists of many hundred thousands of columns of a black kind of rock, hard as marble, of about twenty feet in height, and a pentagonal or five-sided figure. Each column stands by itself, not joining another in any part whatever; and yet so compactly are the whole arranged that scarcely a knife can be introduced between them. What still farther fills the spectator with an amazement that increases by length of examination, is the circumstance that though almost every pillar is pentagonal in its form, and therefore presents an apparently general likeness, no two in twenty thousand have their angles and sides equal among themselves,

SIBSON, THE HISTORIAN, ASCRIBES TO ST. GEORGE A NEAR ORIGIN, A BAD LIFE, AND AN IGNOMINIOUS DEATH, BY OTHERS CALLED MARTYRDOM.

ON A LOFTY PROJECTING CLIFF, EAST OF THE GIANT'S CAUSEWAY, STAND A FEW SHATTERED COLUMNS, USUALLY CALLED "THE CRINERY-POLE."

[GIL]

A New Dictionary of the Belles Lettres.

[GIL]

or to each other. The columns are not each of one solid stone, in an upright position, but composed of several short lengths, exactly joined, not with flat surfaces, but articulated into each other, as a ball in a socket, one end of the joint having a cavity of three or four inches deep, into which the convex end of the opposite joint is exactly fitted.

GIANTS. History, both sacred and profane, makes mention of giants, or people of extraordinary stature. Nations, as well as individuals, in their infancy, love the marvellous; and any event which deviates from the common course of things, immediately becomes a wonder on which poetry eagerly seizes; hence the Cyclops and Laestrygon of the ancients, and the ogres of romance. Instances, however, are by no means wanting of uncommonly large persons, hardly needing the exaggeration of a lively imagination to make them objects of wonder. The giants spoken of in Scripture might be men of extraordinary stature; but not so much above the ordinary measure as they have fancied, who describe them as three or four times larger than men are at present. And when we find the Israelites describing themselves as appearing like grasshoppers before the Anakites, we must bear in mind the universal practice among the nations of the East to express their astonishment in the most extravagant style of hyperbole. The giants of Greek mythology are believed by some to represent the struggle of the elements of nature against the gods, that is, against the order of creation. They were said to hurl mountains and forests against Olympus, disdaining the lightnings of Jupiter, &c. Giants, indeed, make a very considerable figure in the fabulous history of every nation; but, like ghosts and fairies, they have always vanished at the approach of science and civilisation. The fossil bones which gave currency to the belief of their existence, have upon minute inquiry been found generally to belong to elephants, whales, &c.

GIAOUR, a word literally signifying *dog* in the Turkish language; and commonly applied by the Turks to designate the adherents of all religions except the Mohammedan, but more particularly Christians.

GIBBOUS, in astronomy, a term applied to the enlightened part of the moon, during her course from full to new, when the dark part appears falcated or horned, and the light part convex or gibbous.

GIBELINES, or **GHIBELINES**, a faction in Italy, in the 13th century, who were the opponents of another faction called the *Guelphs* [which see.]

GIESECKITE, a mineral of a rhomboidal form and compact texture, of a gray or brown colour, and nearly as hard as calcareous spar.

GILBERTINE, one of a religious order, so named from Gilbert, lord of Sempringham in Lincolnshire.

GILDA MERCATORIA, in law, mercantile meetings, assemblies, or corporate bodies.

GILL, the organ of respiration in fishes, consisting of a cartilaginous or bony arch, attached to the bones of the head, and furnished on the exterior convex side with a multitude of vascular fibrils of a red colour. The water is admitted by the gill-opening, and acts upon the blood as it circulates in the fibrils.—*Gill-slip*, a membrane attached to the posterior edge of the lid of the gill, immediately closing the gill-opening.

GILL, (pron. *jill*), a measure of capacity, containing the fourth part of a pint.—Among miners, a measure equal to a pint.

GILLYFLOWER, in botany, the name of certain plants. The *close gillyflower* is of the genus *Dianthus*, or carnation pink; the *stock gillyflower*, is the *Cheiranthus*; and the *queen's gillyflower*, the *Hesperia*.

GILT-HEAD, in ichthyology, a genus of fishes, the *Sparus*, of many species; so named from their colour, or from a golden spot between their eyes.

GIM'RAL, a brass ring by which a sea compass is suspended in its box, by means of which the card is kept in a horizontal position, notwithstanding the rolling of the ship.

GILD'ING, the art of covering anything with gold, either in a foliated or liquid state. The beauty of gold has induced many attempts to imitate its appearance, and hence several methods of gilding have been invented. The art of gilding, at the present day, is performed either upon metals, or upon wood, leather, parchment, or paper; and there are three distinct methods in general practice; namely, *wash*, or *water gilding*, in which the gold is spread, whilst reduced to a fluid state, by solution in mercury; *leaf gilding*, either burnished or in oil, performed by cementing thin leaves of gold upon the work, either by size or by oil; and *japaner's gilding*, in which gold dust or powder is used instead of leaves. When gold is to be applied to a body that is of metal, the surface is previously covered with some gluey substance or size; and when the body is to be exposed to the injuries of the weather, a composition of drying oil and yellow ochre is used in place of the water-size. In the process of gilding metals, the surface is first cleansed, and then the leaves applied, which, by means of burnishing, and a certain degree of heat, are made to adhere in the manner desired. Gold is also sometimes fixed on metals, by previously reducing it into an amalgam or paste, with mercury. With this amalgam, the metal to be gilded is covered; and, on the application of heat sufficient to evaporate the mercury, nothing is left but the gold, which is afterwards burnished. It is also performed by diluting a solution of gold in nitro-muriatic acid, with alcohol, and applying it to the clean surface of the metal. Gold is also applied to glass, porcelain, and other vitrified substances, of which the surfaces, being very smooth, are capable of perfect contact with the gold leaves. This gilding is so much the more excellent as the gold is more exactly applied, which done, the articles are exposed to a certain degree of heat, and

IN THE FABULOUS STORIES OF MYTHOLOGY, WE READ OF GIANTS WITH FIFTY HEADS, A HUNDRED ARMS, AND SERPENTS INSTEAD OF LEGS.

GOLD-LEAF CAN BE REDUCED TO TEN THOUSANDS OF PARTS OF AN INCH, AND GILDING TO TEN THOUSAND PARTS.

GIN]

The Scientific and Literary Treasury ;

[GIP

afterward slightly burnished; or a more substantial gilding is fired upon glass by the use of powder of gold mixed with a solution of gum-arabic, or with some essential oil and a small quantity of borax.

GIN, or GENEVA, a hot fiery spirit formerly drawn from oats, barley, or malt, redistilled with the addition of berries of the *genièvre* or juniper tree, but now made principally of the oil of turpentine and malt spirits. The Hollands gin is manufactured chiefly at the village of Schiedam, and is drawn from wheat or rye and juniper berries. The English gin is a destructive drink, much resorted to by the lower orders; and their palates are so vitiated by its use, as to render purer spirits in a manner insipid to them.

GINGER, in botany, *anemum singiber*, is an East Indian plant, which is also cultivated to a considerable extent in Jamaica and other West India islands. The root is of the size of a finger, knotty, irregular, and creeping. It possesses an aromatic, pungent flavour; makes an excellent preserve, and is used medicinally as a carminative.

GINGLYMUS, in anatomy, a species of articulation resembling a hinge. That species of articulation in which a bone partly receives and is partly received by the other, so as to admit only of flexion and extension, is called *angular ginglymus*.

GINSENG, a plant of the genus *Penax*, found in the northern parts of Asia and America. It has a jointed, fleshy, taper root, about the size of one's finger, which when dry is of a yellowish white colour, with a mucilaginous sweetness in the taste, accompanied with a slight bitterness. The Chinese value the ginseng highly, and, as well as the Asiatics in general, think it almost an universal medicine. They have recourse to it in all diseases, and, in short, have no confidence in any medicine unless in combination with it; but the virtues most generally ascribed to ginseng, are those of a restorative, a provocative, and a cordial.

GIRAFFE, the CAMELOPARD, [which see.] In addition to the description which we have before given of this animal, we here extract a few lines relative to the speed and habits of the giraffe, from a very interesting account communicated to the Secretary of the London Zoological Society (January, 1836) by M. Thibaut, who, in company with the Arabs, had captured several of these animals. "The first run of the giraffe is exceedingly rapid. The swiftest horse, if unaccustomed to the desert, could not come up with it unless with extreme difficulty. If the giraffe reaches a mountain, it passes the heights with rapidity: its feet, which are like those of a goat, endow it with the dexterity of that animal; it bounds over ravines with incredible power; and horses cannot, in such situations, compete with it. The giraffe is fond of a wooded country; the leaves of trees are its principal food, which it takes leaf by leaf, collecting them from the trees by means of its long tongue. It rejects

the thorns, and in this respect differs from the camel. It is extremely fond of society, and is very sensible. I have observed one of them shed tears when it no longer saw its companions or the persons who were in the habit of attending to it."

GIPSIES, or GYPSIES, a wandering tribe, or race of vagabonds, spread over the greater part of Europe, and some parts of Asia and Africa; strolling about and subsisting mostly by theft, low games, and fortune-telling. The name is supposed to be corrupted from *Egyptian*, as they were formerly thought to have come from Egypt; but it is now believed they are of Indian origin, and that they belonged to the race of the *Sindes*, an Indian caste, which was dispersed, in 1400, by the expeditions of Timour. Their language is the same throughout Europe with but little variation, and even now resembles the dialect of Hindostan. In short, the late Bishop Heber relates, in his Narrative of a Journey through the Upper Provinces of India, that he met with a camp of gypsies on the banks of the Ganges, who spoke the Hindoo language as their mother tongue; and he further observes, that he found the same people in Persia and Russia. Gypsies are remarkable for the yellow brown, or rather olive colour of their skin; the jet black of their hair and eyes; the extreme whiteness of their teeth; and for the symmetry of their limbs, which distinguishes even the men, whose general appearance, however, is repulsive and shy. Though some occasionally follow a trade or honest calling, they rarely settle permanently anywhere. Wherever the climate is mild enough, they are found in forests and deserts, in companies. They seldom have tents, but seek shelter from the cold of winter in grottoes and caves, or they build huts, sunk some feet in the earth, and covered with sods laid on poles. They are fond of instrumental music, which they chiefly practise by the ear, and their lively motions are remarkable in their own peculiar dances. The youthful gypsies traverse the country, the men obtaining their living by gymnastic feats, tricks, &c., while the women invariably practise fortune-telling and chiromancy. They are not nice in their food, but eat all kinds of flesh; even that of animals which have died a natural death. Brandy is their favourite beverage; tobacco their greatest luxury; both men and women chew and smoke it with avidity, and are ready to make great sacrifices for the sake of satisfying this inclination. As for religion they have no settled notions or principles: amongst the Turks they are Mohammedans; in Christian countries, if they make any religious profession at all, they follow the forms of Christianity, without, however, caring for instruction, or having any interest in the spirit of religion. They marry with none but their own race, but their marriages are formed in the rudest manner, and when a gypsy becomes tired of his wife, he will turn her off without ceremony.

AS GINGER-BEER RETAINS ITS CARBONIC ACID IN THE GLASS FOR A CONSIDERABLE TIME, IT IS THE MOST REFRESHING BEVERAGE IN HOT WEATHER.

GYPSIES WERE EXPELLED FRANCE IN 1860, AND IN 1860 AN ACT OF PARLIAMENT WAS PASSED AGAINST THEIR ITINERANCY IN ENGLAND.

[GLA.]

A New Dictionary of the Belles Lettres.

[GLA.]

GIRASOL, a mineral of a white or bluish white colour, but which when turned towards the sun or any bright light reflects a reddish tint; hence its name.

GIRD'ER, in architecture, the principal piece of timber in a floor. Its end is usually fastened into the breastsumers, and the joists are framed into it at one end.

GIRONDISTE, a republican party in France, of a character less exceptionable than many who figured in the dreadful scenes of the revolution. They obtained their appellation from several of their most distinguished members having come from the department of the Gironde; and they were chiefly celebrated by their fatal opposition to the mountain party in the convention, who eventually brought most of them to the guillotine or proscribed them.

GIROUETTE (French, weathercock), a term applied to numerous public characters in France, who, during the revolutionary era, turned with every political breeze. To mark these, a *Dictionnaire des Giroettes* was published, containing their names, &c., with a number of weathercocks against each, corresponding to the number of changes in the individual's political creed. [In our "Biographical Treasury" we have given the lives of the most important of these—not indeed for their merits, but for the influence they severally possessed, and their wanton exercise of power during that unparalleled period in the history of nations.]

GIR'OCK, in ichthyology, the *Lacertus*, a species of gar-fish.

GIVEN, a term much used by mathematicians, to denote something supposed to be known. Thus, if a magnitude be known, it is said to be a *given* magnitude, if the ratio between two quantities be known, these quantities are said to have a *given* ratio, &c. &c.

GLACIERS, immense masses or fields of ice which accumulate in the valleys between high mountains, from the melting of the snow at their top, and which, owing to their elevation, generally remains solid. The ice of the glaciers is entirely different from that of the sea and river water. It is not formed in layers, but consists of little grains of congealed snow; and hence, though perfectly clear, and often smooth on the surface, it is not transparent. As glaciers, in some positions, and in hot summers, decrease, they often also increase for a number of years so as to render a valley uninhabitable. Their increase is caused partly by alternate thawing and freezing; their decrease, by the mountain rivers, which often flow under them, and thus form an arch of ice over the torrent. In the Tyrol, Switzerland, Piedmont, and Savoy, the glaciers are so numerous that they have been calculated to form altogether a superficial extent of 1484 square miles.

GLACIS, in fortification, a mass of earth serving as a parapet to the covered way, having an easy slope or declivity towards the campaign or field.

GLADIATE, in botany, an epithet for

the legume of a plant resembling a sword in shape.

GLADIATORS, in antiquity, combatants who fought at the public games in Rome, for the entertainment of the spectators. They were at first prisoners, slaves, or condemned criminals; but afterwards freemen fought in the arena, either for hire, or from choice. The games were commenced by a *præluæ*, in which they fought with weapons of wood, till, upon a signal, they assumed their arms, and began in earnest to fight in pairs. In case the vanquished was not killed in the combat, his fate was decided by the people. If they wished to save the life of the vanquished gladiator, they signified the same by clenching the fingers of both hands between each other, and holding the thumbs upright, close together; the contrary was signified by bending back their thumbs. The first of these signals was called *pollicem prætere*, the second *pollicem verte*. The victors were honoured with a palm branch, a sum of money, or other marks of the people's favour; and they were not unfrequently released from further service, and received as a badge of freedom, the *rudis*, or wooden sword.

GLADI'OLE, in botany, the Sword-lily, a plant of the genus *Bulbus* or Flowering-rush, and also of the genus *Lobelia* or Cardinal-flower.

GLADI'US, (Latin, a sword): whence *jus gladii*, or right of the sword, is used in our ancient Latin authors, and in our Norman laws, for supreme jurisdiction; and it is probably from hence that, at the creation of an earl, he is *gladio sacristatus*, to denote his having a jurisdiction over the county.

GLADWIN, in botany, a plant of the genus *Frit*.

GLAIR, the white of an egg; or any viscous transparent substance resembling it.

GLAND, in anatomy, a small hollow follicle, formed by the convolution of a great number of vessels, and covered with a membrane, usually provided with an excretory duct, and destined to separate some particular fluid from the mass of blood, or to perfect the lymph. Glands have been divided into *simple*, *compound*, *conglobate*, and *conglomerate*, from their structure; but a more proper division is into *lymphatic* and *secretory*. Some glands are hard and firm, and others extremely soft and tender: of the latter kind in particular are the glands situated in the articulations of the bones of the several parts of the body. They differ also very considerably in their colour, figure, and uses: some of them are salivary, mucous, and lymphatic; others are mucilaginous, sebaceous, and waxy; others lachrymal, pituitary, &c. The excretory duct of a gland is that through which the fluid of the gland is excreted. The vessels and nerves of glands always come from the neighbouring parts, and the arteries appear to possess a high degree of irritability.

GLANDERS, a virulent disease in horses, which shows itself by a discharge of mucus from the nostrils.

THE HIMALAYAN MOUNTAINS, EXTENDING FROM THE SOURCES TO THE SEAS, ARE ALWAYS COVERED WITH SNOW.

SEVERAL ANIMALS HAVE GLANDS AND BAGS SECRETING OFFENSIVE SUBSTANCES, AND CAN SMELL THEIR MANNER WHEN PURSUED.

[GLA]

The Scientific and Literary Treasury ;

[GLA]

GLANDIFEROUS, in botany, an epithet applied to trees which bear acorns or other nuts, as the beech and oak.

GLASS, a hard, brittle, transparent, facitious substance, formed by the fusion of siliceous and alkaline matter. Pliny ascribes its origin to accident. Certain merchants, as he relates, were driven into the mouth of the Belus, a river in Syria, by stress of weather; and being obliged to continue there, and dress their victuals near the shore, where they used kali for fuel, the ashes of the herb mixed with the sand or stones, and produced glass: a phenomenon which, being known, induced the people of Sidon to pursue the hint it afforded, and, eventually, to establish the manufacture in question among the number of human arts. Whether or not this account is to be relied on we have not the means of judging; but we can readily agree with Dr. Johnson, who says, "By some fortuitous liquefaction was mankind taught to produce a body at once in a high degree solid and transparent, which might admit the light of the sun, and exclude the violence of the wind; which might extend the sight of the philosopher to new ranges of existence, and charm him at one time with the unbounded extent of the material creation, and at another with the endless subordination of animal life; and, what is yet of more importance, might supply the decays of nature, and succour old age with subsidiary sight. Thus was the first artificer in glass employed, though without his own knowledge or expectation. He was facilitating and prolonging the enjoyment of light, enlarging the avenues of science, and conferring the highest and most lasting pleasures; he was enabling the student to contemplate nature, and the beauty to behold herself." Silica, formerly styled the earth of flints, which constitutes the basis of all commercial glass, is infusible by itself in the strongest fire of our furnaces; but its vitreous fusion is easily effected by a competent addition of potash or soda, either alone or mixed with lime or litharge. The window-glass manufacture was first begun in England in 1557, in Cratched Friars, London; and fine articles of flint-glass were soon afterwards made in the Savoy House, Strand. In 1635 the art received a great improvement from Sir Robert Mansell, by the use of coal fuel instead of wood. The first sheets of blown glass, for looking-glasses and coach windows, were made in 1673 at Lambeth, by Venetian artisans employed under the patronage of the duke of Buckingham. The casting of mirror-plates was commenced in France about the year 1688, by A. Thevenot; but in excellence and cheapness, the French mirror-plate has been for some time rivalled by the English. There are five distinct species of glass, each requiring a peculiar mode of fabrication, and peculiar material: 1. Bottle glass, which is the coarsest and most simple of any. 2. Broad or coarse window glass; of which there is an improved kind now made near Birmingham, and called British or

German plate. 3. Crown glass, or the best window glass, formed in large circular plates. 4. Flint glass, crystal glass, or glass of lead. 5. Plate or fine mirror glass. The materials of every kind of glass are vitrified in pots made of a pure refractory clay. The glass-pots are placed round a dome-shaped furnace, built upon arches, and open beneath for the free admission of air; there are generally six in each furnace, and they are entirely enclosed, except at an orifice on the side opening into a small recess formed by the alternate projection of the masonry and the flues, in which the workmen stand. Coal is the fuel employed, and the furnace is so built that a rapid current of flame may be directed round each glass-pot, which afterwards passes out with the smoke into the dome and chimney, heating a broad covered shelf in its passage, which is the annealing oven. The materials, or frit, being fused, and the impurities removed, it gradually becomes clearer, abundance of air-bubbles are extricated, and at length the glass appears uniform and complete; the fire round each individual pot is then damped, till its contents acquire a consistency fit for working: the whole process requiring about forty-eight hours from the time the pots are filled. At the working heat, which is a full red, the glass has a peculiarly tenacious consistency, and as it adheres but feebly to polished metals, it is easily wrought and managed with iron tools. Various ornamental forms are also given to the surface of glass vessels by metallic moulds. The mould is usually of copper, with the figure cut on its inside, and opens with hinges to permit the glass to be taken out.—Those readers who consult our pages must be aware that in an article of this nature it is impossible to describe the various manipulations in glass-making, with anything like minuteness of detail; we shall therefore not attempt it, but conclude with a quotation from an old English historian, who, in 1684, thus writes: "Of old time, our country houses instead of glass did use much lattice, and that made either of wicker or fine rifts of oak in checkerwise. I read also that some of the better sort, in and before the time of the Saxons, did make panels of horn instead of glass, and fix them in wooden calures (casements); but as horn in windows is now quite laid down in every place, so our lattices are grown into disuse, because glass is come to be so plentiful, and within verie little so good, cheape, if not better than the other."—*Glass-house*, a manufactory in which siliceous or flint dust, and fixed alkalis are melted, so as to produce a fluid, which, when cold, constitutes glass, but which, while liquid, may be moulded, blown, or drawn into any shape, as before described.—*Glass-blower*. The materials of glass when fluid, are so perfectly ductile and plastic, that the glass is blown into shapes with the breath of the workman, through an iron pipe, about three feet long, assisted by a few very trifling tools. He dips the end of his blow-pipe

THE ART OF MAKING GLASS AND PORCELAIN, BY COMBINING ALKALINE, SAND, AND FLINT TOGETHER, IS ALTOGETHER A CHEMICAL PROCESS.

ALL WHITE TRANSPARENT STONES, WHICH WILL NOT BURN TO LIME, ARE FIT TO MAKE GLASS; AND FOR THEM SAND IS SUBSTITUTED.

GLI]

A New Dictionary of the Belles Lettres.

[GLO

GLASS DOES NOT ACQUIRE THE PROPERTY OF REFLECTING OBJECTS TILL ONE SIDE HAS BEEN COATED WITH TIN AND QUICKSILVER.

into the melting pot, through the hole in the furnace, and the fluid which sticks to the iron is blown with proper skill; a boy generally assisting in the operation, who, while it is still red hot, joins to the blown vessel any peculiar parts. When finished, it is placed in an upper furnace, and kept in a red heat for some hours.

GLASSES, Optical. Glasses intended for optical purposes are spherically ground, and called lenses. They are either convex or concave, and used either as simple magnifiers and spectacles, or for telescopes and microscopes. The grinding of the lenses is performed in brass moulds, either concave or convex, formed to the same curvature as that desired in the lenses; and may be worked either by hand or by machinery.

GLASSWORT, in botany, the *Salsola*, a plant of many species, all of which may be used in the manufacture of glass. Barilla is the semifused ashes of the *Salsola soda*, which is extensively cultivated in Spain.

GLAUBERITE, a mineral of a grayish white or yellowish colour, consisting of dry sulphate of lime and dry sulphate of soda.

GLAUBER-SALT, in chemistry, sulphate of soda, a well known cathartic.

GLAUCOMA, in surgery, a disease in the eye, in which the crystalline humour has a greenish or bluish gray appearance, and its transparency is diminished.

GLAZING, in the manufacture of pottery, the encrustation of vessels with a vitreous substance, the basis of which is lead. After the ingredients are ground together, they are calcined with a moderate heat; and, when cold, reduced to powder. When wanted, the powder is tempered with water, and laid on the ware by means of a brush. Placed in a furnace, the violent heat soon transforms this coating into a perfect glass.

GLEBE LAND, in law, a portion of meadow or pasture land belonging to a parish church or ecclesiastical benefice.

GLEE, in music, a composition of three or more parts; originally used for convivial purposes.

GLEN, in anatomy, the cavity or socket of the eye, and the pupil. Also any slight depression or cavity receiving a bone in articulation.

GLENOIDES, in anatomy, a name for two cavities in the lower part of the vertebrae of the neck.

GLIADINE, in chemistry, one of the constituents of gluten, a slightly transparent, brittle substance, of a straw colour, and in small resembling the honeycomb.

GLIMMER, a mineral, resulting from crystallization, usually appearing in thin, flexible laminae, which exhibit a high polish and strong lustre. It is an essential ingredient in granite, gneiss, and mica slate.

GLIRES, the fourth order of the class *Mammalia* in the Linnæan system, including such animals as have two fore teeth, a cutting one in each jaw, no tusks, and feet with claws formed for running, as the beaver, the hare, &c.

GLISCRORE, in medicine, a term some-

times applied by physical writers to the natural heat and increase of spirits; as also to the exacerbation of fevers which return periodically.

GLISCROCHOLOS, in medicine, an epithet for bilious viscid excrements.

GLOBE, in practical mathematics, an artificial spherical body, on the convex surface of which are represented the countries, seas, &c. of our earth; or the face of the heavens, with the several circles which are conceived upon them. That with the parts of the earth delineated upon its surface, is called the *terrestrial globe*; and that with the constellations, &c. the *celestial globe*. Their principal use, besides serving as maps to distinguish the earth's surface, and the situation of the fixed stars, is to illustrate and explain the phenomena arising from the diurnal motion of the earth. They are consequently of the highest importance in acquiring a knowledge of geography and astronomy. [See EARTH, ASTRONOMY, AMILLARY SPHERE, &c.]

GLOBULARIA, in botany, a genus of plants, class 4 *Tetrandria*, order *Monogymia*. The species are perennials. The leaves of the *Globularia allypum* are sometimes used medicinally, and are said to act as a powerful but safe cathartic.

GLOBULAR CHART, a name given to the representation of the surface, or of some part of the surface of the terrestrial globe upon a plane, wherein the parallels of latitude are circles, nearly concentric, the meridian curves bending towards the poles, and the rhumb-lines are also curves.

GLOBULE, a small particle of matter of a spherical form: a word particularly applied to the red particles of blood, which swim in a transparent serum, and may be discovered by the microscope.

GLOMERATE, in anatomy, an epithet for a gland formed of a conglomeration of sanguineous vessels, having no cavity, but furnished with an excretory duct, as the lachrymal and mammary glands.

GLOMERATUS, in botany, an epithet that signifies growing together in a globular form, as *spica glomerata*, a spike having the spikelets variously heaped together: *panícula glomerata*, a glomerate panicle having the flowers heaped pretty close together.

GLOSSA'GRA, in medicine, a rheumatic pain in the tongue.

GLOSSARY, a dictionary or vocabulary, explaining obscure or antiquated words found in old authors.

GLOSSO-PHARYNGEAL NERVES, in anatomy, the ninth pair of nerves. They arise from the processes of the *cerebellum*, which run to the *medulla spinalis*, and terminate by numerous branches in the muscles of the tongue and pharynx.

GLOSSOCELE, in medicine, an extrusion of the tongue.

GLOT'TIS, in anatomy, the narrow opening at the upper part of the *assperia arteria* or wind-pipe, which, by its dilatation and contraction, contributes to the modulation of the voice.

GLOW-WORM, in entomology, an insect

THERE IS NO AUTHENTIC EVIDENCE OF GLASS BEING USED IN WINDOWS PREVIOUSLY TO THE THIRD OR FOURTH CENTURY.

[GLO]

The Scientific and Literary Treasury ;

[GLY]

NITRIC ACID, WITH THE AID OF HEAT, CONVERTS GLUE INTO MALIC ACID, OXALIC ACID, A SUBSTANCE LIKE SUEET, AND INTO YAMIN.

of the genus *Lampyrus*, remarkable for its luminous appearance in the dark, which proceeds from a vivid phosphoric light with which nature has provided it. The glow-worm is seen about the months of June, July, and August. The light which is perceived towards the lower extremity of its body, is produced by a phosphoric liquor. The insect has the power of varying the degree of its brightness, and even of wholly extinguishing it; so that if an observer approach the spot where he has perceived it, it often happens that the creature renders itself wholly invisible. It seems probable, that it does not emit light, either when moving, or when apprehensive of danger. The lights, which are perceived along the ground, are never seen to change their places; and if the insect be taken, and carried in such a manner that it is itself at rest, it will shine during the whole journey, yet when set down, even in the dark, it will immediately withdraw its luminousness. If, in this case, a light be procured, it will be found that it is crawling in search of a station.—So much has been written on the glow-worm's light, and so many theories have been advanced, that we may, perhaps, be excused for devoting more space than the subject may appear to deserve, in noticing what has been said on the economy of this curious insect. A correspondent of the "Philosophical Magazine" describes it as follows: "The female deposits her eggs in the month of June or July, among moss, grass, &c. These eggs are of a yellow colour, and emit light. After remaining about five or six weeks, the larvæ break their shells and make their appearance; at first they appear white, and are very small, but they soon increase in size, and their colour changes to a dark brown, or nearly black. The body of the larva is formed of eleven rings. It has six feet, and two rows of reddish spots down the back. It emits light in the dark; this light arises from the last ring of its body under the tail, and appears like two brilliant spots when attentively examined. The larvæ are seen creeping about, and shining during the fine nights of autumn, and the light they emit is to direct them to their food. They feed on small snails, the carcases of insects, &c. They frequently cast off their skins: after the expiration of about one year and nine months from their birth, they arrive at their perfect size. They then cease to eat, cast off their skin, and assume another appearance. The form of the perfect insect may be discovered through a thin skin that covers them. After remaining in this state two or three weeks, (scarcely ever moving) they throw off their last skin and arrive at perfection. The male then appears a perfect beetle, with wings and cover to the same. The female, on the contrary, has neither wings, nor wing-cases; she is larger than the male, and of a lighter colour. It is the female that principally shines in a perfect state. Her light is far superior to that emitted by the larvæ, and

arises from the three last rings of the body on the lower side." In Mr. John Murray's "Researches" the cause, nature, and uses of this phenomenon are skilfully treated; and he thus concludes his ingenious observations: "The use to which it is subservient in the animal economy, it is difficult to ascertain—'we see but in part.' Its very existence, however, proves that it is a condition indispensable to its being. Providence has tipt the insect with living fire—a non-material ignition—burning, yet not consumed—even extinguished by a temperature which the animal system, with which it is so singularly interwoven, cannot withstand. It may be a 'lamp to its path,' to guide it to its food, subserving the additional purpose of warding off its enemies—while it may also be the luminous point that directs the nightingale to its proper prey."

GLUCINE, or GLUCINA, a very rare earth, of a sweetish taste, which was discovered in analyzing the beryl. It is infusible in the fire and insoluble in water, but combines with acids, making with them soluble salts.

GLUE, inspissated animal gluten; a tenacious viscid matter, which serves as a cement. It is made from the parings of hides and other offals by boiling them in water, then straining off the impurities and boiling them again. The best glue is that which is oldest; and the surest way to try its goodness, is to lay a piece to steep three or four days, and if it well considerably without melting, and when taken out resumes its former dryness, it is excellent.

GLUME, in botany, the calyx or corolla of grasses.

GLUTEAL, in anatomy, an epithet for a branch of the hypogastric or internal iliac artery, which supplies the *gluteal muscles*; the latter being three large muscles on each side of the rump.

GLUTEN, an adhesive and elastic substance, similar to glue, which is procured by the decomposition of wheat flour or other vegetable substances. It contributes much to the nutritive quality of flour, and gives tenacity to its paste. It has some resemblance to animal tendon or membrane, is very tenacious, and may be used as a cement for broken porcelain vessels. When dried in the air or a stove, gluten diminishes greatly in size, becomes hard, brittle, glistering, and of a deep yellow colour. It is insoluble in ether, in fat and essential oils, and nearly so in water.

GLUTINOUS, in botany, an epithet applied to a leaf, &c. which is becnearched with a slippery moisture.

GLUTTON, in zoology, an animal of the genus *Ursus*, found in the north of Europe and Siberia. It grows to the length of three feet, but has short legs, and moves slowly. It is very voracious, and in order to catch its prey, it climbs a tree, and from that darts down upon its victim.

GLYCERINE, in chemistry, a sweet substance which may be extracted from fats. Its constituent parts are carbon, hy-

COMMON GLUE IS NOT SOLUBLE IN ALCOHOL, BUT IS PRECIPITATED IN A WHITE, COHESIVE, ELASTIC MASS: A LITTLE GLYCERINE SUFFICES FOR IT.

[GNO]

A New Dictionary of the Belles Lettres.

[GOA]

drogen, and oxygen. Water combines with it in almost all proportions; alcohol dissolves it; nitric acid converts it into oxalic acid; and sulphuric acid transforms it into sugar.

GLYCINE, in botany, a genus of the *diadelphia decandria* class of plants, with a papilionaceous flower, and an oblong bilocular pod, containing a number of kidney-shaped seeds, of a scarlet colour, spotted with black.

GLYCONIAN, or GLYCONIC, a kind of verse in Greek and Latin poetry, consisting of three feet, a spondee, a choriamb, and a pyrrhic.

GLYPH, in sculpture and architecture, any channel or cavity intended as an ornament.

GLYPTOGRAPHY, a description of the art of engraving on precious stones.

GNAT, in entomology, the *Culex*, a genus of insects, whose cylindrical body is composed of eight rings. They have six legs, and their mouth is formed by a flexible sheath, inclosing bristles pointed like stings. The gnat of this country is comparatively harmless; but those of warmer climates are peculiarly annoying, especially in marshy situations. They pursue the inhabitants, enter the houses, especially in the evening, announcing their arrival by a sharp buzzing noise. The pain of the wound they inflict is occasioned by a venomous fluid which they inject into it; the best remedy for which are preparations of ammonia. It is a curious fact in entomology, that it is only the females which are thus tormenting.

GNEISS, in mineralogy, a species of aggregated rock, composed of quartz, felspar, and mica, of a structure more or less slaty. It passes on one side into granite, from which it differs in its slaty structure, and on the other into mica slate. It is rich in metallic ores. With regard to the distribution of gneiss, it may be remarked that it is the principal rock of very extensive districts. It forms the declivities of immense mountain chains of granite, and even constitutes entire mountains of itself. It is the predominating rock of all the north of Europe: it abounds also in the southern Alps and the Pyrenees; forms the loftiest chains of the Andes of Quito; and is found plentifully in the United States.

GNOMES, spirits with which the imagination of certain philosophers has peopled the interior parts of the earth, and to whose care mines, quarries, &c. are assigned.

GNO'MON, in dialling, the style or pin of a dial, which by its shadow shows the hour of the day. The word is Greek, and literally signifies something that makes a thing known. It represents the axis of the earth—*Gnomon*, in geometry, a figure formed by the two complements with either of the parallelograms about the diameter.—In astronomy, a style erected perpendicular to the horizon, in order to find the altitude of the sun.

GNOMONICS, the art or science of

dialling, or of constructing dials to show the hour of the day by the shadow of a gnomon.

GNOMIOMETRICAL. The *gnomiometrical telescope* and *microscope* are instruments for measuring the angles of crystals by reflection, and for ascertaining the inclination of strata, and the apparent magnitude of angles when the eye is not placed at the vertex.

GNOSTICS, a sect of philosophers that arose in the first ages of Christianity, who pretended they were the only men who had a true knowledge of the Christian religion. They formed for themselves a system of theology, agreeable to the philosophy of Pythagoras and Plato, and fancied they discovered deeper mysteries in the Scriptures than were perceived by those whom they considered as simple and ignorant. They held that all natures, intelligible, intellectual, and material, are derived by successive emanations from the Deity. In process of time, the name designated sectarians of various descriptions, but who all agreed in certain opinions; and the tenet which seems most particularly to distinguish the Gnostic name, was the existence of two first principles, or deities, the one the author of good, and the other of evil.

GNU, in zoology, a species of antelope, having horns bent forward at the base and backward in the middle. It is a native of Southern Africa; and its form partakes of that of the horse, the ox, and the deer. The gnu is a lively capricious animal; and when irritated, it expresses its resentment by plunging, curveting, tearing the ground with its hoofs, and butting with its head. These animals feed in large herds, and it is only when stragglers have been accidentally separated from the herd, that any of them are found in a solitary state.

GOAT, in zoology, a quadruped of the genus *Capra*; nearly the size of a sheep, but stronger, less timid, and more agile. The horns are hollow, erect, and scabrous. They delight to frequent rocks and mountains, and subsist on scanty coarse food. The milk of goats is sweet and nourishing, and their flesh furnishes provisions to the inhabitants of countries where they abound. But the skin is the most valuable part of this animal. It is prepared for a variety of purposes, takes the dye better than any other skin, and is well known under the name of *marocco*.—The *Cashmere goat*, from whose backs are procured the materials for the manufacture of Cashmere shawls, is smaller than the common domestic goat, and has long, silky, fine hair, not curled, as in the Angora goat.—The *Angora goat* is also furnished with soft, silky hair, of a silver-white colour, hanging down in long curling locks. From the wool of this goat the finest camlets are made.

GOAT'S-BEARD, in botany, a plant of the genus *Tragopogon*.

GOAT'S-THORN, in botany, a plant of the genus *Astragalus*.

GOAT-SUCKER, in ornithology, an

THE HIMALAYA AND URAL MOUNTAINS, AS WELL AS THE HIGHEST NORTHERN LANDS, ARE COMPOSED PRINCIPALLY OF GNEISS.

THE Gnostics REJECTED THE DOCTRINE OF THE RESURRECTION OF THE BODY AND ITS REUNION WITH THE IMMORTAL SPIRIT.

[GOL]

American bird, of the genus *Caymalus*, so called because it was supposed to suck the teats of the goats. Like the owl, this bird is seldom seen in the day-time, unless disturbed, or in dark and gloomy days when its eyes are not dazzled by the bright rays of the sun.

GOBELINS, or **HOTEL-ROYAL DE GODELINS**, a celebrated academy for tapestry-drawing, and manufactory of tapestry, erected in the suburb of St. Marcel, at Paris, by Louis XIV. in the year 1666. The place was previously famous on account of the dyeing manufactory established there by Gales and John Gobelins, in the reign of Francis I. These eminent dyers discovered a method of producing a beautiful scarlet, which has ever since been known by their name, and so extensive has been their fame, that not only the colour, but the house in which their business was carried on, and the river they made use of, are called *Gobelins*.

GODS, (the *gobius* of Linnaeus) in ichthyology, a salt water fish, of the acanthopterygious genus, of which there are many species, but none of them are much esteemed as food.

GOD, the appellation which we give to the Creator and Sovereign of the Universe, the supreme Being.—The words *god* and *goddess* are also the appellatives common to the heathen deities, which they divided into *di majorum gentium*, and *di minorum gentium*, that is, into the superior and inferior gods. Another division was taken from their place of residence: thus there were celestial, terrestrial, infernal, marine, and sylvan gods. They were also divided into animal and natural gods: the animal gods were mortals, who had been raised to divinity by ignorance and superstition; and the natural gods, the parts of nature, such as the stars, the elements, mountains, rivers, &c. There were also deities, who were supposed to preside over particular persons: some had the care of women in child birth, others, the care of children and young persons, and others were the deities of marriage. Each action, virtue, and profession had also its particular god: the shepherds had their Pan, the gardeners, their Flora, the learned, their Mercury and Minerva, and the poets, their Apollo and the Muses.

GODFATHER, and **GODMOTHER**, the man and woman who are sponsors for a child at baptism, who promise to answer for his future conduct, and solemnly promise that he shall follow a life of piety and virtue, by this means laying themselves under an indispensable obligation to instruct the child and watch over his conduct. This practice is of great antiquity in the Christian church, and was probably instituted to prevent children being brought up in idolatry, in case their parents died before they arrived at years of discretion.

GODWIT, in ornithology, a fowl of the grallie order and genus *Scelopar*. It has a bill four inches long, the feathers of the neck, head, and back, are of a reddish

brown, those on the belly white, and the tail is regularly barred with black and white. This fowl frequents fens and the banks of rivers, and its flesh is esteemed a great delicacy.

GOUT, in medicine, a large tumour that forms gradually on the throat between the trachea and the skin.

GOLD, a precious metal of a bright yellow colour, and the most ductile and malleable of all the metals. It is the heaviest metal except platinum, being the most solid and the least porous, and not being liable to be injured by air, it is well fitted to be used as coin. It is wholly incapable of rust, and not sonorous when struck upon. Its luster does not equal that of steel, platinum, or silver, but it surpasses all other metals in this respect. It requires a strong fire to melt it, remaining unaltered in the degree of heat that fuses tin or lead, but running with a less potent heat than is necessary to the fusing of iron or copper. It does not retain its colour till the time of its melting, but becomes ignited and white before it runs, and when in fusion, it appears of a pale bluish green colour on the surface.

It amalgamates the most readily of all the metals with quicksilver. When in a state of fusion, it very easily and very intimately blends itself with silver, and when mixed with that metal, will also run into a mass with iron. The ductility and malleability of gold is such, that one grain of it will cover upwards of fifty square inches, and an ounce is capable of being extended in the form of wire many hundred miles. The heat of the strongest furnace does not change the metallic properties of gold, but by a long continued application of the violent power of the sunbeams, collected in the focus of a burning glass, and instantaneously by means of the electric fluid, it may be calcined, and even reduced to glass. Gold is found in beds of quartz, sand stone, &c. and also in many rivers, particularly in Peru, in minute and irregular grains, which are known by the name of *gold dust*. The mineral formations in which this metal occurs, are the crystalline primitive rocks, trap rocks, and alluvial grounds. It never predominates to such a degree as to constitute veins by itself. It is either disseminated or spread out in thin plates or grains on their surface or implanted in their cavities under the shape of filaments or crystallized twigs. The principal use of gold, as is well known, is in coinage. It has been with mankind, from time immemorial, the representative sign of every species of property. Even before the art of coining was invented, it passed for money in the condition in which it was found in the earth, and in this form it still enjoys a currency in many parts of Africa. It is rarely employed in a state of perfect purity but is almost universally alloyed with copper, or with silver, in order to increase its hardness.

GOLDBEATERS' SKIN, the skin or membrane of any animal, particularly the *intestinum rectum* of an ox, which goldbeaters lay between the leaves of the metal

THERE ARE GOLD MINES IN HUNGARY AND TRANSYLVANIA, IN THE LATTER COUNTRY OCCURRING IN VEINS OF GREAT MAGNITUDE.

SPAIN ACIENTLY POSSESSED MINES OF GOLD IN REGULAR VEINS, BUT THE RICHNESS OF THE AMERICAN MINES CAUSED THEM TO BE NEGLECTED.

[GOL.]

A New Dictionary of the Belles Lettres.

[GON]

while they beat it, whereby the membrane is rendered very thin, and made fit to be applied to cuts and fresh wounds.

GOLDEN NUMBER, in chronology, is that number which indicates the year of the lunar cycle, for any given time. It was called the Golden Number, because in the ancient calendar it was written in letters of gold, on account of its great usefulness in ecclesiastical computations, especially in fixing the time of Easter. It was likewise called the Prime, because it pointed out the first day of the new moon, *primum lune*. To find the Golden Number, add 1 to the year of our Lord, divide the sum by 19, and the remainder is the Golden Number, the quotient at the same time expressing the number of cycles which have revolved from the beginning of the year preceding the birth of Christ.

GOLDEN-FLEECE, in the mythological fables of the ancients, signified the skin or fleece of the ram upon which Phryxus and Hella are supposed to have swam over the sea to Colchis; which being sacrificed to Jupiter, its fleece was hung upon a tree in the grove of Mars, guarded by two brazen-hoofed bulls, and a monstrous dragon that never slept; but was at last taken and carried off by Jason and the Argonauts.

GOLDEN-ROD, in botany, a genus of plants, belonging to the natural order *Compositæ*, containing many species, whose brilliant yellow flowers are very conspicuous in the autumnal months. They are perennial, chiefly herbaceous, with simple, undivided leaves, and bear numerous small flowers, disposed in spikes or panicles.

GOLD-FINCH, in ornithology, the name of a species of *Fringilla* (*Fringilla carduelis*), with the wings variegated with black, yellow, and white. The common goldfinch is a very elegantly coloured bird, somewhat smaller than the common sparrow. There are several other species, as the Greenland goldfinch, with a black spotted head, about the size of the common linnet; and the greenish yellow goldfinch, which is a most elegant bird; the fore-part of its head, and the upper part of the throat being covered with fine scarlet-coloured feathers, the top of the head ash-coloured, and the upper part of the body a yellowish-green.

GOLD-FISH, in ichthyology, an elegant fish of a gold colour, of the genus *Cyprinus*, and of the size of a pilchard. It was originally brought from China, and is now kept in small ponds, glass globes or other vessels, by way of ornament. They are said to be very prolific, and are easily bred, requiring scarcely any farther attention than that of frequently changing the water.

GOLD-LEAF, or **LEAF-GOLD**, gold that is foliated or beaten into a thin leaf. The thickness varies according to the purpose for which it is designed: that which is intended for gold-wire is much thicker than that for the frames of pictures. Gold is beaten on a block of marble, with hammers of polished iron. It is first reduced from the ingot to the thickness of paper; then cut into pieces of about an inch square;

placed between skins; beaten thinner; and divided into squares, and again beaten, until it has acquired the necessary degree of thinness. The finished leaves of gold are put up in small books made of single leaves of soft paper, rubbed over with red chalk to prevent adhesion between them. Boyle has observed that a grain of gold, reduced to leaves, will cover a surface of fifty square inches, that each one of these square inches may be divided into 46,656 other little squares, and that, of course, the entire amount of surface derived from one grain of gold is capable of being divided into 2,322,800 parts, each of which is visible to the naked eye. In short, such is the wonderful extension which the gold-beater is enabled to give to this precious metal, that it has been estimated that an equestrian statue, of the natural size, may be gilded with a piece of gold not exceeding in value ten shillings.

GOLD-WIRE, a cylindrical ingot of silver, superficially gilt, and afterwards drawn through a vast number of holes of different bores (according to the process of wire-drawing) in order to bring it to the requisite fineness, which is sometimes equal to that of a hair. Before each time of drawing, it is covered with wax, to save the gold from being worn away.—*Gold-wire flattened*, the wire already described, flattened between rollers of polished steel, and used in spinning, weaving, lace-making, and embroidery.—*Gold thread*, or *spun gold*, is a flattened silver-gilt wire, wrapped or laid over a thread of yellow silk, by twisting with a wheel and iron bobbins.

GOLDSMITH, an artisan who manufactures vessels and ornaments of gold and silver. Also, one who deals in gold or silver vessels. The company of goldsmiths were incorporated in the reign of Richard II.

GOLDYLOCKS, a name given to certain plants of the genera *Crysocoma* and *Gnaphalium*.

GOLF, a game with bat and ball, much practised in the north of England.

GOMPHOSIS, in anatomy, a species of articulation, wherein one bone is set in the other, like a nail or peg; as the teeth within the jaws.

GOMUTI, in botany, the *Borassus gomutus*, a species of palm, growing in the Indian islands; from the back of which a valuable fibrous substance is obtained that is manufactured into cordage. It undergoes no preparation but that of spinning and twisting; no material similar to our tar or pitch being necessary, as it possesses, in a remarkable degree, the quality of resisting alternations of heat and moisture.

GONG-GONG, or **TAMTAM**, a kind of cymbal used by the Chinese, made of copper alloyed with tin.

GONDOLA, a flat-bottomed boat, generally about thirty feet long and four broad, terminating at each end in a sharp point or peak rising to the height of a man. It is much used at Venice on the canals, and in other parts of Italy, for a passage boat. II

SOUTH AMERICA PURNISHES THREE AND A HALF TIMES MORE GOLD, AND TWELVE TIMES MORE SILVER, THAN EUROPE, ASIA, AND AFRICA.

IN FORTY YEARS (FROM 1790 TO 1830) THE GOLD AND SILVER DUG FROM ALL THE MINES IN THE WORLD, AMOUNTED TO 1880 MILLIONS STERLING.

[GOR]

The Scientific and Literary Treasury;

[GOU]

is usually rowed by two men, called *gondoliers*.

GONG, a Chinese musical instrument, of a circular form, made of tin and copper, which vibrates on being struck with a wooden mallet covered with leather.

GONIOMETER, an instrument for measuring solid angles, or the inclination of planes.

GOOSEANDER, in ornithology, a migratory fowl of the genus *Mergus*, the diver or plunger.

GOOSE, a well known domestic fowl, of the genus *Anas*, which exists in a wild as well as a tame state. The gray lay goose, or common wild goose, is the largest of the British species, and is easily tamed from this sort has sprung the domestic breed. There are, however, many other species.

GOOSEBERRY, in botany, a shrub (the *Ribes grossularia*) that is set with prickles, and yields a fruit of an oval and globular figure, containing many small seeds in a pulpy substance. It is a bush much cultivated in gardens.

GOOSEFOOT (*Chenopodium*), a genus of plants, containing twenty-six species, most of them indigenous to the temperate parts of the eastern continent. Many of the species grow abundantly in waste places throughout Europe, and we are told that the young shoots are sometimes eaten as asparagus. The *Chenopodium quinoa* of Chili is very celebrated in that country, and is carefully cultivated both for the leaves and seeds, the latter of which are used instead of millet.

GOOSE-NECK, in a ship, a piece of iron fixed on the end of the tiller, to which the lanyard of the whip-staff, or the wheel-rope comes, for steering the ship.

GOOSEWING, in seamen's language, a sail set on a boom on the lee side of a ship, also the clews or lower corners of a ship's main sail or fore-sail when the middle part is furled.

GORDIAN KNOT, in antiquity, a knot made in the harness of the chariot of Gordius, king of Phrygia, so very intricate, that there was no finding where it began or ended. An oracle had declared that he who should untie this knot should be master of Asia. Alexander having undertaken it, and fearing that his inability to untie it should prove an ill augury, cut it asunder with his sword, and thus either accomplished or eluded the oracle. Hence, in modern language, to cut the Gordian knot is to remove a difficulty by bold or unusual means.

GORDIUS, the Hair worm, a genus of the *Vermes Intestina*, of which there are five species. The *Gordius aquaticus* is of the thickness of a hog's bristle, and from six to ten inches long, is found in stagnant waters, and twists itself into various contortions and knots. The head is obtusely conical, with a simple circular terminal pore for a mouth, from which a sort of membrane can be forced by pressure. The skin is smooth, but within an inch of the tail there is a small space which is

roughened on the sides with very minute granules. The tail is bifid, the processes short, equal, and obtuse. This singular worm is in perpetual motion and change, and its never-ceasing contortions have a sort of painful character, which involuntarily suggest a comparison of it to "the worm that never dieth."

GORGE, in architecture, the narrowest part of the Tuscan and Doric capitals, lying between the astragal, above the shaft of the column and the annulets.—In fortification, the entrance of a bastion, ravelin, or other outwork.

GORGED, in heraldry, bearing a crown, coronet, or the like, about the neck.

GOSHAWK, in ornithology, a voracious fowl of the genus *Falco*, larger than the common buzzard, but of a more slender shape.

GOSPEL, a revelation of the grace of God to fallen man through a mediator, including the character, actions, and doctrines of Jesus Christ, with the whole scheme of salvation, as revealed by Christ and his apostles, and handed down to us by the four Evangelists.

GOSAMMER, a fine filmy substance, like cobwebs, floating in the air in calm clear weather, especially in autumn. It is mostly seen in stubble fields and on furze or low bushes, and is supposed to be formed by a species of spider.

GOSYPPIUM, Cotton, a genus of plants of which there are ten species, most of these are Asiatic plants, but some are of American growth and culture. [See COTTON.]

GOTHIC STYLE, in architecture, a style in which pointed arches of greater height than breadth, and a profusion of ornaments, in imitation of leaves and flowers, are the principal characteristics.

GOVERNMENT, that form of fundamental rules and principles by which a nation or state is governed. If this power be vested in the hands of one, it is a monarchy, if in the hands of the nobility, an aristocracy, and if in the hands of the people, or those chosen by them, a democracy. The executive government is the power of administering public affairs, the legislative government, that of making the laws. In England, the executive government is in the king (or queen regnant) and his ministers, but the legislative government is in the parliament, that is, the king, lords, and commons, whence the constitution of England is denominated a mixed government.—Government is also a post or office which gives a person the power or right to govern or rule over a place, a city, or province, either supremely or by delegation. Thus, the government of Ireland is vested in the lord-lieutenant.—Government, in grammar, the influence of a word in regard to construction, as when established usage requires that one word should cause another to be in a particular case or mood.

GOUGE, an instrument or tool, used by various artificers, being a sort of round

"SAFETY AND EQUAL GOVERNMENT ARE THINGS, WHICH SUBJECTS WANE AS HAPPY AS THEIR KINGS."—WALLER.

"THOSE GOVERNMENTS WHICH CURB NOT, ENRICH CLIQUE, AND A RICH KNAVE'S A LIEBEL ON OUR LAWS."—YOUNG.

[GRA]

A New Dictionary of the Belles Lettres.

[GRA]

hollow chisel for cutting or hollowing out either wood or stone.

GOURD, or **CAL/ABASH**, a climbing plant, bearing a pulpy edible fruit; allied to the cucumber, melon, squash, &c., and has been cultivated from time immemorial in the warmer parts of Asia and Africa, and also by the aborigines of America, previous to its discovery by the Europeans. The leaves are rounded and slightly viscid; the flowers white, and somewhat stellated; and the fruit large, varying much in shape in different varieties. In Egypt and Arabia the lower classes boil it in vinegar, or make it into a sort of pudding by filling the shell with rice and meat.

GOUT, or **ARTHRITIS**, in medicine, a very painful disease, the principal seat of which is in the joints and ligaments of the feet. It is often periodical or intermitting. It is a disease which seldom attacks young people, and is attended with the secretion of the superfluous earthy matter, which is no longer necessary for the formation of the bones, but which, instead of being carried off by the organs of secretion, is deposited beneath the skin, or accumulates internally, thus producing chalk stones and various internal concretions.

GRACE, in objects of taste, a certain species of beauty, which appears to consist in the union of elegance and dignity.—In theology, the free unmerited love and favour of God; or the divine influence in restraining from sin.—*Days of Grace*, in commercial law, three days allowed for the payment of a bill after it has become due.

The word *grace* is also used in speaking of or to a duke or duchess, as your Grace, his or her Grace.—*The Graces*, among the heathen world, were female beauties deified: they were three in number; Aglaia, Thalia, and Euphrosyne, the constant attendants of Venus.—In music, *graces* are turns, trills, and shakes, introduced for the purpose of embellishment.

GRACILIS, in anatomy, a muscle of the leg, so called from its slenderness.

GRADATION, in general, the ascending step by step, or proceeding in a regular and uniform manner. It also means a degree in any order or series. Thus we say, there is a *gradation* in the scale of being; or we observe a *gradation* in the progress of society from a rude state to civilized life.—*Gradation*, in logic, is an argumentation, consisting of four or more propositions, so disposed, as that the attribute of the first is the subject of the second; and the attribute of the second, the subject of the third; and so on, till the last attribute come to be predicated of the subject of the first proposition.—*Gradation*, in chemistry, a process by which metals are gradually raised to a still higher degree of purity.

GRADIENT. The literal meaning of this word is, "moving by steps;" but it has lately been used technically to denote, in reference to railways, their deviation from a level surface to an inclined plane.

GRAIUATE, one who has obtained a degree at an university, or from some pro-

fessional incorporated society, after a due course of study, and suitable examination.

GRAFTING, in horticulture, the process of inserting a branch of one tree into the stock of another, so that it may receive nourishment from it, while at the same time it produces a new tree, like the old one whence the graft was taken. The use of grafting is to propagate any curious sorts of fruits, so as to be certain of their kinds. All good fruits have been obtained accidentally from seeds; and of the seeds of these it is wholly uncertain whether they will produce fruit worthy of cultivation; but when shoots are taken from such trees as bear good fruit, no alteration need be apprehended. The reason of the advantages obtained by grafting is differently explained; but it seems probable that they should be attributed to the greater facility with which the tender cion can assimilate the juices already prepared by the stock, than those which it must draw immediately from the earth, if planted.

GRAIN, the generic name of the seeds of wheat, barley, oats, rice, &c. All kinds of grain contain nutritious particles of a similar character, although they vary, both in their quantity and in their mixture, in various grains; but their most valuable elements are,—*gluten*, which affords the strongest nourishment for the animal body; *fecula* or *starch*, which, though not so nutritious as gluten, seems to render it more digestible; and a *sweet mucilage*, which is more nutritious than starch, but is small in quantity, and renders the grain liable to the vinous and acetous fermentation.—It is likewise the name of a small weight, the twentieth part of a scruple in apothecaries' weight, and the twenty-fourth part of a penny-weight troy.—*Grain* also denotes the component particles of stones and metals, the veins of wood, &c. Hence *cross grained*, or *against the grain*, is, contrary to the fibres of wood, &c.—*Grains* (in the plural), the husks or remains of malt after brewing, or of any grain after distillation.

GRAINS OF PARADISE, a narcotic pepper, brought from Guinea, and, according to the opinions of some writers, much used by brewers.

GRAL'LÆ, in ornithology, the fourth order of birds, with obtuse bills and long legs, as cranes, snipes, bustards, storks, and ostriches.

GRAL'LIC (from *gralle*), in ornithology, an epithet given to an order of fowls having long legs, naked above the knees, which fit them for wading in water.

GRAMINA, or **GRASSES**, the most numerous family of plants, common to all countries, but varied in species by soil and elevation. An English meadow in natural grass often exhibits a hundred several species. But the most productive grasses have been specially cultivated, and we now have fields sown with rye-grass, red clover, trefoil, sanfoin, lucerne, &c. &c., called artificial grasses. Nor must we omit to mention, that the *grasses* include wheat, rye, barley,

"SEE ALL THINGS IN THEIR OWN PECULIAR PLACE: AND KNOW THAT ORDER IS THE GREATEST GRACE."—DRYDEN.

PARTICULAR KINDS OF GRAIN GROW WILD IN SOME COUNTRIES, BUT THEY HAVE NOT THE PERFECTION OF OUR CULTIVATED GRAIN.

[GRA]

The Scientific and Literary Treasury;

[GRA]

oats, rice, Indian corn, and the sugar-cane; their chief characteristic being that their stems or culms are cylindrical and provided at intervals with knots, from each of which arises a long linear or lanceolate leaf, sheathing the stem for some distance.

GRAMIN EOUS, in botany, an epithet for plants belonging to the family of *grasses*, having simple leaves, a jointed stem, a husky calyx, termed *glume*, and a single seed.

GRAMMAR, the art which analyzes and classifies the words in a language, which details its peculiarities, and furnishes rules, recognised by the best authorities, for its construction. General grammar teaches the principles which are common to all languages, and the grammar of any particular language teaches the principles peculiar to that language. Grammar treats of sentences, and of the several parts of which they are compounded. Sentences consist of words, words of one or more syllables, syllables of one or more letters, so that, in fact, letters, syllables, words, and sentences, make up the whole subject of grammar.—By means of inarticulate sounds beasts can express certain feelings, but man is distinguished from the brute creation by the power of modifying a much greater variety of sounds, and of fixing to each modification a particular meaning. The sounds thus modified are called words, and as words have no natural relation to the ideas and perceptions of which they are significant, the use of them must either have been the result of human sagacity, or have been suggested to the first man by the Author of nature.—*Grammar* is also used for a book containing the rules of this art, methodically digested, as, "Murray's English Grammar," "Moody's New Latin Grammar," &c.

GRAMME, a French measure of weight, equal to 22.966 grains English.

GRAND JURY, a jury convened by the Sheriff to examine into the grounds of accusation against offenders, and validity of indictments. Offenders against whom true bills are found by the grand jury are afterwards tried before a petty jury.

GRANDEE, a designation given to a nobleman of Spain or Portugal.

GRANITE, a primary rock, of uniform structure, composed of particles of quartz, mica, and felspar, crystallized, and cohering without cement. It is the foundation rock of the earth, on which others lie, but raised in mountains whose lofty peaks are formed of it. The aspect of granitic mountains is extremely diverse, depending, in part, upon the nature of its stratification, and the degree of disintegration it has undergone. In Europe, the central part of the principal mountain ranges is of this rock, as in Scandinavia, the Alps, the Pyrenees, and the Carpathian mountains. In Asia, granite forms a considerable part of the Uralian and Altai ranges of mountains, and it appears also to compose the principal mountains that have been examined in Africa. The colour of granite is greatly diversified by the dif-

ferent colours and proportions of the component parts.

GRANITE, in mineralogy, a granitic compound containing two constituent parts, as quartz and felspar, or quartz and hornblende.

GRANITIN, in mineralogy, a granitic aggregate of three species of minerals, some of which differ from the species which compose granite, as quartz, felspar, and jade or horn.

GRANT, in law, a gift in writing of such things as cannot conveniently be passed or verbally conveyed.

GRANULATION, the act of forming into grains. The process by which a metal is reduced into grains is effected by melting the metal, and then pouring it in a very thin stream into cold water. As soon as the metal comes in contact with water it divides into drops, which have a tendency to a spherical shape, and are more or less perfect, according to the thinness of the stream, the height from which it falls, and the temperature of the metal. Some of the more fusible metals may be reduced to much finer grains, by pouring it, in its melting state, into a wooden box, rubbed over with chalk, and shaking it violently before it has time to become solid.—In medicine, the little, grain like, fleshy bodies, which form on the surfaces of ulcers and suppurating wounds, and serve both for filling up the cavities and bringing nearer together and uniting their sides, are called *granulations*. The colour of healthy granulations is a deep florid red, and are always prone to unite. When livid, they are unhealthy, and have only a languid circulation.

GRAPES, the fruit of the vine, growing in clusters, from which wine is expressed. Grapes are found by a chemical analysis to contain super-tartrate of potash, tartaric acid, citric and malic acids, abundance of sugar, a portion of mucilage, jelly, some albumen, and also, as is said, some gluten. France, Spain, Portugal, and Italy, as well as some parts of Germany, produce grapes which yield wines of various qualities and flavours, some of them highly esteemed. The climate of England is not so favourable to their proper ripening, but the grapes we raise in hot houses are generally superior to those which we import from Malaga and other parts of Spain. When dried and preserved, they are called *raisins*.

Whether or not the vine will ever be cultivated to any advantageous extent in England, we are incompetent to form a correct judgment, but we think it due to Mr. Clement Moore,—whose skill and industry (as we can personally attest) have been for many years most successfully directed to this end,—to advise all who may be desirous of gaining sound practical and scientific information on this particular branch of horticulture, to consult the treatise he has published on its growth and culture. He has there, most unquestionably, given examples of native produce, which hold out an encouraging prospect of our becoming independent of "the vine-covered hills," if

POMPEY'S PILLAR, AT ALEXANDRIA, CONSISTS OF A SINGLE BLOCK OF RED GRANITE, UPWARDS OF SIXTY-SEVEN FEET HIGH.

GRAPES SHOULD HANG ON THE VINE TILL THEY ARE PERFECTLY RIPE, FOR IF CHAIRED WHEN GATHERED THEY WILL NEVER RIPE.

[GRA]

A New Dictionary of the Belles Lettres.

[GRA]

CRICKETS AND GRASSHOPPERS EXPECT THEIR CHIRPING NOISE, BY GRATING THEIR SPINY THIGHS AGAINST THEIR HARD WINGS.

not of entering into competition with our continental neighbours.—We observe that Mr. H. has availed himself of the popular method of discussing the merits of his plans, by a course of lectures delivered at the Mechanics' Institution, Winchester; the neighbourhood of which city, he says, is highly favourable to the growth of the vine. Alluding more especially to the southern coast of this island, where alone the solar heat is sufficiently powerful to ripen the fruit, he emphatically observed, that "every cottager should possess a vine, which, if properly treated, would produce him sufficient fruit to pay his rent."

GRAPE-SHOT, in artillery, a combination of small shot put into a thick canvas bag, and corded so as to form a kind of cylinder.

GRAPHITE, in mineralogy, carburet of iron; that substance used for pencils, which is very generally called *black-lead*.

GRAPHOMETER, a mathematical instrument, called also a *semi-circle*, whose use is to observe any angle whose vertex is at the centre of the instrument in any plane, and to find how many degrees it contains.

GRAPNEL, a small anchor fitted with four or five flukes or claws, used to hold boats or small vessels.

GRASSHOPPER, in entomology, a species of the genus *Gryllus*, to which belong the locust and cricket. The grasshopper of our fields is innocent and harmless.

GRATITUDE, an agreeable emotion, in which good-will to a benefactor forms the ground-work. Gratitude for benefits received cannot be too highly cherished; for it implies a feeling and generous heart, and a proper sense of duty.

GRAVEL, small stones or pebbles, intermixed with sand. It is supposed to originate from fragments of rocks and flints, worn by the action of the sea, and by their mutual attritions into rounded and other forms. Its red colour is occasioned by the oxide of iron, and, when found, it affords evidence of a sea-beach having once been on the spot.—*Gravel*, in medicine, a painful disorder, arising from a gritty matter concreting into small stones in the kidneys and bladder.

GRAVER, in the art of engraving, a tool by which all the lines, scratches, and shades are cut in copper, &c.

GRAVIMETER, an instrument for measuring the specific gravities of bodies.

GRAVITATION, in physiology, a species of attraction, or the tendency of one body towards another, in consequence of its gravity. Thus, a body elevated above the earth tends to fall, that is, it *gravitates* towards the centre of the earth; and the planets are supposed to gravitate towards the sun, or centre of the solar system. The following remarks on *gravitation*, from Moseley's *Illustrations of Science*, are so descriptive of its universality, that we cannot resist the temptation of copying them: "Gravitation is fixed in matter eternally and inseparably. No lapse of time wears it away, no modification of circumstances in

which it can be placed—no appliance of artificial means—or power of other natural forces upon it, removes or can remove the slightest conceivable portion of it. You may crush the parts of a body into a powder, apply to it the power of heat, and melt it into a liquid—or you may, by a yet intenser application of heat, dilate it into a gas; you may make of it a chemical solution; bring it again to its original form of a solid—analyze it again and again—combine and recombine it; through all these changes you will not in the slightest conceivable degree have affected the gravity or weight of any one of its particles. Not only is the power of gravitating thus unalterably infixed in matter, but it is infixed in it universally. There is no place on the earth's surface where there is matter and not weight—there is no matter known to exist in our system of the universe which does not gravitate, and if we carry on our inquiries beyond the limits of our system, into the fathomless depths of space, we find there the stars gravitating towards one another." The *vis inertiae*, says Sir Isaac Newton, is a passive principle by which most bodies persist in their motion or rest, receive motion in proportion to the force impressing it, and resist as much as they are resisted. By this principle alone there never could have been any motion in the world; some other principle was necessary for putting bodies into motion; for, from the various compositions of two motions, it is certain that there is not always the same quantity of motion in the world. But by reason of the tenacity of fluids, the attraction of their parts, and the weakness of elasticity in solids, motion is much more apt to be lost than got, and is always upon the decay. There is therefore a necessity of conserving and recruiting it, by active principles; and such is the cause of gravity, by which the planets and comets keep their motion in their orbits, and bodies acquire great motion in falling, &c.

GRAVITY, SPECIFIC, is the relative gravity of any body or substance, considered with regard to some other body, which is assumed as a standard of comparison; and this standard, by universal consent and practice, is rain-water, on account of its being less subject to variation in different circumstances of time, place, &c., than any other body, whether solid or fluid. It happens that a cubic foot of rain water weighs 1000 ounces avoirdupois. Consequently, assuming this as the specific gravity of rain-water, and comparing all other bodies with this, the same numbers that express the specific gravity of bodies, will at the same time denote the weight of a cubic foot of each in avoirdupois ounces, which is a great convenience in numerical computations. From the preceding definition we readily draw the following laws of the specific gravity of bodies, viz. 1. in bodies of equal magnitude, the specific gravities are directly as the weights, or as their densities; 2. in bodies of the same specific gravities, the weights will be as the magni-

THE POWER OF GRAVITY AT TWO MILES FROM THE EARTH, IS FOUR TIMES LESS THAN AT ONE MILE; AND SO ON IN REASONING.

[GRA]

The Scientific and Literary Treasury ;

[GRE]

THE "CHRISTIAN" IS A MYSTERY PECULIAR TO THE GREEK COMMUNION, AND HOLDS THE PLACE OF CONFIRMATION IN THE ROMISH CHURCH.

tudes; 3. in bodies of equal weights, the specific gravities are inversely as the magnitudes. 4. the weights of different bodies are to each other in the compound ratio of their magnitudes and specific gravities. Hence, it is obvious, that, of the magnitude, weight, and specific gravity of a body, any two being given, the third may be found, and we may thus find the magnitude of bodies, which are too irregular to admit of the application of the common rules of mensuration, or we may, by knowing the specific gravity and magnitude, find the weight of bodies which are too ponderous to be submitted to the action of the balance or steelyard, or, lastly, the magnitude and weight being given, we may ascertain their specific gravities. The most accurate and concise mode of ascertaining the density of liquids, is to employ a small glass measure with a very short, narrow neck, and adjusted to hold exactly 1000 grains of distilled water. The vessel being filled with any other liquid, the weight of it is observed, and thence its relative density to water may be found by merely striking off three decimal places. At each operation the glass must be carefully rinsed with pure water, and again dried, by heating it, and then sucking out the humidified air by the help of a slender inserted tube. If fluids of various densities, and not disposed to unite in any chemical affinity, be poured into a vessel, they will arrange themselves in horizontal strata, according to their respective densities, the heavier always occupying a lower place.

GRAVITY, CENTRAL OF, in mechanics, is a point within a body, through which, if a plane pass, the segments on each side will equiperpendicate, that is, neither of them can move the other. Hence, if the descent of the centre of gravity be prevented, or if the body be suspended by its centre of gravity, it will continue at rest in equilibrium in any position. The centre of gravity of a parallelogram or cylinder, or any prism whatever, is in the middle point of the axis, and the centre of gravity of a circle or any regular figure, is the same as the centre of magnitude. The common centre of gravity of two bodies is a point so situated in a right line joining the centres of the two bodies, that if the point be suspended, the two bodies will equiperpendicate and rest. Thus the point of suspension in a balance or steelyard, where the two weights equiperpendicate, is the common centre of gravity of the two weights.

GRAYLING, in ichthyology, a voracious fish of the genus *Salmo*, larger than a trout, and of a silvery gray colour. It is found in clear rapid streams in the north of Europe, and is much esteemed as food.

GRAYWACKE, in geology, a remarkable kind of rock or stone, composed of grains or fragments of different minerals, chiefly of quartz, felspar, siliceous slate, and argillite. These several ingredients are united by an indurated argillaceous substance, or the interstices between the larger fragments are filled by the same materials which form

the larger parts of the rock, but in grains so comminuted as to resemble a homogeneous cement. It is of various colours, generally inclining to some shade of gray or brown.

GREBE, in ornithology, a fowl of the genus *Colymbus* and *Anseres*, of several species.

GREEK CHURCH, that portion of Christians who conform, in their creed, usages, and church government, to the views of Christianity introduced into the former Greek empire, and perfected, since the fifth century, under the patriarchs of Constantinople, Alexandria, Antioch, and Jerusalem. Like the Roman Catholic, this church recognizes two sources of doctrine, the bible and tradition, under which last it comprehends not only those doctrines which were orally delivered by the apostles, but also those which have been approved of by the fathers of the Greek church. It is the only church which holds that the Holy Ghost proceeds from the Father only, thus differing from the Catholic and Protestant churches, which agree in deriving the Holy Ghost from the Father and the Son. Like the Catholic church, it has seven sacraments—baptism, chrism, the eucharist preceded by confession, penance, ordination, marriage, and supreme unction, but it is peculiar in holding that full purification from original sin in baptism requires an immersion three times of the whole body in water, whether infants or adults are to be baptized, and in joining chrism (confirmation) with it as the completion of baptism. It rejects the doctrine of purgatory, has nothing to do with predestination, works of supererogation, indulgences, and dispensations, and it recognizes neither the pope nor any one else as the visible vicar of Christ on earth. In the invocation of the saints, in their fasts, relics, &c. they are as zealous as the Romanists, it may be said, indeed, that the services of the Greek church consist almost entirely of outward forms. This is the religion of Russia, the ecclesiastical establishment of which consists in a holy synod, four metropolitans, eleven arch bishops, nineteen bishops, 12,500 parish churches, and 425 convents, fifty eight of which are connected with monastic schools for the education of the clergy. The Greek church, under the Turkish dominion, remained, as far as was possible under such circumstances, faithful to the original constitution. The patriarch of Constantinople exercises the highest ecclesiastical jurisdiction over the Greeks in the whole Turkish empire, but they labour under many disabilities, among which is a heavy poll tax, under the name of "exemption from beheading."

GREEK FIRE, a combustible composition invented by the Greeks in the middle ages, during their wars with the Arabs and Turks. It consists of naphtha, bitumen, sulphur, gum, &c.

GREEK LANGUAGE The language of the primitive inhabitants of Greece, the Pelasgi, was already extinct in the time of

PETER THE GREAT ABOLISHED THE PATRIARCHAL OFFICE IN THE GREEK CHURCH IN RUSSIA, AND APPOINTED AN EXARCH, WITH LIMITED POWERS.

[GEE]

A New Dictionary of the Belles Lettres.

[GEE]

THE ATMOSPHERE OF GREECE IS SO DRY, THAT AT EIGHTY SIX DEGREES, VAPOR THE WHOLE OF THE INSECTS AND VEGETABLES DISAPPEAR.

Herodotus, who asserts that it was different from the Hellenic, and adds, that it is probable the Hellenes have retained their original language. From the great number of Hellenic tribes of the same race, it was to be expected that there would be different dialects, the knowledge of which is the more necessary for becoming acquainted with the Greek language, since the writers of this nation have transmitted the peculiarities of the different dialects in the use of single letters, words, terminations, and expressions, and that not merely to characterise more particularly an individual represented as speaking, but even when they speak in their own person. It is customary to distinguish three leading dialects, according to the three leading branches of the Greeks, the *Eolic*, the *Doric*, and the *Ionic*, to which was afterwards added the mixed *Attic* dialect. At what time this language first began to be expressed in writing, has long been a subject of doubt. According to the general opinion, Cadmus, the Phœnician, introduced the alphabet into Greece. His alphabet consisted of but sixteen letters, four are said to have been invented by Palamedes in the Trojan war, and four more by Simonides of Ceos. As the Ionians first adopted these letters, and the Athenians received them from them, the alphabet with twenty-four letters is called the *ionic*. Those who have most carefully studied the subject, believe that the use of the alphabet became common in Greece about 550 years before Christ, and about as long after Homer. In Homer's time, all knowledge, religion, and laws were preserved by memory alone, and for that reason were put in verse, till prose was introduced with the art of writing. The Greek language, as preserved in the writings of the celebrated authors of antiquity, as Homer, Hesiod, Demosthenes, Aristotle, Plato, Xenophon, &c. has a great variety of terms and expressions, suitable to the genius and occasions of a polite and learned people, who had a taste for arts and sciences. In it, proper names are significative, which is the reason that the modern languages borrow so many terms from it. When any new invention, instrument, machine, or the like, is discovered, recourse is generally had to the Greek for a name to it, the facility wherewith words are there compounded, affording such as will be expressive of its use, such as barometer, hygrometer, microscope, telescope, thermometer, &c. But of all sciences medicine most abounds with such terms, as, diaphoretic, diagnosis, diarrhoea, hemorrhagy, hydrophobia, phthisis, atrophy, &c.—*Modern Greek, or Romaine*. The Greek language seems to have preserved its purity longer than any other known to us, and even long after its purity was lost, the echo of this beautiful tongue served to keep alive something of the spirit of ancient Greece. All the supports of this majestic and refined dialect seemed to fail, when the Greeks were enslaved by the fall of Constantinople (A.D. 1513.) All the cultivated classes who still retained the pure

Greek, the language of the Byzantine princes, either perished in the conflict, or took to flight, or courted the favour of their rude conquerors by adopting their dialect. In the lower classes only did the common Greek survive the vulgar dialect of the polished classes. But the Greek spirit, not yet extinguished by all the adversities the nation had undergone, finally revived with increasing vigour, and even the love of song kept alive some sparks of patriotic sentiment. From the beginning of the present century, external circumstances have greatly favoured the progress of education in Greece, schools have been established, and the language itself, which in its degradation was not destitute of melody and flexibility, gained energy and vivacity from the efforts of several patriotic individuals, who endeavoured to bring it nearer the ancient classic dialect. Under the protection of England, during the administration of Mr. Canning, much was done towards the mental improvement of the modern Greeks, and the Greek spirit was gradually developed. An Ionic Greek university was opened at Corfu in 1824. It consists of four faculties, for theology, law, medicine, and philosophy. Its chancellor was lord Guildford. Publications of all kinds have appeared, and effectual means have been taken by scholars of first-rate abilities, to enrich and ennoble the modern Greek language from the classic treasures of their accomplished ancestors.

GREEN CLOTH, in British polity, a board or court of justice held in the counting house of the British monarch's household, and composed of the lord steward and inferior officers. To this court is committed the charge and supervision of the royal household in matters of justice and government, with power to correct all offenders, and to maintain the peace of the verge, or jurisdiction of the court royal, which extends every way two hundred yards from the gate of the palace. Without a warrant first obtained from this court, no servant of the household can be arrested for debt.—It takes its name from a green cloth spread over the board at which it is held.

GREEN-FINCH, in ornithology, a species of *Fringilla*, the feathers of which are of a greenish hue, with the wings and tail variegated with yellow.

GREEN HOUSE, or Conservatory, a glazed building, erected for sheltering and preserving the tender exotic plants, which will not bear to be exposed to the open air during the winter season.

GREEN STONE, in geology, a rock of the trap formation, consisting of horn-blend and felspar in the state of grains or small crystals.

GREGARIOUS, in natural history, an epithet for such animals as herd together in flocks.

GREGORIAN. The *Gregorian year*, in chronology, is a correction of the Julian year. In the latter, every secular or hundredth year is bissextile; in the former every one in four. This reformation, which

AFTER THE OTTOMANS HAD BECOME MASTERS OF GREECE, ALL THE INSTITUTIONS WHICH HAD CONTRIBUTED TO PRESERVE THE LANGUAGE, PERISHED.

[GRO]

The Scientific and Literary Treasury ;

[GUA]

was made by pope Gregory XIII. A.D. 1682, is also called the *New style*.

GRENADE, a hollow shell or globe of iron, filled with combustibles, and thrown out of a howitzer. There are also a smaller kind, thrown by hand, which are called *hand-grenades*. These were originally used by soldiers, who, from long service and distinguished bravery, were selected for the service, and hence the name of *grenadiers*, who now form the first company of a battalion.

GRENATITE, a mineral of a dark reddish brown colour, sometimes called prismatic garnet. It occurs imbedded in mica slate, and in talc, and is misuable by the blow-pipe.

GRIFFIN, in the natural history of the ancients, and in heraldry, an imaginary animal, represented with four legs, wings, and a beak, the upper part representing an eagle, and the lower part a lion. By this form the ancients intended to give an idea of strength and swiftness united, with an extraordinary vigilance in guarding whatever was intrusted to its care. This hybrid animal was supposed to watch over mines of gold and hidden treasures, and was consecrated to the sun.

GRISETTE (*French*), originally meant a dress of coarse gray cloth, worn by the females of the lower classes, hence it is used for the females themselves. In the language of the theatres, *grisette* signifies an intriguing young girl, of the class of *soubrettes*.

GROAT, a silver coin, first struck in the reign of Edward I. before whose time the English had no silver coin larger than a penny. It has since been used as a money of account equal to fourpence.

GROSS, in commerce, the number of twelve dozen *Gross weight*, the weight of merchandise or goods, with the dross, bag, cask, &c. in which they are contained, for which an allowance is to be made of tare and tret. This being deducted, the remainder of real weight is denominated *net or net weight* *Idiosoon in gross*, in law, an advowson separated from the property of a manor, and annexed to the person of its owner.

GROSS BLAK, in ornithology, a bird of the genus *Loxia*. It is of a fiery red colour, except round the bill and on the throat, which is black. It is to be met with in North America, and is called the Virginia nightingale, on account of the fineness of its song.

GROSSULAK, in mineralogy, a scarce kind of garnet, so named from its green colour.

GROTESQUE, a word, as applied to painting, sculpture, &c. which denotes irregularity of form and proportions. In its more common acceptation, it means ludicrous, whimsical, extravagant.

GROUND, in painting, the surface on which figures or other objects are represented. In etching, a gummy composition spread over the surface of the metal to be etched, to prevent the nitric acid from eat-

ing, except in such places where this ground is opened with the point of a needle.

—In manufactures, the principal colour, to which others are considered as ornamental.—In music, the name given to a composition in which the base, consisting of a few bars of independent notes, is continually repeated to a continually varying melody.—To *gain ground*, to obtain an advantage; to prevail.—*Ground-angling*, fishing without a float, with a piece of lead fixed a few inches from the hook.—*Ground-ash*, a young shoot from the stump of an ash.—*Ground-bait*, bait for fish which sinks to the bottom of the water.

—*Ground-floor*, the lower floor, or that which is on the basement.—*Ground-ivy*, in botany, a well known plant, the *Glechoma hederacea*—*Ground plate*, in architecture, the outermost pieces of timber lying on or near the ground, framed into one another with mortises and tenons.—*Ground-plot*, the ground on which a building is placed.—*Ground-rent*, rent paid for the privilege of building on another man's ground, and generally held on a long lease.

—*Ground tackle*, in ships, the ropes, &c. belonging to anchors.

GROUNDSEL, in botany, a plant of the genus *Senecio*, of several species.

GROUP, in painting and sculpture, an assemblage of figures or other objects.—*Grouping* is the art of so combining and balancing the parts as to produce an harmonious effect.

GROUSE, in ornithology, a fowl of the genus *Tetrao*, of which there are several kinds, as, the black game, red game, ptarmigan, white grouse, ruffed grouse, &c. The distinguishing mark of this genus is a naked band, often of a red colour, in place of an eyebrow. They are wild, shy, and almost untamable, dwelling in forests and barren countries, far from man and cultivation.

GROVE, a small wood or cluster of trees with a shaded avenue, or a wood impervious to the rays of the sun.

GROB, the worm or maggot produced from the beetle, which afterwards becomes a winged insect.

GRINALES, in botany, one of Linnaeus's natural orders of plants, containing the geraniums, flax, lignum vitae, &c.

GRYL LUN, in entomology, the name of the cricket and locust kind, which, together with the grasshoppers, make only one genus of insects, the characteristics of which are these: the antennae setaceous, the exterior wings membranaceous and narrow, the thorax compressed and angulated, and the legs formed for leaping.

GRYPH'ITE, or *Crowstone*, an oblong fossil shell, narrow at the head, which is very hooked, and wider towards the extremity, where it ends in a circular hump.

GUAIAIC, or **GUAIA CUM**, a resinous substance procured from a tree (the *Guaiacum officinale*) growing in the West Indies. It is much used in medicine as a stimulant.

GUANA, in zoology, a species of lizard, found in South America.

THE WORD GROTESQUE OWES ITS DERIVATION TO THESE MONSTROUS FIGURES WHICH FORMERLY ADORNED MONUMENTAL AND SEPULCHRAL GROTTOS.

THE GUAIAICUM TREE, OR LIGNUM VITAE, IS A DARK LOOKING EVERGREEN, FROM 40 TO 50 FEET IN HEIGHT; THE WOOD HARD AND HEAVY.

GUA]

A New Dictionary of the Belles Lettres.

[GUI]

GUANACO, in zoology, the lama, or camel of South America, in a wild state.

GUANO, a substance of a dark yellow colour and of a strong ambrosial smell. It is found in large quantities on the coasts of Peru and other parts of South America, and appears to be the accumulation of the excrements of innumerable flocks of birds. It is such an excellent manure, that it forms an extensive and profitable branch of trade.

GUARA, in ornithology, the *Tantalus ruber* a Brazilian bird, which when first hatched is black afterwards changes to grey, and then to a bright red colour.

GUARANION, one who engages to ascertain that the stipulations of another are performed also one who engages to secure another in any right or possession.

GUARANTY or GUARANTEE an undertaking or engagement by a third party that the stipulations of a treaty or the engagement or promise of another shall be performed.

GUARD the duty of guarding or defending any post or person from an attack or surprise. Also the soldiers who do this duty. — *Guard* in fencing a posture or action proper to defend the body. — *Van guard* in military affairs a body of troops either horse or foot, that march before an army or division to prevent surprise or give notice of danger. — *Rear guard* a body of troops that march in the rear for a like purpose. — *Life guards* a body of select troops whose special duty is to defend the person of a prince or chief officer.

GUARDANT in heraldry having the face turned towards the spectator.

GUARDIAN in law a person appointed by will or otherwise to superintend the education and property of a minor to whom the guardian is bound to account after the child is of age under responsibility to the Lord Chancellor for the just performance of the trust.

GUARDS in a particular sense the troops that are designed to guard the royal person and palace and which consist both of horse and foot. In Britain the household troops or guards consist of the life guards the royal regiment of horse guards and three regiments of foot guards. — *Jaegers of the Guards* a band of body guards instituted by Henry VIII in the year 1545. Their dress is similar to that of the time of their founder. One hundred are by rotation on duty and there are seventy more out of whom the place of any of the hundred who die is supplied. — *National guards* a military body which has acquired historical importance in the politics of France, originated with the revolution, but underwent many changes both during Napoleon's sway and under the restored Bourbons. It was abolished in April, 1827 for having demanded the removal of Villèle's ministry but was revived at Paris during the popular commotion in July, 1830, which ended in seating Louis Philippe on the throne. — *Guard ship*, a vessel of war appointed to superintend the marine

affairs of a harbour or river, to see that the ships not in commission have their proper watch word kept duly by sending her guard boats round them every night, and to receive seamen who are impressed in time of war.

GUAVA, in botany, an American tree, and its fruit, of the genus *Pavium*. There are two varieties, the *pyrifera* or white guava and the *pomifera* or red guava. The fruit or berry is large and oval shaped, like the pomegranate, and is of an agreeable flavour.

GUDGEON, in ichthyology a small fresh water fish of the genus *Gyrinus*.

GUEBRE, a Persian sect, who still worship fire as an emanation or emblem of the Deity.

GUEIFS or GUELPHS, the name of a family composing a faction formerly in Italy whose contests with a rival faction, called the Ghibelines was the cause of much misery and bloodshed. — The wars of the Gueifs and Ghibelines became the struggle between the spiritual and secular power. The popes who endeavoured to reduce the German emperors to acknowledge their supremacy and the cities of Italy, struggling for independence and deliverance from the oppressive yoke of these same emperors joined the party of the Gueifs. Those who favoured the emperors were called Ghibelines. — A branch of the Gueif family was in the 11th century transplanted from Italy to Germany where it became the ruling race of several countries, and the memory of this ancient name has lately been revived by the institution of the Hanoverian Gueife order.

GUILL a company fraternity or corporation associated for some commercial purpose of which every member was to pay something toward the common charge. The ancient guilds were licensed by the king, and governed by laws and orders of their own.

GUILD HALL the chief hall of the city of London for holding courts and for the meeting of the lord mayor and commonality in order to make laws and ordinances for the welfare and regulation of the city. — *Guild rents* are rents paid to the crown by any guild or fraternity or those that formerly belonged to religious houses and came to the crown at the general dissolution of monasteries.

GUILLOTINE an instrument of public execution for beheading persons at one stroke adopted in France during the period of the Revolution as affording the least barbarous means of putting criminals to death. The invention of this decapitating machine has been erroneously ascribed to Guillotin a French physician. It was merely proposed by him, and adopted by the convention as being less ignominious for the family of the person executed and the first criminal suffered by it, at the *Place de Grève*, April 26th 1793. A similar instrument called *mansera*, was used in Italy for beheading criminals of noble birth the *maiden*, formerly used in

A GRAND CIVIC BANQUET WAS GIVEN AT GUILDHALL, JUNE 18, 1814, TO THE ALLIED SOVEREIGNS OF RUSSIA, PRUSSIA, AND MANY FOREIGN NOBLES.

ON JULY 9, 1814, A GRAND DINNER WAS GIVEN AT GUILDHALL, BY THE CORPORATION OF LONDON, TO HIS GRACE THE DUKE OF WELLINGTON.

[GAS]

The Scientific and Literary Treasury ;

[GAS]

THE GUMMY OR RESINOUS SUBSTANCE FOUND IN EVERY TREE, IS FORMED BY THE VESSELS WHICH DEPOSIT THE NEW ALBUMEN.

Scotland, was also constructed on the same principle.

GUIN EA, an English gold coin, first coined in the reign of Charles II., and till lately current for 21s. It was so called because it was made from the gold that was brought from Guinea, on the coast of Africa.

GUIN'EA-HEN, in ornithology, the *Namada meleagris*, an African fowl domesticated in Europe, which makes a harsh unpleasant cry. Its colour is a dark gray, beautifully variegated with small white spots.

GUIN'EA-PIG, in zoology, a quadruped of the genus *Cavia*, a native of South America, but now domesticated in Europe. It is seven or eight inches long, and of a white colour, variegated with black and light brown spots.

GUITAR, a musical stringed instrument, rather larger than a violin, and played with the fingers. It is much used in Spain and Italy, more especially in the former country, where there are few, even of the labouring class, who do not solace themselves with its practice.

GULAUND, in ornithology, an aquatic fowl inhabiting Ireland. In size it is between a goose and a duck, the breast and belly white, and the head of a beautiful green.

GULES, in heraldry, the red colour.

GULF, in geography, a broad capacious bay, which, when very extensive, takes the name of a sea, as the gulf of Venice, also called the Adriatic sea. A *gulf* and a *bay* differ only in extent we apply *bay* to a large or small recess of the sea, but *gulf* is applied only to a large extent of water. It also means, a deep cavity in the earth, and a whirlpool.

GULL, a marine fowl of the genus *Larus*, and order of *Anseres*. There are several species.

GUM, a concrete vegetable juice, of no particular smell or taste, becoming viscous or tenacious when dissolved or moistened with water, totally dissoluble into a liquid by water, not dissolving in vinous spirits or oils, burning to a black coal, without melting or catching flame, and suffering no dissipation in the heat of boiling water. The pure gums are such as gum arabic, tragacanth, senegal, and the gum of cherry and plum trees.

GUM-ARABIC, a gum which flows from the acacia, in Arabia, Egypt, &c. It is very useful both in medicine and the arts.

GUM-LAC, the produce of an insect which deposits its eggs on the branches of a tree called *bihar*, in Assam, a country bordering on Tibet, and elsewhere in Asia.

GUM RESIN, a mixed juice of plants, consisting of resin and an extractive matter, which has been taken for a gummy substance. The most important species are olibanum, galbanum, scammony, gamboge, euphorbium, asafetida, aloes, myrrh, and gum ammoniac. Almost all the gums are medicinal substances, and little employed in the arts and manufactures.

GUM-SEN'EGAL, a gum resembling gum arabic, brought from the country of the river Senegal, in Africa.

GUM TRAG'ACANTH, the gum of a thorny shrub of that name in Crete, Asia, and Greece. It is employed in calico-printing, and by shoemakers.

GUN, a fire-arm, or weapon of offence, which forcibly discharges a ball, shot, or other offensive matter, through a cylindrical barrel, by means of gunpowder. The larger species of guns are called cannon; and the smaller kinds are called muskets, carbines, fowling pieces, &c. The gun is supposed to have been used in Asia at a very early date, but it was not invented in Europe before the 14th century. Roger Bacon, about the year 1280, suggested the possibility of applying the preparation since called gunpowder to the purposes of war, but the idea of blowing a body to a distance by its power was produced by its accidentally doing so, in the laboratory of Bartholomew Schwartz, a German monk. Guns were originally made of iron bars, soldered together, and strengthened with iron hoops, an example of which is still preserved in the Tower of London.

GUN NERY, the science of using artillery against an enemy judiciously, and to the greatest effect. Besides an accurate acquaintance with the management of ordnance of all kinds, the range and force of every kind, the charge and direction necessary for different distances, their materials, the fabrication and effect of gunpowder, &c., the artilleryist must be able to instruct his men in their several exercises, and be thoroughly acquainted with all the tactics necessary in the art of attack and defence. He must be practically skilled in throwing up batteries and other field works, he must understand mathematics (particularly the doctrine of curves, to calculate the path of the balls), and have some knowledge of mechanics.

GUN POWDER, a composition of nitre, sulphur, and charcoal, mixed and reduced to fine powder, and usually granulated. It is in the highest degree combustible, and, by means of its elastic force, explodes with great intensity.

GUN ROOM, in ships, an apartment under the great cabin, where the gunner and his men prepare their cartridges, &c.

GUNTER'S CHAIN, in mensuration, the chain commonly used in measuring or surveying land, so called from Mr Gunter, the inventor. The chain is 66 feet in length, and is divided into 100 links of 7.92 inches each, consequently an acre of land is equal to 10 square chains—*Gunter's Line*, a logarithmic line, usually graduated upon scales, sectors, &c.—*Gunter's Quadrant*, the simplest form of a quadrant, provided with two sight holes, and a string and bob of lead, by which vertical angles may, for ordinary purposes, be determined. The face of the quadrant is also provided with scales and tables, useful in dialling, surveying, &c.

GUNWALE, or **GUNNEL**, the upper-

THE JUICES OF PLANTS, AND THE FLAVOURS OF FRUIT, DEPEND ON THEIR PECULIAR SECRETIONS, AND ARE ELABORATED WITHIN THEMSELVES.

GYM]

A New Dictionary of the Belles Lettres.

[GYF

most wale of a ship or that piece of timber which reaches on either side from the quarter deck to the forecable being the uppermost bend which finishes the upper works of the hull

GURHOITIE in mineralogy a subvariety of magnesian carbonate of lime found near Gurhoff in lower Austria. It is snow white and has a dull slightly conchoidal or even fracture

GURNARD in ichthyology a fish of several species of the genus *trigla*. The head is loricated with rough lines or bony plates and there are seven rays in the membranes of the gills

GUSTO that which excites pleasant sensations in the palate or tongue. Figuratively this word is used for intellectual taste

GUT the intestinal canal of an animal. It extends with many circumvolutions from the pylorus to the vent. is composed of three coats and is attached to the body by a membrane called the mesentery. The thin and small parts are called by anatomists the *duodenum* the *illum* and the *jejunum* the large and thick parts are called the *cæcum* the *colon* and the *rectum*. By means of this canal the undigested and unabsorbed parts of food are conveyed from the stomach and discharged
